Lin. syst. *Tetrándria, Monogýnia.*. Calyx with an ovate or oblong tube, and a short campanulate 4-toothed limb. Corolla tubular, 4-cleft, with acutish lobes, which are shorter than the tube. Anthers oblong, almost sessile in the throat, not exserted. Stigma bifid. Drupe somewhat baccate, ovate or oblong, crowned, containing a 2-celled putamen: cells 1-seeded. Seeds terete.—Small trees, natives of the Mauritius. Leaves petiolate, opposite, or 3 in a whorl, oblong or obovate, glabrous, usually beset with glandular hairs in the axils of the veins. Stipulas interpetiolar, acute, deciduous. Peduncles axillary, shorter than the leaves, bifid. Flowers small, whitish, sometimes dioecious from abortion, unilateral, and sessile along the branches of the peduncles. This genus has the inflorescence of *Stenóstomum*, but differs in the parts of the flowers being quaternary, not quinary. The flowers are nearly like those of *Malànea*, but the inflorescence is different; the tube of the corolla is longer, and the anthers almost sessile.

1 A. verticilla'ta (D. C. prod. 4. p. 459.) leaves 3 in a whorl, obovate-oblong, cuneated at the base, acuminated at the apex, glabrous on both surfaces; flowers hermaphrodite; drupes oblong. ♄. S. Native of the island of Bourbon, and probably of the Mauritius, where it is called *bois de Losteau*. A. Lostæàna, Comm. in herb. Juss. Malànea verticillàta, Lam. ill. t. 66. f. 1. Desr. in Lam. dict. 3. p. 688. Antirhœ'a Borbónica, Gmel. syst. 1. p. 244. Cunninghàmia verticillàta, Willd. spec. 1. p. 615. Drupe the size of a grain of wheat. Flowers small, white.

Whorled-leaved Antirhœa. Tree 20 feet?

2 A. dioi'ca (Bory, in litt. ex D. C. prod. 4. p. 459.) leaves opposite, and 3 in a whorl, obovate, cuneated at the base, short-acuminated, smoothish, beset with glandular pili in the axils of the veins; flowers dioecious from abortion; drupes oblong. ♄. S. Native of the Mauritius. Pet. Th. mel. obs. p. 56. Malànea neuróp̀ora, Comm. in herb. Thouin. Flowers small, whitish.

Var. β, barbinérvis (D. C. prod. 4. p. 466.) nerves of young leaves bearded, and very hairy in the axils. ♄. S. Native of the Mauritius. Guettárda barbinérvis, Sieb. fl. maur. 1. no. 61. Cham. et Schlecht. in Linnæa. 4. p. 190.

Var. γ, acuminàta (D. C. l. c.) leaves almost smooth, long-acuminated. ♄. S. Native of the Mauritius. Guettárda acuminàta. Sieb. fl. maur. 1. no. 60.

Dioecious Antirhœa. Tree 20 feet?

3 A. frangula'cea (D. C. prod. 4. p. 460.) leaves opposite, ovate, acutish at the base, and rather acuminated at the apex, smoothish, with the axils of the veins glandless; flowers hermaphrodite; drupes ovate. ♄. S. Native of the Mauritius. Guettárda frangulàcea, Sieb. fl. maur. exsic. 2. no. 59. Drupe one-half shorter than in the first species, sometimes 3-celled and 3-seeded, which shows its affinity with *Guettárda*. Flowers small, whitish.

Frangula-like Antirhœa. Tree.

Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXIV. STENO'STOMUM (from *στενος, stenos*, narrow, and *στομα, stoma*, a mouth; in reference to the narrow mouth of the corolla). Gærtn. fil. carp. 3. p. 69, t. 192. under *Stúrmia*. D. C. prod. 4. p. 460.—Stenostèmum, Juss. mem. mus. 6. p. 377.—Malànea species, A. Rich. mem. soc. hist. nat. par. 5. p. 202.—Laugèria species, Swartz.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an ovate tube, and a small 5-toothed limb; teeth permanent, connivent, rather unequal. Corolla funnel-shaped, having the tube a little wider at the throat, and a 5-lobed limb: lobes lanceolate, bluntish. Anthers 5, oblong, hardly exserted. Stigma 2-lobed. Drupe ovate-oblong, crowned, containing a 2-celled putamen. Seeds terete, solitary in the cells, inverted. Embryo central, in the fleshy albumen.—West Indian trees. Leaves opposite, oval or oblong, on short petioles. Stipulas at length deciduous. Peduncles axillary, divided into a bifid cyme. Flowers small, white, sessile and unilateral along the branches of the cyme, and one in each fork.—Inflorescence of *Antirhœ'a*, but differs from that genus in the parts of the flowers being quinary; and from *Guettárda* in the putamen of the fruit being 2-celled, not many celled.

§ 1. *Corollas glabrous.*

1 S. lu'cidum (Gærtn. fil. carp. 3. p. 69.) leaves oblong, obtuse, shining above, glabrous on both surfaces; teeth of calyx short, obtuse. ♄. S. Native of the West Indies, as in Jamaica, Santa Cruz, St. Lucia, Porto-Rico, Trinidad, &c. Stúrmia lù-

cida, Gærtn. fil. carp. 3. p. 192. Guettárda lùcida, Pers. ench. 1. p. 201. Laugèria lùcida, Swartz. fl. ind. 1. p. 475. Vahl, symb. 3. p. 40. t. 57. Flowers small, white.

Lucid-leaved Stenostomum. Clt. 1818. Tree 20 feet.

2 S.? acuta'tum (D. C. prod. 4. p. 460.) leaves oblong, acute at the base, and acuminated at the apex, glabrous on both surfaces, reticulately veined above; lobes of calyx linear-subulate, very acute, almost equal in length to the tube. ♄. S. Native of Guadaloupe. Stipulas triangular, acuminated, deciduous. Peduncles bifid, each of the branches bearing 4-5 flowers. Perhaps this species is nearly allied to *Guettárda resinòsa*, but the number of the cells of the ovarium is not rightly known. Flowers small, white.

Acute-calyxed Stenostomum. Shrub.

§ 2. *Corollas clothed with silky tomentum.*

3 S. tomentòsum (D. C. prod. 4. p. 460.) leaves ovate, acute, tomentose beneath; drupes oblong, acuminated, glabrous. ♄. S. Native of Jamaica, on the west side among bushes. Laugèria tomentòsa, Swartz, fl. ind. 1. p. 477. Guettárda tomentòsa, Pers. ench. 1. p. 201. Flowers small, white. The specimens collected by Bertero in Jamaica differ from the description of Swartz, in the limb of the calyx being truncate and entire, not 5-toothed, and therefore there are probably two nearly allied species, natives of Jamaica.

Tomentose Stenostomum. Clt. 1820. Tree 20 feet.

† *Species not sufficiently known.*

4 S.? bifurca'tum (D. C. prod. 4. p. 460.) leaves ovate, acute at both ends, glabrous, beset with glandular pili in the axils of the veins beneath; peduncles bifurcate. ♄. S. Native of the West India islands. Malànea bifurcàta, Desr. in Lam. dict. 3. p. 688. The inflorescence is the same as that of the other species, but the number of the parts of the flower is not described.

Bifurcate-peduncled Stenostomum. Tree.

5 S.? ni'tidum (D. C. prod. 4. p. 461.) leaves ovate, shining, quite glabrous, except in the axils of the veins beneath, which are beset with glandular hairs; peduncles dichotomous. ♄. S. Native of the West India islands. Malànea nítida, Desr. in Lam. dict. 3. p. 688. The number of the parts of the flowers being undescribed, the genus to which it belongs is rather doubtful.

Shining Stenostomum. Tree.

6 S.? dicho'tomum (D. C. prod. 4. p. 461.) leaves elliptic-oblong, obtuse, rather coriaceous, glabrous on both surfaces; peduncles dichotomous; flowers tetrandrous. ♄. S. Native of Mexico. Laugèria dichótoma, Moc. et Sesse, icon. ined. Corolla of a dirty cream colour, with blunt lobes. Perhaps a genuine species of *Stenóstomum*, or a species of *Antirhœ'a*.

Dichotomous-peduncled Stenostomum. Tree.

Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXV. CHIO'NE (a mythological name, the daughter of Deucalion, or from χιονεος, *chioneos*, snowy, white as snow; in reference to the cymes of white flowers). D. C. prod. 4. p. 461.—Crùsea, A. Rich. mem. soc. hist. nat. Par. 5. p. 204. t. 19. f. 1. but not of Schiede and Deppe, nor Bartl. nor D. C.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with an obovate tube, and a marginal repandly 5-toothed limb. Corolla tubular, short, with a 5-lobed limb; lobes flattish, obtuse. Stamens inserted above the tube. Style simple; stigma 2-lobed: lobes short, obtuse. Fruit olive-formed, rather fleshy, much furrowed when dried, crowned by the limb of the calyx, containing a 2-celled putamen. Seeds solitary, almost terete.—A glabrous tree. Leaves opposite, coriaceous, joined together by an entire stipular sheath. Flowers white, cymose; cymes terminal, pedunculate. Allied to *Malànea*.

1 C. gla'bra (Rich. l. c. under *Crùsea*,) ♄. S. Native of Tortoise island. Psychótria megalospérma, Vahl, eclog. amer. 3. p. 3. t. 21. ex herb. Juss. but neither the description nor the figure agree well with it, and it is therefore Jacquínia venòsa, Swartz, prod. p. 47. Rœm. et Schultes, syst. 4. p. 491.

Glabrous Chione. Clt. 1824. Tree 40 feet?

Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXVI. TIMO'NIUS (Timon or Aytimon is the name of the first species in Amboyna). Rumph. amb. 3. p. 216. t. 140. D. C. prod. 4. p. 461.—Bòbea, Gaud. vòy. uran. t. 93.—Bobæ'a, A. Rich. mem. soc. hist. nat. Par. 5. p. 215.—Burnèya, Cham. et Schlecht. in Linnæa. 4. p. 188.—Eríthalis, Forst. but not of Lin.

Lin. syst. *Tetrándria*, *Monogýnia*. Calyx with an ovate tube, and a tubular truncate 2-6-toothed limb. Corolla tubular, salver-shaped, with a 4-6-parted spreading limb, a naked throat, and oval obtuse lobes. Stamens 4, almost sessile, inserted in the upper part of the tube of the corolla. Anthers oblong-heart-shaped, sessile in the throat. Stigmas 2, exserted, digitately 5-cleft, with the lobes linear. Drupe globose, smooth, crowned by the limb of the calyx, containing from 7-25 bony distinct 1-seeded indehiscent pyrenæ. Seeds inverted, linear. Albumen fleshy. Embryo terete.—Glabrous trees. Leaves opposite. Stipulas interpetiolar, acute, entire. Peduncles axillary, shorter than the leaves, bearing each 3 flowers at the apex, the middle flower sessile, and the lateral ones pedicellate, each girded by a cup-shaped 2-lobed permanent bractea at the base.—Allied to *Guettárda*, but differs in the pyrenæ being distinct, not combined.

1 T. Ru'mphii (D. C. prod. 4. p. 461.) leaves lanceolate; peduncles bearing 3 flowers, but only 1 fruit; fruit smooth, ovate-globose. ♄. S. Native of the Island of Amboyna, in open places and on hills. Timònius, Rumph. amb. 3. p. 216. t. 140. Eríthalis Tìmon, Spreng. pug. 1. p. 18. Pyróstria hexaspérma, Roxb. E. polýgama β, Willd. spec. 1. p. 997.

Rumphius's Timonius. Tree.

2 T. Forste'ri (Cham. et Schlecht. in Linnæa. 4. p. 189. under *Burnèya*) leaves opposite; flowers axillary: male ones disposed in cymes: hermaphrodite ones solitary; berries roundish. ♄. S. Native of the Society Islands; and in Romanzoff's Island. Eríthalis polýgama, var. *a*. Forst. prod. 1. p. 101. Erith. cymòsa, Spreng. pug. 1. p. 17. Erith. polýgama *a*. Willd. spec. 1. p. 997. Fruit containing usually 25 pyrenæ. The flowers are described by Chamisso and Schlecht. as quaternary and quinary, but they are also sometimes senary.

Forster's Timonius. Tree.

3 T. Gaudicha'udii (Cham. et Schlecht. in Linnæa. 4. p. 190. under *Burnèya*) leaves elliptic, bluntish, acute at the base; cymes on long peduncles: fertile ones 3-flowered: but the sterile ones are twice bifid and 7-flowered. ♄. S. Native of the Island of O-Wahu, and of a number of the Sandwich Islands. Bòbea elàtior, Gaud. in Freyc. voy. p. 473. t. 93. Fruit containing usually 12 bony pyrenæ.

Gaudichaud's Timonius. Tree.

Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXVII. HAMILTO'NIA (so named after William Hamilton of Woodlands, near Philadelphia, in North America, an eminent botanist, and the first who was at the expence of erecting a conservatory in that country for the preservation of plants of hot climates). Roxb. hort. beng. (1814.) p. 15. fl. ind. 2. p. 223. but not of Muhl. nor Willd.—Spermadíctyon, Roxb. cor. 3. (1819.) p. 32.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with an ovate tube, a 5-parted limb, and subulate permanent segments.

Corolla funnel-shaped, with a long straight tube (f. 102. *b.*), and 5 oblong lobes (f. 102. *c.*). Stamens 5, inserted in the throat of the corolla, inclosed. Stigma 5-cleft. Capsule crowned by the calyx, dehiscing at the apex, 1-celled, containing 5 triquetrous 1-seeded pyrenæ. Seeds inserted by the base, erect, covered by a dry reticulated membrane or epidermis. Albumen very sparing. Embryo erect, with an oblong radicle, and cordate foliaceous cotyledons.—East Indian shrubs. Leaves lanceolate, on short petioles. Stipulas short, acute, broad and adpressed at the base. Flowers disposed in fascicles or umbels, sweet-scented.—This genus has been joined with *Ancylánthus* by Jussieu, but is sufficiently distinct from that genus.

FIG. 102.

1 H. suave'olens (Roxb. hort. beng. p. 15. fl. ind. 2. p. 223.) glabrous; leaves broad-lanceolate; heads of flowers densely umbellate, pedunculate, terminal; calyx beset with glandular hairs. ♄. S. Native of the East Indies, on the Rajmuhal hills. Spermadíctyon suavèolens, Roxb. cor. 3. p. 32. t. 236. R. Br. in bot. reg. t. 348. Lasiánthus tubiflòrus, Blum. bijdr. p. 990. Leaves 3-6 inches long. Stipulas broad, ensiform. Flowers sessile, in terminal corymb-formed heads, on short trichotomous branchlets, numerous, pure white, delightfully fragrant.

Sweet-scented Hamiltonia. Fl. Oct. Clt. 1818. Sh. 4 to 6 ft.

2 H. sca'bra (D. Don, prod. fl. nep. p. 137.) leaves ovate-lanceolate, short-acuminated, scabrous on both surfaces, rounded at the base; calycine segments linear, villous. ♄. S. Native of Nipaul, at Narainhetty, and between Hetounra and Bhempedi, chiefly between Bhinsadoban, and the last-mentioned village, forming the most extensive thickets. Dr. Wallich has also met with it about the village near Cheesnagurree, and on several mountains in the valley. Hamiltònia Dulìna and Nonatèlia filamentòsa, Hamilt. mss. Hamilt. azùreum, Wall. in Roxb. fl. ind. 2. p. 225. Spermadíctyon azùreum, Lindl. bot. reg. 1235. Flowers azure blue, perfuming the air by their delicious fragrance from November until March, during which time they are very beautiful. Inflorescence ample, densely villous, especially the corollas. The tender parts of the plant emit a fetid smell, like those of *Pædèria* and *Serissa*.

Scabrous Hamiltonia. Fl. Jan. Clt. 1823.? Sh. 4 to 6 ft.

3 H. pilòsa (Roxb. fl. ind. 2. p. 226.) shrub stiff, very pilose; leaves lanceolate; fascicles of flowers axillary, intermixed with hairy bracteas. ♄. S. Native of the Moluccas.

Pilose Hamiltonia. Shrub 4 to 6 feet.

Cult. The species are desirable for every collection of stove plants, being free flowerers, very fragrant, and of easy culture. They succeed best in a mixture of loam and peat; and cuttings strike root readily in sand, with a hand-glass over them, in a moist heat.

CXVIII. LEPTODE'RMIS (from λεπτος, *leptos*, slender, and δερμα, *derma*, the skin; the branches are covered with separating fibrous bark). Wall. in Roxb. fl. ind. 2. p. 191. A. Rich, mem. soc. hist. nat. par. 5. p. 221. D. C. prod. 4. p. 462.—Hamiltònia species, D. Don, prod. fl. nep. p. 137.

Lin. syst. *Pentándria, Monogýnia.* Involucrum calyciform, of 2 leaves, closely girding the ovarium. Tube of calyx inclosed within the involucrum; limb of calyx short, permanent, 5-lobed; lobes roundish, adpressed. Corolla funnel-shaped, scabrous from minute papillæ, with a terete tube, which is hairy inside, and 5 ovate cuspidate lobes which are involutely valvate in æstivation. Stamens 5, with very short filaments and inclosed anthers. Ovarium 5-celled; cells 1-seeded. Style filiform; stigma quadrifid. Fruit oblong, 5-celled? 5-valved? 5-seeded.—Shrubs, with decussate, tetragonal branches. Leaves lanceolate or oblong, on short petioles, membranous. Stipulas length of petioles, adpressed, permanent, acute. Flowers sessile, scentless, white.—Perhaps sufficiently distinct from *Hamiltònia*.

1 L. lanceola'ta (Wall. in Roxb. fl. ind. 2. p. 191.) leaves lanceolate, attenuated, acute, membranous, villous; flowers sessile by threes at the ends of the branches; stipulas triangular, villous; branches quadrangular, downy while young. ♄. G. Native of Nipaul, on the mountains, though it is among the less common plants. Hamiltònia fruticòsa, D. Don, prod. fl. nep. p. 137. Flowers white, scentless. According to the description in fl. nep. the flowers are said to be hexamerous and hexandrous.

Lanceolate-leaved Leptodermis. Shrub 3 to 4 feet.

2 L. oblo'nga (Bunge, in mem. acad. sc. Petersb. 2. p. 108.) leaves oblong, glabrous; flowers terminal, aggregate. ♄. G. Native of China, on the mountains.

Oblong-leaved Leptodermis. Shrub.

Cult. See *Hamiltònia* above for culture and propagation.

CXIX. PSATHU'RA (from ψαθυρος, *psathuros*, fragile or brittle; the branches are brittle). Comm. in Juss. gen. p. 206. mem. mus. 6. p. 396. Lam. ill. t. 260. Gærtn. fil. carp. 3. p. 82. t. 194. f. 4. A. Rich, mem. soc. hist. nat. par. 5. p. 214. D. C. prod. 4. p. 462.—Chicoinæ'a, Comm.—Psatùra, Poir. dict. 6. p. 587.—Psathỳra, Spreng. syst. 2. p. 127. but not of Fries.

Lin. syst. *Penta-Hexándria, Monogýnia.* Calyx with an ovate tube, and a campanulate 5-6-toothed permanent limb. Corolla bearded inside, with a short tube, and a 5-6-lobed spreading limb; lobes acute, rather longer than the tube, valvate in æstivation. Anthers 5-6, almost sessile at the throat. Stigmas 5-6-lamellate. Berry globose, furrowed, crowned by the limb of the calyx, containing 4-6 1-seeded pyrenæ. Seeds erect. Albumen fleshy. Embryo erect.—Small glabrous trees, with knotted fragile branches. Leaves lanceolate, acute at both ends, petiolate, smooth. Stipulas ovate, caducous, with an elevated zone, which is joined to the petioles. Peduncles rising from the axils of the upper leaves, loosely panicled, shorter than the leaves.

1 P. Borbónica (Gmel. syst. 1. p. 577.) leaves oblong-lanceolate; peduncles 7-8-flowered. ♄. S. Native of the Island of Bourbon, on the mountains, where it is called *Bois cassant*. P. corymbòsa, Gærtn. fil. carp. 3. p. 82. P. Borbónica, Roxb. fl. ind. 2. p. 158. Flowers minute, pentandrous, disposed in axillary and terminal trichotomous corymbs. Stigma 2-lobed. Drupe containing 5 pyrenæ.

Bourbon Psathura. Tree small.

2 P. myrtifòlia (A. Rich, diss. l. c.) leaves oblong, bluntish; peduncles usually 3-flowered, lateral flowers sterile and deciduous; limb of calyx 5-parted; lobes lanceolate. ♄. S. Native of the Mauritius. Perhaps sufficiently distinct from the preceding.

Myrtle-leaved Psathura. Tree small.

3 P. terniflòra (A. Rich, diss. l. c.) leaves elliptic-lanceolate, acute; peduncles at the tops of the branchlets, usually by threes, 1-flowered; limb of calyx wide, obsoletely 5-7-toothed. ♄. S. Native of the Mauritius.

Three-flowered Psathura. Tree small.

Cult. For culture and propagation see *Hamiltònia* above.

CXX. MYONI'MA (*μυς μυος, mys myos*, a rat, and *ονημι, onemi*, to succour; rats are very fond of the fruit, and eat it with great avidity). Comm. in Juss. gen. p. 206. mem. mus. 6. p. 397. Lam. ill. t. 68. Gærtn. fil. carp. 3. p. 86. t. 195. A. Rich, mem. soc. hist. nat. par. 5. p. 211. D. C. prod. 4. p. 463.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a globose tube, and a small bluntly 8-toothed limb. Corolla with a short tube, and a bluntly 5-parted limb. Stamens 4; filaments very short; anthers oblong, exserted. Stigmas 4, linear, short, thickish, approximate, almost concrete. Berry globose, not crowned, containing 4 1-seeded pyrenæ, which adhere to the flesh of the fruit. Seeds umbilicate, fixed by the middle. Albumen fleshy. Embryo dorsal, erect, with an inferior, nearly terete radicle, and cordate blunt cotyledons.—Small glabrous trees or shrubs, natives of the Mauritius. Leaves coriaceous. Stipulas small, very acute, deciduous. Pedicels axillary and terminal, shorter than the leaves. Perhaps not distinct from *Polyòzus*.

§ 1. *Fruit containing 4 pyrenæ. Myonìmæ vèræ.*

1 M. obova'ta (Lam. ill. no. 1482. t. 68. f. 1. dict. 4. p. 397.) leaves obovate, obtuse, on short petioles; peduncles 1-3-flowered; berries bluntly tetragonal. ♄. S. Native of the Island of Bourbon, where it is called *Bois de rat*, from the fruit being grateful to mice and rats. M. Borbónica, Ræuch. nom. Berries red, size of grapes.

Obovate-leaved Myonima. Shrub 4 to 6 feet.

2 M. myrtifòlia (Lam. ill. no. 1483. t. 58. f. 2. dict. 4. p. 398.) leaves ovate-lanceolate, acute, on short petioles; peduncles 1-3-flowered; berries spherical. ♄. S. Native of the Island of Bourbon. M. lanceolàta, Willd. spec. 1. p. 614. Rubiàcea, no. 103. Sieb. fl. maur. fasc. 2.

Myrtle-leaved Myonima. Shrub 4 to 5 feet.

3 M. multiflòra (A. Rich, diss. p. 132.) leaves nearly sessile, rather cordate at the base, ovate-oblong, acute, shining above, reticulately nerved, veiny beneath; corymbs terminal. ♄. S. Native of the Mauritius. Ixòra parviflòra, Lam. ill. no. 1473. t. 66. f. 2. exclusive of the syn. of Rheed. Ixòra micrántha, Rœm. et Schultes, syst. 3. p. 179. Faràmea corymbòsa, Sieb. fl. maur. 2. no. 62. but not of Aubl.

Var. β, oblongifòlia (D. C. prod. 4. p. 463.) leaves oblong, obtuse; corymbs more crowded.

Var. γ, ovàta (D. C. l. c.) leaves ovate. ♄. S. Ixòra parviflòra, Poir. suppl. 3. p. 207. Eugènia violàcea, Lam. dict. 3. p. 200. Mýrtus androsæmoìdes, Poir. dict. 4. p. 409. Faràmea, Sieb. fl. maur. 2. no. 63. Perhaps a proper species.

Many-flowered Myonima. Shrub 4 to 5 feet.

§ 2. *Fruit containing 2 pyrenæ. Myonìmæ dùbiæ. Perhaps a proper genus.*

4 M.? umbella'ta (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 463.) leaves obovate or obovate-oblong, coriaceous; peduncles axillary, many-flowered at the apex; pedicels 7-8, umbellate; berries roundish; calycine teeth very short, acutish. ♄. S. Native of the Island of Luzon, one of the Philippines. Segments of corolla valvate in æstivation. Genitals not exserted. Seeds narrow, cylindrical, as in *Guettárda*, ex Bartl. Perhaps a section of *Myonìma*, as *Laugèria* is of *Guettárda*.

Umbellate-flowered Myonima. Tree small or shrub.

Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXXI. PYRO'STRIA (from *pyrus* and *striatus*; in allusion to the fruit being shaped like a pear, and striated). Comm. in Juss. gen. 206. mem. mus. 6. p. 397. Lam. ill. t. 65. A. Rich, in mem. soc. hist. nat. par. 5. p. 216. D. C. prod. 4. p. 464.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx with an obovate tube, and a small 4-5-toothed limb. Corolla subcampanulate, spreading, 4-5-cleft, with lanceolate acute lobes, and a tomentose throat. Stamens 4-5, hardly exserted. Stigma capitate, bifid: having the lobes approximate (ex Rich.). Fruit pear-shaped, 6-8-striped, but not crowned, containing 4-5 1-seeded, bony, combined pyrenæ. Embryo inverted. Albumen fleshy.—Small glabrous trees, natives of the Mauritius. Leaves on short petioles. Stipulas lanceolate, acuminated, rather longer than the petioles. Peduncles axillary, 1-3-flowered. The number of the cells of the fruit is variable.

1 P. oleoìdes (Lam. ill. no. 1484. t. 65. f. 3.) leaves oblong, obtuse; stipulas glabrous; peduncles 1-3-flowered; drupes 8-seeded. ♄. S. Native of the Island of Bourbon, where it is called *Bois Mussard*. P. Commersòni, Gmel. syst. 1. p. 247. P. salicifòlia, Willd. spec. 1. p. 614.

Olive-like Pyrostria. Tree 20 feet.

2 P. hexaspe'rma (Roxb. fl. ind. 1. p. 403.) leaves oblong, acute; stipulas pilose; corymbs axillary, dichotomous, with recurved branches; drupes 6-seeded. ♄. S. Native of the East Indies in the Island of Hominoa.

Six-seeded Pyrostria. Tree.

3 P. orbicula'ris (A. Rich, l. c.) leaves oval-orbicular, sessile at the base and rather cordate, obtuse at the apex; stipulas glabrous; peduncles 1-flowered, furnished each with an involucel composed of 2 keeled leaves, which girds the flower. ♄. S. Native of the Island of Bourbon.

Orbicular-leaved Pyrostria. Shrub.

4 P. cordifo'lia (A. Rich, l. c.) leaves oval, acute, rather cordate at the base, on very short petioles; stipulas combined, sheath-formed, obtuse, and permanent; flowers pedicellate, solitary, girded by scales, which are combined into the form of an involucel; lobes of corolla oval, acute. ♄. S. Native of the Mauritius.

Heart-leaved Pyrostria. Tree small.

5 P. polymórpha (A. Rich, l. c.) leaves sometimes linear-lanceolate, sessile, variegated: sometimes orbicular and obtuse, petiolate: sometimes oblong-cordate, acute: stipulas acute, hardly combined at the base, caducous; flowers solitary, girded each by a 3-4-toothed tomentose involucel; lobes of corolla lanceolate. ♄. S. Native of the Mauritius.

Variable Pyrostria. Tree small.

6 P. macrophy'lla (A. Rich, l. c.) leaves oval-oblong, somewhat cordate, on short petioles, scrobiculate in the axils of the veins beneath; stipulas glabrous; flowers sessile, solitary, axillary, girded each by a 2-leaved involucel. ♄. S. Native of the Mauritius. Fruit egg-shaped, ribbed, crowned by the calyx.

Long-leaved Pyrostria. Tree small.

Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXXII. OCTA'VIA (from *Octavus*, the eighth; in reference to the drupe containing 8 pyrenæ). D. C. prod. 4. p. 464.

Lin. syst. *Pentándria, Monogýnia?* Calyx with a globose tube, and a truncate hardly conspicuous limb. Corolla, stamens, and style unknown. Ovarium crowned by a fleshy shining permanent disk, which is perforated in the middle. Drupe fleshy, globose, smooth, not crowned by the calyx, containing 8 1-seeded pyrenæ, which are disposed in a whorl. Albumen fleshy. Embryo unknown.—A glabrous shrub, native of Guiana. Leaves petiolate, oval, long-acuminated, membranous, shining above. Bracteas ovate-oblong, acuminated, erect, much shorter than the petioles, falling off very slowly. Flowers sessile, solitary, bractless, in the axils of the superior leaves, or on the tops of the branchlets.—This genus is not sufficiently known from the want

of the flowers; but it appears to come nearest to *Pyróstria*, but differs from that genus in the truncate calyx and inflorescence.

1 O. SESSILIFLÒRA (D. C. l. c.) ♄. S. Native of French Guiana, where it was collected by Patris.

Sessile-flowered Octavia. Shrub.

Cult. See *Hamiltònia*, p. 555. for culture and propagation.

CXXIII. LITOSA'NTHES (from λιτος, *litos*, small, and ανθος, *anthos*, a flower; the flowers are small). Blum. in flora, 1825, p. 189. bijdr. p. 994. D. C. prod. 4. p. 465.—Litosánthes, A. Rich. mem. soc. hist. nat. par. 5. p. 213.

Lin. syst. *Tetrándria, Monogýnia.* Limb of calyx small, 4-toothed. Corolla globose, with a villous throat, and a short spreading 4-cleft limb. Stamens 4, inclosed; filaments very short, inserted beneath the throat; anthers linear. Style inclosed, perforating the fleshy disk; stigma subclavate, 4-toothed at the apex. Drupe succulent, obovate, umbonate, inflated, when young 4-celled, but in the adult state usually 1-celled, containing generally 4 1-seeded pyrenæ, which are furnished with papery aril at the base, and fixed to the central axis, which is incomplete. Embryo incurved.—A shrub, with the habit of *Fernèlia*. Leaves small, trapeziform, almost sessile. Peduncles axillary, filiform, usually bearing 2 flowers at the apex.—This genus is nearly allied to *Pyróstria*.

1 L. BIFLO'RA (Blum. l. c.) ♄. S. Native of the western parts of Java, on the mountains in woods.

Two-flowered Litosanthes. Shrub 4 to 6 feet.

Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXXIV. ERI'THALIS (from ερι, *eri*, and θαλλω, *thallo*, to grow green; in allusion to the leaves being of a deep shining green). P. Browne, jam. p. 165. t. 17. f. 3. Lin. gen. no. 238. Juss. gen. p. 206. mem. mus. 6. p. 396. Lam. ill. t. 159. Gærtn. fruct. 1. t. 26. A. Rich. mem. soc. hist. nat. Par. 5. p. 213. D. C. prod. 4. p. 465.—Herrèra, Adans. fam. 2. p. 158. but not of Ruiz et Pav.

Lin. syst. *Peta-Decándria, Monogýnia.* Calyx with an ovate tube, a short permanent subtruncate limb, having its border hardly 5-10-toothed. Corolla rotate, almost without a tube, 5-10-parted; lobes linear-oblong, spreading. Stamens 5-10, scarcely adnate at the bottom of the corolla; filaments subulate; anthers linear. Stigma appearing simple at first sight, but on more close examination it will be found to be bilamellate. Drupe globose, furrowed, crowned by the calyx, containing 5-10 1-seeded pyrenæ. Seeds pendulous. Albumen fleshy.—Glabrous shrubs. Leaves petiolate, having the lateral nerves hardly evident. Stipulas broad, short, mucronate, sheathing, permanent. Peduncles axillary, panicled, rather longer than the leaves. Flowers small, white.

1 E. FRUTICÒSA (Lin. spec. 251.) leaves obovate; panicles pedunculate; berries 8-10-furrowed, crowned by the truncate limb of the calyx. ♄. S. Native of Martinico, Guadaloupe, Jamaica, St. Thomas, Porto-Rico, Cuba, &c. in woods on the mountains. Swartz, obs. p. 80.—Browne, jam. t. 17. f. 3.—Plum. ed. Burm. t. 249. f. 2.—Eríthalis odorífera, Jacq. amer. 72. t. 173. f. 23. Flowers white, sweet-scented, usually hexandrous. Berries purple.

Var. β, *inodòra* (Jacq. amer. p. 72.) shrubby; branches procumbent; flowers inodorous; berries white. ♄. S. Native of Curacoa, on rocks by the sea side. E. inodòra, Rœm. et Schultes, syst. 5. p. 268. This is a shrub about 2 feet high.

Shrubby Erithalis. Fl. July, Aug. Clt. 1793. Tree 10 to 15 ft.

2 E. ANGUSTIFÒLIA (D. C. prod. 4. p. 465.) leaves oblong-lanceolate, acuminated at both ends; panicles pedunculate, few-flowered; berry 5-9-furrowed, crowned by the 5-toothed limb of the calyx. ♄. S. Native of Cuba, about the Havannah. Teeth of calyx 5-6, more conspicuous than those of the first species, and the tube of the corolla is a little longer. Berry nearly dry, containing 5-7 pyrenæ.

Narrow-leaved Erithalis. Shrub.

3 E.? PENTAGÒNIA (D. C. prod. 4. p. 465.) leaves oval-lanceolate, acute; panicles terminal; fruit deeply 5-furrowed, not crowned by the calyx; style very short, crowned by 5 reflexed stigmas. ♄. S. Native of Cuba. Fruit the size of a pea, containing 5 chartaceous compressed narrow pyrenæ. Style permanent. Corolla and stamens unknown. Habit of the other species of *Eríthalis*, but is probably a distinct genus.

Five-angled-fruited Erithalis. Shrub 4 to 6 feet.

Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXXV. RETINIPHY'LLUM (from ρητινη, *retine*, resin, and φυλλον, *phyllon*, a leaf; the leaves are covered with resin). Humb. et Bonpl. pl. equin. 1. p. 86. t. 25. H. B. et Kunth, nov. gen. amer. 3. p. 421. A. Rich. mem. soc. hist. nat. Par. 5. p. 208. D. C. prod. 4. p. 366.—Nonatèlia species, Juss. Spreng.

Lin. syst. *Pentándria, Monogýnia.* Calyx with a subglobose tube, a 5-cleft limb, and acute lobes. Corolla salver-shaped, with a terete tube, and 5 spreading linear obtuse lobes. Stamens 5; filaments exserted from the throat of the corolla; anthers oblong. Stigma thick, undivided. Drupe globose, crowned by the calyx, furrowed, containing 5 bony 1-seeded pyrenæ.—Small glabrous trees. Leaves obovate, obtuse or emarginate at the apex, cuneated at the base, coriaceous, downy beneath. Stipulas sheathing. Spikes of flowers axillary, at the tops of the branches, pedunculate. Flowers secund, 2-4 in a cluster, flesh-coloured, propped by 3-5 coloured bracteas.

1 R. SECUNDIFLÒRUM (Humb. et Bonpl. l. c.) ♄. S. Native of South America, on the shady banks of the Orinoco and Atabapo, near St. Balthazar. Nonatèlia secundiflòra, Spreng. syst. 1. p. 751. The leaves and branches are covered by a kind of yellow resinous matter. Berries size of a pea, brownish.

Secund-flowered Retiniphyllum. Shrub 10 to 12 feet.

Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXXVI. NONATE'LIA (the Guiana name of one of the species). Aubl. guian. 1. p. 182. Lam. ill. t. 155. Juss. gen. p. 205. H. B. et Kunth, nov. gen. amer. 3. p. 422. A. Rich. mem. soc. hist. nat. Par. 5. p. 206. t. 19. f. 2. D. C. prod. 4. p. 466.—Oribàsia, Schreb. gen. no. 307.—Psychótria species, Willd.—Nonatèlia species, Juss. mem.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an ovate tube, and a 5-toothed permanent limb. Corolla tubular, funnel-shaped, having the tube as if it was gibbous, and a 5-lobed limb. Stamens 5, almost inclosed. Stigmas 2? obtuse. Drupe globose, furrowed, containing 5 coriaceous 1-seeded pyrenæ. Albumen horny.—Shrubs or small trees. Leaves glabrous or downy, oval-oblong. Stipulas combined together more or less, or free. Thyrse terminal, panicle-formed or corymb-formed. Flowers often bracteolate, white.

1 N. RACEMO'SA (Aubl. guian. 1. p. 187. t. 72.) leaves elliptic-oblong, acuminated at both ends, petiolate; stipulas twin on both sides, 3 times shorter than the petioles; thyrse panicled, a little longer than the petioles; flowers bracteolate at the base. ♄. S. Native of Guiana, in the woods of Orapu. Psychótria racemòsa, Willd. spec. 1. p. 966. Oribàsia racemòsa, Gmel. syst. 1. p. 367. Flowers small, white. Bracteas 4, deciduous. Fruit globose, 5-angled, 5-celled. Perhaps N. racemòsa, A. Rich. act. soc. hist. nat. Par. 1792. p. 107. is the same.

Racemose-flowered Nonatelia. Fl. June, July. Clt. 1818. Shrub 2 to 3 feet.

2 N. PANAME'NSIS (D. C. prod. 4. p. 466.) leaves oblong, acuminated at both ends, petiolate; stipulas twin on both sides,

connected at the base by a ligula, linear-subulate, longer than the petioles; thyrse terminal, panicled, divaricate, sessile, short. ♄. S. Native of Panama. N. divaricàta, Bartl. in herb. Hænke, but not of A. Rich. Drupe roundish, depressed, containing 5 pyrenæ. Allied to *N. racemòsa*.

Panama Nonatelia. Shrub 3 to 4 feet.

3 N. viola'cea (Aubl. guian. 1. p. 188. t. 73.) leaves elliptic, acuminated, tapering into the short petioles at the base; stipulas solitary on both sides, ovate, obtuse, deciduous; thyrse many-flowered, about half the length of the leaves; flowers bracteate. ♄. S. Native of Guiana, in woods. Rœm. et Schultes, syst. 5. p. 221. exclusive of the observations. Psychótria violàcea, Willd. spec. 1. p. 966. but not of Aubl. Oribàsia violàcea, Gmel. Bracteas permanent. Corollas white. Berries ovate, 5-celled, of a violaceous colour, about the size of currants.

Violaceous-berried Nonatelia. Fl. June, July. Clt. 1824. Shrub 4 to 5 feet.

4 N. officina'lis (Aubl. guian. 1. p. 182. t. 73.) leaves ovate, acute, glabrous; stipulas combined into a 4-toothed sheath; panicles corymbose; involucrum small, 3-leaved under each flower. ♄. S. Native of Cayenne, in sterile places. Lam. dict. 1. p. 342. Stems nodose. Flowers white. Berry 5-celled and 5-seeded, according to Aublet. Psychótria involucràta, Swartz, fl. ind. occ. p. 413. a native of Jamaica, is certainly distinct from the plant of Aubl. in the fruit being 2-celled and 2-seeded.

Officinal Nonatelia. Fl. June, July. Clt. 1827. Shrub 2 to 3 feet.

5 N. lu'tea (Aubl. guian. 1. p. 190. t. 74.) leaves broad-ovate, acuminated; stipulas bluntly 2-lobed; panicles erect; tube of corolla narrow at the base, long, and with the segments of the limb acute. ♄. S. Native of French Guiana, at the foot of Mount Couron. Psychótria lùtea, Willd. spec. 1. p. 971. but not of Sieb. Flowers yellow. Young fruit 5-celled, ex Aubl.

Yellow-flowered Nonatelia. Fl. June, July. Clt. 1823. Shrub 1 foot.

6 N. longiflo'ra (Aubl. guian. 1. p. 185. t. 71.) leaves lanceolate, acuminated, acute at the base, glabrous; stipulas combined into a sheath, furnished with 2 acute lobes on each side; thyrse panicled, few-flowered, pedunculate, one-half shorter than the leaves; tube of corolla incurved, and with the segments of the limb bluntish. ♄. S. Native of French Guiana, in woods. Psychótria longiflòra, Willd. spec. 1. p. 971. but not of Poir. Leaves greenish yellow. Berry globose, brownish purple, 10-striped, 5-celled, ex Aubl. Habit of *Palicùrea Pavéttæ*.

Long-flowered Nonatelia. Shrub 2 to 3 feet.

7 N. grandiflo'ra (H. B. et Kunth, nov. gen. amer. 3. p. 422.) leaves elliptic-oblong, acuminated, acute at the base, glabrous; stipulas connate, bifid; corymbs pedunculate, terminal. ♄. S. Native of South America, on the banks of the Orinoco and the Tuamini, near Javita. Flowers rose-coloured. Fruit oval, furrowed, 5-celled, ex Bonpl.

Great-flowered Nonatelia. Shrub.

8 N.? macrophy'lla (H. B. et Kunth, l. c. p. 423.) leaves ovate, acuminated, membranous, glabrous above, and clothed with fine down beneath; panicles terminal, pedunculate. ♄. S. Native of South America, in the woods of the Orinoco near Javita. Schwenkféldia macrophýlla, Spreng. syst. 1. p. 765. Stamens probably 5. Flowers yellow. Drupe globose, 10-furrowed, 4-5-celled, ex Kunth.

Long-leaved Nonatelia. Shrub.

9 N. formo'sa (A. Rich. in mem. soc. hist. nat. Par. 5. p. 207.) leaves elliptic, long-acuminated, abruptly petiolate, glabrous above, and rugged from tomentum beneath; spikes terminal, simple, erect, length of leaves; flowers tetramerous; fruit 4-celled; corolla with a long tube, which is very villous inside. ♄. S. Native of French Guiana. Allied to *N. longiflòra*.

Beautiful Nonatelia. Shrub.

10 N. divarica'ta (A. Rich. l. c.) leaves elliptic, acuminated, tapering into the petioles at the base; flowers 5-6-together, on the top of a common peduncle; fruit globose, 4-furrowed, containing 4 pyrenæ. ♄. S. Native of French Guiana, in woods. Flowers unknown.

Divaricate Nonatelia. Shrub.

11 N.? hi'spida (Wall. in Roxb. fl. ind. 2. p. 187.) leaves oblong, acuminated, oblique at the base, villous beneath; stipulas linear-lanceolate, broad at the base; flowers sessile, axillary, verticillate, with hispid bracteas; stigma 5-lobed. ♄. S. Native of the East Indies, in Silhet. Corolla funnel-shaped, white. Ovarium hairy, 5-celled. Habit of *Sabìcea*. Perhaps a proper genus.

Hispid Nonatelia. Shrub 3 to 4 feet.

Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXXVII. GYNOCHTHO'DES (from γυνη, *gyne*, a female, and οχθωδης, *ochthodes*, warted; in reference to the warted stigma). Blum. bijdr. p. 993. A. Rich. mem. soc. hist. nat. Par. 5. p. 208. D. C. prod. 4. p. 467.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Limb of calyx short, quite entire. Corolla 4-5-parted, villous inside, with the segments of the limb conniving at the base, and spreading at the apex, each tipped by a short inflexed claw. Stamens 4-5, inclosed, inserted in the base of the corolla. Stigma bifid, warted. Drupe globose, baccate, umbilicate, containing 4 1-seeded triquetrous pyrenæ, which are furnished with papery aril. Embryo albuminous, erect.—A climbing glabrous shrub. Leaves opposite, oblong-oval, acute, coriaceous, glabrous. Stipulas permanent, twin on both sides, approximate, erect, at length marcescent. Flowers crowded, axillary. This genus is nearly allied to *Nonatèlia* according to the author.

1 G. coria'cea (Blum. l. c.) ♄. ◡. S. Native of Java, among bushes between Rompien and Kuripan.

Coriaceous-leaved Gynochthodes. Shrub cl.

Cult. For culture and propagation see *Pædèria*, p. 561.

CXXVIII. CŒLOSPE'RMUM (from κοιλος, *koilos*, hollow, and σπερμα, *sperma*, a seed; the seeds are concave inside). Blum. bijdr. p. 994. A. Rich. mem. soc. hist. nat. Par. 5. p. 209. D. C. prod. 4. p. 468.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Limb of calyx urceolate, quite entire, deciduous. Corolla with a short tube, and a spreading 4-5 cleft limb; lobes oblong-linear. Stamens 4-5, exserted; filaments inserted in the throat; anthers long, linear, incumbent. Style perforating the disk. Stigma bifid, exserted. Drupe globose, umbilicate, containing 4 1-seeded chartaceously arillate pyrenæ, which are hollow inside, and gibbous on the outside. Embryo albuminose, erect.—Glabrous climbing shrubs, with terete branches. Leaves opposite, petiolate. Stipulas broad, short, truncate. Corymbs or umbels axillary and terminal, simple or compound. This genus is nearly allied to *Gynochthòdes*, but differs from it in the stamens being exserted.

1 C. sca'ndens (Blum. bijdr. p. 468.) leaves oval, acute; flowers subumbellate, exceeding the upper leaves. ♄. ◡. S. Native of Java and the island of Nusa-Kambanga, on the mountains, climbing upon trees, where it is called *Sambon* and *Tjunkankan*.

Climbing Cœlospermum. Shrub cl.

2 C. corymbo'sum (Blum. herb. ex D. C. prod. 4. p. 468.) leaves oblong, acuminated at both ends; flowers subumbellate, 3 times shorter than the upper leaves. ♄. ◡. S. Native of Java.

Corymbose-flowered Cœlospermum. Shrub cl.
Cult. See *Pœdèria*, p. 561. for culture and propagation.

CXXIX. ANCYLA'NTHUS (from *αγκυλος, ankylos*, curved, and *ανθος, anthos*, a flower; the corolla is incurved). Desf. mem. mus. 4. p. 5. t. 2. Juss. mem. mus. 6. p. 396. A. Rich. mem. soc. hist. nat. Par. 5. p. 209. D. C. prod. 4. p. 468.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an ovate tube, and a 5-parted limb (f. 103. *d.*); lobes acute. Corolla tubular, incurved (f. 103. *b.*), with the tube widened at the apex, and an irregular 5-lobed limb (f. 103. *c.*): the 2 superior lobes the longest, all ending in callous points. Anthers 5, sessile at the throat (f. 103. *e.*). Stigma thick, terete, 5-lobed at the apex (f. 103. *d. e.*). Ovarium 5-celled (f. 103. *g.*); cells 1-seeded.—A shrub, with villous branchlets. Leaves elliptic, obtuse, puberulous, on short petioles, reticulated beneath. Stipulas coriaceous, acute, sheathing at the base. Flowers 1-3 together, on short pedicels, axillary, spreading, bracteolate, hairy.—From the stigma and lobes of the corolla this genus agrees with *Cuvièra*.

FIG. 103.

1 A. rubigino'sa (Desf. l.c.) ♄. S. Native of Angola, on the western coast of Africa. (f. 103.)
Rusty Ancylanthus. Shrub 2 to 3 feet.
Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXXX. PHALLA'RIA (from *Phallus*, in reference to the form of the stigma). Schum. pl. guin. p. 112. D. C. prod. 4. p. 619.

Lin. syst. *Pentándria, Monogy'nia.* Calyx with a globose or turbinate tube, and an acutely 5-toothed limb. Corolla tubular, 5-cleft: segments acute, spreading or reflexed. Anthers 5, oval, inserted at the throat. Style filiform; stigma phalliform. Ovarium 2-seeded?—Glabrous shrubs, natives of Guiana. Branches terete. Leaves opposite, ovate-elliptic, on short petioles. Stipulas interpetiolar, acuminated. Peduncles axillary.—Nearly allied to *Cuvièra*.

1 P. horizonta'lis (Schum. pl. guin. p. 112.) branches horizontal, unarmed; peduncles umbellate. ♄. S. Native of Guiana. Stigma conical, and as if it was furnished with a reflexed membrane from the very loose margin, truncate at the apex.
Horizontal-branched Phallaria. Shrub.

2 P. spino'sa (Schum. pl. guin. p. 113.) branches spinose; peduncles racemose. ♄. S. Native of Guiana. Stigma of a capitate conical form, bifid at the apex, ex Schum.
Spinose Phallaria. Shrub.
Cult. See *Hamiltònia*, p. 555. for culture and propagation.

CXXXI. HYLA'CIUM (from *αυλαξ αυλακος, aulax aulakos*, a furrow; in reference to the style and stigma being furrowed). Beauv. fl. d'ow. 2. p. 83. t. 113. D. C. prod. 4. p. 619.—Psychótria species, Juss. mem. mus. 6. p. 379.

Lin. syst. *Pentándria, Monogy'nia.* Calyx with a short hemispherical tube, and a 5-toothed limb. Corolla funnel-shaped, with a long tube, and 5 roundish reflexed lobes. Anthers 5, almost sessile in the throat. Style thick at the base, 5-furrowed; stigma cylindrical, truncate at the base and apex, 5-furrowed. Drupe dry, containing a 2-celled rugged nucleus; cells 1-seeded, but one of them is usually abortive.—A shrub. Leaves opposite, on short petioles, ovate-oblong, attenuated at both ends, glabrous. Stipulas unknown. Corymbs terminal; pedicels 2-3-flowered. Flowers white. This genus is nearly allied to *Palicùrea*, if the fruit be 2-celled, but if it be 5-celled it is more nearly allied to *Nonatèlia*; but in the form of the stigma it agrees with *Cuvièra*.

1 H. Owarie'nse (Beauv. l. c.) ♄. S. Native of Western Africa, in the kingdom of Waree in deserts.
Waree Hylacium. Shrub.
Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXXXII. CUVIE'RA (in honour of M. Frederick Cuvier, the celebrated French zoologist). D. C. ann. mus. 9. p. 222. t. 15. Juss. mem. mus. 6. p. 396. D. C. prod. 4. p. 468. A. Rich. mem. soc. hist. nat. Par. 5. p. 210. but not of Koel.

Lin. syst. *Pentándria, Monogy'nia.* Calyx with a short tube, and a 5-parted limb: lobes linear, acute, foliaceous, spreading, 3 times longer than broad. Corolla campanulate, 5-cleft; lobes linear, very acute, hardened, and therefore spinescent? Anthers 5, inclosed in the throat; filaments very short. Stigma large, dilated, cup-formed, obtuse, and somewhat pentagonal, with reflexed edges. Fruit baccate, 5-celled; cells 1-seeded.—A glabrous shrub, with diverging branches. Leaves oval-oblong, acute, almost sessile. Stipulas combined into a short bidentate sheath. Panicles terminal, corymbose. The corolla has a membrane on the inside, which is separable from it, and this membrane is probably furnished with the stamens. Ovarium destitute of the urceolus at the apex.

1 C. acutiflo'ra (D. C. l. c.) ♄. S. Native of Sierra Leone, where it was collected by Smeathmann. Cuvièra Africàna, Spreng. syst. 1. p. 760.
Acute-flowered Cuviera. Shrub 3 to 4 feet.
Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXXXIII. DONDI'SIA (named after James de Dondis, who was among the first who illustrated the descriptions of plants by figures). D. C. prod. 4. p. 469. but not of Adans. nor Scop. nor Rchb.

Lin. syst. *Pentándria, Monogy'nia.* Calyx with a turbinate tube, which is adnate to the ovarium, and a very short hardly 5-toothed limb. Corolla with a short broad tube, furnished with one series of retrograde scarious stiff hairs inside, which is perhaps the loose jagged part of a membrane inside the tube; lobes 5, acuminated, valvate in æstivation, but at length spreading. Stamens 5, inserted in the throat of the corolla between the lobes; filaments short, slender. Style filiform, tumid in the middle, and hispid. Stigma ovate, truncate at the base, almost cup-shaped. Ovarium 1-celled? many seeded? Fruit unknown.—A glabrous shrub, native of India, with slender branches. Leaves oblong, acuminated, acute at the base, on very short petioles. Stipulas acute, short, deciduous. Racemules 3-4-flowered, short, axillary or rising from very short branchlets, bracteolate, much shorter than the leaves.—This genus is nearly allied to *Cuvièra* and *Stigmánthus*, but differs from both in the truncate calyx, which is 5-parted in those genera; from *Cuvièra* in the limb of the corolla being unarmed, in the tube being pilose inside, not clothed by a membrane, in the form of the stigma, and perhaps of the fruit; and from *Stigmánthus* in the tube of the corolla being short, not long, in the style being tumid in the middle, and in the ovarium being turbinate, not roundish.

1 D. Leschenau'ltii (D. C. prod. 4. p. 469.) ♄. S. Native of the East Indies, on mountains, where it was collected by Leschenault.
Leschenault's Dondisia. Shrub 4 to 5 feet.
Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXXXIV. STIGMA'NTHUS (from στιγμα, *stigma*, a stigma, and *ανθος*, *anthos*, a flower; in allusion to the large stigma). Lour. coch. p. 146. Juss. mem. mus. 6. p. 390. D. C. prod. 4. p. 469.—Stigmatánthus, Rœm. et Schultes, syst. 5. p. xv.

Lin. syst. *Pentándria*, *Monogy'nia*. Calyx with a short tube, a 5-parted limb, and filiform segments. Corolla funnel-shaped, with a long tube, and 5 ovate-oblong spreading lobes. Stamens 5; filaments very short; anthers reflexed. Style filiform, longer than the corolla; stigma ovate, furrowed, large. Berry dry, tubercular, compressed, 1-celled. Seeds many, bony.—A climbing shrub, with glabrous lanceolate leaves. Cymes large, axillary, and terminal. Flowers white.—This genus is not sufficiently known; it differs from *Cuvièra* in the 1-celled fruit; and from *Dondìsia* in the 5-parted calyx. Perhaps both this genus and *Dondìsia* are referrible to Tribe *Gardeniàceæ*, subtribe *Gardenièæ*.

1 S. cymòsus (Lour. l. c.). ♄. G. Native of Cochin-china, in woods on the mountains. Cuvièra Asiática, Spreng. syst. 1. p. 760.

Cymose-flowered Stigmanthus. Shrub climbing.

Cult. See *Hamiltònia*, p. 555. for culture and propagation.

CXXXV. STRU'MPFIA (named by Jacquin after Christopher Charles Strumpf, professor of chemistry and botany at Hall, in Magdeburg, editor of Linnæus's Genera Plantarum in 1752). Jacq. amer. p. 218. Lam. ill. t. 731. A. Rich, mem. soc. hist. nat. par. 5. p. 218. t. 19. f. 3. D. C. prod. 4. p. 469.—Strúmphia, Pers. ench. 2. p. 211.

Lin. syst. *Pentándria*, *Digy'nia*. Limb of calyx campanulate, cleft in 5 parts beyond the middle; lobes acuminated. Corolla sub-campanulate, deeply 5-parted, with hardly any tube, but with erectish lanceolate lobes or segments, which are somewhat reflexed at the apex. Stamens 5; filaments very short, inserted in the bottom of the corolla, connate; anthers combined into an ovate-oblong somewhat pentagonal tube, which is 5-celled inside; cells regularly disposed, 3 external and 2 internal. Style length of stamens. Stigma bifid; with the lobes erect and obtuse. Ovarium 2-celled; cells 1-ovulate. Drupe pea-formed, umbilicate, containing a 2-celled globose nucleus, rarely 1-celled from abortion.—A small shrub with a short stem. Leaves fleshy, 3 in a whorl, linear, obtuse, with revolute margins. Stipulas interpetiolar. Flowers small, disposed in short, nearly simple axillary racemes: having 2 opposite scale-formed bracteas under each flower.

1 S. marí'tima (Jacq. l. c.). ♄. S. Native of Curacoa, on rocks by the coast. The leaves resemble those of rosemary, and the stipulas are blackish. Flowers small. The whole plant has a disagreeable smell.

Sea-side Strumpfia. Shrub 3 feet.

Cult. For culture and propagation see *Hamiltònia*, p. 555.

CXXXVI. BILLIO'TIA (named by Aloysia Colla, of Turin, after his daughter, Madame Tecofila Billioti, a famous botanical artist). D. C. prod. 4. p. 618. but not of Colla.—Vivìània, Colla. ann. soc. lin. par. 1825. but not of Cav. nor Raddi nor Rafin.—Melanopsídium, Cels. hort. but not of Poit.

Lin. syst. *Penta-Heptándria*, *Monogy'nia*. Calyx with the tube adhering to the ovarium, and a 5-7-parted limb. Corolla salver-shaped: having the tube bearded with bristles inside, and a 5-7-parted limb. Stamens 5-7, adnate to the tube. Ovarium crowned by a nectariferous urceolus. Style 1; stigmas 4. Drupe 1-seeded by abortion.—A smoothish shrub. Leaves opposite, petiolate, elliptic, acutish, villous on the petioles, margins, and the nerves on the under side of the leaves, the rest glabrous. Stipulas solitary at each of the nodi, probably formed of 4, which are combined into a sheath, which is cleft on one side, and denticulated at the apex, downy when young, brown in the adult state, falling off at length in a circular manner at the base.

1 B. psychotrioìdes (D. C. l. c.). ♄. S. Native country unknown. Viviània psychotrioìdes, Colla, l. c. Melanopsídium nìgrum, Cels. hort. Colla, hort. rip. t. 35. Leaves 3 inches long and 15 lines broad, on petioles 3-4 lines long. Stipulas 6-7 lines long. Flowers white, disposed in terminal heads.

Psychotria-like Billiotia. Clt.? Shrub.

Cult. See *Hamiltònia*, p. 555. for culture and propagation.

Tribe VIII.

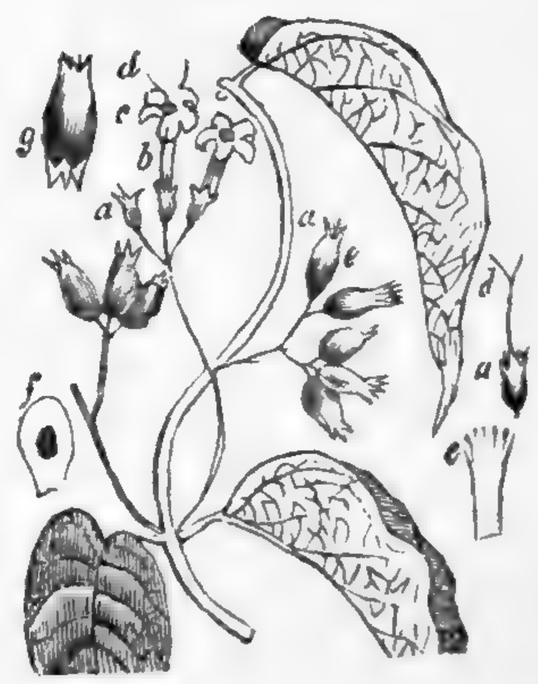
PÆDERIE'Æ (this tribe agrees with *Pædèria* in important characters). D. C. prod. 4. p. 470.—Lygodysodeàceæ, Bartl. in herb. Hænke, ex D. C. prod. 4. p. 470. Fruit 2-celled, indehiscent, hardly fleshy, and the rind is easily separated from the carpels or nuts, which are compressed, 1-seeded (f. 104. *f.*), and hanging from the central filiform axis. Albumen fleshy.—Climbing shrubs, with opposite leaves and interpetiolar stipulas.

CXXXVII. LYGODYSO'DEA (from λυγος, *lygos*, a twig, and δυσωδης, *dysodes*, fetid; all parts of the species are fetid when bruised, like those of *Pædèria*). Ruiz et Pav. fl. per. prod. p. 32. t. 5. Bartl. in herb. Hænke. D. C. prod. 4. p. 470.—Disòdea, Pers. ench. 1. p. 210.

Lin. syst. *Pentándria*, *Monogy'nia*. Calyx with an ovate globose tube, and a 5-toothed acute, permanent limb (f. 104. *a.*). Corolla having the tube much longer than the teeth of the calyx (f. 104. *b.*), with a hairy throat, and 5 somewhat revolute lobes (f. 104. *c.*). Anthers oblong, sessile within the tube (f. 104. *e.*). Style equal in length to the tube; stigmas 2, slender (f. 104. *d.*), exserted. Fruit indehiscent, oval, somewhat compressed, shining, crowned by the calycine teeth (f. 104. *g.*); the rind is crustaceous, and at length becomes brittle and breaks irregularly, and therefore is easily separated from the carpels or seeds. Carpels or seeds 2 in each fruit, indehiscent, oval, applied together, girded by a nerve-formed winged margin, hanging by a thread from the base of the fruit, and when the rind has been separated from them appear pendulous. Albumen a thin fleshy membrane, combined with the tegument of the carpella or wanting altogether. Embryo straight, with an inferior terete radicle, cordate foliaceous flat cotyledons, and an inconspicuous plumule.—Smoothish twining shrubs, holding the same station in America as the genus *Pædèria* does in Asia. Stems terete or compressed. Leaves opposite, petiolate, cordate or ovate, acuminated. Stipulas very short, rather truncate, combined with the petioles. Panicles few-flowered, loose, terminating in few-leaved, axillary branchlets, or axillary and leafy.—This genus comes very near *Pædèria*, and might probably form a distinct order with it from the distinct calyx and carpels.

1 L. fœ'tida (Ruiz et Pav. fl. per. 2. p. 48. t. 188.) stems alternately compressed and furrowed; corymbs axillary, leafless, one half shorter than the leaves; leaves all more or less cordate. ♄. ◠. S. Native of Peru, in groves at Muna and Pozuzo. Dysòdea fœ'tida, Pers. ench. 1. p. 210. Petioles 4 lines long. Flowers purplish white. This plant has been confused with *Pædèria fœ'tida* by Sprengel.

FIG. 104.



Fetid Lygodysodea. Sh. tw.

2 L. cilia'ta (Bartl. in herb. Hænke, ex D. C. prod. 4. p.

470.) stems terete; corymbs axillary, bearing 2-4 leaves, length of leaves; leaves some of them cordate and others ovate at the base. ♄. ⌒. S. Native of Mexico, where it was collected by Hænke. Rondelètia volùbilis, Sesse et Moc. fl. mex. icon. ined. L. Mexicàna, D. C. annot. fl. mex. ined. Petioles, nerves of leaves on the under side, and margins ciliated with hairs. Petioles 12-15 lines long, villous above.

Ciliated-leaved Lygodysodea. Shrub tw.

Cult. See *Pædèria*, p. 562. for culture and propagation.

CXXXVIII. LECO'NTEA (named after John Leconte, F.L.S. of Savannah, in Georgia; a celebrated American botanist). A Rich, mem. soc. hist. nat. par. 5. p. 105. t. 20. f. 1-2. D. C. prod. 4. p. 470.

Lin. syst. *Pentándria, Monogy'nia.* Limb of calyx 5-parted; lobes subulate, spreading. Corolla with a longish terete tube, and a 5-parted limb. Stamens 5, inserted in the throat, which is naked, almost sessile; anthers oblong, exserted. Style simple; stigmas 2, linear, recurved. Ovarium 2-celled, 2-seeded. Fruit compressed, crowned, a little striated: rind coriaceously membranous, bursting from the carpels or seeds at the base. Carpels compressed, 1-seeded, with winged margins, hanging each from the top of a thread, which rises from the base of the fruit. Seeds erect. Embryo straight, in fleshy albumen, with a short radicle, and longer obtuse cotyledons.—Small climbing shrubs, natives of Madagascar. Leaves opposite, petiolate, tomentose. Stipulas undivided. Flowers almost sessile, disposed in spikes; spikes in fascicles, erect, or incurved, rising from the top of a common axillary peduncle.

1 L. arge'ntea (A. Rich, l. c.) leaves oval, abruptly acuminated, obtuse at the base, clothed with silvery tomentum beneath; spikes erect, in fascicles, elongated; flowers distant; fruit oblong-oval. ♄. ⌣. S. Native of Madagascar.

Silvery-leaved Lecontea. Shrub cl.

2 L. Bojeria'na (A. Rich, l. c.) leaves heart-shaped, tomentose, abruptly acuminated at the apex; spikes in fascicles, very short, recurved; flowers approximate; fruit nearly orbicular. ♄. ⌣. S. Native of Madagascar. Lygodysòdea Língun, Bojer?

Bojer's Lecontea. Clt. 1823. Shrub cl.

Cult. For culture and propagation see *Pædèria*, p. 562.

CXXXIX. PÆDE'RIA (from *pæderos*, an opal; in reference to the transparent berries). Lin. mant. p. 7. no. 1252. Juss. gen. p. 205. (exclusive of Danàis) mem. mus. 6. p. 381. Lam. ill. 166. f. 1. Gærtn. fil. carp. 3. p. 84. t. 195. A. Rich, mem. soc. hist. nat. par. 5. p. 194. D. C. prod. 4. p. 471.

Lin. syst. *Pentándria, Monogy'nia.* Calyx with an ovate tube, and a small 5-toothed permanent limb. Corolla funnel-shaped, hairy inside, 5-lobed, plicate in æstivation. Stamens 5, sometimes abortive; anthers oblong, almost sessile in the middle of the tube. Style not exserted; stigma bifid. Berry small, ovate-globose, 2-celled, 2-seeded: the rind at length becoming brittle, and easily separated. Albumen fleshy. Embryo straight, with a terete inferior radicle; flat, foliaceous, large cotyledons, and an inconspicuous plumule.—Sarmentose shrubs, rarely erect. Leaves opposite, petiolate, lanceolate, ovate or cordate, acute. Stipulas solitary on both sides. Peduncles terminal and axillary, branched, somewhat corymbose. Flowers small, white, usually unisexual.

* *Climbing shrubs.*

1 P. fœ'tida (Lin. mant. p. 52.) leaves oblong or lanceolate, cordate at the base, glabrous; panicles axillary, opposite, short, few-flowered, rarely terminal; bracteoles minute; anthers inclosed; berry ovate, a little compressed. ♄. ⌣. S. Native of the East Indies, very common in many places, as well as of Japan, and the Moluccas, among bushes. Lam. dict. 2. p. 257. ill. t. 166, f. 1. Thunb. jap. 107. Roxb. in Wall. fl. ind. 2. p. 517. Sieb. fl. maur. 2. no. 82. Apócynum fœ'tidum, Burm. fl. ind. p. 71.—Rumph. amb. 5. p. 160.—Kœmpf. icon. sel. t. 9.—Somaràji, asiat. res. 4. p, 261. Stipulas broad, cordate. Panicles axillary, brachiate. Flowers numerous, of a deep pink colour. Seeds compressed, bordered by a membranous wing. The leaves vary much in form. The whole herb has a fetid smell, when bruised. The roots are used as an emetic by the Hindoos.

Fetid Pæderia. Clt. 1806. Shrub cl.

2 P. recu'rva (Roxb. fl. ind. 2. p. 518.) leaves lanceolate, acuminated, glabrous; corymbs terminal, recurved, villous; anthers inclosed; berries globose, dry, striated a little. ♄. ⌣. S. Native of the East Indies, at Chittagong. Leaves 6 inches long and from 2-3 broad. Stipulas with a subulate hairy point. Stigma simple, linear, clavate. Berry size and colour of a black currant.

Recurved-corymbed Pæderia. Shrub cl.

3 P. macroca'rpa (Wall. cat. no. 7292.) leaves broad, cordate, acuminated, downy above and woolly beneath; racemes long, axillary, panicled, downy; fruit oblong, compressed, with a polished rind. ♄. ⌣. S. Native of the Burmese Empire, at Rangoon.

Large-fruited Pæderia. Shrub tw.

4 B. lanuginòsa (Wall. pl. asiat. rar. 2. p. 52. t. 165.) leaves broad-ovate, and ovate-lanceolate, acuminated, sagittately cordate at the base, downy above and woolly beneath; racemes long, axillary and terminal, panicled, downy or pilose as well as the petioles; fruit roundish, compressed. ♄. ⌣. S. Native of the Burman Empire, on the banks of the river Abran. Flowers green and purple.

Woolly-leaved Pæderia. Shrub tw.

5 P. tomentòsa (Blum. bijdr. p. 968.) leaves ovate-cordate, acute, tomentose beneath; panicles axillary and terminal, elongated, leafy. ♄. ⌣. S. Native of Java, among bushes on the mountains, common.

Tomentose-leaved Pæderia. Shrub tw.

6 P. verticilla'ta (Blum. bijdr. p. 968.) leaves 3 in a whorl, elliptic-oblong, acuminated, glabrous; panicles axillary and terminal, elongated, leafy. ♄. ⌣. S. Native of Java, on Mount Salak.

Whorled-leaved Pæderia. Shrub tw.

* * *Erect shrubs, which probably do not rightly belong to the genus.*

7 P. ere'cta (Roxb. fl. ind. 2. p. 519. but not of Spreng.) erect; leaves almost sessile, broad-lanceolate, smooth; panicles terminal, erect, in the forks of the branches; stamens exserted a little. ♄. S. Native of the East Indies, in Silhet. Leaves 4 inches long and $1\frac{1}{2}$ broad. Flowers numerous, small, white, inodorous. Berries the size of a pea, when ripe highly polished, black, smooth.

Erect Pæderia. Shrub 2 to 3 feet.

8 P. terna'ta (Wall. in Roxb. fl. ind. 2. p. 520.) erect, trichotomous, smooth: with triangular branchlets; leaves 3 in a whorl, oblong-lanceolate; corymbs axillary, trichotomous, erect, shorter than the leaves; limb of calyx campanulate, obscurely 5-toothed. ♄. S. Native of the East Indies, on the Juyuntyapoora mountains bordering on Silhet. Flowers rather large, funnel-shaped, white, on long filiform pedicels, each pedicel having a pair of linear ciliated bracteas above the middle. The flowers are said to be fragrant when quite fresh, but they emit a very offensive smell on being steeped in water after they have been dried. Corolla fleshy, half an inch long, with a 5-cleft, rarely 4-cleft border. Fruit unknown.

Ternate-leaved Pæderia. Tree small.

† *Species not sufficiently known.*

9 P.? Va'lli-ka'ra (Juss. mem. mus. 6. p. 381.) climbing; branches terete, villously tomentose; leaves broad-ovate, acute, somewhat cordate, rather pilose above, and rather woolly beneath; corymbs axillary, many-flowered. ♄. ◡. S. Native of Malabar. Rheed. mal. 7. p. 35. t. 18. Hondbessen, Adans, fam. 2. p. 158. Berry globose, green, probably 1-seeded. Flowers 5-cleft, according to the figure, but tetrandrous according to the description.

Valli-kara Pæderia. Shrub cl.

10 P.? sessiliflòra (Poir. suppl. 2. p. 449.) stems ascending; leaves lanceolate, glabrous; petioles geniculated at the base; racemes rather longer than the leaves, brachiate, panicled; flowers sessile, sub-secund. ♄. S. Native of the Mauritius. Said to be allied to *P. fœ'tida*, but is probably a species of *Laugèria*.

Sessile-flowered Pæderia. Shrub ascending.

11 P. Brazilia'na (D. C. prod. 4. p. 472.) leaves cordate-oblong, pilose beneath and on the branches; panicles terminal, much branched; flowers pedunculate. ♄. S. Native of Brazil, in the province of Minas Geraes. Anthers inclosed. Berry dry, containing 2 pyrenæ. Pædèria erécta, Spreng. neu. entd. 3. p. 34. but not of Roxb.

Brazilian Pæderia. Shrub 3 to 4 feet?

Cult. The species of *Pædèria* are free growers, and will thrive in any kind of rich light soil; and cuttings strike root readily in the same kind of soil, under a hand-glass.

Tribe IX.

COFFEA'CEÆ (this tribe agrees with the genus *Coffèa* in the fruit being baccate, and in containing 2 hard 1-seeded nuts). D. C. diss. 1806. H. B. et Kunth, nov. gen. amer. 3. p. 352. exclusive of some genera. A. Rich, ex D. C. prod. 4. p. 472. —Psychotriàceæ and Cephalídeæ, Cham. et Schlecht. in Linnæa. 4. p. 4. and p. 133. Fruit 2-celled (f. 105. *h*. f. 107. *c*.), baccate, containing 2 1-seeded bony or crustaceous nuts (f. 107. *d*.), which are flat inside and usually marked by a furrow on the outside; rarely containing only 1 nut from abortion. Nuts adhering by the inner sides. Albumen horny.—Trees or shrubs. Leaves opposite. Stipulas inter-petiolar, with 2 on each side, which are either combined or distinct.

Sub-tribe I. Coffee'æ (this sub-tribe contains shrubs agreeing with the genus *Coffèa* in having distinct flowers). D. C. prod. 4. p. 472—Psychotriàceæ, Cham. et Schlecht. 4. p. 4. Flowers distinct, not combined.

CXL. AMARACA'RPUS (from *αμαρα*, *amara*, leading water, and *καρπος*, *karpos*, a fruit; probably in reference to the furrow on the outside of the pyrenæ or nuts). Blum. bijdr. p. 954. A. Rich, mem. soc. hist. nat. par. 5. p. 198. D. C. prod. 4. p. 472.

Lin. syst. *Tetrándria, Monogy'nia*. Calyx with an oval tube and a 4-cleft unequal limb. Corolla funnel-shaped, with a villous throat and a deeply 4-cleft limb. Stamens 4, inserted in the throat of the corolla. Style 1; stigma 2-lobed. Drupe baccate, crowned by the calyx, containing 2 bony 1-seeded pyrenæ, which are furrowed a little on the back.—A small shrub, with downy branchlets. Leaves opposite, on short petioles, lanceolate, glabrous above, paler beneath, and rather downy on the veins. Stipulas connate at the base, bifid at the apex, deciduous. Flowers small, solitary, in the axils of the leaves, rarely terminal, sessile, bracteolate at the base.—Habit and axillary inflorescence of this genus disagree with *Psychótria*.

1 A. pube'scens (Blúm. bijdr. p. 954.). ♄. S. Native of Java, and the Island of Nusa-Kambanga.

Pubescent Amaracarpus. Shrub.

Cult. See *Coffèa*, p. 584. for culture and propagation.

CXLI. DAMNACA'NTHUS (from *δαμναω*, *damnao*, to conquer, *ακανθος*, *acanthos*, a spine; in reference to the strong opposite thorns). Gærtn. fil. carp. 3. p. 18. t. 182. D. C. prod. 4. p. 473.—Cánthium species, ex Juss. Rich.

Lin. syst. *Pentándria, Monogy'nia*. Calyx with a globose tube, and a small 5-toothed permanent limb. Corolla, stamens, and style unknown. Berry globose, 2-celled, crowned by the calyx. Seeds solitary in the cells, and fixed to the bottom of the cells. Albumen cartilaginously fleshy. Embryo very minute, seated in the base of the albumen, with a short inferior radicle.—An Indian shrub, furnished with opposite spines, but the leaves and flowers are hardly known.—This genus is nearly allied to *Cánthium*, but differs in the seeds being fixed to the bottom of the cells, not to their tops, and in the embryo being small. The Spina spinàrum of Rumph. amb. cited by Gærtner, for this plant has nothing to do with *Rubiàceæ*, in the leaves being alternate and serrated, and is therefore referrible to *Stigmaròta Janghòmas;* but perhaps the Oxycántha Javánica, Rumph. amb. 7. t. 19. f. 3. is a species of *Damnacánthus* or *Cánthium*.

1 D. I'ndicus (Gærtn. fil. l. c.). ♄. S. Native of the East Indies. Carissa spinàrum, Thunb. in litt. to Gærtn.

Indian Damnacanthus. Shrub.

Cult. For culture and propagation, see *Chiocócca*, p. 569.

CXLII. CAN'THIUM (*Canti* is the Malabar name of one of the species). Lam. dict. 1. p. 602. Juss. gen. p. 204. mem. mus. 6. p. 380. Gærtn. fil. carp. 3. p. 93. t. 196. Roxb. fl. ind. 2. p. 169. Blum. bijdr. p. 966. D. C. prod. 4. p. 473. but not of Labill. nor Lindl.—Cánthium species, A. Rich, mem. soc. hist. nat. par. 5. p. 187.—Gardènia species, Lin. fil.—Webèra species, Schreb.

Lin. syst. *Tetra-Pentándria, Monogy'nia*. Calyx with an ovate tube, and a short 4-5-toothed limb. Corolla with a short tube, a bearded throat, and 4-5 spreading lobes. Anthers 4-5, inserted at the throat, hardly exserted. Style filiform, exserted; stigma undivided, thick, ovate-globose, or mitre-formed. Berry globose, or didymous, fleshy, crowned by the calycine teeth, 2-celled. Seeds solitary in each cell, inserted towards the apex, inverted, incurved. Albumen fleshy. Embryo central, with a long superior radicle.—Asiatic or African shrubs, with spinose or unarmed branches. Leaves opposite, rather coriaceous. Stipulas interpetiolar, solitary on both sides. Peduncles axillary, short, many-flowered.

Sect. I. Euca'nthium (from *eu*, well or good, and *cánthium*; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 473. Mature fruit 2-celled, terminated by an umbilicus.

* *Unarmed shrubs, with pentandrous flowers.*

1 C. Corne'lia (Cham. et Schlecht. in Linnæa 4. p. 14.) branches unarmed; peduncles, calyxes, and petioles villous; leaves oval, obtuse at the base, acute at the apex, rather villous on both surfaces; peduncles bifid; cymes dense, many-flowered. ♄. S. Native of Senegal. Pavétta Cornèlia, Reichb. in Sieb. fl. seneg. exsic. no. 21. Fruit unknown. Flowers white.

Cornelia Canthium. Shrub 4 to 5 feet.

2 C. subcorda'tum (D. C. prod. 4. p. 473.) unarmed; leaves ovate, rather cordate, acutish, downy beneath, as well as on the branches; peduncles bifid, cymose, many-flowered; fruit a little compressed and rather cordate. ♄. S. Native of Senegal, in

humid places; and of Gambia, near Albreda, where it was collected by Leprieur and Perrottet. Flowers smaller than in any other species of the genus. Stigma ovate. Fruit almost like that of the following.

Subcordate-leaved Canthium. Tree.

3 C. DI'DYMUM (Gærtn. fil. carp. 3. p. 94. t. 196. exclusive of the syn. of Rheed.) shrubby, unarmed, glabrous, and smooth; leaves on short petioles, obtuse, and oval, glandular in the axils of the veins beneath; cymes axillary, on short peduncles; fruit didymous. ♄. S. Native of Coromandel, on the mountains.

Didymous-fruited Canthium. Shrub.

4 C. MOLUCCA'NUM (Roxb. fl. ind. 2. p. 172.) shrubby, unarmed; leaves oblong; tube of corolla gibbous, length of style; stigma turbinate. ♄. S. Native of the Moluccas. The rest unknown.

Molucca Canthium. Shrub.

5 C. FASCICULA'TUM (Blum. bijdr. p. 967.) arboreous, unarmed; leaves elliptic-lanceolate, glabrous; flowers in axillary fascicles. ♄. S. Native of the west of Java, in mountain woods. Said to be allied to *C. dìdymum*.

Fascicled-flowered Canthium. Tree.

6 C. GLA'BRUM (Blum. bijdr. p. 967.) arboreous, unarmed; leaves ovate, or elliptic-oblong, obtuse, acutish at the base, glabrous; cymes axillary, branched, many-flowered. ♄. S. Native of Java, in woods on the mountains.

Var. β, pubérulum (Blum. l. c.) leaves roughish above and puberulous beneath. ♄. S. Native of Java, at the foot of Mount Salak.

Glabrous Canthium. Tree.

7 C. MÌTE (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 474.) unarmed, glabrous; leaves petiolate, ovate, acuminated, glandular in the axils of the veins beneath; cymes axillary, loose, 3 times shorter than the leaves. ♄. S. Native of the Island of Luzon, one of the Philippines. Stipulas acuminated. Cymes bipartite, with diverging branches, and many-flowered branchlets. Calyx with 5 short, acute teeth.

Mild Canthium. Shrub.

8 C. LU'CIDUM (Hook. et Arn. in Beech, voy. pt. bot. p. 65.) branches unarmed; leaves on short petioles, elliptic, obtuse, attenuated a little at the base, coriaceous, shining above, pale beneath; cymes pedunculate, axillary, nearly globose. ♄. S. Native of the Society Islands. Calyx 4-5-toothed. Corolla 4-5-lobed. Stamens 4-5. Closely allied to *C. glàbrum* and *C. nìtens*.

Lucid-leaved Canthium. Shrub.

** *Unarmed shrubs, with tetrandrous flowers.*

9 C. NÍTENS (D. C. prod. 4. p. 474.) unarmed, glabrous; leaves petiolate, broad-ovate, bluntish, shining and glossy above; racemes compound, axillary, many-flowered, a little longer than the petioles. ♄. S. Native of the East Indies, where it was collected by Leschenault. Petioles 8 lines long. Stipulas triangular, deciduous. Peduncles disposed in dense panicles. Tube of corolla a little longer than the lobes, which are oval and obtuse. Stigma thick, ovate, much exserted.

Shining-leaved Canthium. Shrub.

*** *Spinose shrubs, with tetrandrous flowers.*

10 C. PARVIFLÒRUM (Lam. dict. 1. p. 602.) shrubby; branchlets glabrous; spines opposite, horizontal, supra-axillary; leaves ovate, on short petioles, smooth, longer than the spines, usually in fascicles; racemes rising beneath the spines at the axils; berries nearly globose. ♄. S. Native of Coromandel, frequent. Roxb. cor. 1. p. 39. t. 51. fl. ind. 2. p. 170. Gærtn. fil. carp. 2. p. 196. f. 3.? Webèra tetrándra, Willd. spec. 1. p. 1224. Kanden-kara, Rheed. mal. 5. p. 71. t. 36. When the plant is in luxuriance, the spines are sometimes threefold. Flowers small, yellow. Berries yellow, obcordate, compressed laterally, size of a cherry. The bush makes excellent fences. The leaves are universally eaten in curries; on this account the plant has the name of Balusoo-kura, which latter word means esculent.

Small-flowered Canthium. Shrub 5 to 6 feet.

11 C. HEBE'CLADUM (D. C. prod. 4. p. 474.) shrubby; branchlets velvety; spines opposite, rising from an acute angle; leaves obovate, glabrous, hardly longer than the spines; pedicels numerous, 1-flowered, axillary. ♄. S. Native of the Island of Luzon, one of the Philippines. C. parviflòrum, Bartl. in herb. Hænke. but not of Lam.

Downy-branched Canthium. Shrub 5 to 6 feet.

**** *Spinose shrubs, with pentandrous flowers.*

12 C. MUNDTIA'NUM (Cham. et Schlecht. in Linnæa. 4. p. 131.) a small erect shrub: with opposite spinescent branches; leaves ovate-oblong, of the same colour on both surfaces, membranous; petioles downy inside; cymes axillary, pedunculate. ♄. G. Native of the Cape of Good Hope, at Plittenberg's Bay. Habit of *Plectrònia ventòsa*, but the cymes are on longer peduncles; the flowers are smaller, and the stipulas are glabrous inside, not leaving a margin of white wool on falling, as in that plant.

Var. β, pubéscens (D. C. prod. 4. p. 474.) leaves downy on both surfaces. ♄. G. Growing along with the species.

Mundt's Canthium. Shrub 4 to 5 feet.

13 C. HÓRRIDIUM (Blum. bijdr. p. 966.) shrubby, erect; spines spreading, straight; leaves small, almost sessile, ovate-oblong, acutish, downy on both surfaces, as well as the branches and stipulas; flowers twin or tern, axillary, on very short peduncles. ♄. S. Native of Java, among bushes about Buitenzorg. Branches spreading, opposite.

Horrid Canthium. Shrub 5 to 6 feet.

14 C. PARVIFÒLIUM (Roxb. fl. ind. 2. p. 170.) shrub thorny and hairy; leaves oval, hairy beneath; flowers axillary, crowded; tube of corolla globose. ♄. S. Native of the East Indies. The inside of the tube of the corolla is surrounded by a circle of straight white bristles of its own length, inserted round its mouth, and pointing to its bottom. The figure in Pluk. alm 27. t. 133. f. 3. so often referred to as this plant, has nothing to do with it; consequently it is neither Manètia diacántha, Willd. spec. 1. p. 670., nor Azìma diacántha, Lam. dict. 1 p. 343.

Small-leaved Canthium. Shrub 5 to 6 feet.

15 C. ANGUSTIFÒLIUM (Roxb. fl. ind. 2. p. 169.) shrub thorny; leaves lanceolate, glabrous, and shining, on short petioles; flowers numerous, axillary, on short pedicels; berries roundish, retuse. ♄. S. Native of the East Indies, on hills, in the vicinity of Chittagong, Silhet, and the whole eastern frontier of Bengal. Branches glabrous. Flowers small, greenish-yellow. Corolla with a short gibbous tube, and 5 lanceolate segments. Drupe roundish, when ripe yellow.

Narrow-leaved Canthium. Shrub.

16 C. RHEE'DII (D. C. prod. 4. p. 474.) shrub thorny; leaves oval-lanceolate, acuminated, on very short petioles, shining; flowers numerous, axillary, on short pedicels; berries roundish-ovate, compressed. ♄. S. Native of Malabar, where the Brachmans called it *Canti*, hence the generic name. Tsjeron-kara, Rheed. mal. 5. p. 73. t. 37. Root reddish, bitter. Flowers small, greenish. Berries green. It differs from *C. parviflòrum* in the flowers being 5-cleft and pentandrous.

Rheede's Canthium. Shrub.

17 C. PEDUNCULA'RE (Cav. icon. 5. p. 21. t. 436.) shrub thorny; leaves ovate, acute, almost sessile, downy; peduncles

axillary, solitary, longer than the leaves. ♄. S. Native of the Island of Luzon, one of the Philippines. Teeth of calyx subulate. Corolla pale purple, with a woolly throat, and 5 lanceolate, very acute segments. Filaments shorter than the corolla. Berry ovate, sub-compressed. This shrub is perhaps generically distinct from *Cánthium*.

Peduncular Canthium. Shrub 8 to 10 feet.

18 C. lycioìdes (A. Rich, diss. p. 108.) spines supra-axillary, simple; leaves small, oblong-oval, acuminated, rather hairy; stipulas broad, ending in a long abrupt point at the apex; flowers axillary, pedunculate, solitary. ♄. S. Native of Manilla. Habit of a species of *Lýcium*. The rest unknown.

Lycium-like Canthium. Shrub.

19 C. Chine'nse (Pers. ench. 1. p. 200.) shrub thorny; leaves obovate; flowers sessile, hairy. ♄. G. Native of China, at Macao; and of Madras. Gardènia spinòsa, Thunb. diss. gard. no. 7. t. 2. f. 4. exclusive of the synonymes. Willd. spec. 1. p. 1229. Rándia spinòsa, Poir. dict. 2. p. 829. Leaves many from the buds under the spines, glabrous. Corolla white, a little longer than the calyx, with ovate, obtuse, spreading segments. Stigma clavate. This plant does not probably belong to *Cánthium*.

China Canthium. Fl. Ju. Aug. Clt. 1800. Sh. 5 to 8 ft.

20 C. sca'ndens (Blum. bijdr. p. 966.) climbing; spines divaricate or recurved; leaves on short petioles, oblong, acuminated, downy beneath as well as on the branches; flowers disposed in axillary fascicles; fruit didymous. ♄. ◡. S. Native of the Island of Nusa-Kambanga, near Java, among bushes. Thorns much shorter than the leaves, straight, or a little recurved, but sometimes wanting on the branchlets. Fruit rather rugged, like that of *Psy'drax*.

Climbing Canthium. Shrub cl.

Sect. II. Pleuroga'ster (from πλευρον, *pleuron*, a side, and γαστηρ, *gaster*, a belly; the cicatrice occasioned by the falling of the flower is left at one side of the fruit). D. C. diss. ined. acad. sc. par. 1806. prod. 4. p. 475. Mature fruit 1-celled, furnished with the floral cicatrice on one side at the base.

21 C. anomoca'rpum (D. C. prod. 4. p. 475.) glabrous; branches divaricate, and probably at length becoming spinescent; leaves oval, acuminated, on short petioles; pedicels slender, elongated, 1-flowered, corymbose, usually deflexed, rising from the axils of the superior leaves. ♄. S. Native of Sierra Leone, where it was collected by Smeathmann; and of the Gambia, at Albreda. This plant comes near to *Plectrònia ventòsa*, from the singularity of the fruit.

Anomalous-fruited Canthium. Shrub.

Cult. For culture and propagation see *Chiocócca*, p. 569.

CXLIII. PLECTRO'NIA (from πληκτρον, *plecktron*, a whip; in reference to the square branches). Lin. mant. p. 6. no. 1249. Lam. ill. t. 146. A. Rich, mem. soc. hist. nat. par. 5. p. 189. but not of Burm. nor Lour.—Rhâmnus species, Burm.

Lin. syst. *Tetrándria, Monogýnia*. Calyx with an obovate or oblong tube, and a 5-toothed limb. Teeth very short, acutish. Corolla short, rather funnel-shaped, with a 5-parted limb, and a bearded throat; segments acute, reflexed. Stamens 5, inserted in the throat, a little exserted. Style short; stigma sub-capitate, of 2 approximate lamellæ. Berry dry, naked at the apex, emarginate, obovate-oblong, compressed, didymous, containing 2 chartaceously coriaceous, 1-seeded, indehiscent pyrenæ, which are flat inside.—Small African trees, with opposite, sub-spinose branches. Leaves opposite, petiolate, elliptic, acute at both ends, rather coriaceous, pale beneath. Stipulas solitary on each side, apiculated. Peduncles axillary, short, solitary, racemose, or corymbose; pedicels about equal in length to the fruit, slender.—This genus, along with *Damnacánthus*, *Psy'drax*, and *Cánthium* ought probably to be united.

1 P. vento'sa (Lin. mant. p. 52.) branchlets glabrous, tetragonal; stipulas 3 times shorter than the petioles; peduncles many-flowered, corymbose. ♄. S. Native of the Cape of Good Hope, in woods much exposed to the wind. Serissa Capénsis, Thunb. fl. cap. p. 193. exclusive of the syn. of Willd. Cruse, rub. cap. p. 21. 24. t. 2. Cánthium Thunbergiànum, Cham. et Schlecht. in Linnæa. 4. p. 130. Plectrònia corymbòsa, A. Rich. l. c.—Burm. afr. p. 257. t. 94. Flowers greenish white.

Windy Plectronia. Clt. 1816. Tree.

2 P. Madagascarie'nsis (A. Rich. in mem. soc. hist. nat. Par. 5. p. 189.) branchlets glabrous, compressed; pedicels axillary, 1-flowered. ♄. S. Native of Madagascar, where it was collected by M. Chapelier. The whole shrub is glabrous. Leaves oval, attenuated at the base, petiolate. Stipulas short, acuminated, deciduous. Flowers unknown. Fruit obovate, emarginate at the apex, and probably obcordate and compressed, usually 1-celled by abortion.

Madagascar Plectronia. Shrub or tree.

3 P. hirsu'ta (D. C. prod. 4. p. 476.) branchlets villous; leaves villous beneath; stipulas length of petioles. ♄. S. Native of Senegal, by the sides of woods near Dagana, where it was collected by Leprieur and Perrottet. Cánthium Senegalénse, A. Rich. l. c. p. 188. Branches terete, divaricate, spreading, forming straight angles. Peduncles axillary, villous, compressed, corymbose at the apex. Berry 2-celled, emarginate at the apex; but one of the cells is usually abortive, in this case the fruit becomes 1-celled, and the umbilicus lateral, which is indicated by the permanent 5-toothed calyx.

Hairy Plectronia. Shrub 4 to 6 feet.

Cult. See *Chiocócca*, p. 569. for culture and propagation.

CXLIV. PSY'DRAX (from ψυδρακες, *psydrakes*, pustulæ; in allusion to the fruit, which are warted). Gærtn. fruct. 1. p. 125. t. 26. f. 2. A. Rich. mem. soc. hist. nat. Par. 5. p. 190. D. C. prod. 4. p. 476.

Lin. syst. *Pentándria, Monogy'nia*. Calyx with an obovate tube, and a 5-toothed deciduous limb. Corolla with a short tube, a hairy throat, and 5 oval acute reflexed lobes. Stamens inclosed, inserted at the throat. Style much exserted; stigma bilamellate. Berries fleshy, areolate at the apex, obovate, compressed, wrinkled from tubercles, marked by a furrow on both sides, 2-celled, containing usually 2, rarely 3 pyrenæ; pyrenæ oblong, scabrous from wrinkles, 1-seeded, marked by a linear furrow, and an umbilicus in the middle. Seeds bony, filling the pyrenæ. Albumen amygdalaceous, scrobiculate. Embryo inverted, filiform, curved into the form of a Greek sigma, with linear cotyledons.—Shrubs, with opposite ovate leaves, and axillary racemes of small flowers. This genus, from the hard fruit being often 3-celled, and from the form of the embryo, almost agrees with the tribe *Guettardàceæ*.

1 P. dico'ccos (Gærtn. fruct. 1. p. 125. t. 26. f. 2.) leaves elliptic, long-acuminated, gradually tapering into the short petioles at the base; stipulas lanceolate, acute, permanent; cymes pedunculate, branched; fruit rather heart-shaped. ♄. S. Native of Ceylon.

Two-seeded Psydrax. Shrub.

2 P. ma'jor (A. Rich. l. c. p. 191.) leaves elliptic, on short petioles, short-acuminated; stipulas semi-oval, bluntish; cymes pedunculate, simple; fruit heart-shaped. ♄. S. Native of Madagascar. Very like the preceding species, but differs in the broader leaves with shorter points, caducous stipulas, simple cymes, and larger fruit.

Larger Psydrax. Shrub.

3 P. ME'DIA (A. Rich. l. c.) leaves oval, very blunt, gradually attenuated at the base; stipulas ending in long points, caducous; cymes hardly pedunculate, simple, few-flowered; fruit deeply emarginate, didymous. ♄. S. Native of Madagascar.

Intermediate Psydrax. Shrub.

4 P. ANGUSTIFO'LIA (A. Rich. l. c.) leaves linear, acutish at the apex, gradually attenuated at the base; stipulas lanceolate, caducous; cymes hardly pedunculate, 3-5-flowered; fruit small, heart-shaped, didymous. ♄. S. Native of Madagascar.

Narrow-leaved Psydrax. Shrub.

Cult. For culture and propagation see *Chiocócca*, p. 569.

CXLV. MARQUI'SIA (evidently called so after some person of the name of Marquis, who is unknown to us). A. Rich. mem. soc. hist. nat. Par. 5. p. 192. D. C. prod. 4. p. 477.—Cánthium species, Labill.

LIN. SYST. *Pentándria, Monogy'nia.* Calyx with an ovate tube, and a short acutely 5-parted limb. Corolla with a short tube, a glabrous throat, and 5 oblong spreading bluntish lobes, which are longer than the tube. Anthers 5, ovate, sessile at the throat of the corolla. Style filiform, length of tube; stigmas 4-6. Berry ovate, fleshy, 2-celled, crowned by the calyx. Seed or pyrenæ solitary in the cells, erect, convex on the outside, but flat and furrowed inside.—A glabrous shrub, with spinose branches. Leaves on short petioles, opposite, lanceolate, small, attenuated at both ends. Stipulas small, solitary on both sides, adhering to the petioles. Pedicels axillary, solitary, 1-flowered, deflexed, calyculated by 4 small combined bracteas under the flower. Flowers small. This genus differs from *Cánthium* in the stigma being divided into many lobes, and in the seeds rising from the bottom of the cells, not from the top.

1 M. BILLARDIE'RII (A. Rich. l. c.) ♄. G. Native of Van Diemen's Land. Cánthium quadrífidum, Labill. nov. holl. 1. p. 69. t. 94. A very spinose shrub, very variable in habit, having the branches sometimes loose and elongated, and sometimes short and crowded. Pedicels rising each from a sheath.

La Billardier's Marquisia. Shrub 5 to 6 feet.

Cult. For culture and propagation see *Chiocócca*, p. 569.

CXLVI. NESCI'DIA (from *nescio*, to be ignorant; the fruit being unknown the genus is very doubtful). A. Rich. mem. soc. hist. nat. Par. 5. p. 192. D. C. prod. 4. p. 477.

LIN. SYST. *Pentándria, Monogy'nia.* Limb of calyx hardly any, quite entire. Corolla with a short tube, a naked throat, and a 5-cleft limb; segments incumbent, bluntish. Stamens 5, inserted in the throat, almost sessile, inclosed. Anthers linear, acute. Style short; stigmas 2, linear, acute, joined face to face. Ovarium 2-celled; ovula solitary in the cells, fixed to the middle dissepiment. Seeds unknown.—A glabrous shrub, native of the Mauritius. Leaves opposite, petiolate, like those of a myrtle, coriaceous, scarcely acute. Stipulas short, interpetiolar. Flowers axillary, solitary, girded by a bidentate calyculous at the base.—This is a doubtful genus from the fruit being unknown, but it has the habit of *Myonìma*.

1 N. MYRTIFO'LIA (A. Rich. l. c.) ♄. S. Native of the Mauritius.

Myrtle-leaved Nescidia. Shrub 5 to 6 feet.

Cult. See *Chiocócca*, p. 569. for culture and propagation.

CXLVII. DIPLO'SPORA (from *διπλοος, diploos*, double, and *σπορα, spora*, a seed; in reference to the cells of the fruit being 2-seeded). D. C. prod. 4. p. 477.—Cánthium species, Lindl.

LIN. SYST. *Tetrándria, Monogy'nia.* Calyx with an obovate tube, a very short subcampanulate 4-toothed limb. Corolla with a wide tube, which is shorter than the lobes, a pilose throat, and 4 ovate fleshy spreading lobes. Anthers 4, sessile at the throat, semi-exserted. Style length of the tube; stigma bifid. Ovarium 2-celled; cells 2-seeded; ovula collateral, ascending. Fruit and seeds unknown.—A glabrous shrub, native of China, with tetragonal branches. Leaves opposite, petiolate, oblong-lanceolate, acuminated at both ends. Stipulas solitary on both sides, ovate, acuminated, permanent. Flowers axillary, crowded, almost sessile, yellowish-green, calyculate by combined bracteas at the base. This genus agrees with *Epithínia* in the cells of the ovarium being biovulate, but differs in the ovula being collateral, not one on the top of the other.

1 D. VIRIDIFLO'RA (D. C. prod. 4. p. 477.) ♄. G. Native of China. Cánthium dùbium, Lindl. in bot. reg. t. 1026.

Green-flowered Diplospora. Fl. July. Clt. 1824. Shrub 3 to 4 feet.

Cult. See *Chiocócca*, p. 569. for culture and propagation.

CXLVIII. EPITHI'NIA (from *επι, epi*, upon, and *θιν, thin*, the seashore; the shrub grows among mangroves on the seashore). Jack, in mal. misc. 1. no. 2. p. 12. D. C. prod. 4. p. 477.

LIN. SYST. *Tetrandria, Monogy'nia.* Limb of calyx cylindrical, scarcely 4-toothed, permanent. Corolla tubular, with a 4-parted spreading acute limb, and a villous throat. Stamens 4, exserted; anthers linear. Style exserted; stigma bifid. Berry 8-furrowed, containing 2 oblong 2-seeded pyrenæ. Seeds placed one above another.—An Indian shrub. Leaves opposite, petiolate, obovate, smooth, almost veinless. Stipulas wanting? Peduncles axillary, dichotomous, many flowered, with a solitary flower in the fork. Flowers white.—This genus is said to be allied to *Malànea*, but differs in the cells of the fruit being 2-seeded, and from all other Rubiaceous plants in the want of stipulas.

1 E. MALAYA'NA (Jack, l. c.) ♄. S. Native of the islands of Malacca, Singapore, in marshes among mangroves.

Malay Epithinia. Shrub.

Cult. For culture and propagation see *Chiocócca*, p. 569.

CXLIX. SIDERODE'NDRON (from *σιδηρος, sideros*, iron, and *δενδρον, dendron*, a tree; in reference to the hardness of the wood of the trees). Schreb. gen. no. 691. Vahl, ecl. amer. 1. p. 10. Juss. mem. mus. 6. p. 374. A. Rich. mem. soc. hist. nat. Par. 5. p. 183. t. 16. f. 3. D. C. prod. 4. p. 478.—Sideroxyloìdes, Jacq. amer. p. 19.

LIN. SYST. *Tetrándria, Monogy'nia.* Calyx with a subglobose tetragonal tube, and a very small 4-toothed limb. Corolla with a long terete tube, which is hardly widened at the apex, a glabrous throat, and 4 oval roundish bluntish spreading lobes. Anthers 4, sessile in the throat of the corolla, oblong, hardly exserted, one-half shorter than the lobes of the corolla. Style bifid at the apex, length of the corolla. Berry dry, nearly globose, naked at the apex, 2-celled, 2-seeded. Seeds convex on the outside, concave inside, and furnished with a circular areola as in *Bacònia*. Albumen cartilaginous. Embryo unknown.—Glabrous hard-wooded trees, natives of South America. Branches terete, but tetragonal when young, as well as the pedicels. Leaves opposite, oval-oblong, acute, rather coriaceous, petiolate. Stipulas solitary on both sides, apiculated by a short point. Peduncles axillary, trifid or trichotomous. Flowers rose coloured on the outside, and white inside. This genus is nearly allied to *Coffèa*.

1 S. TRIFLO'RUM (Vahl, ecl. 1. p. 10.) peduncles twin, axillary, 3-flowered. ♄. S. Native of the islands of Montserrat and Martinico, where it is called *bois de fer* or iron-wood. S. férreum, Lam. ill. p. 282. Sideroxyloìdes férreum, Jacq, amer.

p. 19. t. 175. f. 9.—Pluk. alm. t. 224. f. 2. Petioles short, and the leaves are acute at the base, ex Vahl.

Three-flowered Ironwood-tree. Clt. 1793. Tree tall.

2 S. multiflo'rum (A. Rich. l. c.) peduncles axillary, tripartite, having the lateral branches trifid, and the middle one twice trifid. ♄. S. Native of French Guiana. Petioles 2-3 lines long. Peduncles 3 or 4 lines longer than the petioles. Leaves acuminated at the apex, but hardly acute at the base.

Var. β, angustifòlium (D. C. prod. 4. p. 478.) leaves oblong, acuminated. ♄. S. Native along with the species.

Many-flowered Ironwood-tree. Tree.

† *A doubtful species.*

3 S. paniculà'tum (Willd. herb. no. 2811. ex Cham. et Schlecht. in Linnæa. 4. p. 26.) panicles axillary, pedunculate, hairy, with subdichotomous branches; leaves ovate-cordate, acutely mucronate, nearly sessile. ♄. S. Native of South America, on the banks of the river Atabapo, near San-Balthazar. Psychótria cordifòlia, H. B. et Kunth, nov. gen. amer. 3. p. 365. but not of Dietr. The fruit is unknown, but the tree agrees better with *Siderodéndron* than with *Psychótria* in the tetrandrous flowers and axillary panicles. Flowers blue, glabrous, with a villous throat.

Panicled-flowered Ironwood-tree. Shrub.

Cult. See *Chiocócca*, p. 569. for culture and propagation.

CL. EUMA'CHIA (Eumachus, an author cited by Theophrastus). D. C. prod. 4. p. 478.—Petèsia, Gærtn. fil. carp. 3. p. 66. t. 192. but not of P. Browne, nor Lin.—Petèsia species, Juss. and Spreng.

Lin. syst. *Tetrandria, Monogy'nia.* Calyx with an obovate tube, and a 4-toothed deciduous limb. Corolla funnel-shaped, with a short tube, a naked throat, and a 4-parted limb; lobes roundish, spreadingly reflexed. Stamens inserted in the bottom of the tube; filaments short; anthers oblong in the throat. Stigma bifid, having the lobes long and acute. Berry globose, naked at the apex, 2-celled; cells 1-seeded. Seeds convex on the back, and flattish in front, with a moon-shaped umbilicus. Albumen cartilaginous. Embryo unknown.—A glabrous Australian tree. Branches terete. Leaves opposite, petiolate, smooth, oblong-lanceolate. Cymes terminal and axillary, trifid. Corolla flesh coloured.

1 E. cà'rnea (D. C. prod. 4. p. 479.) ♄. S. Native of the island of Namoka, one of the Friendly Islands. Petèsia càrnea, Forst. 2. no. 51.

Flesh-coloured-flowered Eumachia. Tree.

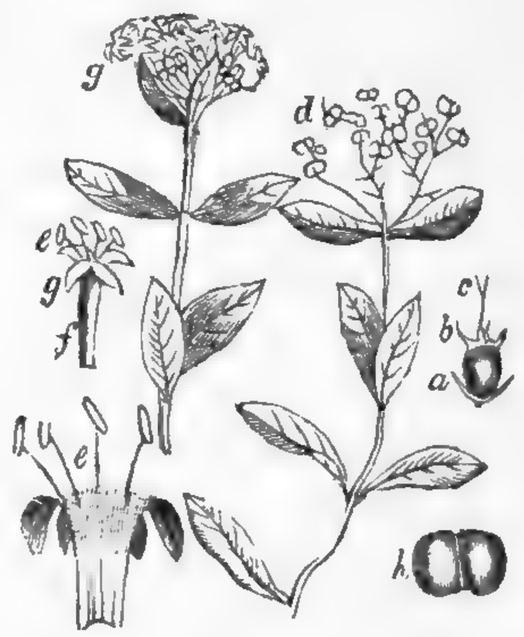
Cult. For culture and propagation see *Chiocócca*, p. 569.

CLI. DECLIEU'XIA (named after M. Declieux, a French gardener, who carried the coffee plants first into Martinico). H. B. et Kunth, nov. gen. amer. 3. p. 352. Mart. et Zucc. in Rœm. et Schultes, mant. 3. p. 111. Cham. et Schlecht. in Linnæa. 4. p. 4. A. Rich. mem. soc. hist. nat. Par. 5. p. 193. D. C. prod. 4. p. 479.—Psyllocárpus, Pohl, in litt. but not of Mart.

Lin. syst. *Tetrandria, Monogy'nia.* Calyx with an obovate tube, and a 4-parted limb (f. 105. *b.*). Corolla funnel-shaped (f. 105. *g.*), with a terete tube (f. 105. *f.*), a bearded throat, and 4 spreadingly reflexed lobes. Stamens 4, inserted in the throat; filaments filiform; anthers linear, fixed by the middle, exserted (f. 105. *e.*); stigma bifid (f. 105. *c.*). Berry nearly dry, 2-celled, subdidymous, compressed (f. 105. *h.*), crowned by the permanent calyx (f. 105. *b.*), containing 2 chartaceously coriaceous 1-seeded pyrenæ. Albumen horny. Embryo unknown.—Shrubs, rarely herbs, natives of America. Stems erect, tetragonal when young. Leaves opposite or in whorles, nearly sessile. Stipulas small, interpetiolar. Corymbs terminal, tripartite, bracteate, with dichotomous branches. Flowers white, lateral and sessile, or terminal and pedunculate, bibracteate.

1 D. chiococcoìdes (H. B. et Kunth, nov. gen. amer. 3. p. 353. t. 281.) shrubby, glabrous; leaves opposite, sessile, oblong-lanceolate, acute, cuneated at the base, with rather revolute edges; corymbs sessile, tripartite; stamens about equal in length to the lobes of the corolla. ♄. S. Native of New Andalusia, on the banks of the Orinoco, near the monastery of Caripe: and of Rio Janeiro, ex Cham. et Schlecht. in Linnæa. 4. p. 4. Rœm. et Schultes, mant. 3. p. 112. Houstònia fruticòsa, Willd. mss. in Rœm. et Schultes, syst. 3. p. 527. Shrub 4 feet high. Flowers white. (f. 105.)

FIG. 105.



Chiococca-like Declieuxia. Sh. 4 feet.

2 D. Mexica'na (D. C. prod. 4. p. 479.) suffruticose, glabrous; leaves opposite or 3 in a whorl, sessile, oblong-lanceolate, obtuse at the base, acute at the apex; corymbs pedunculate, 4-5-parted; stamens about equal in length to the lobes of the corolla. ♄. S. Native of Mexico. D. chiococcoìdes, Bartl. in herb. Hænke. Flowers white.

Mexican Declieuxia. Shrub $1\frac{1}{2}$ foot.

3 D. thymbroìdes (Mart. et Zucc. in Rœm. et Schultes, mant. 3. p. 111.) shrub much branched; leaves disposed in verticillate fascicles, sessile, linear, acute, attenuated at both ends, and are, as well as the branches, roughish; flowers solitary or few together on the tops of the branches. ♄. S. Native of Brazil.

Thymbra-like Declieuxia. Shrub.

4 D. satureioìdes (Mart. et Zucc. in Rœm. et Schultes, mant. 3. p. 111.) shrub much branched; leaves linear-lanceolate, attenuated at the base, sessile, opposite or 6 in a whorl, and are, as well as the branches, scabrous from hairs; flowers axillary, solitary. ♄. S. Native of Brazil. The rest unknown.

Savory-like Declieuxia. Shrub.

5 D. galioìdes (Pohl, in litt. under the name of *Psyllocárpus,*) plant subherbaceous, glabrous; branches terete; leaves 3 in a whorl, linear; whorles distant; panicles terminal, having the branches disposed 3 in a whorl, cymose. ♄. S. Native of Brazil, where it was collected by Pohl.

Galium-like Declieuxia. Shrub 1 foot.

6 D. spergulifòlia (Mart. et Zucc. l. c.) shrubby, glabrous; leaves linear-subulate, opposite, sessile; racemes dichotomous; terminal. ♄. S. Native of the south of Brazil. Cham. et Schlecht. in Linnæa. 4. p. 6. Panicle terminal, dichotomously compound from cymes: having the branchlets capillary, elongated, and erect, with alternate flowers. Flowers twin, one of each pair sessile. Stamens inclosed. Cham. et Schlecht.

Spurry-leaved Declieuxia. Shrub.

7 D. marioìdes (Mart. et Zucc. l. c.) shrubby; stem and branches clothed with soft down; leaves 3 in a whorl, rarely 4, ovate-lanceolate, almost sessile, glabrous, with revolute edges; flowers axillary, almost terminal. ♄. S. Native of Brazil.

Cat-thyme-like Declieuxia. Shrub.

8 D. œnanthoìdes (Mart. et Zucc. l. c.) plant herbaceous, glabrous; stem nearly simple; leaves 4 in a whorl, sessile, remote, linear-lanceolate, acute; racemes bifid, forming a terminal panicle. ♄. S. Native of the south of Brazil. Panicle, ex Cham. et Schlecht. in Linnæa. 4. p. 5. terminal, from whorles

of branches, usually twin, and forming a terminal umbel, with a central flower. Flowers sessile.

Œnanthe-like Declieuxia. Shrub.

9 D. FOLIO'SA (Pohl, in litt. under the *Psyllocárpus,*) shrubby, scabrous in every part; branches tetragonal; leaves opposite, linear-oblong, acuminated at both ends, revolute at the margins while young; cymes terminal, few-flowered. ♄. S. Native of Brazil, where it was collected by Pohl. In the axils of the leaves there are two young leaves, and therefore at first sight appear 6 in a whorl.

Leafy Declieuxia. Shrub.

10 D. CORDI'GERA (Mart. et Zucc. l. c.) suffruticose, nearly simple, clothed with roughish pubescence; leaves opposite, decussate, approximate, sessile, ovate-cordate, acute, concave on the back; racemes bifid, terminal, crowded into a dense panicle. ♄. S. Native of Brazil within the tropic. Cham. et Schlecht. in Linnæa. 4. p. 7. Psyllocárpus cordifòlius, Pohl, in litt. Leaves rarely 3 in a whorl. Panicle terminal, erect, many flowered, nearly globose, with angular flexuous branches, dichotomous, hence bearing sessile flowers.

Heart-bearing Declieuxia. Shrub.

11 D. GLAU'CA (Mart. et Schlecht. in Linnæa. 4. p. 8.) shrubby, glabrous, pruinosely glaucescent; leaves opposite, sessile, ovate, very acute, erectly adpressed, coriaceous; panicle terminal, erect, nearly globose, dense. ♄. S. Native of Brazil within the tropic. Very nearly allied to the preceding species.

Glaucous Declieuxia. Shrub.

12 D. PASSERI'NA (Mart. et Zucc. in Rœm. et Schultes, mant. 3. p. 112.) shrubby, glabrous; leaves opposite, decussate, sessile, adpressed, imbricating in 4 rows, ovate, acute, 3-5-nerved beneath; flowers axillary, sessile, covered each by a leaf. ♄. S. Native of Brazil.

Passerina-like Declieuxia. Shrub.

13 D. DAPHNOÌDES (Mart. et Zucc. l. c.) shrubby; branches twiggy; leaves opposite, decussate, somewhat imbricating in 4 rows, sessile, ovate-cordate, acute, rather concave above, scabrous from hairs beneath, 7-9-nerved; peduncles axillary, few-flowered. ♄. S. Native of Brazil. The rest unknown.

Daphne-like Declieuxia. Shrub.

14 D. IMBRICA'TA (Pohl, in litt. under the name of *Psyllocárpus,*) shrubby, glabrous; branches terete; leaves opposite, decussate, erect, ovate, hardly subcordate, cuspidate, stiff, having 4 small ribs on each side of the midrib; peduncles axillary, few-flowered. ♄. S. Native of Brazil.

Imbricated-leaved Declieuxia. Shrub.

15 D. RHEXIOÌDES (Mart. et Zucc. l. c.) shrubby, glabrous; young branches subumbellate, twiggy; leaves opposite, decussate, sessile, erectly spreading, imbricating in 4 rows, orbicularly ovate, acute, 5-nerved; flowers axillary, almost solitary. ♄. S. Native of Brazil.

Rhexia-like Declieuxia. Shrub.

16 D. ORIGANOÌDES (Zucc. l. c.) shrubby, clothed with roughish hairs; branches dichotomous, terete; leaves opposite, rather remote, on short petioles, nearly orbicular, acute, many nerved; flowers terminal, thyrsoid. ♄. S. Native of Brazil. Leaves like those of *Origanum Dictámnus*.

Origanum-like Declieuxia. Shrub.

17 D. MO'LLIS (Zucc. l. c.) shrubby; leaves opposite, ovate-lanceolate, somewhat rhomboid, acute, tapering into the short petioles at the base, with ribbed veins, clothed with villi; flowers terminal, disposed in dichotomous panicles. ♄. S. Native of Brazil.

Soft Declieuxia. Shrub.

18 D. LYSIMACHIOÌDES (Zucc. l. c.) plant herbaceous or suffruticose, downy; branches simple, erect; leaves 3 in a whorl, ovate, attenuated at both ends, acute; flowers terminal, dichotomously panicled. ♄. S. Native of Brazil.

Lysimachia-like Declieuxia. Shrub.

19 D. RUBIOÌDES (Zucc. l. c.) shrubby, glabrous; leaves opposite, decussate, ovate, acute, rounded and cordate at the base, shining above; flowers terminal, disposed in dichotomous panicles. ♄. S. Native of Brazil.

Rubia-like Declieuxia. Shrub.

20 D. A'LBA (Zucc. l. c.) shrubby, scabrous; leaves opposite, decussate, ovate, acute, sessile, rounded at the base; racemes terminal, bifid, disposed in dichotomous cymes. ♄. S. Native of Brazil.

White Declieuxia. Shrub.

21 D. DIVERGENTIFLÒRA (Pohl, in litt. under Psyllocárpus,) suffruticose; branches terete, clothed with velvety hairs; leaves opposite, sessile, ovate, acutish, nerved, clothed with fine velvety down on both surfaces; cyme terminal, on short peduncles, of 6 diverging rays; corollas glabrous. ♄. S. Native of Brazil, where it was collected by Pohl.

Diverging-flowered Declieuxia. Shrub.

22 D. PULVERULE'NTA (Mart. Cham. et Schlecht. in Linnæa. 4. p. 9.) suffruticose, clothed with short dense hairs in every part except the corollas; leaves usually 3 in a whorl, rarely opposite, sessile, ovate, acute or acuminated; cymes terminal, of many rays, subfastigiate. ♄. S. Native of Brazil within the tropic.

Powdery Declieuxia. Shrub.

23 D. POLYGALOÌDES (Zucc. in Schultes, mant. 3. p. 113.) suffruticose; branches twiggy, erect; leaves 3 or 4 in a whorl, sessile, lanceolate, acute, erect, smoothish; flowers terminal, panicled. ♄. S. Native of Brazil. The rest unknown.

Polygala-like Declieuxia. Shrub.

24 D. VINCOÌDES (Mart. et Zucc. l. c.) shrubby, glabrous; leaves opposite or 3 in a whorl, ovate, attenuated at both ends, acute, sessile, shining; flowers terminal, disposed in dichotomous panicles. ♄. S. Native of Brazil.

Vinca-like Declieuxia. Shrub.

25 D. PRUINÒSA (Pohl, in litt. under Psyllocárpus, D. C. prod. 4. p. 481.) suffruticose, glabrous, glaucous; branches terete; leaves opposite, sessile, orbicularly ovate, mucronate; cymes terminal, trichotomous, on short peduncles, fastigiate. ♄. S. Native of Brazil.

Frosted Declieuxia. Shrub.

26 D. MUCRONULA'TA (Mart. Cham. et Schlecht. in Linnæa. 4. p. 10.) suffruticose, quite glabrous; leaves opposite, sessile, elliptic or obovate, cuneated at the base, mucronate at the apex: the mucrone usually reflexed; cymes terminal, on short peduncles, somewhat fastigiate. ♄. S. Native of Brazil within the tropic. Stem and branches terete, furnished with 2 slight wings. Psyllocárpus trichótomus, Pohl, in litt. may be referrible to this, but the mucrones of the leaves are not reflexed in the specimens of that plant collected by Pohl.

Mucronate-leaved Declieuxia. Shrub.

27 D. GLA'BRA (D. C. prod. 4. p. 481.) plant suffruticose, glabrous; stem somewhat tetragonal; leaves opposite, petiolate, elliptic-oblong, acuminated at both ends, but not mucronate; cymes terminal, of many rays, subumbellate. ♄. S. Native of Brazil, Pohl; about Caraccas, Vargas. Psyllocárpus glàber, Pohl. in litt. Very like the preceding.

Glabrous Declieuxia. Shrub.

28 D.? PSYCHOTRIOÌDES (D. C. prod. 4. p. 481.) suffruticose, glabrous; leaves opposite, on short petioles, elliptic, long-acuminated, acute at the base; cymes terminal, on short peduncles, trichotomous, one-half shorter than the leaves. ♄.? ♃.? S. Native of Cayenne, where it was collected by Patris; and of Panama and Mexico, according to Hænke. herb. Coffèa didy-

mocárpa, Bartl. in herb. Hænke. Flowers unknown. Stipulas twin on both sides, subulate.

Psychotria-like Declieuxia. Shrub.

29 D. herba'cea (Cham. et Schlecht. in Linnæa. 4. p. 11.) plant herbaceous, glabrous; branches straight, glabrous, terete, a little winged; leaves opposite, petiolate, ovate-lanceolate, attenuated, acute; cymes axillary, on long peduncles, of 5 spreading rays. ♃. S. Native of Brazil, about Rio Janeiro. Knóxia Brasiliénsis, Spreng. syst. 1. p. 406. Habit of *Borrèria láxa*. Corolla a line long. Fruit nearly dry. This plant ought probably to be excluded from the present genus, according to Martius in Linnæa. l. c.

Herbaceous Declieuxia. Shrub.

Cult. For culture and propagation see *Chiocócca*, p. 569.

CLII. TERTRE'A (named after J. B. du Tertre, a traveller in the French West Indian Islands, and who has written a general history of them). D. C. prod. 4. p. 481.—Schièdea, A. Rich. mem. soc. hist. nat. Par. 5. pt. 1. p. 186. (1830) but not of Schlecht. in 1826.

Lin. syst. *Pentándria, Monogýnia.* Limb of calyx 4-parted: lobes erect, oval, obtuse, ciliated. Corolla short, funnel-shaped, 4-cleft; lobes short, obtuse, rather spreading: throat beset with hairs. Stamens exserted, inserted in the upper part of the tube. Style shorter than the corolla. Stigmas 2, short, obtuse. Drupe oblong, compressed, crowned by the calyx, with 2 opposite furrows, containing 2 chartaceous 1-seeded pyrenæ. Seed oblong, compressed, pendulous.—A shrub, native of Martinico, having the branchlets usually spinescent at the apex. Leaves opposite, oval, acute, on short petioles, membranous, glabrous. Stipulas interpetiolar, acuminated. Flowers small, disposed in a terminal oppositely branched raceme.

1 T. Martinice'nsis (A. Rich. l. c.) ♄. S. Native of Martinico.

Martinico Tertrea. Shrub 1 to 2 feet.

Cult. For culture and propagation see *Chiocócca*, p. 569.

CLIII. CHIOCO'CCA (from χιων, *chion*, snow, and κοκκος, *kokkos*, a berry; the berries of *C. racemòsa* are white, hence it is called snow-berry). P. Browne, jam. p. 174. Lin. gen. no. 231. Jacq. amer. p. 68. Juss. mem. mus. 6. p. 378. Lam. ill. t. 160. Gærtn. fruct. 1. p. 125. t. 26. A. Rich. mem. soc. hist. nat. Par. 5. p. 186. D. C. prod. 4. p. 482.—Lonicèra species, Lin. hort. cliff. et spec. ed. 1st.—Chiocócca species, Spreng.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an ovate tube, and an acutely 5-toothed permanent limb. Corolla funnel-shaped, with an obconical tube or throat, and 5 acute lobes. Stamens with the filaments hardly adnate to the bottom of the corolla, downy, and shorter than the anthers, which are inclosed and linear. Style rather clavate at the apex, entire or slightly 2-lobed. Berry somewhat didymous, compressed, crowned by the teeth of the calyx, containing 2 chartaceous 1-seeded pyrenæ. Seeds pendulous. Embryo with a long superior radicle. Albumen cartilaginous.—Shrubs generally with a somewhat climbing habit. Leaves opposite, ovate or oblong, acute, glabrous. Stipulas broad at the base, permanent, more or less apiculated. Racemes axillary, opposite, simple or panicled. Flowers pedicellate, of a yellowish white colour. Roots emetic and alexiteric.

1 C. racemòsa (Jacq. amer. p. 68. Lin. spec. 246.) leaves oval, acuminated at both ends, smooth; stipulas broad at the base, and apiculated by a long point at the apex; racemes many flowered; corolla much longer than the teeth of the calyx; filaments of stamens downy. ♄. S. Native of the West India islands, Mexico, and Carthagena, on hills. Swartz, obs. p. 76. Andr. bot. rep. t. 284. Tratt. tab. t. 631. Hook. fl. exot. t. 93.—Sloane, hist. t. 188. f. 3.—Dill. hort. elth. t. 228. f. 295. and therefore the Lonicèra álba, Lin. spec. ed. 1. p. 175. A very variable shrub. Corollas at first white and scentless, but at length becoming yellowish and sweet-scented. Leaves shining on the upper surface. Berries snow white, hence the English name snow-berry, and the Greek one *chiococca*. The stamens are glabrous in the figure given by Hooker, and the stigma is trifid in that given by Andrews, variations which have never been seen in nature. The root has much the same acrid bitter taste as snake-root, and has been long used as a strong resolutive or attenuant; it is administered with great success in obstinate rheumatisms, and old syphilitic taints. It is best given in decoction; it is also an excellent emetic, and may be used as ipecacuanha.

Var. β, scándens (Pers. ench. 1. p. 209.) branches very slender, and evidently climbing; leaves oblong; racemes shorter than the leaves, simple. ♄. S. Native of Jamaica, and the island of Santa Cruz.—Browne, jam. p. 164. no. 2. Swartz, obs. 76. var. β.

Var. γ, laxiflòra (D. C. prod. 4. p. 482.) climbing; leaves oblong; racemes panicled, longer than the leaves. ♄. S. H. Cultivated in the botanic garden at Calcutta.

Var. δ, longiflòra (D. C. prod. 4. p. 482.) leaves oblong, long-acuminated; racemes simple, equal in length to the leaves. ♄. S. Native of Guadaloupe, where it was collected by Badier.

Var. ε, Floridànum (D. C. l. c.) leaves elliptic, hardly acuminated; racemes simple, a little longer than the leaves. ♄. S. Native of Florida and Mexico by the sea side. Chiocócca racemòsa, Michx. fl. bor. amer. 1. p. 103.

Racemose-flowered Snow-berry. Fl. Feb. Clt. 1729. Shrub 4 to 6 feet.

2 C. densiflòra (Mart. spec. med. bras. p. 17. t. 6.) leaves ovate, rather coriaceous; stipulas broad at the base, apiculated by a longish point; racemes many flowered; corolla much longer than the teeth of the calyx; filaments densely bearded. ♄. S. Native of Brazil, in woods at Almadas and Ferradas, on the mountains of Bahia; and at the Port of St. Catharine, ex Cham. et Schlecht. in Linnæa. 4. p. 13. Racemes simple. Flowers white, sweet-scented. This species grows plentiful about Bahia, where we have seen it either with loose or crowded branches and leaves.

Var. β, Cubénsis (D. C. prod. 4. p. 482.) leaves ovate, subcordate; racemes rather compound; filaments bearded. ♄. S. Native of Cuba.

Dense-flowered Snow-berry. Shrub 3 to 4 feet.

3 C. angui'fuga (Mart. spec. mat. med. bras. p. 17. t. 5.) leaves ovate, acuminated; stipulas very broad, short, each ending in a short point; racemes panicled; corolla hardly 3 times longer than the calycine teeth. ♄. S. Native of Brazil, in woods, French Guiana, Trinidad, Peru, Cuba, and about Cumana, on the Spanish Main. Cham. et Schlecht. in Linnæa. 4. p. 13. C. brachiàta, Ruiz et Pav. fl. per. 2. p. 67. t. 219. f. b. C. racemòsa, H. B. et Kunth, nov. gen. amer. 3. p. 352. Sieb. fl. trin. exsic. no. 38. C. parviflòra and C. paniculàta, Willd. in Rœm. et Schultes, syst. 5. p. 203. Pedicels and branchlets glabrous. Flowers white. Root diuretic, and is called by the Brazilians Cainca.

Var. β, pubéscens (D. C. prod. 4. p. 483.) pedicels and branchlets downy. ♄. S. C. pubéscens, Willd. in Rœm. et Schultes, syst. 5. p. 202.

Anguifugal Snow-berry. Fl. June, Aug. Clt. 1824. Shrub 3 to 4 feet.

4 C. odora'ta (Hook. et Arn. in Beech. voy. pt. bot. p. 65.) leaves broad-oval, rather coriaceous, very blunt, acute at the base, and running down the short petioles; peduncles axillary, solitary, 3-4-flowered; corolla with a bearded throat. ♄. S.

Native of Elizabeth Island, one of the Society Islands. Coffèa odoràta, Forst. prod. 1. p. 94.? The flowers are described as fragrant, and smelling like cowslips.

Sweet-scented Snow-berry. Shrub.

5 C. barba'ta (Forst. prod. 1. p. 96. Hook. et Arn. in Beech. voy. pt. bot. p. 65. t. 14.) erect; leaves oval, acute at the base, and tapering into the short petioles, acuminated and obtuse at the apex; peduncles axillary, solitary, 1-3-flowered; corolla with a bearded throat, 5-cleft. ♄. S. Native of the Society and Friendly Islands. Flowers white. Drupe size of a filbert.

Bearded-flowered Snow-berry. Shrub.

6 C.? Java'na (Blum. bijdr. p. 968.) shrub parasitical; leaves oblong-lanceolate, acuminated at both ends, glabrous, velvety and shining above; corymbs terminal, trichotomous. ♄. S. Native of Java, in woods on the mountains upon trees. Coffèa Javánica, Blum. cat. hort. buit. p. 46. Perhaps a species of *Psychótria*.

Java Snow-berry. Shrub parasitical.

Cult. A mixture of loam, peat, and sand is the best soil for the species of *Chiocócca*; and cuttings strike root freely in sand under a hand-glass in heat.

CLIV. MARGA'RIS (from μαργαρον, *margaron*, a pearl; the berries are white and shining in *M. nudiflòra*, and are called *perlitas*, or pearls, by the Mexicans). D. C. prod. 4. p. 483.—Descliæ'a, Moc. et Sesse, fl. mex. icon. ined. ex D. C. l. c.

Lin. syst. *Pentándria, Monogýnia.* Calyx with a globose tube, and a somewhat turbinate semi-5-cleft limb; teeth acutish, permanent. Corolla funnel-shaped, with an obconical tube, which is 5-toothed or with 5 short lobes at the apex. Stamens 5, inserted in the middle of the tube; filaments a little shorter than the corolla; anthers ovate. Stigma capitate, undivided or slightly 2-lobed. Berry globose, crowned by the calyx, 2-celled, 2-seeded. Seeds semi-ovate, acute at one end.—Shrubs, with slender branches. Leaves opposite, ovate, glabrous, about the size of those of the common myrtle. Stipulas small, solitary on both sides. Pedicels axillary, opposite, short, 1-flowered. Flowers white, usually secund, bibracteolate under the calyx. Berries white.

1 M. barbi'gera (D. C. prod. 4. p. 483.) leaves acute; corollas bearded inside. ♄. S. Native of Mexico. Descliæ'a leucocárpa, Moc. et Sesse, fl. mex. icon. ined. Berries size of a pea.

Beard-bearing Pearl-berry. Shrub.

2 M. nudiflòra (D. C. prod. 4. p. 483.) leaves mucronate; corolla glabrous inside. ♄. S. Native of Mexico, about Tapelpa. Chiocócca axillàris, Moc. et Sesse, fl. mex. icon. ined. Descliæ'a margaritària, Moc. et Sesse, fl. mex. icon. ined. Shrub 8 feet high. Berries ovate, globose, a little smaller than a pea, white and shining, hence they are called *perlitas* by the Mexicans.

Naked-flowered Pearl-berry. Shrub 8 feet.

Cult. See *Chiocócca* above for culture and propagation.

CLV. SALDI'NIA (meaning unknown to us). A. Rich. in mem. soc. hist. nat. Par. 5. p. 206. D. C. prod. 4. p. 483.—Morínda species, Poir.

Lin. syst. *Tetrándria, Monogy'nia.* Limb of calyx short, subcampanulate, obsoletely repand. Corolla with a short tube, a 4-parted limb, and a pilose throat; lobes oblong, acute, spreading. Stamens 4, inserted in the throat, hardly exserted; anthers oblong, almost sessile. Fruit small, egg-shaped, compressed, umbilicated by the limb of the calyx, drupaceous, usually 1-celled, and 1-seeded by abortion. Seed erect, oblong. Embryo nearly terete, slender. Albumen fleshy.—Shrub. Leaves opposite, elliptic, acuminated, coriaceous, glabrous on short petioles. Stipulas subulate, acute. Flowers small, almost sessile, 4-5-together in the axils of the leaves.

1 S. pseu'do-mori'nda (A. Rich. l. c.) ♄. S. Native of Madagascar. Morínda axillàris, Poir. in Lam. dict. 4. p. 315. Ronàbea species, Juss.

False-Morinda Shrub.

Cult. See *Chiocócca* above for culture and propagation.

CLVI. SCOLOSA'NTHUS (from σκωλος, *skolos*, a thorn, and ανθος, *anthos*, a flower; the peduncles are sometimes hardened into thorns, which sometimes, though rarely, bear the flowers). Vahl, ecl. 1. p. 11. t. 10. Juss. mem. mus. 6. p. 377. A. Rich. mem. soc. hist. nat. Par. 5. p. 205. D. C. prod. 4. p. 484.—Antacánthus, L. C. Rich. mss.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a short ovate tube, and 4 linear-lanceolate acute lobes. Corolla tubular, somewhat tetragonal before expansion; the tube somewhat quadrangular at the apex; lobes 4, ovate, acute, revolute. Stamens having the filaments downy and adnate to the tube at the base; anthers linear, not exserted. Stigmas 2, obtuse, hardly longer than the tube. Drupe nearly globose, crowned by the calyx, containing a 2-celled 2-seeded nucleus, ex Rich., or very often 1-celled and 1-seeded by abortion.—West Indian shrubs, with the habit of *Catesbæ'a* or *Justícia spinòsa*. Leaves small, almost sessile, oblong or obovate, coriaceous, opposite, usually disposed in fascicles in the axils. Stipulas small, interpetiolar. Peduncles 1-flowered, axillary, 1-4-together, and sometimes they are hardened into simple bifid or trifid spines, which are usually naked, rarely floriferous. Flowers small, purple or saffron coloured.

1 S. versi'color (Vahl, ecl. amer. 1. p. 11. t. 10.) leaves obovate, shining above; spines simple, bipartite or twin. ♄. S. Native of Santa Cruz and Porto Rico. Chomèlia versícolor, Spreng. syst. 1. p. 110. Catesbæ'a parviflòra, Lam. ill. t. 67. f. 2. Leaves 3 lines long. Spines commonly in pairs from each alternate axil, combined at the base, for the most part a little longer than the leaves, stiff, purplish, often bearing a flower at one of the points; they are the peduncles which have hardened, and keep growing on after the flowers have fallen. Flowers on short peduncles; those from the tops of the spines solitary, usually drooping, purple, and abortive; others are axillary, solitary, or more rarely 2-4-together, erect, saffron coloured, and fertile. Fruit snow white.

Party-coloured-flowered Scolosanthus. Shrub 3 to 4 feet.

2 S. triaca'nthus (D. C. prod. 4. p. 484.) leaves oblong, rather glaucescent; spines for the most part trifid. ♄. S. Native of St. Domingo, where it was collected by Bertero. Catesbæ'a triacántha, Spreng. syst. 1. p. 416. Leaves 4-5 lines long. Flowers and fruit not sufficiently known, but the habit is that of *Catesbæ'a*.

Three-spined Scolosanthus. Shrub.

Cult. See *Ixòra*, p. 574. for culture and propagation.

CLVII. CHOME'LIA (named by Jacquin after J. B. Chomel, M.D. physician to Louis XV.; author of Abrégé de L'Histoire des plantes usuelles, edition 1st, 12mo. Paris, 1712.) Jacq. amer. p. 18. t. 13. Juss. mem. mus. 6. p. 375. Cham. et Schlecht. in Linnæa. 4. p. 185. A. Rich. mem. soc. hist. nat. Par. 5. p. 182. but not of Lin.—Ixòra species, Lam.

Lin. syst. *Tetrandria, Monogy'nia.* Calyx with a turbinate tube, and a permanent limb, which is 4-toothed to the middle. Corolla salver-shaped, with a long slender tube, a glabrous throat, and 4 spreading lobes, which are shorter than the tube. Anthers 4, sessile, or on short filaments, inserted at the throat of the corolla. Style bifid at the apex, situated among the anthers. Drupe ovate, crowned, containing a 2-celled (or 1-

celled from abortion) nucleus; cells 1-seeded. Seeds pendulous in the cells, oblong.—American shrubs, usually spinescent, glabrous or downy. Leaves opposite on short petioles, stiff, coriaceous. Stipulas short, interpetiolar. Peduncles axillary, one or few-flowered, short.—This genus differs from *Ixòra* in habit and inflorescence, but more particularly in the fruit containing a hard nut; and from this it is more nearly allied to *Scolosánthus* than to *Ixòra*.

1 C. spino'sa (Jacq. amer. 18. t. 13.) leaves ovate, acuminated, almost sessile, glabrous; peduncles axillary, usually 3-flowered; lobes of calyx and corolla acute. ♄. S. Native of Carthagena, in woods; and probably of St. Domingo. Ixòra spinòsa, Lam. dict. 3. p. 344. Flowers white, fragrant at night, $1\frac{1}{2}$ inch long.

Spiny Chomelia. Clt. 1793. Shrub 8 to 12 feet.

2 C. fasciula'ta (Swartz, fl. ind. occ. 1. p. 238.) leaves ovate, acute, glabrous, on short petioles; pedicels 2-3-together, axillary, 1-flowered; lobes of calyx rather spatulate, unequal; lobes of corolla oblong. ♄. S. Native of Grenada, in hedges. Ixòra fasciculàta, Swartz, prod. p. 30. Willd. spec. 1. p. 610. Flowers white. Fruit unknown.

Fascicled-flowered Chomelia. Clt. 1825. Shrub 5 feet.

3 C. obtu'sa (Cham. et Schlecht. in Linnæa. 4. p. 185.) leaves elliptic, acutish at the base, glabrous, on short petioles; peduncles axillary, 1-3-flowered; lobes of calyx and corolla obtuse. ♄. S. Native of the south of Brazil. Flowers white.

Blunt-calyxed Chomelia. Shrub 4 to 5 feet.

4 C. pube'scens (Cham. et Schlecht. in Linnæa. 4. p. 187.) leaves ovate, acute, on short petioles, pilose on the nerves above, and silky beneath; peduncles axillary, 1-flowered. ♄. S. Native of Brazil within the tropic. Perhaps the same as C. Brasiliàna, A. Rich. mem. soc. hist. nat. Par. 5. p. 183.

Downy Chomelia. Shrub.

Cult. See *Ixòra*, p. 574. for culture and propagation.

CLVIII. BACO'NIA (in memory of Bacon, baron of Verulam. Lord Bacon's speculations in natural knowledge may allow us to claim him as a botanist). D. C. ann. mus. hist. nat. par. 9. p. 219. Juss. mem. mus. 6. p. 374. A. Rich. mem. soc. hist. nat. Par. 5. p. 184. D. C. prod. 4. p. 485.—Verulàmia, D. C. mem. mss. Poir. dict. 8. p. 543. Smith, in Rees' cycl. vol. 37.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a very short tube, adnate to the ovarium at the base, and a bluntly 4-cleft limb. Corolla funnel-shaped, with a short terete tube, a bearded throat, and 4 oblong acute lobes, which are longer than the tube, and twisted in æstivation. Anthers 4, linear, almost sessile, erect, situated at the throat between the lobes, and a little shorter than them, at length twisted spirally. Style filiform, exserted; stigma undivided, or hardly 2-lobed. Disk thick, crowning the ovarium. Berry dry, 2-celled, 2-seeded. Seeds semi-globose. Albumen cartilaginous. Embryo erect, nearly terete.—A glabrous African shrub. Leaves opposite, petiolate, oval, acuminated at both ends. Stipulas connate, sheathing, short. Corymbs terminal, trichotomous. Flowers white.—This genus is nearly allied to *Ixòra*, but differs in the tube of the corolla being shorter; and to *Polyòzus*, but differs in the stigma being undivided.

1 B. corymbòsa (D. C. diss. ined. t. 1. ann. mus. 9. p. 219.) ♄. S. Native of Sierra Leone, where it was collected by Smeathmann. Verulàmia corymbòsa, Poir. dict. 8. p. 543. Ixòra nítida, Schum. pl. guin. p. 77.

Var. β, *angustifòlia* (D. C. prod. 4. p. 485.) leaves narrower than in the species, and more acuminated at both ends. ♄. S. Native of Gambia and Cayor, in humid places, where it was collected by Leprieur and Perrottet.

Corymbose-flowered Baconia. Shrub 4 to 5 feet.

Cult. See *Ixòra*, p. 574. for culture and propagation.

CLIX. IXO'RA (the name of a Malabar idol, to which the flowers of some of the species are offered). Lin. gen. no. 131. Juss. gen. p. 203. mem. mus. 6. p. 375. Gærtn. fruct. 1. p. 117. t. 25. D. C. prod. 4. p. 485.—Pavétta sect. Ixòra, Blum. bijdr.—Ixòra species of Lam. and Roxb.—Pavétta species, A. Rich.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an ovate tube, and a small 4-toothed limb (f. 106. *a.*). Corolla salver-shaped (f. 106. *b.*), with a slender terete tube (f. 106. *d.*), and a 4-parted spreading limb (f. 106. *b.*); tube longer than the lobes. Anthers 4, almost sessile in the throat, exserted a little. Style equal in length to the tube of the corolla, or a little longer, but shorter than the corolline lobes, bifid at the apex (f. 106. *e.*); lobes of stigma diverging or revolute. Berry drupaceous, nearly globose, crowned by the permanent calyx, 2-celled, containing 2 chartaceous 1-seeded pyrenæ, which are flat or hollow inside, and gibbous on the back. Albumen cartilaginous. Embryo dorsal, erect, incurved, with foliaceous cotyledons, and a long radicle.—Shrubs, sometimes rising to the height of small trees, natives of Asia, rarely of Africa. Leaves opposite. Stipulas broad at the base, acute at the apex, or ending in a bristle-like awn. Corymbs terminal, usually trichotomous. Flowers scarlet, rose-coloured, flame-coloured or white, usually fragrant.

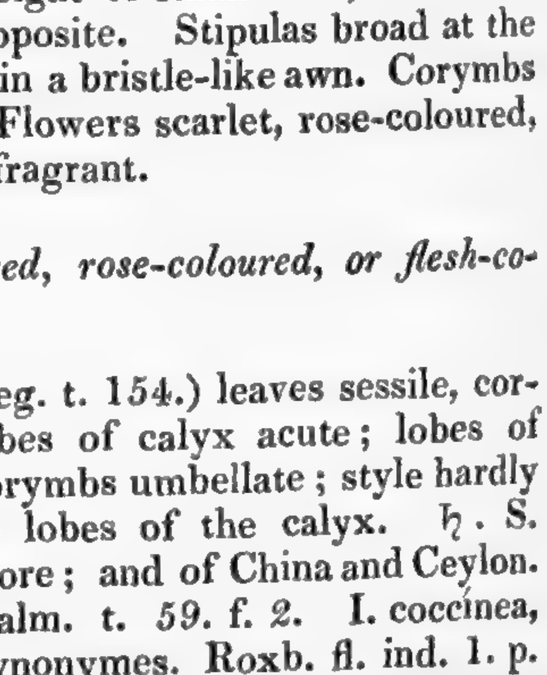
* *Flowers scarlet, flame-coloured, rose-coloured, or flesh-coloured.*

1 I. grandiflòra (Ker. bot. reg. t. 154.) leaves sessile, cordate, oblong, acute, shining; lobes of calyx acute; lobes of corolla ovate-lanceolate, acute; corymbs umbellate; style hardly exserted; berry crowned by the lobes of the calyx. ♄. S. Native of the East Indies, at Tanjore; and of China and Ceylon.—Burm. fl. zeyl. t. 57.—Pluk. alm. t. 59. f. 2. I. coccínea, Lin. spec. 159. exclusive of the synonymes. Roxb. fl. ind. 1. p. 385. Smith in Rees' cycl. no. 1. Pavétta coccínea, ex Blum. bijdr. 950. An elegant shrub. Flowers scarlet, disposed in ample corymbs. Tube of corolla almost 2 inches long.

Great-flowered Ixora. Fl. Aug. Clt. 1814. Sh. 3 to 4 feet.

2 I. Bandhu'ca (Roxb. fl. ind. 1. p. 386.) leaves sessile, cordate, stem-clasping, oval-oblong, obtuse; corymbs coarctate; lobes of calyx acutish; lobes of corolla ovate, acutish; style exserted; berry crowned by the spreading calyx. ♄. S. Native of the East Indies, where it is often celebrated by the Hindoo poets. Ker. bot. reg. t. 513. Bandhúca, Jones in asiat. res. 4. p. 250. Schétti, Rheed. mal. 2. p. 13. t. 12. ex Ham. in Lin. trans. 14. p. 190. I. arbòrea, Lodd. bot. cab. t. 609? but not of Roxb. I. obovàta, Roth, nov. spec. p. 90.? A shrub, with spreading branches. Flowers of a deep scarlet colour. Tube of corolla 15 lines long. (f. 106.)

FIG. 106.



Bandhuca Ixora. Fl. July. Clt. 1815. Shrub 2 to 4 feet.

3 I. propi'nqua (R. Br. in Wall. cat. 6119.) leaves almost sessile, ovate or oblong, cordate at the base, coriaceous, glabrous, mucronate or acuminated; corymbs compound, sessile,

many flowered; calycine teeth acute; lobes of corolla oblong, acuminated; style exserted, bifid, smooth. ♄. S. Native of Madras, Ceylon, and Martaban. I. coccínea Ceylonénsis, Roxb. Flowers scarlet. Very nearly allied to *I. Bandhùca.*

Allied Ixora. Shrub.

4 I. STRI'CTA (Roxb. fl. ind. 1. p. 388.) leaves almost sessile, lanceolate-oblong or oblong; corymbs dense, compound; lobes of calyx acutish; lobes of corolla obovate, very blunt; stigma a little exserted; anthers apiculated. ♄. S. Native of China, about Canton, Manilla, the Moluccas, and Philippines, and now cultivated in Java. I. coccínea, Curt. bot. mag. t. 169. Schnev. icon. t. 1. Lour. coch. p. 75. Osb. res. p. 220. but not of Lin. I. stricta, Roxb. hort. beng. p. 10. I. flámmea, Salisb. prod. p. 62. I. speciòsa, Willd. enum. 1. p. 157. I. incarnàta, Roxb. ex Smith, in Rees' cycl. no. 4. Rœm. et Schultes, syst. 3. p. 179. exclusive of the synonymes. Pavétta stricta, Blum. bijdr. p. 950. Flámma sylvàrum peregrìna, Rumph. amb. 4. t. 47. Branches straight. Flowers of an orange scarlet colour, much crowded. Tube of corolla 9-10 lines long. Berries red.

Straight-branched Ixora. Fl. July, Aug. Clt. 1690. Shrub 1 to 3 feet.

5 I. CROCA'TA (Lindl. bot. reg. 782.) leaves firm, rather coriaceous, oval-lanceolate, much attenuated; corymbs many-flowered, decompound, crowded, fastigiate; teeth of calyx ovate, acute, short; lobes of corolla obovate-cuneated, 3 times or more shorter than the tube; style a little exserted, rather hairy in the middle. ♄. S. Native of China. I. Chinénsis, Lam. dict. 3. p. 344. Flowers orange coloured. Tube of corolla 15 lines long. The species is very nearly allied to *I. stricta*; but differs in the leaves being stiffer, and in the tube of the corolla being twice the length.

Saffron-coloured-flowered Ixora. Fl. Aug. Sept. Clt. 1822. Shrub 2 to 3 feet.

6 I. INCARNA'TA (D. C. prod. 4. p. 486. but not of Roxb. ex Smith,) leaves almost sessile, oblong, obtuse and rather cordate at the base, and bluntish at the apex; corymbs on short peduncles; lobes of calyx acute; lobes of corolla oval-oblong, acute. ♄. S. Native of the Moluccas, and now cultivated in Java. Lodd. bot. cab. t. 1048. Pavétta incarnàta, Blum. bijdr. p. 950. The flowers are either pale rose-coloured, flesh-coloured or white; but in the British gardens there is only the pale red flowered variety to be found. Tube of corolla 10-11 lines long.

Flesh-coloured-flowered Ixora. Shrub 2 to 3 feet.

7 I. AMŒ'NA (Wall. cat. no. 6121.) leaves oblong-lanceolate, glabrous, petiolate; stipulas cuspidate at the apex; corymbs compound, pedunculate; lobes of calyx obtuse; lobes of corolla bluntish; style and anthers exserted. ♄. S. Native of the East Indies, at Amherst, Chappedong, Tavoy, Pulo-Penang, &c. Flowers apparently pale, scarlet.

Pleasing Ixora. Shrub.

8 I. FU'LGENS (Roxb. fl. ind. 1. p. 387.) leaves almost sessile, lanceolate, acute; corymbs terminal, compound; lobes of calyx cordate; tube of corolla with a contracted mouth; lobes of corolla lanceolate, acute; berry 2-lobed. ♄. S. Native of the Moluccas. I. lanceolàta, Lam. dict. 3. p. 343. I. longifòlia, Curt. bot. mag.—Rumph. amb. 4. t. 46.? and therefore I. longifòlia, Smith in Rees' cycl. no. 3.? Branches weak. Flowers deep scarlet. Berries deep purple. Perhaps the Bem-Schetti, Rheed. mal. 2. t. 57. is a paler variety of this or a nearly allied species.

Fulgent Ixora. Fl. June, Aug. Clt. 1823. Shrub 2 to 5 ft.

9 I. NOTONIA'NA (Wall. cat. no. 6132.) leaves ovate-oblong or oblong, acuminated, coriaceous, glabrous; panicles terminal, with the branches corymbose and dense; lobes of corolla obtuse; stigma exserted, undivided; stipulas much acuminated. ♄. S. Natives of the East Indies, on the Nellighery mountains. Flowers apparently red or scarlet.

Noton's Ixora. Shrub.

10 I. TENUIFLÒRA (Roxb. fl. ind. 1. p. 397.) leaves on short petioles, oblong, obtuse, smooth; panicles terminal, corymbose, contracted; lobes of calyx cordate, obtuse; corolla with a long slender tube, and oblong obtuse lobes, which are longer than the erect style or stamens. ♄. S. Native of the Moluccas. Flowers scarlet. Allied to *I. fúlgens.*

Slender-flowered Ixora. Shrub 2 to 4 feet.

11 I. CONGE'STA (Roxb. fl. ind. 1. p. 397.) leaves on short petioles, oblong, coriaceous, acuminated, with coarse parallel veins; corymbs terminal, short, dense; flowers almost sessile; teeth of calyx bluntish; lobes of corolla oblong, obtuse; stigma exserted. ♄. S. Native of the Moluccas. Flowers scarlet. Allied to *I. fúlgens.*

Crowded-flowered Ixora. Shrub 2 to 4 feet.

12 I. PE'NDULA (Jack, mal. misc. no. 2. p. 11.) leaves broad-elliptic, quite glabrous, pale beneath; branches compressed; corymbs on long trichotomous peduncles, pendulous; lobes of calyx small, acutish; lobes of corolla narrow; stigma exserted. ♄. S. Native of Pulo-Penang, where the most of the Malay Ixoras are called *Bunga-yarum.* Flowers red.

Pendulous Ixora. Shrub 2 to 4 feet.

13 I. ELONGA'TA (Heyne, ex Wall. cat. no. 6131.) leaves petiolate, broad-ovate, tapering much to the base, glabrous; floral ones ovate, sessile, cordate at the base, and clasping the stem; peduncles terminal, trichotomous, with the branches corymbose; corymbs hairy; corolla with a smooth tube, but the segments are downy on the outside, particularly in æstivation; lobes of corolla acute; stigma exserted. ♄. S. Native of the East Indies. Flowers apparently red or scarlet.

Elongated-peduncled Ixora. Shrub.

14 I. RO'SEA (Wall. in Roxb. fl. ind. 1. p. 398.) leaves almost sessile, oblong, acute, acuminated, contracted at the base and somewhat emarginate, rather downy on the nerves beneath, as well as the branchlets; corymbs terminal, decompound, large, loose; lobes of calyx acute, rather ciliated; lobes of corolla oblong-cuneated, acute; stigma exserted. ♄. S. Native of Bengal, on the hills of Silhet. Ker, bot. reg. t. 540. Sims, bot. mag. 2428. Lodd. bot. cab. t. 729. Flowers rose coloured. Tube of corolla about an inch long. There is a variety of this plant having the leaves glabrous beneath.

Rose-coloured-flowered Ixora. Fl. July. Clt. 1819. Shrub 2 to 4 feet.

15 I. PARVIFLÒRA (Vahl, symb. 3. p. 11. t. 52. but not of Lam.) leaves on short petioles, coriaceous, lanceolate-oblong, obtuse, cordate at the base, glabrous; stipulas triangular, acute; corymbs panicled, terminal; teeth of calyx short, bluntish; lobes of corolla oblong, 3 times shorter than the tube; stigma a little exserted. ♄. S. Native of the East Indies. Flowers scarlet.

Small-flowered Ixora. Shrub.

16 I. AMBOÍNICA (D. C. prod. 4. p. 487.) leaves on short petioles, ovate-oblong, acuminated, undulated, glabrous; corymbs compound, trichotomous, divaricate; lobes of calyx and corolla acute. ♄. S. Native of Amboyna. Pavétta Amboínica, Blum. bijdr. p. 949. Leaves larger than any other of the genus.

Amboyna Ixora. Shrub 4 feet.

17 I. ERUBE'SCENS (Wall. cat. no. 6143.) leaves oblong, blunt at both ends, glabrous, on short petioles: upper ones sessile; corymbs downy; lobes of corolla linear; stigma exserted. ♄. S. Native of the Burmese empire, on the banks of the Atram. Flowers reddish. I. affìnis, Wall. cat. no. 6144. does not ap-

pear to differ from this species, except in the more acuminated leaves.

Reddish-flowered Ixora. Shrub.

18 I. Java'nica (D. C. prod. 4. p. 487.) leaves on short petioles, ovate-oblong, acuminated, glabrous; corymbs on long peduncles, trichotomous, divaricate; segments of the calyx obtuse, of the corolla oval and rounded. ♄. S. Native of Java, on the mountains in woods. Pavétta Javánica, Blum. bijdr. p. 949. Flowers of a deep vermilion colour. Habit of *I. coccínea* and *I. incarnàta*.

Java Ixora. Shrub 3 to 4 feet.

19 I. pauciflòra (D. C. l. c.) leaves on short petioles, oblong, acuminated, acute at the base, glabrous; cymes on short peduncles, tripartite, few-flowered; teeth of calyx acute; lobes of corolla oval, acutish. ♄. S. Native of the west of Java, on Mount Pangarangha, in woods. Pavétta pauciflòra, Blum. Flowers of a vermilion colour. Allied to *I. Javánica*, but differs in the cymes being fewer-flowered, and on shorter peduncles; and in the teeth of the calyx being acute.

Few-flowered Ixora. Shrub.

20 I. salicifòlia (D. C. prod. 4. p. 487.) leaves on short petioles, linear-lanceolate, acuminated, glabrous; corymbs bracteate; calycine segments acute; segments of corolla lanceolate, acuminated. ♄. S. Native of Java, on the mountains. Pavétta salicifòlia, Blum. bijdr. p. 951. Flowers scarlet. A very beautiful species. Leaves 9-10 inches long, and 6 lines broad.

Willow-leaved Ixora. Shrub 3 to 4 feet.

21 I. Finlaysonia'na (Wall. cat. no. 6166.) leaves obovate-lanceolate, glabrous, tapering much to the base, obtuse, and mucronate at the apex, petiolate; corymbs terminal, compound; lobes of calyx membranous; lobes of corolla obtuse; stigma exserted. ♄. S. Native of the East Indies. Flowers apparently red.

Finlayson's Ixora. Shrub.

* * *Flowers white.*

22 I. bla'nda (Ker. bot. reg. t. 100.) leaves oval or ovate-lanceolate, almost sessile; cymes trichotomous, compound, contracted, many-flowered; teeth of calyx short, bluntish; lobes of corolla obovate, reflexed; style a little exserted. ♄. S. Native of the East Indies. I. álba, Roxb. fl. ind. 1. p. 389. but not of Lin. Nearly allied to *I. stricta*, but differs in the corolla being white. Peduncles and calyxes red. Stigma exserted, but shorter than the lobes of the corolla. Tube of corolla 10 lines long. Flowers at first white, but becoming yellow as they fade. Stipulas broad at the base, and ending in an awn.

Bland-flowered Ixora. Fl. Aug. Clt. 1768. Sh. 3 to 4 ft.

23 I. macrophy'lla (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 487.) glabrous; leaves cuneate-obovate, or oblong-obovate, acute, on short petioles; peduncles elongated, bracteolate at the base, and trichotomously corymbose at the apex; teeth of calyx acute, hardly perspicuous; stigma exserted, with revolute lobes; fruit nearly globose. ♄. S. Native of the Island of Manilla. Allied to *I. cuneifòlia*. Flowers blackish in the dried state, but probably white in the recent state.

Large-leaved Ixora. Shrub.

24 I. subse'ssilis (Wall. cat. no. 6139.) leaves oblong, tapering to both ends, petiolate, glabrous; corymbs almost sessile, dense; lobes of calyx subulate; lobes of corolla acute; stigma exserted, ♄. S. Native of Silhet, on the mountains. Stipulas subulate at the apex. Flowers apparently white.

Almost-sessile-corymbed Ixora. Shrub.

25 I. cuneifòlia (Roxb. fl. ind. 1. p. 390.) leaves broad-cuneated, lanceolate or oblong-lanceolate, acuminated, glabrous; corymbs terminal, on long peduncles, panicled; flowers crowded; lobes of calyx oblong, conical; lobes of corolla oblong, obtuse; stigma exserted. ♄. S. Native of the East Indies, about Dacca and Serampore. Ker. bot. reg. 648. Lodd. bot. cab. t. 1215. Corolla white, with the tube about 6-7 lines long. Berries turbinate, red. Down very minute on the peduncles, branchlets, and usually on the nerves of the leaves underneath.

Wedge-leaved Ixora. Fl. Ju. Jul. Clt. 1822. Sh. 2 to 4 ft.

26 I. barba'ta (Roxb. fl. ind. 1. p. 394.) leaves oblong, on short petioles, shining: upper ones almost sessile, and roundly cordate at the base; panicle spreading, loose, sub-corymbose; lobes of calyx acutish; lobes of corolla oblong, bearded with long white hairs at the throat; stigma exserted. ♄. S. Native of the East Indies. Smith, in Rees' cycl. no. 6. Sims, bot. mag. 2505. Bem.—Schetti, Rheed. mal. 2. t. 13.? Flowers white. Stigma, according to Roxb. almost at the throat, but in the specimens examined it is exserted. Berries red.

Bearded Ixora. Fl. June, July. Clt. 1823. Sh. 8 to 12 ft.

27 I. oxyphy'lla (Wall. cat. no. 6159.) leaves elliptic-lanceolate, long-acuminated, glabrous, on short petioles; stipulas subulate at the apex; lobes of calyx subulate; stigma exserted. ♄. S. Native of Silhet, on the mountains. Flowers apparently white.

Sharp-leaved Ixora. Shrub.

28 I. undula'ta (Roxb. fl. ind. 1. p. 395.) leaves broad-lanceolate, acuminated, undulated, glabrous; panicle terminal, compound, having its branches corymbose at the apex; lobes of calyx acute; segments of corolla linear, bluntish; stigma exserted; berry transversely oval, somewhat didymous. ♄. S. Native of Bengal, in woods. Smith, in Rees' cycl. no. 7. Roth, nov. spec. p. 91. Rœm. et Schultes, syst. 3. p. 190. Lindl. hort. trans. 7. p. 50. Ixòra Cània. Ham. ex Wall. cat. no. 6130. Flowers white. Tube of corolla, 5 lines long; lobes reflexed.

Waved-leaved Ixora. Fl. June, Aug. Clt. 1820. Shrub 3 to 4 feet.

29 I. specta'bilis (Wall. cat. no. 6133.) leaves broad, elliptic-lanceolate, petiolate, glabrous: upper ones oblong, cordate at the base and stem clasping; peduncles elongated, trichotomous, having the branches corymbose; teeth of calyx small, acute; lobes of corolla narrow. ♄ S. Native of the Burmese Empire, near Martaban. Flowers apparently white.

Showy Ixora. Shrub.

30 I. lanceola'ria (Colebr. in Roxb. fl. ind. 1. p. 397.) leaves approximate, very long, ovate-lanceolate, acuminated, on short petioles, glabrous; corymbs terminal, almost sessile, small; bracteoles coloured; corolla with a filiform tube, and linear-oblong lobes; anthers linear, bifid at the base; style exserted. ♄. S. Native of the East Indies, in Travancore. Branches twiggy, pendulous, somewhat dichotomous. Stipulas subulate at the apex, rather longer than the petioles. Corolla white, having the tube 9 lines long. Berries red, globose.

Lanceolar-leaved Ixora. Shrub 4 to 6 feet.

31 I. leuca'ntha (Wall. cat. no. 6148.) leaves ovate-lanceolate, acuminated on short petioles; peduncles and corymbs downy; stipulas subulate at the apex; lobes of calyx, and bracteas subulate; lobes of corolla long and narrow; stigma much exserted; corymbs loose. ♄. S. Native of the East Indies, near Travancore. Flowers white.

White-flowered Ixora. Shrub.

32 I. arbòrea (Roxb. mss. ex Smith, in Rees' cycl. no. 5. but not of Lodd.) leaves elliptic-oblong, obtuse, on short petioles, rather undulated, smooth; corymbs trichotomous, divaricate, sessile, many-flowered; teeth of calyx acutish; lobes of corolla oblong, obtuse, one-half shorter than the tube; stigma hardly exserted. ♄. S. Native of the East Indies. I. Pavétta, Andr. bot. rep. t. 78. Pers. ench. 1. p. 130. but not of Roxb. Corolla white, 5 lines long. Stigmas 2, thickish, greenish at the throat.

Arboreous Ixora. Fl. June, Aug. Clt. 1800. Shrub 4 to 12 feet.

33 I. BRACHY'PODA (D. C. prod. 4. p. 488.) glabrous leaves, on very short petioles, elliptic-oblong, bluntly acuminated; stipulas intrapetiolar, combined, truncate, and mucronated on both sides; corymbs terminal, pedunculate, shorter than the leaves; limb of calyx very short, bluntly 5-toothed. ♄. S. Native of equinoctial Africa, in the woods of Casamancia, where it was collected by Leprieur and Perrottet. Leaves 6 inches long, and 2 broad, and the petioles about 2 lines long. Tube of corolla, almost an inch long. Bracteas small. Flowers pale in the dried specimens, but are probably white in the recent state.

Short-petioled Ixora. Shrub 4 to 5 feet.

34 I. ACUMINA'TA (Roxb. fl. ind. 1. p. 393.) leaves petiolate, broad-lanceolate, acuminated, smooth, glaucous: floral leaves stem-clasping, and broader; corymbs supra-decompound, crowded, almost sessile; lobes of calyx ensiform; lobes of corolla ovate-oblong, obtuse; stigma exserted, undivided. ♄. S. Native of the East Indies, in the province of Silhet, in woods. Flowers large, white, with the tube $1\frac{1}{2}$ inch long. Calyxes white.

Acuminated-leaved Ixora. Shrub 3 to 5 feet.

35 I. SIAME'NSIS (Wall. cat. no. 6162.) leaves ovate-oblong, mucronate, cordate at the base: upper ones attenuated at both ends; corymbs terminal; lobes of corolla acute; stigma exserted. ♄. S. Native of Siam, in the East Indies. Flowers white?

Siam Ixora. Shrub.

36 I. OPA'CA (R. Br. in Wall. cat. no. 6141.) leaves long-lanceolate, acuminated, petiolate, glabrous; corymbs downy; teeth of calyx small; lobes of corolla obtuse; stigma exserted. ♄. S. Native of Pulo-Penang. Flowers apparently white.

Opaque-leaved Ixora. Shrub.

37 I. BRACHIA'TA (Roxb. fl. ind. 1. p. 391.) leaves on short petioles, broad-lanceolate, obtuse, glabrous; panicle brachiate, with remote diverging corymbose branches; tube of corolla filiform, and the lobes are obovate and emarginate; anthers sessile at the throat; stigma exserted. ♄. S. Native of Bengal, in woods. Flowers small, white. Nearly allied to I. parviflòra, Vahl, but differs in the flowers being white. Berries deep purple, rather larger than peas. Petioles about half an inch long.

Brachiate-panicled Ixora. Clt. 1823. Shrub 2 to 4 feet.

38 I. DECÍPIENS (D. C. prod. 4. p. 488.) glabrous; leaves on short petioles, oblong-lanceolate, acutish at the base, acute or obcordate at the apex; stipùlas broad at the base, and ending in a subulate awn at the apex; corymbs terminal, tripartite at the base, sessile, with panicled branches; lobes of calyx short, bluntish; corolla with a slender tube, and oval, bluntish lobes; style pilose. ♄. S. Native of Coromandel, on the mountains. I. parviflòra, Roxb. fl. ind. 1. p. 393. but not of Vahl, nor Lam. Flowers white, sweet-scented. Tube of the corolla 4 lines long, twice the length of the lobes. Berries roundish, black.

Deceiving Ixora. Fl. Aug. Oct. Clt. 1806. Tree 20 feet.

39 I. BRUNÒNIS (Wall. cat. no. 6136.) leaves obovate-lanceolate, sessile, cordate at the base, acuminated at the apex, downy beneath, but villous on the nerves; peduncles and corymbs villous, as well as the calyxes and corollas outside; bracteas and teeth of calyx subulate; lobes of the corolla narrow, acute; stigma exserted. ♄. S. Native of Pulo-Penang. Flowers apparently white. Allied to *I. villòsa*.

Brown's Ixora. Shrub.

40 I. VILLÒSA (Roxb. fl. ind. 1. p. 392.) leaves broad-cuneated-lanceolate, acuminated, villous beneath, on short petioles; corymbs trichotomous, or 6 to 7 times divided, with the branches trichotomous and villous; lobes of calyx oblong, ciliated; corolla with a very long slender tube, and oblong obtuse lobes. ♄. S. Native of the East Indies, in Silhet. Flowers white, fragrant. Stipulas and branches villous.

Villous Ixora. Shrub 4 to 5 feet.

41 PUBIFLÒRA (D. C. prod. 4. p. 489.) leaves sessile, obovate-oblong, cuneated, and somewhat cordate at the base, acuminated at the apex, downy on the nerves on both surfaces, as well as the branchlets, corymbs, and corollas; stipulas long, subulate at the apex; corymbs terminal, dense, sessile; teeth of calyx and alabastra, very acute. ♄. S. Native of the East Indies. A very distinct species. Leaves 8 inches long and 3 broad. Corolla having the tube about 9 to 10 lines long, and the lobes linear and acute, about 3 lines long.

Downy-flowered Ixora. Shrub.

42 I. LONGIFÒLIA; leaves broad, elliptic-lanceolate, tapering to both ends, glabrous above, and villous beneath, particularly on the nerves, as well as the branches, petioles, peduncles, panicles and fruit; segments of the calyx subulate. ♄. S. Native of Pulo-Penang. I. macrophýlla, R. Br. in Wall. cat. no. 6165.

Long-leaved Ixora. Shrub.

† *Species not sufficiently known.*

43 I. A'LBA (Lin. spec. 160. but not of Roxb.) leaves ovate-lanceolate: flowers fasciculate. ♄. S. Native of the East Indies, but is a very obscure species, and probably fictitious; the description taken from the figure in Pluk. alm. t. 109. f. 2. and Bem.—Schetti Rheed, mal. 2. t. 14. Plukenet's plant belongs to *I. incarnàta*, and Rheede's probably to *I. fúlgens*. The flowers are said to be terminating in small clusters, white, and without scent.

White-flowered Ixora. Shrub 6 to 7 feet.

44 I. LOUREÍRI; leaves ovate-oblong, acute, smooth, nearly sessile; cymes or corymbs fasciculate. ♄. G. Native of Cochin China. I. álba, Lour. coch. 76. Flowers white. Berries red.

Loureiro's Ixora. Shrub 3 to 4 feet.

45 I. MONTA'NA (Lour. coch. p. 76.) leaves oblong, broadest at the apex, obtuse, cuneated and cordate at the base, nearly sessile, glabrous; corymbs terminal, fastigiate. ♄. G. Native of Cochin China, on the mountains. Flowers scarlet.

Mountain Ixora. Shrub 3 to 4 feet.

46 I. NOVEMNE'RVIA (Lour. coch. p. 76.) climbing; leaves ovate-lanceolate, almost sessile, 9-nerved, rough; cymes terminal, hemispherical. ♄. ◡. G. Native of Cochin China, in uncultivated places. Flowers white, terminating in hemispherical cymes. Tube of the corolla very long and slender. Stigma ovate, bifid. Berry 1-seeded.

Nine-nerved-leaved Ixora. Shrub cl.

47 I.? VIOLA'CEA (Lour. coch. p. 76.) climbing; leaves lanceolate, almost sessile, pilose, 9-nerved; cymes axillary. ♄. G. Native of Cochin China, in uncultivated places, climbing over trees. Flowers violaceous. Berry 1-seeded. Seed ovate, rough.

Violaceous-flowered Ixora. Shrub cl.

48 I. THYRSIFLÒRA (Poir. suppl. 3. p. 208.) leaves almost sessile, ovate-cuneated, obtuse, glabrous on both surfaces, hoary beneath; stipulas ovate, acute; thyrse terminal, crowded; teeth of calyx acute, somewhat setaceous; corolla with a slender tube, and oval obtuse lobes, which are shorter than the tube. ♄. G. Native of the Cape of Good Hope.

Thyrse-flowered Ixora. Shrub.

49 I. LAXIFLÒRA (Smith, in Rees' cycl. vol. 19. no. 8.) leaves elliptic-oblong, acute, tapering into the petioles at the base: upper ones rounded at the base, almost sessile; panicles corymbose, loose, longer than the leaves; lobes of the corolla convex, spreading, bearded in the disk above: style nearly the length of

the limb. ♄. S. Native of Sierra Leone. This plant does not probably belong to the genus.

Loose-flowered Ixora. Shrub.

N.B. *C. multiflòra* (Swartz, prod. 30. fl. ind. occ. p. 240.) should be excluded from the order altogether, from the leaves being alternate, and crowded into fascicles; in the want of stipulas; in the flowers rising from the same bud as the fascicles of leaves; in the tube of the corolla being funnel-shaped, and in the stamens being inserted in the receptacle.

Cult. Most of the species of this genus are truly beautiful when in blossom, and are therefore worth cultivating in every collection. They require to be kept in a moist heat, but the pots should never be plunged in tan. A mixture of turfy loam, turfy peat, and sand in equal portions, is the best soil for them; and cuttings strike root readily if planted in sand or even mould, placed in heat, with a hand-glass over them.

CLX. PAVE'TTA (the vernacular name of *P. Indica* in Malabar). Lin. gen. no. 132. Juss. gen. p. 203. mem. mus. 6. p. 375. Gærtn. fruct. 1. p. 116. t. 25. D. C. prod. 4. p. 490. —Pavéttæ veræ, Blum. bijdr. p. 951.—Ixòra species of Lam. and Roxb.—Pavétta species, A. Rich.—Pavàte, Ray.

Lin. syst. *Tetrándria, Monogýnia.* All as in *Ixòra*, but differs from that genus in the style being much exserted beyond the mouth of the tube of the corolla, even exceeding the segments of its limb, clavate at the apex, nearly entire, or the lobes of the stigma are so close as scarcely to be distinguished. Flowers white.—All the species are either natives of Africa or Asia.

* *Asiatic species, especially from India and Arabia.*

1 P. I'ndica (Lin. spec. 160.) leaves oval-oblong, acuminated at both ends, petiolate; stipulas broad, acute, somewhat concrete; panicle terminal, subcorymbose, with opposite branches; teeth of calyx acute; lobes of corolla one-half shorter than the tube; style very long. ♄. S. Native of the East Indies, frequent in hedges, and among bushes. Gærtn. fr. 1. t. 25. P. álba, Vahl, symb. 3. p. 11.? Ixòra paniculàta, Lam. dict. 3. p. 344. Ixòra Pavétta, Roxb. fl. ind. 1. p. 395. Pavétta polyántha, Wall. cat. no. 6176. Pavétta, Rheed. mal. 5. p. 10. —Burm. ind. t. 13. f. 3. Pavàte, Raii, hist. 1581. Flowers white. There are varieties of this species with either glabrous branches and leaves, or the branches and under surfaces of the leaves are downy.

Indian Pavetta. Fl. Aug. Oct. Clt. 1791. Sh. 3 to 4 feet.

2 P. arenòsa (Lour. coch. p. 73.) branches brachiate; leaves lanceolate, tubercular, shining; flowers terminal, fastigiate; calyx baccate, 5-toothed; corolla salver-shaped, 5-cleft; anthers 4, sessile at the throat; berry ovate, 1-seeded. ♄. G. Native of China, about Canton. P. I'ndica, Ker, bot. reg. 190. The leaves appear as if they were sprinkled over with sand, hence the Chinese name of the shrub *Tasa* or sand plant. Flowers white.

Sandy-leaved Pavetta. Fl. March, Oct. Clt. 1799. Shrub 3 to 4 feet.

3 P. tomento'sa (Roxb. ex Smith in Rees' cycl. vol. 26. but not of Rich.) leaves petiolate, oblong, villous on both surfaces, but particularly beneath; panicles terminal, broad, tomentose, with trifid branches. ♄. S. Native of the East Indies. Ixòra tomentòsa, Roxb. fl. ind. 1. p. 396. Pavétta tomentòsa, Roth, nov. spec. p. 89. Pavétta velutìna, Wall. cat. no. 6174. Flowers numerous, white, fragrant. Style twice the length of the tube of the corolla; stigma clavate, undivided. Berry globose.

Tomentose Pavetta. Shrub.

4 P. monta'na (Reinw. in Blum. bijdr. p. 952.) leaves on long petioles, oblong-lanceolate, much acuminated at both ends, downy, as well as the corymbs, which are terminal, trichotomous, and brachiate; calycine teeth acute; segments of corolla acutish. ♄. S. Native of Java, in woods on the mountains. Very nearly allied to *P. I'ndica.* Flowers white, having the segments tipped with green.

Mountain Pavetta. Shrub 4 to 5 feet.

5 P. odora'ta (Blum. bijdr. p. 952.) arboreous; leaves on short petioles, oblong, acute at both ends, but usually bluntish at the apex, coriaceous, glabrous; corymbs terminal, trichotomous, divaricate, downy; limb of calyx bluntly toothed; segments of corolla obtuse. ♄. S. Native of Java, on the mountains in woods. Flowers white, very sweet scented.

Sweet-scented-flowered Pavetta. Shrub 4 to 5 feet.

6 P. macrophy'lla (Blum. bijdr. p. 953.) leaves on short petioles, oblong, very blunt, attenuated at the base, coriaceous, glabrous; corymbs axillary and terminal, downy, trichotomously fastigiate; segments of calyx and corolla blunt. ♄. S. Native of Java, in mountain woods. Flowers white.

Long-leaved Pavetta. Shrub 4 to 5 feet.

7 P. reticula'ta (Blum. bijdr. p. 953.) leaves oblong, acuminated at both ends, coriaceous, glabrous, reticulated beneath; corymbs terminal, trichotomous, loose, on long peduncles; segments of calyx acute; segments of corolla lanceolate, acuminated. ♄. S. Native of Java, on Mount Salak. Flowers white. Stem 4 feet high. Young branches compressed. Fruit didymously globose.

Reticulated-leaved Pavetta. Shrub 4 feet.

8 P. lo'ngipes (D. C. prod. 4. p. 490.) leaves oval-oblong, acuminated, petiolate, glabrous; stipulas short, acuminated; peduncles terminal, longer than the leaves, corymbose at the apex, few-flowered; fruit ovate, didymous, naked at the apex. ♄. S. Native of the island of Timor. Upper leaves 4-5 inches long, 1½ to 2 broad. Peduncles slender, 6 inches long. Corolla with a slender tube, and 4 oblong spreadingly reflexed lobes. Anthers linear. Style a little exserted; stigma thick, bipartite.

Long-peduncled Pavetta. Shrub 4 to 5 feet.

9 P. paludo'sa (Blum. bijdr. p. 954.) leaves on short petioles, oblong, bluntish, membranous, glabrous: the upper ones oblong-cordate, sessile; corymbs terminal, on long peduncles, trichotomous, coloured; teeth of calyx obtuse; segments of corolla oblong, acute. ♄. S. Native about Batavia, in marshes. Flowers white. Allied to *Ixòra barbàta.*

Marsh Pavetta. Shrub 4 to 5 feet.

10 P. sylva'tica (Blum. bijdr. p. 953.) leaves oblong-lanceolate, acuminated at both ends, membranous, glabrous, downy in the axils of the veins beneath; corymbs terminal, peduncculate, loosely trichotomous; limb of calyx obsoletely denticulated; segments of corolla oblong, obtuse. ♄. S. Native of Java, in woods on the Seribu mountains. Flowers small, white.

Wood Pavetta. Shrub 4 to 5 feet.

11 P. breviflo'ra (D. C. prod. 4. p. 491.) leaves oval, acute, acuminated at the base, on short petioles, rather membranous, glabrous; panicle corymbose, many-flowered, with opposite branches and branchlets, and are as well as the flowers glabrous; tube of corolla hardly longer than the lobes. ♄. S. Native of the East Indies, on the Nellighery mountains, where it was collected by Leschenault. Tube of corolla 3 lines long. Style 4 lines long, clavate at the apex. Stipulas broad, rather membranous. Plant becoming blackish on drying.

Short-flowered Pavetta. Shrub 3 to 4 feet.

12 P. Rothia'na (D. C. prod. 4. p. 491.) branchlets and calyxes clothed with hoary villi; leaves elliptic, petiolate, rather hairy, but while young clothed with hoary tomentum; stipulas

triangular, glabrous inside; flowers disposed in panicled corymbs, bearded; corolla with a long terete tube, which is bearded at the throat, and oblong obtuse lobes; style setaceous, glabrous. ♄. S. Native of the East Indies. P. villòsa, Roth, nov. spec. p. 88. but not of Vahl.

Roth's Pavetta. Shrub 3 to 4 feet.

13 P. naucleæflo'ra (R. Br. in Wall. cat. no. 6171.) villous in every part; leaves oblong-lanceolate, acuminated; corymbs terminal; teeth of calyx short, acute; lobes of corolla obtuse. ♄. S. Native of Pulo Penang. Fruit round.

Nauclea-flowered Pavetta. Shrub.

14 P. Brunònis (Wall. cat. no. 6172.) soft and villous all over; leaves obovate; stipulas and bracteas broad, membranous; peduncles trichotomous, having the branches dense and corymbose; lobes of calyx subulate. ♄. S. Native of the East Indies, on the Nellighery mountains. Pavétta móllis, Wall. cat. no. 6179. Leaves smoothish above in the adult state.

Brown's Pavetta. Shrub.

15 P. Weberæfòlia (Wall. cat. no. 6182.) leaves broad-lanceolate, glabrous, tapering to both ends; corymbs downy; fruit spherical. ♄. S. Native of Pulo-Penang and Chittagong.

Webera-leaved Pavetta. Shrub.

16 P. Sumatre'nsis (Roth, nov. spec. p. 88. and in Rœm. et Schultes, syst. 3. p. 176.) leaves petiolate, oblong-elliptic, glabrous, strigose on the ribs beneath; corymbs trichotomous; flowers pentandrous, clothed with white tomentum; corolla with a filiform tube, and oblong obtuse lobes; style much exserted; stigma oblong, glabrous. ♄. S. Native of Sumatra. Flowers white.

Sumatra Pavetta. Shrub 3 to 4 feet.

17 P. longiflòra (Vahl, symb. 3. p. 12.) leaves lanceolate-elliptic, and are as well as the branches glabrous; stipulas pilose inside; flowers disposed in fascicles; teeth of calyx rather long, acute. ♄. S. Native of Arabia Felix. Ixòra occidentàlis, Forsk. cat. p. cv. Ixòra longiflòra, Poir. suppl. 3. p. 208. Flowers white. Berries black. Corolla an inch and a half in diameter.

Var. β, Javàna (D. C. prod. 4. p. 491.) leaves on short petioles, oblong, acute at both ends, coriaceous; corymbs terminal, fastigiate, trichotomous, downy; tube of corolla very long; lobes of calyx and corolla acute. ♄. S. Native of Java, in woods on the mountains. Pavétta longiflòra, Blum. bijdr. p. 952.

Long-flowered Pavetta. Shrub.

18 P. villòsa (Vahl, symb. 3. p. 12.) branches and calyxes villous, hoary; leaves on short petioles, elliptic-lanceolate, clothed with canescent villi while young; flowers in fascicles. ♄. G. Native of Arabia Felix. Ixòra villòsa, Poir. suppl. 3. p. 208. Leaves smooth on the upper surface in the adult state. Branches 4-cornered. Flowers white. Stipulas, style, and stigma as in *P. Indica.*

Villous Pavetta. Shrub.

* * *African species.*

19 P. Owarie'nsis (Beauv. fl. d'ow. 1. p. 87. t. 52.) leaves on long petioles, ovate-oblong, attenuated at both ends, membranous, glabrous; corymbs terminal; lobes of calyx oval, acutish; lobes of corolla linear, obtuse, almost the length of the tube; style twice as long as the tube, clavate at the apex. ♄. S. Native of the west coast of Africa, between Waree and Buonopozo. Ixòra Owariénsis, Poir. suppl. 3. p. 207. Flowers white. Throat of corolla very villous. Stipulas short, stem-clasping, apiculated by a short point at the apex.

Waree Pavetta. Shrub 4 to 5 feet.

20 P. Ca'ffra (Thunb. prod. p. 29. fl. cap. 1. p. 535.) leaves obovate, almost sessile, glabrous; stipulas membranous, connate; flowers subumbellate; teeth of calyx setaceous; lobes of corolla oblong, acute, shorter than the tube. ♄. G. Native of the Cape of Good Hope, in the woods of Krakokamma. Ixòra Cáffra, Poir. suppl. 3. p. 209. Pavétta corymbòsa, Houtt. ed. 1. p. 11. t. 40. and Crinìta Capénsis, Houtt. pfl. syst. 5. p. 357. t. 40. f. 1. ex Thunb. and Rœm. syst. 3. p. 175. Ixòra álba, Burm. herb. Pav. thyrsiflòra, Thunb. herb. Corymbs of flowers terminating in shorter branches. Flowers white. Style much exserted, clavate at the apex. This is a beautiful shrub when in flower.

Caffrarian Pavetta. Fl. June, Aug. Clt. 1823. Shrub 3 to 4 feet.

21 P. parviflòra (Afz. rem. guin. p. 47.) leaves oblong, attenuated at both ends; stipulas acute; peduncles dichotomously umbellate; calyxes and corollas villous. ♄. S. Native of Guiana. Flowers white.

Small-flowered Pavetta. Shrub 4 to 5 feet.

22 P.? Smeathma'nni (D. C. prod. 4. p. 492.) leaves oval, short-acuminated, coriaceous, smooth, on short petioles; corymbs axillary, on short peduncles; teeth of calyx oblong, ciliated; corolla with a terete tube, and the limb globose before expansion. ♄. S. Native of Sierra Leone. Pavétta parviflòra, Smeathm. herb. Perhaps this plant belongs to a different genus.

Smeathmann's Pavetta. Shrub 3 to 4 feet.

23 P. subgla'bra (Schum. pl. guin. p. 78.) branches terete, nearly glabrous; leaves ovate, acuminated, rather ciliated at the base; petioles rather hairy; stipulas ciliated on the inside, ovate, mucronate; corymbs festigiate, terminal; lobes of calyx lanceolate, acute. ♄. S. Native of Guinea. Flowers white. Stigma globose.

Nearly-glabrous Pavetta. Shrub 4 to 5 feet.

24 P. genipæfòlia (Schum. pl. guin. p. 78.) branches terete, downy; leaves oblong-lanceolate, acuminated, shining, glabrous, downy beneath and on the petioles; stipulas setaceously acuminated; corymbs terminal, globose; peduncles and calyxes hairy. ♄. S. Native of Guinea. Flowers white.

Genipa-leaved Pavetta. Shrub 4 to 5 feet.

25 P. lateriflòra; leaves oblong-lanceolate, coriaceous, acuminated, almost sessile, disposed in 2 rows; peduncles axillary, subcorymbose. ♄. S. Native of Sierra Leone. Flowers white. Berry roundish, containing a 1-seeded nut. Cotyledons long, twisted. Perhaps the same as *P. Smeathmánni.*

Side-flowered Pavetta. Shrub 4 to 6 feet.

26 P. cane'scens (D. C. prod. 4. p. 492.) branchlets clothed with white hairs; leaves elliptic, attenuated at the base, on short petioles, reticulately veined, downy above, and clothed with canescent villi beneath; corymbs lateral, many-flowered, almost sessile; pedicels and calyxes hairy; corolla with a downy tube, and a glabrous limb; style much exserted, rather clavate at the apex. ♄. S. Native of the South Western Coast of Africa, in Angola. Pavétta tomentòsa, A. Rich. mem. soc. hist. nat. par. 5. p. 181. but not of Roxb. Flowers white.

Canescent Pavetta. Shrub.

* * * *Species natives of Madagascar.*

27 P.? anthophy'lla (A. Rich. in mem. soc. hist. nat. par. 5. p. 181.) quite glabrous; leaves short, oval, acute, rather fleshy; stipulas broad, short, acuminated, permanent; flowers cymose, terminal, pentamerous; one of the calycine lobes is drawn out into a leaf; anthers inclosed; style much exserted. ♄. S. Native of Madagascar. Perhaps a proper genus.

Leaf-flowered Pavetta. Shrub.

28 P. cine'rea (A. Rich. l. c.) shrub clothed with grey tomentum; leaves rather oval, acute, gradually narrowed at the base, clothed with cinereous tomentum, especially beneath; stipulas connate, lanceolate, permanent; cymes terminal, peduncu-

late, branched; flowers tomentose. ♄. S. Native of Madagascar.

Cinereous Pavetta. Shrub.

29 P. GRA'CILIS (A. Rich. l. c.) quite glabrous; leaves elliptic-oblong, very acute, almost sessile; stipulas connate, narrow-lanceolate; cymes few-flowered, terminal; flowers very long, slender; stamens exserted; style hardly exserted beyond the tube. ♄. S. Native of Madagascar. Perhaps a proper genus.

Slender-flowered Pavetta. Shrub.

* * * * *Species natives of the South Sea Islands.*

30 P. OPULÌNA (D. C. prod. 4. p. 492.) leaves ovate-lanceolate; corymbs coarctate, globose, terminal. ♄. S. Native of New Caledonia. Coffèa Opulìna, Forst. prod. 1. no. 93. Chiocócca Opulìna, Spreng. syst. 1. p. 756. Ixòra species, A. Rich. Bracteas roundish, scarious. Pedicels rather hispid. Lobes of the corolla 4, linear, revolute, obtuse. Style simple, clavate, twice longer than the corolla. Flowers white.

Guelder-rose-like Pavetta. Shrub.

31 P. SAMBU'CINA (D. C. prod. 4. p. 492.) leaves oblong-lanceolate, acute, glabrous; cymes corymbose, terminal. ♄. S. Native of the Friendly Islands. Coffèa Sambùcina, Forst. prod. 1. no. 92. Branchlets tetragonal. Leaves a span long. Branches of the panicle verticillate. Lobes of the corolla 5, spreading, bluntish. Style simple, clavate, much longer than the stamens, ex Spreng. pug. 1. p. 16. Chiocócca sambùcina, Spreng. syst. 1. p. 756. Ixòra species, ex A. Rich. Flowers white.

Elder-like Pavetta. Shrub.

32 P. TRIFLÒRA (D. C. prod. 4. p. 492.) leaves ovate-lanceolate, acuminated; peduncles terminal, by threes, 3-flowered. ♄. S. Native of Otaheite. Chiocócca triflòra, Spreng. syst. 1. p. 756. Coffèa triflòra, Forst. prod. 1. no. 95. Flowers white.

Three-flowered Pavetta. Shrub.

† *Species not sufficiently known.*

33 P. ANGUSTIFÒLIA (Rœm. et Schultes, syst. 3. p. 175.) leaves linear-lanceolate, attenuated at both ends; cymes terminal, trichotomous, subumbellate; teeth of calyx acute; corolla with a slender tube, and oblong acute lobes. ♄. S. Native of the East Indies. Pavétta I'ndica, Burm. fl. ind. p. 35. t. 13. f. 3. exclusive of the synonymes. Ixòra angustifòlia, Lam. dict. 3. p. 45. Flowers white. Stigma nearly entire as in *Pavétta*, and about equal in length to the lobes of the corolla, as in *Ixòra*.

Narrow-leaved Pavetta. Shrub 3 to 4 feet.

34 P. AMPLEXICAU'LIS (Pers. ench. 1. p. 131.) glabrous; leaves stem-clasping, oval; segments of corolla acute, lanceolate. ♄. S. Native of the East Indies; and is often mixed with *P. I'ndica* according to Persoon.

Stem-clasping-leaved Pavetta. Shrub 3 to 4 feet.

35 P.? PARASI'TICA (Lour. coch. p. 73.) stem parasitical, much branched; leaves verticillate, ovate, tomentose; clusters of flowers axillary; calyx tetragonal, truncate, villous; corolla with a long tube, and 4 oblong inflexed lobes; style equal in length to the corolla; berry 1-seeded. ♄. G. Native of Cochin-china, in gardens, growing upon trees. Flowers small, dusky yellow. This plant should probably be removed from the genus.

Parasitical Pavetta. Shrub 1 foot.

Cult. For culture and propagation see *Ixòra*, p. 574.

CLXI. SAPRO'SMA (from σαπρος, *sapros*, rancid, and οσμη, *osme*, a smell; the wood and berries are very fetid). Blum. bijdr. p. 956. A. Rich. mem. soc. hist. nat. Par. 5. p. 178. D. C. prod. 4. p. 493.—Brùchia, Schwagr.

Lin. syst. *Tetrándria*, *Monogýnia*. Calyx with an oval tube, and a small 4-toothed permanent limb. Corolla 4-cleft, with a hairy throat. Stamens 4, inserted in the throat of the corolla; filaments short; stigma bifid. Berry oval, smooth, umbilicate, 1-seeded, crowned by the permanent calyx. Embryo erect, in fleshy albumen.—Trees or shrubs, natives of Java. Leaves opposite, glabrous, acuminated at both ends. Flowers crowded, terminal, rarely axillary, sessile. Berry and wood very fetid.—This genus comes very near the following.

1 S. ARBO'REUM (Blum. bijdr. p. 956.) arboreous; leaves petiolate, elliptic-oblong; flowers crowded, terminal, and sometimes axillary. ♄. S. Native of Java, in mountain woods.

Tree Saprosma. Tree.

2 S. FRUTICO'SUM (Blum. bijdr. p. 956.) shrubby; leaves almost sessile, oblong-lanceolate; flowers crowded, terminal. ♄. S. Native of Java, on Mount Parang.

Shrubby Saprosma. Shrub.

Cult. See *Ixòra*, p. 574. for culture and propagation.

CLXII. COUSSA'REA (Aublet does not give the meaning of this word). Aubl. guian. 1. p. 98. t. 38. Lam. ill. 1. p. 281. t. 65. A. Rich. mem. soc. hist. nat. Par. 5. p. 177. t. 18. f. 1. and 2. D. C. prod. 4. p. 493.—Coussàrea and Frœlíchia, Juss. mem. mus. 6. p. 376.—Frœlíchia, Vahl. ecl. præf. 3. but not of Mœnch, nor Wulf.—Billardièra, Vahl, ecl. 1. p. 13. t. 10. f. 3. but not of Smith, nor Mœnch.—Pechèya, Scop. intr. p. 143. no. 530.

Lin. syst. *Tetrándria*, *Monogýnia*. Calyx with an ovate tube, and a short tubular sinuately 4-toothed limb. Corolla with an elongated terete tube, which is hardly tumid at the apex, and a glabrous throat. Stamens 4, inserted in the upper part of the tube, inclosed; anthers oblong-linear. Style filiform; stigma bipartite, with the lobes linear, and hardly exserted. Berry ovate-globose, hardly fleshy, crowned by the tubular limb of the calyx, 1-celled, 1-seeded. Seed rather globose, fixed to the sides of the parietes. Embryo small, in a pit at the bottom of the albumen, which is horny, with a thick coriaceous radicle, which is longer than the small cotyledons.—Glabrous shrubs, natives of America. Leaves opposite, coriaceous, on short petioles. Stipulas solitary on both sides, acute. Flowers terminal, few, rather crowded, on short pedicels, white.

1 C. VIOLA'CEA (Aubl. guian. 1. p. 98. t. 38.) leaves ovate, acuminated; flowers terminal, almost sessile. ♄. S. Native of French Guiana, in the woods called Caux woods. Flowers white. Berries violaceous.

Violaceous-berried Coussarea. Shrub 7 to 8 feet.

2 C. RACEMO'SA (A. Rich. in mem. soc. hist. nat. Par. 5. p. 177.) leaves elliptic, acuminated; stipulas caducous; flowers small, disposed in terminal pedunculate racemes; fruit ovoid, compressed, white. ♄. S. Native of French Guiana.

Racemose-flowered Coussarea. Shrub.

3 C. MACROCA'RPA (A. Rich. l. c.) leaves elliptic, acuminated; stipulas caducous; flowers disposed in terminal and axillary, hardly pedunculate racemes; fruit ovoid, black. ♄. S. Native of French Guiana. Very like the preceding species.

Long-fruited Coussarea. Shrub.

4 C.? SQUAMO'SA (Lam. ill. p. 281. no. 1462.) leaves ovate-oblong; cymes scaly, axillary; limb of calyx cylindrical. ♄. S. Native of the Caribbee islands.

Scaly-cymed Coussarea. Shrub.

5 C. FRŒLI'CHIA (A. Rich. l. c.) leaves oblong-lanceolate, acuminated at both ends; panicle corymbose, terminal, pedunculate; peduncles compressedly angular. ♄. S. Native of the island of Trinidad, ex Vahl; and of Porto Rico, where it was collected by Ryan. Frœlichia paniculàta, Vahl, ecl. præf. p. 3. Billardièra paniculàta, Vahl, ecl. 1. p. 13. t. 10. f. 3.

Stipulas very short, rounded, acuminated on both sides, ex Vahl; but in the specimen collected at Porto-Rico by Ryan, the stipulas are connate a little way at the base, and bidentate at the apex; both are, however, probably the same species.

Frœlich's Coussarea. Shrub.

Cult. For culture and propagation see *Ixòra*, p. 574.

CLXIII. POLYO'ZUS (from πολυ, *poly*, many, and οζος, *ozos*, a branch; in reference to the shrub, which is much branched). Lour. coch. p. 74. exclusive of the first species. D. C. prod. 4. p. 494. Blum. bijdr. p. 947.—Polyòzus, A. Rich. mem. soc. hist. nat. Par. 5. p. 183.—Ixòra species, Poir.

Lin. syst. *Tetra-Pentándria*, *Monogýnia*. Calyx with a turbinate tube, and an obsoletely denticulated deciduous limb. Corolla with a cylindrical tube, a villous throat, and 4-5 spreadingly reflexed lobes, which are longer than the tube. Anthers 4-5, alternating with the lobes of the corolla, hardly exserted. Style short; stigma bifid. Ovarium crowned by the disk. Berry drupaceous, nearly globose, 2-celled, naked at the apex; cells containing 1 pyrena each. Pyrenæ excavated on the inside, and gibbous on the back, coriaceous, 1-seeded. Albumen cartilaginous. Embryo minute, erect.—Small glabrous trees, natives of Asia and the Mauritius. Leaves opposite. Stipulas interpetiolar. Cymes trichotomous, axillary, and terminal.—This genus is nearly allied to *Ixòra*, but differs in the tube being shorter than the corolline lobes, and in the limb of the calyx being deciduous. It is also nearly allied to *Bacònia*, but differs in the stigma being bifid.

1 P. lanceola'ta (Lour. coch. p. 75.) leaves lanceolate, petiolate; racemes terminal, compound; flowers tetramerous and tetrandrous. ♄. G. Native of China, about Canton. Branches diffuse. Flowers reddish.

Lanceolate-leaved Polyozus. Shrub 4 feet.

2 P. acumina'ta (Blum. bijdr. p. 948.) leaves oblong-lanceolate, very much acuminated; racemes axillary; flowers tetramerous and tetrandrous. ♄. S. Native of the western part of Java, on the mountains. Branchlets compressed. Stipulas broad, short. Flowers small, corymbose; corymbs in the axils of the superior leaves on short peduncles.

Acuminated-leaved Polyozus. Shrub.

3 P. latifo'lia (Blum. bijdr. p. 948.) leaves elliptic-oblong, acute at both ends; flowers pentamerous and pentandrous. ♄. S. Native of the island of Nusa-Kambanga, near Java.

Broad-leaved Polyozus. Shrub.

† *Doubtful species.*

4 P.? Maderaspata'na (D. C. prod. 4. p. 495.) leaves petiolate, oblong-lanceolate, hardly acute at the base, and rather acuminated at the apex; corymbs terminal, trichotomous; flowers pentamerous and pentandrous. ♄. S. Native of the East Indies, about Madras. Stipulas broad, short, acuminated, adpressed. Leaves coriaceous, those of the flowering branches 4 inches long and $1\frac{1}{2}$ broad, standing on petioles about half an inch long.

Madras Polyozus. Shrub.

5 P.? barba'ta (Smith, in Rees' cycl. vol. 26. under *Pavétta*,) leaves lanceolate-oblong, acute, smooth; panicles brachiate, divaricate, smooth; tube of corolla one-half shorter than the lobes, which are 5, and beset with bristles in the mouth. ♄. S. Native of the island of Hominoa, in the East Indies. Leaves coriaceous, a foot long, and 2 inches broad. Stigma cylindrical, acute. From the tube of the corolla being shorter than the lobes, and the flowers being pentamerous and pentandrous, it is probably a true species of *Polyòzus*.

Bearded Polyozus. Shrub.

N. B. *P. bipinnàtus* (Lour. coch. p. 75.) should be excluded from the present order altogether, from the bipinnate leaves, but its true place is unknown.

Cult. For culture and propagation see *Ixòra*, p. 574.

CLXIV. GRUMI'LEA (from *grumula*, a little heap; in reference to the albumen, which is grumose). Gærtn. fruct. 1. p. 138. t. 28. f. 2. D. C. prod. 4. p. 495.—Grunìlea, Poir. suppl. 2. p. 857.—Grumìlia, Du Theis, Gloss. bot. p. 210.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with an ovate tube, and a 5-toothed limb. Corolla, stamens, and style unknown. Berry crowned by the calyx, ovate-globose, rather coriaceous, 2-celled, rarely 3-celled. Seeds solitary in each cell, plano-convex or angular. Albumen rather cartilaginous, grumose from chinks and fissures. Embryo erect, small, rather curved, and nearly dorsal, with lanceolate cotyledons.—This genus is hardly known, but from the albumen it comes very near to *Rutídea*; and to *Psychótria* from the form of the fruit.

1 G. nìgra (Gærtn. fruct. 1. p. 138. t. 28. f. 2.) berry smooth; teeth of calyx on the top of the fruit, conniving and rounded. ♄. S. Native of Ceylon, where it is called *Hogdala*. Berries black.

Black-berried Grumilea. Shrub.

2 G. psychotrioìdes (D. C. prod. 4. p. 495.) berry striated lengthwise, crowned by the short tubular truncate limb of the calyx. ♄. S. Native of the western coast of Africa, in Casamancia at Itou, where it was collected by Leprieur and Perrottet. Shrub glabrous. Leaves petiolate, elliptic, cuneated at the base, acute at the apex, shining. Stipulas solitary on both sides, lanceolate, deciduous. Flowers unknown. Fruit 5-6 together at the tops of the branches, sessile, almost capitate, black, ovate, 2-celled. Seeds ruminated as in *Annòna*.

Psychotria-like Grumilea. Shrub 4 to 5 feet.

Cult. For culture and propagation see *Ixòra*, p. 574.

CLXV. RUTI'DEA (from ρυτις, *rutis*, a wrinkle; in allusion to the wrinkled albumen). D. C. diss. 1807. ined. with a figure, ann. mus. hist. nat. Par. 9. p. 219. prod. 4. p. 497. Juss. mem. mus. 6. p. 378. A. Rich. mem. soc. hist. nat. Par. 5. p. 179.—Rytídea, Spreng.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with a globose tube, and a small 5-parted limb: lobes ovate. Corolla funnel-shaped, with a terete tube, which is dilated at the apex, and 5 spreading oval lobes. Anthers 5, sessile in the throat of the corolla, exserted, oblong, but shorter than the lobes of the corolla. Style clavate at the apex; stigmas 2, combined, indicated only by a furrow. Berry nearly dry, globose, crowned by the vestiges of the calyx, 1-celled, 1-seeded. Seed globose, umbilicate at the base, wrinkled on the outside. Albumen large, grumose, cartilaginous. Embryo oblique, terete.—Shrubs, natives of India and Africa. Branches terete, hispid while young. Leaves opposite, on short petioles, hispid on the nerves and petioles. Stipulas twin on both sides, combined to the middle, subulate at the apex. Spikes racemose, interrupted, terminal; flowers disposed in almost sessile opposite fascicles. Bracteas and calyxes hispid. Corollas glabrous, becoming black on drying, but probably white in the recent state.

1 R. parvifo'ra (D. C. l. c.) branches, petioles, and nerves of leaves on the under surface, rather hispid; leaves elliptic-oblong; spikes terminal, formed of interrupted fascicles of flowers; fruit glabrous. ♄. S. Native of Sierra Leone, where it was collected by Smeathmann; and of Casamancia near Itou, where it was collected by Leprieur and Perrottet.

Small-flowered Rutidea. Shrub 3 to 4 feet.

2 R.? mo'llis (Blum. ex D. C. prod. 4. p. 495.) every part of the plant is clothed with soft hairy tomentum; leaves elliptic-

oblong, clothed with soft hairs on both surfaces, but most so beneath; corymbs terminal, dichotomous; fruit rather villous, globose, 1-seeded. ♄. S. Native of the island of Pulo-Penang. The fabric of the seed is unknown.

Soft Rutidea. Shrub.

Cult. For culture and propagation see *Ixòra*, p. 574.

CLXVI. FARA'MEA (Aublet does not give the meaning of this name). A. Rich. mem. soc. hist. nat. Par. 5. p. 175. t. 17. f. 1 and 2. D. C. prod. 4. p. 496.—Faràmea and Tetramèrium, Juss. mem. mus. 6. p. 376.

Lin. syst. *Tetrándria*, *Monogýnia*. Calyx with a turbinately globose tube, and a very short 4-toothed or entire limb. Corolla with a short terete tube, a naked throat, and 4 spreading oblong or linear acute lobes, which are longer than the tube. Anthers 4, sessile, inclosed. Style short, bifid at the apex. Berry dry, 2-celled while young, but in the adult state it is globose, depressed, 1-celled, and 1-seeded, marked by 8 crenulations at the cicatrice. Seeds fixed to the bottom of the cell, umbilicate at the base, globosely depressed. Albumen horny. Embryo lateral, small, horizontal.—Glabrous, dichotomously branched shrubs, natives of America. Leaves petiolate, oval or oblong, acuminated. Stipulas interpetiolar, solitary on each side, broad at the base, and setaceously cuspidate at the apex. Flowers corymbose or umbellate, on the tops of the branches or peduncles. Corollas white.

Sect. I. Eufara'mea (this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 496.—Faràmea, Aubl. guian. 1. p. 102. t. 40. Lam. dict. 2. p. 460. ill. t. 63.—Famàrea, Vittm. summ. pl. 1. p. 357. Peduncles terminal, 1-3 together, bearing each a simple umbel of flowers at the apex. Flowers involucrated by caducous bracteas. Stipulas ending in an awn.

1 F. sessiliflo'ra (Aubl. guian. 1. p. 104. t. 40. f. 2.) umbels terminal, solitary, simple, sessile; calyx 4-toothed. ♄. S. Native of Guiana, in the woods called Cauxwoods. Leaves obovate. Flowers white.

Sessile-flowered Faramea. Shrub 7 to 8 feet.

2 F. sertuli'fera (D. C. prod. 4. p. 496.) peduncles terminal, solitary, nearly terete, bearing a simple umbel of flowers at the apex; calyx truncate. ♄. S. Native of Cuba, about the Havannah. Branches slender, dichotomous. Leaves oblong, acuminated at both ends.

Garland-bearing Faramea. Shrub.

3 F. trunca'ta (D. C. prod. 4. p. 496.) peduncles terminal by threes, compressed at the apex, bearing each a simple umbel of flowers; calyx truncate. ♄. S. Native of French Guiana. Very like the following species, but differs in the calyx being truncate. Corolla marcescent. Fruit pale, but exactly like those of *F. odoratissima*.

Truncate-calyxed Faramea. Shrub 4 to 5 feet.

4 F. corymbòsa (Aubl. guian. 1. p. 102. t. 40. f. 1.) peduncles terminal by threes, compressed at the apex, each bearing a simple umbel of flowers; calyx 4-toothed. ♄. S. Native of French Guiana, in the woods called Cauxwoods. Lam. ill. t. 63. Flowers white.

Corymbose-flowered Faramea. Shrub 7 to 8 feet.

Sect. II. Tetrame'rium (from τετρας, *tetras*, fourfold, and μερις, *meris*, a part; in reference to the flowers being tetramerous). D. C. prod. 4. p. 496.—Tetramèrium, Gærtn. fil. carp. 3. p. 90. t. 196. H. B. et Kunth, nov. gen. amer. 3. p. 373.—Coffèa section Potìma, Pers. ench. 1. p. 209.—Darlùca, Rafin. ann. gen. sc. phys. 6. p. 87. ? Coffèa and Ixòra species, Lin. Corymbs terminal, trichotomous. Flowers naked.

* *Stipulas ending in an awn.*

5 F. odorati'ssima (D. C. prod. 4. p. 496.) leaves oval-oblong, acutish at the base, and abruptly acuminated at the apex; stipulas broad, ending in a subdorsal awn; corymbs terminal; limb of calyx very short, truncate, ten times shorter than the tube of the corolla; berry crowned by the very short bluntly 4-toothed limb of the calyx. ♄. S. Native of the West Indian islands, as in St. Domingo, Jamaica, Porto-Rico, Guadaloupe, Cayenne, Panama, and probably of Mexico. Plum. ed. Burm. t. 156. f. 2. P. Browne, jam. t. 6. f. 1. but not fig. 2.—Coffèa occidentàlis, Jacq. amer. t. 47. Lin. spec. p. 246. Ixòra Americàna, Lin. amœn. acad. 5. p. 393. ex Swartz. Tetramèrium odoratíssimum, Gærtn. fil. carp. 3. p. 90. t. 196. Tetramèrium occidentàle, Nees and Mart. nov. act. nat. cur. 12. p. 13. Flowers white, sweet-scented, about the size of those of the jasmine; hence it is called jasmine in Jamaica.

Very-sweet-scented-flowered Faramea. Clt. 1793. Sh. 6 ft.

6 F. latifo'lia (D. C. prod. 4. p. 497.) leaves oval, abruptly acuminated; stipulas broad, ending in a subdorsal awn; corymbs terminal; tube of calyx slightly tetragonal, somewhat 4-toothed, 5 times shorter than the tube of the corolla. ♄. S. Native of Brazil, in the province of Rio Janeiro. Tetramèrium latifòlium, Cham. et Schlecht. in Linnæa. 4. p. 30. It differs from the preceding species in the flowers being one-half smaller. This plant is probably also a native of Trinidad and Santa Cruz.

Broad-leaved Faramea. Shrub 6 feet.

7 F. Montevide'nsis (D. C. prod. 4. p. 497.) leaves oblong, acuminated at both ends; stipulas broadish at the base, ending in a subdorsal awn at the apex; corymbs terminal; berries crowned by the limb of the calyx, which is tubularly cup-shaped and subtruncate. ♄. S. Native of Brazil, about Monte-Video; and of Porto-Rico. Tetramèrium Montevidénse, Cham. et Schlecht. in Linnæa. 4. p. 29. Flowers white. Leaves and inflorescence almost like those of *F. odoratíssima;* but the limb of the calyx on the fruit is very different.

Monte-Video Faramea. Shrub 4 to 6 feet.

8 F. stipula'cea D. C. prod. 4. p. 497.) leaves oblong, attenuated at the base, and acute at the apex; stipulas broad at the base, and ending in a dorsal awn at the apex; corymbs terminal; limb of calyx acutely 4-toothed; berry globose, crowned by the short limb of the calyx. ♄. S. Native of Brazil, within the tropic. Tetramèrium stipulàceum, Cham. et Schlecht. in Linnæa. 4. p. 31. Flowers white. Habit of *F. jasminoìdes*, but differs in the dorsal awn to the stipulas.

Stipulaceous Faramea. Shrub 4 to 6 feet.

9 F. cœru'lea (D. C. l. c.) leaves ovate-elliptic, acute at both ends; stipulas dilated at the base, and ending in a short awn at the apex; peduncles axillary, usually 3-flowered; limb of calyx acutely 5-toothed, 6 times shorter than the tube of the corolla. ♄. S. Native of Brazil. Tetramèrium cœrùleum, Nees et Mart. nov. act. bonn. 12. p. 12. Peduncles and branches 2-edged. Corolla of an amethyst colour, with lanceolate segments.

Blue-flowered Faramea. Shrub 5 to 6 feet.

10 F. axillarifloʻra (D. C. prod. 4. p. 673.) leaves sessile, ovate-oblong, cordate at the base, acuminated at the apex; stipulas ending in a long-awned acumen; branches much compressed; flowers on short pedicels, in fascicled corymbs from the axils of the leaves. ♄. S. Native of Brazil, about Bahia, where it was collected by Salzmann, G. Don, &c. Flowers white. Fruit exactly like that of *F. odoratíssima*. Leaves 7-8 inches long, and about 3 broad.

Axillary-flowered Faramea. Shrub 4 to 6 feet.

11 F. Guayaquile'nsis (D. C. l. c.) leaves oblong, acuminated, almost sessile; stipulas oblong, acuminated, and a little awned, permanent: upper ones bifid on both sides; panicle ter-

minal, trichotomous, divaricate. ♄. S. Native of Guayaquil. Tetramèrium multiflòrum, Bartl. in herb. Hænke. Flowers white? Stipulas different in form from any other species.

Guayaquil Faramea. Shrub 4 to 6 feet.

** *Stipulas never ending in an awn.*

12 F. jasminoìdes (D. C. prod. 4. p. 497.) leaves elliptic-oblong, acuminated at both ends; stipulas ovate, large, acutish; corymbs terminal; calyx urceolate, with 4 long teeth; berry globose, crowned by the short limb of the calyx. ♃.? S. Native of New Granada, near Ibague. Tetramèrium jasminoìdes, H. B. et Kunth, nov. gen. amer. 3. p. 373. t. 287. Coffèa flàvicans, Willd. mss. in Rœm. et Schultes, syst. 5. p. 201. Branches tetragonal. Leaves pale green, yellowish beneath. Lobes of corolla one-half shorter than the tube. Flowers white.

Jasmine-like Faramea. Shrub.

13 F.? sessilifo`lia (D. C. l. c.) leaves oblong, acuminated, cordate, sessile; stipulas ovate, acuminately subulate; corymbs terminal, trichotomous; limb of calyx urceolate, 4-toothed. ♄. S. Native in woods on the banks of the Orinoco, between Maypure and St. Fernando de Atabapo. Tetramèrium sessilifòlium, H. B. et Kunth, nov. gen. amer. 3. p. 374. Ixòra sessilifòlia, Spreng. syst. 1. p. 409. Flowers white. Anthers probably exserted. From the fruit being unknown, it is doubtful whether it belongs to the present genus.

Sessile-leaved Faramea. Shrub.

14 F. multiflo`ra (A. Rich. in mem. soc. hist. nat. Par. 5. p. 176.) leaves oval-elliptic, acuminated, abruptly petiolate; stipulas interpetiolar, connate, sheath-formed, acuminated; flowers corymbose, terminal. ♄. S. Native of French Guiana.

Many-flowered Faramea. Shrub.

15 F. calyciflo`ra (A. Rich. l. c.) leaves elliptic, acuminated; stipulas interpetiolar, acuminated; flowers spiked; spikes terminal, pedunculate; limb of calyx tubular, large, permanent. ♄. S. Native of French Guiana. From the calyx being permanent, it does not probably belong to the present genus.

Calyx-flowered Faramea. Shrub.

Sect. III. Farameoìdes (from *faramea*, and *idea*, like; but is meant only as an alteration of the generic name). D. C. prod. 4. p. 498. Panicles thyrsoid, terminal.

16 F. albe'scens (D. C. prod. 4. p. 498.) panicle terminal, pedunculate, having its branches bearing umbels of flowers at the apex; calyx truncate. ♄. S. Native of French Guiana. Branchlets compressedly angular. Leaves oblong, acuminated at both ends, shining on both surfaces, pale green. Stipulas acute, deciduous while young. Peduncles 2-edged, furnished with 3-4 pairs of branches. Panicles white, one-half shorter than the leaves. Corollas elongated, very like those of *F. truncàta*.

Whitish-panicled Faramea. Shrub 4 to 6 feet.

17 F. Martìni (D. C. l. c.) panicles terminal, on short peduncles, shorter than the leaves; branches corymbose at the apex; calyx hardly toothed; leaves large, oval; anthers exserted at the throat. ♄. S. Native of Guiana, at Mount Kaw, where it was collected by Martin. Branchlets compressed. Stipulas broad, short, permanent. Leaves glabrous, membranous, attenuated at the base. Lobes of corolla 4, a little longer than the tube. Calyx urceolate. Fruit unknown.

Martin's Faramea. Shrub 4 to 6 feet.

Cult. For culture and propagation see *Coffèa*, p. 584.

CLXVII. STREMPE'LIA (named after Charles Frederick Strempel, author of Filicum Berolinensium Synopsis, Berlin, 1822-1828). A. Rich. mem. soc. hist. nat. Par. 5. p. 180. D. C. prod. 4. p. 498.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx with an obovate-globose tube, and a campanulately tubular 4-5-toothed limb. Corolla tubular, terete, with a 4-5-parted spreading limb, lanceolate acute segments, and a naked throat. Stamens inserted in the middle of the tube; filaments beset with short hairs in the free part; anthers linear, inclosed. Fruit ovoid, striated, fleshy, crowned by the tubular limb of the calyx, containing 2 bony 1-seeded indehiscent nuts, which are flat on the inside, and furrowed in the middle. Seed erect. Embryo nearly terete.—A Guiana shrub. Leaves opposite, elliptic. Stipulas fringed. Flowers sessile, umbellate on the tops of the peduncles.

1 S. Guiane'nsis (A. Rich. l. c.) ♄. S. Native of French Guiana.

Guiana Strempelia. Shrub.

Cult. For culture and propagation see *Coffèa*, p. 584.

CLXVIII. COFFE`A (so named from Caffeé, a province of Narea in Africa, where the common coffee grows in abundance). Lin. gen. no. 230. exclusive of some species. Gærtn. fr. 1. p. 118. t. 25. Lam. ill. t. 160. Juss. mem. mus. 6. p. 379. D. C. prod. 4. p. 498.

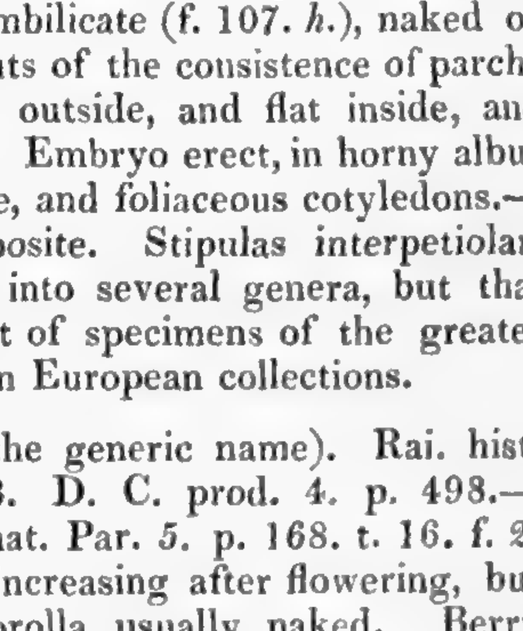
Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx with an ovate, globose or turbinate tube, and a small 4-5-toothed limb (f. 107. *a.*). Corolla tubular, funnel-shaped, with a spreading 4-5-parted limb (f. 107. *b.*), and oblong lobes. Stamens 4-5, rising from the middle of the tube of the corolla, or from its apex, exserted or inclosed. Style bifid at the apex, having the lobes rarely combined. Berry umbilicate (f. 107. *h.*), naked or crowned, containing 2 1-seeded nuts of the consistence of parchment, which are convex on the outside, and flat inside, and marked by a longitudinal furrow. Embryo erect, in horny albumen, with a terete obtuse radicle, and foliaceous cotyledons.—Trees and shrubs. Leaves opposite. Stipulas interpetiolar. This genus is probably divisible into several genera, but that has not been attempted on account of specimens of the greater number of the species being rare in European collections.

Sect. I. Coffe (altered from the generic name). Rai. hist. pl. Juss. act. acad. sc. Par. 1713. D. C. prod. 4. p. 498.—Coffèa, A. Rich. mem. soc. hist. nat. Par. 5. p. 168. t. 16. f. 2. Tube of calyx very short, not increasing after flowering, but always vanishing. Throat of corolla usually naked. Berry ovate or globose. Stigma bifid.—Trees and shrubs. Stipulas solitary on both sides, undivided, neither toothed nor ciliated. Inflorescence axillary in the genuine species. Flowers from 4 to 7 cleft, but usually 5 cleft.

* *Peduncles axillary. Flowers 5-7-cleft, pentandrous or heptandrous.*

1 C. Ara'bica (Lin. spec. p. 245.) leaves oval-oblong, acuminated, glabrous, shining on the upper surface; peduncles axillary, short, aggregate; corolla 5-cleft: anthers exserted; berries ovate. ♄. S. Native of Arabia Felix and Æthiopia, from whence it has been carried to almost all parts of the world within the tropics. Gærtn. fruct. 1. t. 25. Sims, bot. mag. 1303. Tratt. tab. t. 400. Tuss. ant. t. 18. Delaun. herb. amat. t. 285. Church. ad Steph. med. bot. 4. t. 182. C. laurifòlia, Salisb. prod. p. 62. — Juss. act. ac. par. 1713. t. 7. Ellis, mon. 1774. in 4to. Till. pis. t. 32. Pluk. alm. t. 272. f. 1. Alp. egypt. t. 36. Blackw.

FIG. 107.



herb. t. 337. Plench. icon. t. 130. Stipulas awl-shaped, undivided. Leaves wavy, dark-green and shining above, paler beneath. Flowers white, sweet-scented, disposed in axillary clusters of 4-5. Berries red, cherry-formed. The seeds or nuts are involved in a thin elastic pellucid aril. The coffee-tree is frequently cultivated in the hot-houses of our gardens for ornament, where it both flowers and ripens its fruit. It is propagated by the berries, which must be sown soon after they are gathered, or they will not vegetate. Cotyledons transversely ovate, 3-nerved at the base, and emarginate at the apex.

Few vegetable substances have been more generally esteemed for their medicinal and dietetic properties than the berries of the coffee-tree. The plant is fully described by Ellis and several other writers. The coffee-tree is generally regarded as a native of Arabia, but Bruce says it derives its name from *Caffee*, a province of Narea, in Africa, where it grows spontaneously in great abundance. The plant does not appear to have been known by the Greeks or Romans, nor are there any facts respecting its origin in the East. It has been well ascertained, however, that the berries were imported into every part of Europe, and used as a favourite beverage, long before it was known of what plant they were the product. Prosper Alpinus has seen the coffee-tree, without fructification, in some gardens in Egypt; but the first intelligible botanical account was published by Ant. de Jussieu, in the Mem. Acad. Scienc. Paris, in 1713. We are informed by Boerhaave, in his Index to the Leyden Garden, that it was first introduced into Europe by Nicholas Wisten, a burgomaster of Amsterdam, and chairman of the Dutch East India Company, who gave directions to the governor of Batavia to procure seed from Mocha, in Arabia Felix. These being sown in the Island of Java, several plants were procured, and one was transmitted by Wisten, about the year 1610, to the botanic garden at Amsterdam. From the progeny of this plant, not only the principal botanic gardens in Europe, but also the West India Islands, were supplied with this valuable tree. Soon after its introduction into Holland, it was cultivated by Bishop Compton, at Fulham.

In Arabia the fruit is dried in the sun upon mats, and the outer coat is separated by means of a large stone cylinder. It is again placed in the sun, winnowed, and packed up in bales. In the West India Islands, as soon as the fruit is of a deep red colour, it is reckoned to be ready for being gathered. Large linen bags, kept open by means of hoops round their mouths, is suspended by the negroes from their necks, who pull the berries with their hands, and, after filling the bags, empty them into a large basket. A single negro can easily collect three bushels in a day. As the berries do not ripen together, they are collected at three different gatherings. One thousand pounds of good coffee are produced from one hundred bushels of the berries just from the tree. The coffee-berries may now be dried in two different ways. The first method is to place them in the sun, in layers of four inches thick, on inclined planes. In a few days the pulp is discharged by fermentation, and in about three weeks the coffee is completely dry. The skin of the berries, already broken, is removed by mills, or in wooden mortars. The second method is to separate the grain from the pulp at once, by means of a mill, and the grains are then left to soak in water for twenty-four hours. They are afterwards dried, and then stripped of the pellicle, or parchment, as it is called, by means of appropriate mills. The grains of coffee are afterwards winnowed, and mingled with the grindings and dust of the parchment, in which state they are put up into bags for sale.

Culture.—The coffee-tree is less cultivated in Jamaica than in Barbadoes, St. Domingo, and some other islands in the West Indies. Richness of soil lessens the flavour of the seeds; on this account, coffee produced in the dry, hot, arid climate of Arabia is always better than that from the West India Islands. In cultivating the coffee in the West Indies, the berries are sown immediately after being gathered, as they are found to retain their vegetative quality only a few weeks. In three months the seeds so sown produce plants fit for transplanting to the final plantation. In the low lands they are planted five feet apart, and in the mountains ten feet or more. In three years the plants will produce a crop, and continue bearing a number of years. The berries are gathered when they are just about to drop.

Qualities and chemical properties.—When the seeds of coffee are roasted, a portion is converted into tannin by the action of heat, and an agreeable aromatic substance is developed, the nature of which has not been ascertained. The same principle is also developed by roasting barley, beans, and many other vegetables, which, on that account, are occasionally employed as substitutes for coffee, and suit some stomachs better. The infusion of unroasted coffee in boiling water is of a yellowish green colour; but the decoction, by continuing the boiling, becomes brown, and turbid on cooling. From experiments made chiefly by Cadet, it appears that coffee contains an aromatic principle, a little oil, gallic acid, mucilage, extractive and bitter principle. Other analyses have been made by chemists. M. Grindel found it to contain kinic acid, and M. Paysse has discovered what he has endeavoured to show as a peculiar acid, to which he has given the name of coffee acid. More recently, M. Robiquet is said to have demonstrated another principle, which he names *Cafeine*. It is in silk-like acicular crystals, bearing a resemblance to Benzoic acid. It liquefies by the aid of a gentle heat; in close vessels it volatilizes, and sublimes in needles. Cafeine is neither acid nor alkaline; it furnishes a great quantity of azote; it dissolves with difficulty in ether, but quickly in water and alcohol.

Medical properties and uses.—It is evident that we are indebted to the Arabians for our use of this pleasant beverage, as the first rite of Eastern hospitality is the presentation of a bowl of coffee. In Europe it is said to have been first used in Italy, in the year 1650; and, according to Dulaine, was introduced at the court of Paris, in 1669, by Soliman Aga, ambassador from the Porte. An Armenian, named Pascal, opened the first Café, and Procope the second, in "Rue des Fossés, Saint Germain des Près." Nearly at the same time coffee was introduced into London.

By some, coffee is supposed to be best suited to the aged; and its abuse, as when taken too strong, is said to impair digestion, instead of promoting it; and it stimulates, heats, and produces watchfulness in certain constitutions. The Mahometans of India, who use a great deal of coffee in the same way as we do, with the exception of combining milk with it, believe it to have the effect of soothing and allaying nervous irritations, and prescribe it to stop the vomiting in cholera morbus. Dr. Ainslie also states, that it is often employed for the same purposes by the Spaniards at Manilla. It is said that Sir John Floyer, during his residence in Lichfield, found great benefit in his own person by the use of coffee in asthma. Sir John confirms its success in a letter to Dr. Percival; "On reading the section of coffee," says he, "in the second volume of your essays, one quality occurred to me which I had observed of that liquor, confirming what you had said of its sedative powers. It is the best abater of periodic asthma that I have seen. The coffee ought to be the best Mocha, newly burnt, and made very strong immediately after grinding it. I have commonly ordered an ounce for one dish, which is to be repeated afresh after the interval of a quarter of an hour, without milk or sugar." Percival's Essays, vol. iii.

As a general palliative, strong coffee is often serviceable in various kinds of head-ache; and where its own sedative power

is unavailing, it forms one of the best vehicles for the administration of laudanum. It diminishes in some degree the hypnotic power of the latter, but counteracts its distressing secondary effects. When laudanum is intermixed with strong coffee for the cure of many modifications of head-ache, tranquillity and ease are produced, though there may be no sleep; when laudanum, on the contrary, is taken alone, sleep will, perhaps, follow, but is mostly succeeded by nausea and a return of pain. Hence the Turks and Arabians make strong coffee their common vehicle for opium, from its tendency to counteract the narcotic principle of the latter; and on the same account it is plentifully administered after the stomach has been evacuated of its contents, in cases of poisoning by opium.

For common purposes, infusion of coffee is the most agreeable method of preparing it, as the aromatic and volatile principles are dissipated by boiling.

Coffee is named by the Persians *Cohwa* and *Coho;* by the Turks, *Chaube* and *Cahvey;* by the Arabians, *Cachua*, *Caoua*, *Caffaye*, and *Cahouah;* and by the Egyptians, *Eleave*. In Germany it is called *Arabische Kafferbaum;* in Cochin China, *Caycaphe*.

The Galla, a wandering nation of Africa, in their incursions in Abyssinia, being obliged to traverse immense deserts, and being also desirous of falling on the Abyssinians without warning, that they may be encumbered as little as possible with baggage, carry nothing with them to eat, but coffee roasted till it can be pulverized, and then mixed with butter into balls, and put into a leathern bag: one of these, about the size of a billiard-ball, keeps them, they say, in strength and spirits during a whole day's fatigue, better than a loaf of bread, or a meal of meat.

Arabian or Common Coffee-tree. Fl. Aug. Nov. Clt. 1696. Shrub 5 to 15 feet.

2 C. Mauritia'na (Lam. dict. 1. p. 550. ill. t. 160. f. 2.) leaves oval, acute at both ends, reticulately veined; peduncles axillary, solitary, 1-flowered, very short; berries oblong, acute at the base. ♄. S. Native of the Island of Bourbon, in the woods. C. Arábica β, Willd. spec. 1. p. 974. C. sylvéstris, Willd. mss. in Rœm. et Schultes, syst. 5. p. 201. Flowers white. This species is known in the Island of Bourbon under the name of *Café-Marron*, but should not be confounded with the variety of *C. Arábica*, known in commerce under the name of *Café Bourbon*, or *Bourbon Coffee*.

Mauritian Coffee-tree. Shrub 4 to 5 feet.

3 C. Benghale'nsis (Roxb. hort. beng. p. 15. fl. ind. 2. p. 194.) leaves oval-oblong, acuminated at both ends; flowers axillary, rather aggregate, sessile; stipulas undivided, subulate, much acuminated; corolla 5-cleft, with oblong lobes; anthers inclosed. ♄. S. Native of Bengal, but chiefly about Silhet; and of Nipaul. Roth. nov. spec. 148. Rœm. et Schultes, syst. 5. p. 200. Branches so placed as to form a bush of a pyramidal form. Leaves from ovate to oblong, glabrous. Flowers 1-3 together or more, axillary, white, sweet-scented. Berry black, size of a small cherry. It was for some time much cultivated in Bengal, under the idea of its being the Arabian Coffee; it is now neglected, being of inferior quality, and not productive; however, the number of its flowers entitle it to a conspicuous place in the flower-garden.

Bengal Coffee-tree. Shrub 4 to 6 feet.

4 C. stenophy'lla; leaves oblong-lanceolate, acuminated; peduncles almost sessile, axillary, 2-3-flowered. ♄. S. Native of Sierra Leone, where it is cultivated. Flowers white. Berries oblong, black. The seeds of this species are roasted and used as the common coffee, and are even considered superior to it.

Narrow-leaved Coffee-tree. Shrub 4 to 6 feet.

5 C. hirsu'tus; leaves ovate, acuminated, on short petioles; young branches, petioles, and veins of leaves hairy; peduncles axillary, 3-flowered. ♄. S. Native of Sierra Leone, in the low lands. Flowers white.

Hairy Coffee-tree. Shrub 4 to 5 feet.

6 C.? microca'rpa (D. C. prod. 4. p. 499.) leaves elliptic-oblong, short-acuminated, and are, as well as the branches, quite glabrous; flowers in fascicles along the branches, after the falling of the leaves, and therefore they appear as if they were disposed in interrupted racemes, but in fact the flowers are merely in fascicles from the axils of the fallen leaves; fruit elliptic, 3 times longer than their pedicels, and crowned by the cup-shaped limb of the calyx. ♄. S. Native of Africa in Casamancia, in woods, at Cape Rouge, where it was collected by Perrottet and Leprieur. Leaves $2\frac{1}{2}$ inches long, and 8-9 lines broad. Stipulas solitary, undivided, acuminately subulate, deciduous. Flowers white.

Small-fruited Coffee-tree. Shrub 4 to 5 feet.

7 C. laurìna (Smeathm. in herb. L'Her. et D. C. prod. 4. p. 499.) leaves oblong-lanceolate, mucronate, cuneated at the base, coriaceous, quite glabrous; racemes axillary, crowded with flowers, much shorter than the leaves; corolla 5-cleft, with a villous throat; anthers exserted, but rather shorter than the lobes of the corolla; berries globose. ♄. S. Native of Sierra Leone. Poir. suppl. 2. p. 14. Leaves yellowish in the dried state. Calyx truncate. Corollas white.

Laurel-like Coffee-tree. Shrub 4 to 5 feet.

8 C.? stipula'cea (D. C. prod. 4. p. 492.) leaves elliptic or oblong, petiolate, acuminated at both ends; stipulas foliaceous, oblong, acute, striated lengthwise, deciduous; peduncles axillary, very long, corymbose at the apex, trichotomous. ♄. S. Native of French Guiana, where it was collected by Patris. Limb of calyx obscurely but acutely 5-toothed. Flowers unknown. Berries ovate, not crowned. Peduncles 6 inches long.

Stipulaceous Coffee-tree. Shrub 4 to 6 feet.

9 C. peduncula'ta (Roxb. fl. ind. 2. p. 195.) leaves elliptic, almost sessile, smooth; peduncles terminal and axillary, in fascicles, long, 1-flowered; tube of the corolla slender, smooth; stamens inclosed. ♄. S. Native of the Moluccas.

Pedunculated Coffee-tree. Shrub.

** *Peduncles axillary. Flowers tetramerous and tetrandrous.—Ixòra species, Spreng.*

10 C. Guiane'nsis (Aubl. guian. 1. p. 150. t. 57.) leaves ovate-oblong, bluntly acuminated, quite glabrous; peduncles axillary, aggregate, very short, 1-flowered; corollas 4-cleft, with acute lobes; anthers inclosed; berries globose, small. ♄. S. Native of French Guiana, and of the Island of Trinidad, ex Sieb. fl. trin. no. 44. Ixòra Guianénsis, Spreng. syst. 1. p. 409. Flowers small, white. Berries violaceous.

Guiana Coffee-tree. Shrub 1 to 3 feet.

11 C. ròsea (Moc. et Sesse. fl. mex. icon. ind. ex D. C. prod. 4. p. 499.) leaves oval-oblong, acuminated at both ends, glabrous; peduncles axillary, 5-flowered, much shorter than the leaves; corollas 4-cleft, with revolute lobes; anthers exserted; berries globose. ♄ S. Native of Mexico. Corollas rose-coloured. Berries reddish, size of a pea.

Rose-coloured-flowered Coffee-tree. Shrub 4 to 6 feet.

12 C. obova'ta (Cham. et Schlecht. in Linnæa, 6. p. 412.) glabrous; leaves obovate, cuneated, acuminated, acute, feather-veined; cymes axillary, almost sessile, aggregate, short, many-flowered; stipulas ovate-triangular, caducous. ♄. S. Native of Mexico, in shady places, near Masantla. Leaves half a foot long. Tube of the calyx ovate, with short acute teeth. Corolla with a short tube and a naked throat. Anthers linear, exserted.

Obovate-leaved Coffee-tree. Shrub.

13 C. LANCEOLA'TA (Cham. et Schlecht. in Linnæa. 6. p. 412.) stems, petioles, nerves, and primary veins of leaves underneath downy; leaves lanceolate, glaucescent beneath, feather-veined; cymes axillary, usually solitary, few-flowered, on short peduncles; stipulas small, ovate-triangular, caducous. ♄. S. Native of Mexico, near Jalapa. Leaves 2-3 inches long, acuminated. Calyx with a clavate tube, and small acute teeth. Anthers linear, exserted.

Lanceolate-leaved Coffee-tree. Shrub.

14 C. TETRA'NDRA (Roxb. fl. ind. 2 p. 193.) leaves broad-lanceolate, acute, shining; stipulas bifid; peduncles axillary and terminal, in fascicles, long, slender, 1-flowered; corollas usually 4-cleft, with a long slender tube; anthers inclosed; berries globose. ♄. S. Native of Silhet and Chittagong, and the whole east border of Bengal. Leaves 4-5 inches long, and hardly 2 broad. Corolla with a 4-5-cleft border. Stamens 4-5. Berries size of a small cherry, blackish-purple when ripe, 1 or 2-celled. An erect slender-branched Shrub.

Tetrandrous-flowered Coffee-tree. Shrub.

15 C. DENSIFLÒRA (Blum. bijdr. p. 965.) leaves oval-oblong, acuminated, clothed with fine down on the veins beneath; flowers crowded, axillary; corollas 5-cleft. ♄. S. Native of Java, on Mount Salak. There are varieties of this with smaller and larger flowers.

Dense-flowered Coffee-tree. Shrub.

16 C. ANGUSTIFO'LIA (Roxb. fl. ind. 2. p. 195.) leaves lanceolate, stiff, shining; panicles axillary; throat of corolla bearded; lobes of corolla linear, longer than the tube, but equal to the anthers, which are filiform and exserted. ♄. S. Native of Pigeon Island, one of the Malay Archipelago.

Narrow-leaved Coffee-tree. Shrub.

17 C. RACEMÒSA (Ruiz et Pav. fl. per. 2. p. 64. t. 214. f. a. but not of Lour.) leaves oblong-oval, acuminated, glabrous; stipulas bifid; racemes axillary and terminal, drooping while in flower, but erect in the fruit-bearing state; flowers almost sessile, 5-cleft; anthers exserted; berry oval. ♄. S. Native of Peru, in groves at Pati and Macora, where it is called *Café*. Rúdgea racemòsa, Spreng. syst. 1. p. 755. Flowers white.

Racemose Coffee-tree. Shrub 4 to 6 feet.

18 C. ZANQUEBA'RIÆ (Lour. coch. p. 145.) leaves ovate-lanceolate, glabrous; peduncles axillary, many-together, short, 1-flowered; corollas 6-7-cleft; berries oblong-ovate, angularly nerved. ♄. S. Native of Africa, on the coast of Zanquebar, in woods. Amajoùa Africàna, Spreng. syst. 2. p. 126. Flowers white. Berries red. This species is cultivated near Mozambique in gardens along with *C. Arábica*, and where the seeds are used as a substitute for the common coffee.

Zanquebar Coffee-tree. Shrub 5 to 6 feet.

19 C. I'NDICA (Poir. suppl. 2. p. 14.) leaves ovate-oblong, acuminated, glabrous; stipulas very short, undivided; panicles short, divaricate, terminal; pedicels elongated; fruit small, obobovate, not crowned by the calyx. ♄. S. Native of Java. Flowers unknown.

Indian Coffee-tree. Shrub.

* * * *Panicles terminal. Flowers* 4-5-*parted, tetrandrous or pentandrous.*

20 C. PANICULA'TA (Aubl. guian. 1. p. 152. t. 58.) leaves ovate-oblong, acuminated, shining; branches tetragonal; stipulas acute, caducous; panicles terminal, divaricate; flowers 4-cleft; anthers inclosed. ♄. S. Native of Guiana, in woods. Tetramèrium paniculàtum, Spreng. syst. 1. p. 409. Flowers white, sweet-scented. Berries ovate-globose, bluish, containing 2 seeds or nuts, one of which is usually abortive.

Panicled-flowered Coffee-tree. Clt. 1822. Sh. 6 to 8 feet.

21 C. MOZAMBICA'NA (D. C. prod. 4. p. 500.) leaves ovate-lanceolate, scabrous from tubercles; racemes terminal, erect, brachiate; peduncles tetragonal. ♄. S. Native of the eastern coast of Africa, in the island in Mozambique Channel. C. ramòsa, Rœm. et Schultes, syst. 5. p. 198. C. racemòsa, Lour. coch. p. 145. but not of Ruiz et Pav. The flowers are unknown, but are probably tetrandrous. Berries small, red, watery, roundish, 1-celled, 2-seeded. Seeds truncate, marked by a furrow inside.

Mozambique Coffee-tree. Shrub 4 feet.

22 C. SEMIEXSE'RTA (Colebr. in Roxb. fl. ind. 2. p. 195.) leaves oblong-lanceolate, acuminated; corymbs terminal. ♄. S. Native of Bengal, in Silhet. Berries purple, size of large peas. Habit of *Ixòra*.

Half-exserted-stamened Coffee-tree. Shrub.

SECT. II. HO'RNIA (named after M. Van Horn, who, in the year 1690, carried coffee from Arabia to Batavia, and in the year 1710 to the gardens of Amsterdam). D. C. prod. 4. p. 500. Tube of calyx increasing after the flowers have fallen, and crowning the berry by a neck, having the teeth almost obsolete. Flowers 5-cleft. Stigma bifid. Throat of corolla glabrous. Berry ovate or globose, usually 1-seeded from abortion.—Shrubs, natives of Peru. Inflorescence axillary or terminal. Stipulas solitary on both sides, undivided, never toothed nor ciliated.

23 C. SUBSE'SSILIS (Ruiz et Pav. fl. per. 2. p. 64. t. 215. lower figure,) leaves glabrous, coriaceous, sessile, oblong-lanceolate, acuminated, excavated at the base; stipulas ovate; racemes axillary, trichotomous, shorter than the leaves. ♄. S. Native of Peru, on the Andes in forests at Chinchao, Quebrada, and Pati. Coffèa macrophýlla, Dietr. nachtr. 2. p. 344. Leaves a foot long, shining above. Peduncles quadrangular. Berries ovate, at first red, but at last becoming purplish, ovate, 1-seeded, size of cherries. Probably a species of *Faràmea*.

Sessile-leaved Coffee-tree. Shrub 5 to 6 feet.

24 C. UMBELLA'TA (Ruiz et Pav. fl. per. 2. p. 64. t. 215. upper figure,) leaves glabrous, coriaceous, petiolate, oblong, acuminated, nerved by transverse veins; stipulas roundish; peduncles terminal, usually by threes; flowers crowded, umbellate, involucrated. ♄. S. Native of Peru, on the Andes in forests. Branches dichotomous, rather tetragonal. Involucrum 4-leaved, and involucels 7-leaved. Berries red, ovate.

Umbellate-flowered Coffee-tree. Shrub 10 to 12 feet.

25 C.? ACUMINA'TA (Ruiz et Pav. fl. per. 2. p. 64. t. 214. f. b.) leaves petiolate, oval, acuminated, glabrous, villous in the axils of the veins; stipulas ovate, deciduous; racemes terminal, few-flowered; flowers crowded. ♄. S. Native of Peru, on the Andes in forests. Branches tetragonal, a little compressed. Corollas white, 5-cleft (ex descript.), with revolute segments. Berries oval, red, 1-seeded, size of cherries, blunt at the apex, crowned by the tubular limb of the calyx.

Acuminated-leaved Coffee-tree. Shrub 5 to 6 feet.

SECT. III. PANCRA'SIA (named after M. Pancras, who first transmitted the coffee-tree from the gardens of Amsterdam to those of Paris, in the year 1713). D. C. prod. 4. p. 501. Throat of corolla bearded. Berries crowned by the vestiges of the calyx. Racemes or corymbs terminal. Stipulas usually fringed or ciliately toothed, as in *Rúdgea*, but differs from that genus in the calyx not being parted, and in the lobes of the corolla not being horned. Flowers 5-cleft.—Glabrous Peruvian shrubs.

* *Stipulas ciliated.*

26 C. CILIA'TA (Ruiz et Pav. fl. per. 2. p. 65. t. 216. f. a.) leaves oblong, acuminated; stipulas truncate, ciliated: racemes subpanicled, terminal; flowers aggregate, sessile, 4-5-cleft;

anthers exserted. ♄. S. Native of Peru, in forests on the Andes. Rúdgea ciliàta, Spreng. syst. 1. p. 755. Branches thickened at the nodi. Bracteas small, subulate, at the ramifications of the panicle. Corollas white, with reflexed segments. Berries red, globose. Perhaps the same as *C. ciliàta* of Brazil, which was collected on the road to Felisbert, by the Prince de Neuwied, but according to Nees and Martius, in nov. act. bonn. 12. p. 13., it differs from the Peruvian plant in the racemes being shorter.

Ciliated-bractead Coffee-tree. Shrub 4 to 6 feet.

27 C. foveola'ta (Ruiz et Pav. fl. per. 2. p. 65. t. 216. f. b.) leaves oblong-oval, acuminated, with pits in the axils of the veins beneath; stipulas ovate, ciliated with glands while young; panicles terminal; anthers exserted. ♄. S. Native of Peru, in forests on the Andes. Psychótria foveolàta, Spreng. syst. 1. p. 746. but not of Ruiz et Pav. Psychótria scrobiculàta, Spreng. fil. ind. p. 572. Bracteas small, subulate. Corollas white, but pale purple on the outside. Berries reddish, depressed at both ends.

Pitted-leaved Coffee-tree. Shrub.

28 C. Mexica'na (D. C. prod. 4. p. 501.) leaves oblong, acuminated, reticulately veined beneath; stipulas crested; corymbs terminal, trifid; limb of calyx truncate, obtuse. ♄. S. Native of Mexico. Rúdgea Mexicàna, Bartl. in herb. Hænke. Branches dichotomous. Fruit dry, indehiscent, chartaceous, the nuts separating at length from each other. Seeds hemispherical, having a very narrow furrow in front. It differs from *Rúdgea* in the limb of the calyx not being 5-parted, but quite entire.

Mexican Coffee-tree. Shrub.

29 C. ni'tida (Ruiz et Pav. fl. per. 2. p. 65. t. 217. f. a.) leaves oblong, bluntly acuminated, shining; stipulas truncate, ciliated; panicles terminal; flowers sessile; anthers inclosed. ♄. S. Native of Peru, on the Andes in forests. Rúdgea nítida, Spreng. syst. 1. p. 755. exclusive of the synonymes of Kunth. Branches compressed. Stipulas covered with white linear glands on the outside. Corollas white. Berries red, globose, size of peas.

Shining-leaved Coffee-tree. Shrub 5 to 6 feet.

30 C. laurifo'lia (H. B. et Kunth, nov. gen. amer. 3. p. 372. but not of Salisb.) leaves oblong, somewhat acuminated, coriaceous, shining; stipulas ciliately multifid; corymbs terminal; berries elliptic. ♄. S. Native of South America, in shady humid places at the Missions of the Orinoco. Coffèa coriàcea, Willd. mss. in Rœm. et Schultes, syst. 5. p. 201. ex Kunth. Corolla and stamens unknown. Perhaps a species of Psychótria, ex A. Rich.?

Laurel-leaved Coffee-tree. Shrub 12 to 20 feet.

31 C. verticilla'ta (Ruiz et Pav. fl. per. 2. p. 66. t. 217. f. b.) leaves oblong-lanceolate and obovate, acuminated; stipulas ovate, ciliated; panicles terminal; branches of panicle in whorles of fours; anthers exserted. ♄. S. Native of Peru, in forests on the Andes. Rúdgea verticillàta, Spreng. syst. 1. p. 755. Bracteas small, setaceous. Calyx small, ciliated. Flowers sessile, white, on the tops of the ramifications of the panicle.

Whorled-panicled Coffee-tree. Shrub 4 to 6 feet.

** *Stipulas undivided or bidentate, but never ciliated.*

32 C. longifo'lia (Ruiz et Pav. fl. per. 2. p. 66. t. 218. f. a.) leaves oblong-lanceolate, repandly undulated; stipulas ovate, undivided; panicles terminal; anthers exserted. ♄. S. Native of Peru, in forests on the Andes. Leaves shining above, a foot long. Corolla white with reflexed segments. Berries globose, red.

Long-leaved Coffee-tree. Shrub.

33 C. microca'rpa (Ruiz et Pav. fl. per. 2. p. 66. t. 218. f. b.) leaves lanceolate, acute; stipulas bidentate on both sides; cymes axillary and terminal, spreading; anthers hardly exserted. ♄. S. Native of Peru, on the Andes in forests. Branches a little compressed at the apex. Bracteas subulate. Corollas white, downy on the outside. Berries reddish, globose, size of black pepper. Perhaps belonging to a different section.

Small-fruited Coffee-tree. Shrub.

34 C. spica'ta (H. B. et Kunth, nov. gen. amer. 3. p. 371. t. 286.) leaves elliptic-oblong, acute, coriaceous, shining; stipulas connate, bidentate on both sides; spikes terminal; flowers sessile, disposed in whorles; lobes of corolla ending each in a callous horn. ♄. S. Native of New Granada. Rúdgea spicàta, Spreng. syst. 1. p. 755. Tube of corolla villous inside. Fruit unknown. Perhaps a species of *Psychótria*.

Spiked-flowered Coffee-tree. Shrub.

35 C. oleifo'lia (H. B. et Kunth, nov. gen. amer. 3. p. 372.) leaves oblong, somewhat acuminated, coriaceous, shining; stipulas truncate; corymbs terminal. ♄. S. Native of South America, near Santa Fe de Bogota. Tetramèrium oleæfòlium, Spreng. syst. 1. p. 409. Branches slightly 5-angled. Corolla 5-cleft, ex Kunth, 4-cleft, ex Mutis. Fruit unknown. Perhaps a species of Mapoùria according to A. Rich.

Olive-leaved Coffee-tree. Shrub.

Sect. IV. Strau'ssia (named after Laurence Strauss, who was the first, in 1666, to recommend coffee as a beverage). D. C. prod. 4. p. 502. Berries turbinate or acuminated at the base. Stipulas ovate, deciduous, ciliated on the lower margin of the cicatrices. Flowers 4-6-cleft. Stamens 4-6. Stigma bifid. Berries globose or oval.—Shrubs, natives of the islands in the South sea. Cymes terminal.

36 C. Luzonie'nsis (Cham. et Schlecht. 4. p. 32.) leaves lanceolate, acute at both ends, with rather reflexed margins; stipulas ovate-oblong, rather scarious, deciduous, with the cicatrices rather ciliated at the margins; cymes terminal, sessile, contracted while young; flowers 4-6-cleft; throat of corolla bearded. ♄. S. Native of the Island of Luzon. Corolla white, glabrous. Anthers exserted a little. The central flower is 5-cleft, and the rest either 4 or 5-cleft. Berries almost globose, acute at the base, sometimes 1-seeded by abortion. Branches fistular.

Luzon Coffee-tree. Shrub 4 to 6 feet.

37 C. Kadua'na (Cham. et Schlecht. in Linnæa. 4. p. 33.) leaves cuneate-obovate, somewhat scrobiculate in the axils of the veins, with reflexed margins, usually clothed with rufescent down beneath; stipulas ovate, acute, caducous, the inner margins of the cicatrices ciliated; cymes terminal, on long peduncles, of 5 rays, 4 of which are disposed in a whorl around the other, which is central; corolla 5-cleft, with a naked throat. ♄. S. Native of the Sandwich Islands, particularly in O-Wahu. Berry elliptic, attenuated at the base, rarely 1-seeded by abortion. Branches compressed. Mr. Arnott remarked, that the segments of the calyx are not ciliated as stated by the authors, although the bracteas are.

Kadu's Coffee-tree. Shrub 4 to 5 feet.

38 C. Chammissònis (Hook. et Arn. in Beech. voy. pt. bot. p. 86.) leaves elliptic-oblong, scrobiculate in the axils of the veins, with reflexed margins, quite glabrous on both surfaces; stipulas ovate, caducous, having the inner margins of the cicatrices glabrous; cymes on long peduncles of 5 rays, which are disposed in a whorl; corolla 5-cleft, with a naked throat. ♄. S. Native of the Sandwich Islands. Very like the preceding.

Chammisso's Coffee-tree. Shrub 4 to 6 feet.

39 C. Marinia'na (Cham. et Schlecht. in Linnæa. 4. p. 35.) leaves elliptic, acute at both ends, scrobiculate in the axils of the veins; stipulas ovate, deciduous, with the inner margins of the cicatrices ciliated; cymes terminal, pedunculate, with the branchlets decussate; corolla 5-cleft, with a bearded throat. ♄. S.

Native of the Island of O-Wahu, in forests on the mountains. Branches and branchlets of panicle compressed.

Marin's Coffee-tree. Shrub 4 to 6 feet.

Cult. All the species of *Coffèa* thrive well in a mixture of turfy loam, turfy peat, and sand. They require to be watered a good deal, and to have plenty of pot-room to thrive well. Ripe cuttings strike root freely in sand under a hand-glass in a moist heat; and the young plants so raised, produce flowers and fruit more readily than those raised from seed. As the plants are apt to be infested by insects, particularly the mealy bug, they should be examined often, and the insects rubbed off with a brush, otherwise the plants will look unsightly.

CLXVIII (A). RU'DGEA (named by Salisbury after Edward Rudge, F. R. and L. S., author of Plantarum Guianæ Rariorum, Icones et Descriptiones, 2 vol. fol. London, 1805). Salisb. in Lin. trans. 8. p. 327. Juss. mem. mus. 6. p. 381. D. C. prod. 4. p. 503.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with an ovate-globose tube, and a 5-parted limb; lobes acute. Corolla with a long slender terete tube, 5 linear spreadingly recurved segments, which are hooked on the back and acute, and a naked throat. Anthers sessile, within the throat, inclosed. Stigma bilamellate. Fruit 2-celled, 2-seeded.—Trees or shrubs, natives of Guiana. Branchlets and petioles clothed with cinereous down. Leaves opposite, large, smoothish. Stipulas interpetiolar, large, ovate, fringed, deciduous. Panicles terminal, dense, bracteolate, with the branches opposite. Flowers blackish in the dried state, but most probably white in the recent state. Fruit not sufficiently known.

1 R. LANCEÆFO'LIA (Salisb. l. c. t. 18.) leaves lanceolate, acuminated; tube of corolla 10 times longer than the lobes of the calyx. ♄. S. Native of French Guiana. Leaves 10 inches long, and about 3 broad. Corolla downy outside.

Lance-leaved Rudgea. Shrub or tree.

2 R. OVALIFÒLIA (Salisb. l. c. t. 19.) leaves oval, acuminated; tube of corolla 6 times longer than the lobes of the calyx. ♄. S. Native of French Guiana. Leaves 4-5 inches broad, and 7-8 long. Corolla downy outside.

Oval-leaved Rudgea. Shrub or tree.

Cult. See *Coffèa* above for culture and propagation.

CLXIX. ANTHERU'RA (from *ανθηρα, anthera,* an anther, and *ουρα, oura,* a tail; the anthers end in a long tail each). Lour. coch. p. 144. D. C. prod. 4. p. 503.—Psychótria species, Willd. Poir.

LIN. SYST. *Pentándria, Monogýnia.* All as in *Psychótria,* but the corolla is rotate and 5-parted; the anthers sagittate at the base, and furnished with a long reflexed tail at the apex; the style subulate, and longer than the corolla, and the stigma simple.—A glabrous shrub, with reddish diffuse branches. Leaves opposite, ovate-lanceolate, on short petioles. Panicles terminal, erect, loose, racemose. Flowers white, with red filaments. Berries ovate, brownish red. Stipulas unknown.

1 A. RU'BRA (Lour. coch. p. 144.) ♄. G. Native of Cochinchina and the Moluccas. Caryophyllàster rùber, and probably C. álbus, Rumph. amb. 3. p. 136. Psychótria rùbra, Poir. suppl. 4. t. 597. Psychótria Antherùra, Rœm. et Schultes, syst. 5. p. 188. Leaves 2-3 inches long.

Red-branched Antherura. Shrub 5 feet.

Cult. For culture and propagation see *Coffèa* above.

CLXX. RONA'BEA (Aublet does not give the meaning of this word). Aubl. guian. 1. p. 154. Lam. ill. t. 166. Juss. gen. p. 205. mem. mus. 6. p. 380. A. Rich. mem. soc. hist. nat. Par. 5. p. 270. D. C. prod. 4. p. 503.—Psychótria species, Willd.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with an ovate tube, and a small 5-toothed limb. Corolla oblong, rather funnel-shaped, with 5 spreading acute lobes, and a naked throat. Anthers 5, oblong, inclosed. Stigma bilamellate. Berry ovate, umbilicate, containing 2 1-seeded nuts, which are flat inside, and convex outside.—Glabrous shrubs, natives of Guiana. Leaves oval, acute, on short petioles. Stipulas solitary on both sides. Peduncles axillary, 2-6-flowered, shorter than the petioles. Flowers small, white. Bracteoles 2 under each flower.—Allied to *Psychótria,* but differs in the berries not being ribbed. Perhaps the species of *Psychótria* with axillary peduncles ought to be joined to this genus.

1 R. LATIFÒLIA (Aubl. guian. 1. p. 155. t. 59.) stems flexuous; leaves ovate, ending in a short point, variegated with green and blue above. ♄. S. Native of Guiana, in woods at Oyac-Orapu and Sinemari. Psychótria axillàris var. α, Willd. spec. 1. p. 962. Stems simple, nodose, twisted. Stipulas broad, acute. Flowers white. Lobes of corolla pilose. Berries black.

Broad-leaved Ronabea. Shrub 2 to 3 feet.

2 R. ERE'CTA (Aubl. guian. 1. p. 156.) stems erect; leaves ovate, acute, thin, greenish-yellow. ♄. S. Native of Guiana, in woods along with the preceding. R. latifòlia β, Gmel. syst. 1. p. 365. Psychótria axillàris β, Willd. spec. 1. p. 962. Leaves 4 inches long and 1½ broad. Flowers white. Berries black.

Erect Ronabea. Shrub 1 to 2 feet.

3 R.? MYODE'NDRON (A. Rich. in mem. soc. hist. nat. 5. p. 270.) leaves linear-lanceolate, very acute, petiolate; flowers disposed in few-flowered terminal corymbs; fruit didymous, hardly umbilicate. ♄. S. Native of Brazil, where it is called *Herbo do rato.* Flowers white.

Rat-tree Ronabea. Shrub.

4 R.? MORINDOÌDES (A. Rich. l. c.) leaves elliptic, acuminated, petiolate; flowers small, crowded into many terminal pedunculate pea-formed heads; fruit pea-formed, rather umbilicate at the apex; seeds chinky outside. ♄. S. Native of French Guiana. Flowers white.

Morinda-like Ronabea. Shrub.

5 ? R.? DIDYMOCA'RPOS (A. Rich. l. c.) leaves elliptic, acuminated, on short petioles; stipulas connate intrapetiolar truncate, furnished each with 2 bristles; flowers disposed in a terminal cyme; fruit didymous, umbilicated by a terminal dot. ♄. S. Native of French Guiana. This and the two preceding are very doubtful species of *Ronàbea,* from the flowers being terminal, and ought perhaps on that account to be joined with *Psychótria.*

Twin-fruited Ronabea. Shrub.

Cult. For culture and propagation see *Coffèa* above.

CLXXI. PSYCHO'TRIA (said to be from *ψυχη, psyche,* life; in allusion to the powerful medicinal qualities of *P. emética,* or as others say from *ψυχοτροφον, psychotrophon,* an ancient name for an herb loving shade). Lin. gen. no. 229. H. B. et Kunth, nov. gen. amer. 3. p. 354. D. C. prod. 4. p. 504.—Psychótrophum, P. Browne, jam.—Psychótria species, Juss. Lam. Willd.—Psychótria and Mapoúria, A. Rich.—Psychótria Simìra and Mapoúria, Aubl.

LIN. SYST. *Pentándria, Monogýnia.* Calyx with an ovate tube, and a short 5-lobed 5-toothed or nearly entire limb. Corolla short, funnel-shaped, 5-cleft, regular; limb spreading or reflexed; throat bearded or glabrous. Stamens 5; anthers exserted or inclosed in the throat. Stigma bifid. Berry drupaceous, crowned by the limb of the calyx, furnished with 10 blunt ribs in the dried state, containing 2 1-seeded chartaceously-coriaceous ribbed pyrenæ. Seed erect, with cartilaginous albumen, and a small basilar embryo.—Small trees or shrubs, rarely

herbs, natives within the tropics. Leaves opposite, petiolate. Stipulas variable. Peduncles sometimes axillary, but usually terminal. Flowers disposed in panicles or corymbs, rarely tetramerous, but almost always pentamerous; sometimes, however, there are tetramerous and pentamerous flowers to be found at the same time, and on the same plant. The species are very numerous and truly intricate, therefore difficult to define.

§ 1. *Peduncles axillary.—Perhaps all the species belonging to the present section belong to the genus Ronàbea.*

* *Species natives of South America.*

1 P.? excélsa (H. B. et Kunth, nov. gen. amer. 3. p. 355. t. 281.) arboreous; branchlets terete, downy; leaves oblong, acuminated, narrowed at the base, membranous, glabrous; stipulas deciduous; peduncles axillary, few-flowered; flowers tetramerous and tetrandrous. ♄. S. Native of Mexico, near Xalappa. Corolla white, glabrous: with the lobes oblong, and longer than the tube. Drupe globose, red, 2-celled; cells 1-seeded; ovula erect.

Tall Psychotria. Tree tall.

2 P.? emética (Mutis, in Lin. fil. suppl. p. 144. exclusive of the synonymes of Marcgrave and Piso,) plant suffruticose, erect, simple, pilosely tomentose; leaves oblong, acuminated, narrowed at the base, membranous, ciliated, rather pilose beneath; stipulas ovate, acuminated, very short; peduncles axillary, few-flowered, subracemose. ♄. S. Native of New Granada, near Nares on the banks of the Magdalena, and in the province of Girone. H. B. et Kunth, nov. gen. amer. 3. p. 355. Humb. et Bonpl. pl. equin. 2. p. 142. t. 126. Cephæ'lis emética, Pers. ench. 1. p. 203. Ipecacuánha noir, Rich. dict. sc. med. 26. p. 4. with a figure. Ipecacuánha, fl. med. 4. f. 201. Flowers white. Berries bluish, ovate-globose, smooth, not furrowed; hence it is probably a species of *Ronàbea*. Throat of corolla closed by villi. Root perpendicular, knotted, branched, emetic, with a slender axis and thick friable bark; and is the ipecacuanha supplied by Spanish America, but not that supplied by Brazil, which is *Cephæ'lis Ipecacuánha*.

Emetic Psychotria or Spanish American Ipecacuanha. Sh. 1 to 1½ foot.

3 P. hi'rta (Willd. in Rœm. et Schultes, syst. 5. p. 191.) branches, peduncles, petioles, and under side of leaves hairy; leaves obovate-oblong, acuminated at both ends; stipulas ovate, obtuse; peduncles axillary, 3-flowered. ♄. S. Native of New Granada, on Mount Quindiu. The rest unknown. Perhaps a variety of *P. rufescens*.

Hairy Psychotria. Shrub.

4 P. macrophy'lla (Ruiz et Pav. fl. per. 2. p. 56. t. 202. f. a.) plant herbaceous, glabrous; branches terete; leaves oval-lanceolate, acuminated, large, membranous; stipulas broad-ovate, unidentate, short-acuminated; panicles axillary, on short peduncles, with opposite dichotomous branches; fruit oval. ♃. S. Native of Peru, in forests on the Andes. Flowers small, sessile, white. Fruit of an obscure violaceous colour. Leaves a foot long. Stipulas beset with glands inside at the base.

Long-leaved Psychotria. Pl. 7 to 8 feet.

5 P. Willdenòwii (D. C. prod. 4. p. 505.) leaves oblong, attenuated at the base and apex, petiolate, coriaceous, shining, downy beneath; stipulas 2-lobed; panicles axillary, very short, sessile. ♄. S. Native of South America. P. magnoliæfòlia, Rœm. et Schultes, syst. 5. p. 190. P. floribúnda var. Spreng.

Willdenow's Psychotria. Shrub.

6 P. uliginòsa (Swartz, prod. p. 43. fl. ind. occ. p. 421.) plant subherbaceous, simple, erect, glabrous; leaves lanceolate-oblong, acuminated, shining; stipulas connate, acute, convex; cymes pedunculate, tripartite, opposite in the axils of the upper leaves; flowers sessile; corolla with a villous throat; berries spherical; seeds crested on the outside. ♄. S. Native of Jamaica, in low rather humid parts of the mountains. P. Browne, jam. p. 160. no. 1.? Root long, creeping. Berries scarlet, compressed in the dried state. Flowers pale red.

Bog Psychotria. Pl. 2 to 3 feet.

7 P. læ'vis (D. C. prod. 4. p. 505.) glabrous; leaves oval, acute at the base, and ending in a short cuspidate point at the apex, smooth above, almost nerveless; stipulas thick, with a reflexed acumen; peduncles axillary, compressed, shorter than the leaves, trifid at the apex, and each of the branchlets bearing crowded sessile flowers; fruit nearly globose, not crowned. ♄. S. Native of Porto-Rico, where it was collected by Bertero. P. Phytolácca, Spreng. in herb. Balb, and probably of Poir. Seeds compressed. Ribs of fruit thick, distant.

Smooth Psychotria. Shrub.

8 P. Hooke'ri; shrubby, glabrous; branches tetragonal; leaves lanceolate, tapering into the short petioles, coriaceously membranous, with finely reflexed margins, pale and reticulated beneath; stipulas oval, acute, deciduous; peduncles axillary, short; flowers on short pedicels, bracteate at the base; bracteas small, convolute, toothed; flowers dioecious; fruit oval, crowned by the limb of the calyx, which is tubular, and minutely 5-toothed at the apex. ♄. G. Native of Juan Fernandez. Hippòtis triflòra, Bertero, in ann. des scienc. nat. 21. p. 348. but not of R. and Pav. P.? triflòra, Hook. et Arn. in bot. misc. 3. p. 359. but not of Schum. Fruit a drupaceous berry, nearly half an inch long, inclosing 2 chartaceous pyrenæ.

Hooker's Psychotria. Shrub 3 to 5 feet.

9 P.? pyrifo'lia (Hook. et Arn. in bot. misc. 3. p. 360.) arboreous, glabrous; branches obscurely tetragonal; leaves broad-ovate or oblong, on long petioles, with erosely sinuated finely reflexed margins, coriaceously membranous, paler beneath and reticulated; stipulas broad-ovate, acute, deciduous; peduncles axillary, 3-flowered; drupe turbinate, crowned by the erect acuminated teeth of the calyx. ♄. G. Native of Juan Fernandez, where it is called *Peralillo* according to Bertero. Hippòtis pyrifòlia, Bertero, mss. Bertero thinks it may only be a variety of the preceding species, but it is much larger; he did not meet with the flower; but if its structure prove to be the same as the other, both merit being raised to the rank of a genus according to Arnott.

Pear-leaved Psychotria. Shrub 4 to 6 feet.

10 P. agna'ta (D. C. prod. 4. p. 505.) leaves narrow, oblong, attenuated at both ends, shining above, hairy beneath, and bearded on the mid-rib on both surfaces; stipulas acutely bidentate; peduncles axillary, corymbose at the apex, downy; flowers crowded on the tops of the branches of the peduncles; fruit nearly globose. ♄. S. Native of St. Domingo. Nerves of leaves yellowish. Leaves and branchlets crowded. Flowers downy outside when young. Berries glabrous. Perhaps sufficiently distinct from the next species.

Kindred Psychotria. Shrub.

11 P. neuro'tricha (D. C. l. c.) leaves elliptic-oblong, acuminated at both ends, glabrous, except the middle nerve, which is beset with a series of hairs on both surfaces; stipulas acutely bidentate, permanent; panicles axillary, rather deflexed, racemose, and rather pilose; flowers sessile, crowded on the tops of the lateral short branches of the panicle; fruit subobovate. ♄. S. Native of Porto-Rico. Bracteas broad, ovate, permanent, under the flowers. Berries glabrous. Flowers unknown.

Hairy-nerved-leaved Psychotria. Shrub.

** *Species natives of Africa.*

12 P. triflòra (Schum. pl. guin. p. 108.) shrubby; branches brachiate; branchlets rather tetragonal, pilose; leaves ovate,

bluntly acuminated, downy beneath; stipulas reniformly cordate, acute, entire; peduncles very short, axillary, 3-flowered. ♄. S. Native of Guinea. Flowers white.

Three-flowered Psychotria. Shrub 3 to 4 feet.

13 P. multiflo'ra (Schum. pl. guin. p. 108.) plant shrubby, decumbent or scandent, quite glabrous; branchlets rather tetragonal; leaves oblong-ovate, attenuated at the apex, on short petioles; stipulas entire, acuminated; panicles axillary, subcapitate; peduncles length of the petioles. ♄. S. Native of Guinea, at Asiama. Corolla white, downy inside.

Many-flowered Psychotria. Shrub decumbent.

14 P. umbella'ta (Schum. pl. guin. p. 108.) shrub much branched, glabrous; branchlets alternately compressed; leaves hardly petiolate, lanceolate; stipulas acuminated, cleft at the apex, deciduous; peduncles axillary, angular, trifid at the apex, umbelliferous; berries globose, umbilicate at the apex. ♄. S. Native of Guinea. Leaves 2-4 inches long. Peduncles 2 inches long. Corolla white.

Umbellate-flowered Psychotria. Shrub 3 to 4 feet.

15 P. Ko'lly (Schum. pl. guin. p. 110.) shrubby, glabrous; branchlets compressed; leaves petiolate, ovate-elliptic, acutish, of a different colour beneath; stipulas ovate, acutish; corymbs axillary and terminal, fastigiate; tube of corolla cylindrical. ♄. S. Native of Guinea, where it is called *Kolly-Tjo* by the natives.

Kolly-Tjo Psychotria. Shrub 3 to 4 feet.

16 P. obvalla'ta (Schum. pl. guin. p. 111.) plant herbaceous, creeping; petioles elongated, rather hairy at the apex; leaves oblong, cordate, obtuse, glabrous; stipulas ovate, acutish; peduncles almost axillary, usually 5-flowered; flowers girded by a foliaceous 4-leaved involucrum. 4. S. Native of Guinea, at Aquapim.

Environed Psychotria. Pl. creeping.

* * * *Species natives of Asia.*

17 P. Philippe'nsis (Cham. et Schlecht. in Linnæa. 4. p. 21.) glabrous and resinous; branchlets tetragonal; leaves obovate, very blunt, petiolate, coriaceous; stipulas very short, intrafoliaceous, permanent; cymes opposite, axillary or supra-axillary, 3 times shorter than the leaves, dichotomous; ovarium cylindrical, crowned by the truncate limb of the calyx. ♄. S. Native of the Island of Luzon, about Tierra Alta by the sea side.

Philippine Psychotria. Shrub.

§ 2. *Peduncles terminal.*

* *Species natives of Peru.*

18 P. reticula'ta (Ruiz et Pav. 2. p. 56. t. 212. f. b.) plant herbaceous, downy; branches tetragonal, glabrous; leaves ovate-lanceolate, acuminated, reticulately veined, rather coriaceous; stipulas subconcrete at the base, bifid beyond the middle, with the lobes linear-lanceolate and acuminated; panicles terminal, longer than the leaves, with opposite spreading hairy-velvety branches, and crowded flowers. 4. S. Native of Peru, on the Andes in groves. Leaves a foot long, downy beneath, and having the nerves purplish. Corolla small, yellow, downy outside, with a villous throat.

Reticulated-leaved Psychotria. Pl. 7 to 8 feet.

19 P. acutiflòra (D. C. prod. 4. p. 506.) leaves oblong, acuminated, ciliated, downy beneath, rather scabrous above, clothed with hairy tomentum on the mid-rib on both surfaces, as well as the branchlets; panicles terminal, erect, rather hairy, longer than the leaves, with cymosely bifid branches; segments of corolla mucronately cuspidate. ♄. S. Native of Guayaquil, where it was collected by Hænke. Guettárda acutiflòra, Bartl. in herb. Hænke. Nearly allied to *P. defléxa*. Stipulas connate, sheathing, ending each in a sublanceolate acumen.

Acute-flowered Psychotria. Shrub.

20 P. pilòsa (Ruiz et Pav. fl. per. 2. p. 60. t. 208. f. a.) suffruticose, pilose; branches tetragonal; leaves oblong, acuminated at both ends; stipulas bifid, with lanceolate acute lobes, which are about the length of the petioles; panicles short, terminal, on short peduncles, with opposite branches; bracteas lanceolate, acute, ciliated; teeth of calyx acute. ♄. S. Native of Peru, on the Andes in humid parts of forests. Leaves 4 inches long. Inflorescence as in *Aspérula*. Bracteas bluish. Peduncles hairy. Berries blue, about the size of peas.

Pilose Psychotria. Shrub 2 feet.

21 P. cymòsa (Ruiz et Pav. fl. per. 2. p. 59. t. 206. f. b.) suffruticose, glabrous; branches compressedly tetragonal; leaves oblong-lanceolate, acute, shining above; stipulas bipartite, with the lobes linear-subulate and distant; cymes terminal, on short peduncles, of 5 rays; segments of the calyx long, subulate; tube of corolla villous at the base; berries oval. ♄. S. Native of Peru, in groves on the Andes. Leaves 6 inches long. Peduncles compressed. Corolla purplish. Berries violaceous. Calyx almost as in *Geóphila*.

Cymose-flowered Psychotria. Shrub 3 to 4 feet.

22 P. magnoliæfo'lia (H. B. et Kunth, nov. gen. amer. 3. p. 360. but not of Willd.) glabrous; branchlets compressed; leaves elliptic, bluntish at both ends, rather membranous; stipulas oblong, obtuse, length of the petioles; cymes pedunculate, of 4 spreading rays; flowers sessile, usually by threes. ♄. S. Native about Quito. Fruit unknown. Said to be allied to *P. ardisiæfòlia*. Leaves 7-8 inches long and 4-5 broad, on petioles 8-9 lines long.

Magnolia-leaved Psychotria. Shrub 4 to 6 feet.

23 P. glomera'ta (H. B. et Kunth, nov. gen. amer. 3. p. 362.) glabrous; branchlets compressed; leaves oblong or obovate-oblong, acute, narrowed at the base, membranous; stipulas lanceolate, acuminated, ciliated; panicles pedunculate, very simple, spreading; flowers disposed in verticillate heaps, sessile; fruit nearly globose. ♄. S. Native of Peru. Said to be allied to *P. ardisiæfòlia*, but the inflorescence is different. Sprengel asserts this species to be a native of New Granada and Brazil, but without giving any authority for so stating.

Heaped-flowered Psychotria. Shrub.

24 P. rugulòsa (H. B. et Kunth, nov. gen. amer. 3. p. 556.) glabrous; branches compressed; leaves lanceolate, long-acuminated, rather coriaceous, narrowed at the base, a little wrinkled, foveolate in the axils of the veins beneath; stipulas lanceolate, acuminated; panicles pedunculate, having the lower branches 4 in a whorl, and spreading; fruit nearly globose, didymous. ♄. S. Native of the temperate parts of Peru.

Wrinkled-leaved Psychotria. Shrub.

25 P. vi'ridis (Ruiz et Pav. fl. per. 2. p. 61. t. 210. f. b.) glabrous; branchlets somewhat tetragonal; leaves oblong, acuminated, foveolate in the axils of the veins beneath at the base; stipulas connate, lanceolate, caducous, one-half longer than the petioles; panicles pedunculate, terminal, with opposite branches; flowers crowded, sessile; berry globose. ♄. S. Native of Peru, in groves on the Andes. Palicùrea víridis, Rœm. et Schultes, syst. 5. p. 195. Corollas small, green, with a hairy throat. Anthers inclosed. This has nothing to do with *Palicùrea tinctòria*, with which it has been confounded by Sprengel. Leaves 3-4 inches long.

Green-flowered Psychotria. Shrub 6 to 7 feet.

26 P. repa'nda (Ruiz et Pav. fl. per. 2. p. 61.) glabrous; branches somewhat tetragonal, leafy at the top; leaves lanceolate-oblong, repand; stipulas connate at the base, lanceolate, ciliated on the back and margins, caducous; panicles terminal, with brachiate compressed branches; bracteoles ovate, acute; flowers sessile, on the tops of the branches of the panicle.

ħ. S. Native of Peru, on the Andes in groves. Corolla small, yellow, with a villous throat. Berries size of pepper-corns, purple.

Repand-leaved Psychotria. Shrub 4 to 6 feet.

27 P. foveola'ta (Ruiz et Pav. fl. per. 2. p. 59. t. 207. f. b.) leaves narrow-lanceolate, acuminated at both ends, hardly petiolate, with the axils of the upper veins often glandularly foveolate, but downy on the veins beneath, as well as the branchlets and peduncles; stipulas oval, deciduous; panicles pedunculate, having the branchlets drooping while bearing the fruit; flowers 3-5, sessile at the top of each branch of the panicle. ħ. S. Native of Peru, on the Andes in groves, at Chinchao and Cuchero, ex Ruiz et Pav.; and on the mountains about the Guanocco, ex herb. Hænke. P. foveolàta, Spreng. syst. 1. p. 743. no. 39. exclusive of the synonymes. Branches rather tetragonal. Corolla small, cream-coloured. Berries ovate, purplish-green, ex Bartl, globose and rufous, and about the size of pepper berries.

Foveolate-leaved Psychotria. Tree 18 feet.

28 P. divarica'ta (H. B. et Kunth, nov. gen. amer. 3. p. 362. but not of Willd.) glabrous; branchlets terete; leaves lanceolate-oblong, acute, narrowed at the base, membranous, foveolate in the axils of the veins beneath; panicles pedunculate, rather ovate, with opposite spreading branches; flowers pedicellate. ħ. S. Native of Peru, on the Andes in temperate places about Quito. Very nearly allied to *P. foveolàta*. There is a variety of this with tetramerous tetrandrous flowers.

Divaricate Psychotria. Shrub.

29 P. virga'ta (Ruiz et Pav. fl. per. 2. p. 60. t. 209. f. a.) glabrous; leaves oblong or elliptic, acuminated, coriaceous, reticulately-veined beneath; stipulas bluntly bifid, length of the petioles; cymes on short peduncles, trichotomous, crowded with flowers; flowers almost sessile, on the tops of the branches of the cyme; fruit oval. ħ. S. Native of Peru, on the Andes in cold mountain forests. Leaves 4 inches long, with red nerves, and reflexed margins, bitter, and supplying a yellow colour when dried. Corollas sulphur-coloured, with a villous throat. Berries ovate, deep blue, size of peas. P. virgàta Jamaicénsis, Spreng. syst. 1. p. 742. is perhaps a very distinct species from the present.

Twiggy Psychotria. Shrub 9 to 10 feet.

30 P. cuneifòlia (D. C. prod. 4. p. 507.) glabrous; leaves obovate, cuneated at the base, and ending in a short cuspidate point at the apex; stipulas small, deciduous; panicles erect, shorter than the leaves, with opposite branches. ħ. S. Native of Peru, at Guayaquil. P. glabràta, Bartl. in herb. Hænke, but not of Swartz. Flowers unknown. Berries ovate-globose, 10-striped in the dried state. Seeds semi-ovate.

Wedge-leaved Psychotria. Shrub.

31 P. Hænkea'na (D. C. prod. 4. p. 507.) glabrous; leaves oval-oblong, acuminated at both ends; stipulas bifid on both sides, acuminated; peduncles a little shorter than the leaves; cymes contracted. ħ. S. Native of Guayaquil, and probably of Mexico. P. pedunculàta, Bartl. in herb. Hænke. Allied to P. pedunculàta, Swartz, but differs in the stipulas being much more acuminated, in the leaves being narrower, and more acuminated at both ends. Cymes obconical. Flowers and fruit unknown.

Hænke's Psychotria. Shrub.

32 P. trífida (Ruiz et Pav. fl. per. 2. p. 60. t. 209. f. b.) smoothish; branchlets bluntly tetragonal; leaves lanceolate, acuminated, shining above, but downy along the nerves and veins beneath; stipulas connate at the base, acutely bifid at the apex; cymes sessile, tripartite, with the branches again trifid; flowers sessile, by threes at the tops of the branchlets of the cyme; corollas downy; berries roundish-turbinate. ħ. S. Native of the Andes of Peru, in mountain groves. Leaves 3 inches long. Throat of corolla villous. Berries black.

Trifid-cymed Psychotria. Tree 18 feet.

33 P. capita'ta (Ruiz et Pav. fl. per. 2. p. 59. t. 206. f. a.) smoothish; branchlets slightly tetragonal; leaves oblong, acuminated, very veiny, downy beneath; stipulas bifid, obtuse; panicles shorter than the leaves, ovate, terminal, on short peduncles; peduncles bracteate, opposite; flowers crowded. ħ. S. Native of Peru, on the Andes in groves. Cephæ'lis Peruviàna, Spreng. syst. 1. p. 749. Stipulas hispid, glandular on the inner side at the base. Bracteas lanceolate; bracteoles ovate, acute. Berries ovate, blackish, umbilicate.

Capitate-flowered Psychotria. Shrub 9 to 10 feet.

34 P. villòsa (Ruiz et Pav. fl. per. 2. p. 59. t. 207. f. a.) branchlets, peduncles, petioles, and nerves of leaves clothed with rufous villi; leaves attenuated at both ends, glabrous above in the adult state, downy on the nerves beneath; stipulas ovate-oblong, acute, caducous; panicles pedunculate, with the branches and branchlets opposite; flowers by threes, glabrous. ħ. S. Native of the Andes of Peru, in mountain groves. Bartl. in herb. Hænke. Knots of branches pilose. Leaves 4-5 inches long. Bracteas small, acuminated. Berries red, globose, rather compressed, size of small peas. Allied to *P. micrántha* and *P. hirsùta*.

Villous Psychotria. Shrub 9 to 10 feet.

35 P. micra'ntha (H. B. et Kunth, nov. gen. amer. 3. p. 363. t. 284.) hairy from rufescent villi; branchlets terete; leaves obovate-elliptic, acuminated, cuneated at the base, rather coriaceous; stipulas oblong, awnedly bidentate; cymes pedunculate, of 6 rays, diffuse; flowers glomerate; corollas hairy on the outside; fruit globosely elliptic, hairy. ħ. S. Native of Peru, ex Kunth; or at the river Magdalena, ex Willd. P. rufescens, Willd. in Rœm. et Schultes, syst. 5. p. 192. but not of Kunth.

Small-flowered Psychotria. Shrub.

36 P. subtomentòsa (Ruiz et Pav. fl. per. 2. p. 61. t. 210. f. a.) clothed with downy tomentum; branchlets bluntly tetragonal; leaves lanceolate-oblong, acute; stipulas connate at the base, acutely bifid at the apex; corymbs pedunculate, trifid, bearing almost sessile crowded flowers at the tops of the branchlets; corollas hairy. ħ. S. Native of the Andes of Peru, in mountain groves. Leaves 3 inches long, white beneath. Stipulas glandular. Calyx and corolla blue. Bracteas subulate. Cephæ'lis subtomentòsa, Spreng. syst. 1. p. 749.

Subtomentose Psychotria. Shrub 4 to 6 feet.

** *Species natives of Brazil.*

37 P. a'lba (Ruiz. et Pav. fl. per. 2. p. 58. t. 205. f. a.) smoothish; branchlets compressed; leaves elliptic-oblong, acute at both ends, beset with rows of hairs along the nerves beneath, and often foveolate in the axils of the nerves; stipulas ovate-oblong, undivided, rather concrete; panicles pedunculate, terminal, shorter than the leaves, with the branches opposite; calyx short, truncate; berries ovate. ħ. S. Native of South America, especially in tropical Brazil, Guayaquil, and Andes of Peru. Cham. et Schlecht. in Linnæa. 4. p. 19. P. ardisiæfòlia, H. B. et Kunth, nov. gen. amer. 3. p. 359. Bartl. in herb. Hænke. P. densiflòra, Willd. in Rœm. et Schultes, syst. 5. p. 189. P. pàtula, Willd. in Rœm. et Schultes, syst. 5. p. 189. P. ardisiæfòlia, P. pàtula, and P. álba, Spreng. Leaves 6-8 inches long. Stipulas obovate, hairy at the base. Bracteas conniving, ovate, acute. Flowers and berries white.

Var. β, tónsa (Cham. et Schlecht. in Linnæa. 4. p. 19.) leaves glabrous, nearly obovate, few-veined. ħ. S. Native of Brazil, near Rio Janeiro.

White-berried Psychotria. Shrub 12 feet.

38 P. leioca'rpa (Cham. et Schlecht. in Linnæa. 4. p. 22.)

smoothish; leaves narrow-lanceolate, acuminated at both ends, membranous; stipulas rather concrete, bidentate on both sides; cymes pedunculate, terminal: with the branchlets slender, opposite or verticillate, downy; flowers tetrandrous, rarely pentandrous; calyx 5-lobed; fruit globose, ribless. ♄. S. Native of tropical Brazil.

Var. β, extratrópica (Cham. et Schlecht. in Linnæa. 4. p. 22.) cymes quite glabrous; flowers triandrous or tetrandrous; calycine teeth unequal. ♄. S. Native of the south of Brazil, without the tropic. Perhaps a proper species.

Smooth-fruited Psychotria. Shrub 4 to 6 feet.

39 P. nitídula (Cham. et Schlecht. in Linnæa. 4. p. 25.) quite glabrous; leaves lanceolate, acuminated, on very short petioles; stipulas triangular, acute, at length bifid, permanent; cymes terminal, pedunculate, length of leaves of 5 compressed rays, 4 of them in a whorl, and the other in the centre of these 4; calyx acutely 5-toothed. ♄. S. Native of tropical Brazil. Leaves 3-4 inches long, and 10-18 lines broad. Flowers small, pedicellate. Fruit unknown.

Shining-leaved Psychotria. Shrub 4 to 6 feet.

40 P. formòsa (Cham. et Schlecht. in Linnæa. 4. p. 24.) leaves glabrous, obovate or elliptic, short-acuminated, cuneated at the base, of the consistence of parchment; stipulas ovate, acute, small, deciduous; panicles terminal, pedunculate, loose, longer than the leaves, downy or hairy; lobes of the corolla acute, bearded at the apex. ♄. S. Native of tropical Brazil. Very like *P. álba*, and the cicatrices of the stipulas are beset with rufous villi, as in it.

Beautiful Psychotria. Shrub 6 to 8 feet.

41 P. cuspida'ta (Bred. ex Willd. in Rœm. et Schultes, syst. 5. p. 192.) smooth and glabrous; leaves oval, cuneated at the base, acuminated at the apex, scrobiculately villous in the axils when old; stipulas bidentate, truncate; panicles terminal, pedunculate, 3 times shorter than the leaves, with compressed branches, which are dilated at the ramifications. ♄. S. Native of tropical Brazil, and at Caraccas. Allied to *P. nonatelioìdes* and *P. cornifòlia*.

Cuspidated-leaved Psychotria. Shrub 5 to 6 feet.

42 P. nonatelioìdes (Cham. et Schlecht. in Linnæa. 4. p. 26.) smooth and glabrous; branchlets compressed; leaves lanceolate, acute at the base, and long-acuminated at the apex, membranous; stipulas 2-lobed, permanent; cymes racemose, terminal, one-half shorter than the leaves; pedicels 3-flowered: middle flower and one of the lateral ones tribracteate. ♄. S. Native of tropical Brazil, and at Caraccas. P. involucràta, Willd. herb. Fruit unknown. Habit of *P. cornifòlia*.

Nonatelia-like Psychotria. Shrub.

43 P. nóxia (St. Hil. pl. rem. bras. p. 234. t. 21. f. *a*.) branchlets compressed, furnished with 2 rows of hairs; leaves lanceolate, acuminated, on short petioles, approximate, glabrous; stipulas short, bipartite; flowers 2-4 in a fascicle, sessile, bracteate, terminal, and axillary; bracteas acuminated, ciliated; fruit elliptic. ♄. S. Native of Brazil, in the province of Minas Geraes. This species is supposed to be hurtful to animals who eat it.

Hurtful Psychotria. Shrub 5 to 6 feet.

44 P. ellíptica (Ker. bot. reg. t. 607. but not of Willd.) glabrous; leaves elliptic, attenuated at both ends, shining, membranous; stipulas sheathing, ovate, rather erosely fringed, deciduous; cymes terminal, sessile, tripartite, with trichotomously panicled branches, shorter than the leaves. ♄. S. Native of Brazil. Flowers short, white. Calyx cup-shaped, slightly toothed.

Elliptic-leaved Psychotria. Fl. May, June. Clt. 1821. Sh. 3-4 feet.

45 P. chænótricha (D. C. prod. 4. p. 509.) quite glabrous; branchlets compressed; leaves elliptic, acuminated at both ends, smooth; stipulas short, bifid at both sides; corymbs terminal, sessile, with umbellate branches, much shorter than the leaves, each branch bearing 4-5 flowers at the apex; corollas glabrous on the outside, but villous in the throat. ♄. S. Native of Brazil, at Bahia, in sand by the sea-side, where it was collected by Salzmann. Flowers cream-coloured. Anthers copper-coloured, sessile in the throat of the corolla among the villi. Style a little exserted.

Gaping-haired Psychotria. Shrub.

46 P. barbiflòra (D. C. prod. 4. p. 509.) quite glabrous; branchlets compressed; leaves oval-ovate, acute at the base, acuminated at the apex, shining above; stipulas combined at the base, biaristate; peduncles terminal, very short, densely corymbose at the apex, bracteate under the flowers; corolla glabrous outside, with the lobes of the limb hairy above. ♄. S. Native of Brazil, on hills about Bahia, where it was collected by Salzmann. Style exserted. Anthers inclosed. Fruit black, globose, a little furrowed.

Bearded-flowered Psychotria. Shrub 4 to 6 feet.

47 P. Bahie'nsis (D. C. prod. 4. p. 509.) quite glabrous; leaves elliptic, attenuated at the base, acuminated at the apex, shining above; stipulas rather concrete at the base, and furnished with 2 ligulæ on both sides, lanceolate, acuminated; peduncles terminal, one-half shorter than the leaves, racemosely corymbose at the apex; corollas beardless. ♄. S. Native of Brazil, about Bahia, where it was collected by Salzmann. Shrub 3 feet high. Flowers white, probably dioecious. Branches compressed.

Var. α, stylòsa (D. C. l. c.) style exserted; anthers inclosed; fruit globose, sub-didymous, hardly furrowed.

Var. β, staminea (D. C. l. c.) style inclosed; anthers exserted. Perhaps a proper species, or the male variety of the preceding.

Bahia Psychotria. Shrub 3 feet.

48 P.? sambu'cina (Link, in Rœm. et Schultes, syst. 5. p. 188.) glabrous: leaves ovate-lanceolate, acuminated, petiolate; stipulas deciduous; branches of the panicle glabrous, verticillate, 3 times shorter than the leaves. ♄. S. Native of Brazil. Leaves a span long, and 3-4 inches broad, of a livid black colour in the dried state.

Elder-like Psychotria. Shrub.

49 P. longifòlia (Hoffmans. ex Willd. in Rœm. et Schultes, syst. 5. p. 190.) leaves ovate-oblong, acuminated, cuneately attenuated at the base; stipulas bifid; panicles terminal. ♄. S. Native of Brazil. Leaves a foot long. Perhaps the same as *P. racemòsa*.

Long-leaved Psychotria. Shrub.

50 P. grandifòlia (Hoffmans. ex Willd. in Rœm. et Schultes, syst. 5. p. 190.) leaves ovate, acute; stipulas bifid, obtuse; flowers panicled. ♄. S. Native of Brazil. Leaves half a foot long. Corollas yellow. Very like *P. latifòlia*, but differs in the form of the stipulas.

Great-leaved Psychotria. Shrub.

* * * *Species natives of Guiana.*

51 P. Mapu'ria (Rœm. et Schultes, syst. 5. p. 187.) glabrous; leaves obovate, each ending in a short blunt acumen, cuneated at the base; stipulas ovate-roundish, deciduous; panicles terminal, shorter than the leaves; fruit ovate-globose, striated. ♄. S. Native of French Guiana, on the banks of rivers. Mapoùria Guianénsis, Aubl. guian. 1. p. 175. t. 67. Simìra nítida, Poir. dict. 7. p. 196. P. nítida, Willd. spec. 1. p. 963. Leaves 8 inches long, and 4-5 broad. Corollas white, having the limb longer than the tube. Stamens filiform, exserted. Stigma bilamellate.

Mapuria Psychotria. Shrub 7 to 8 feet.

52 P. Mapourioìdes (D. C. prod. 4. p. 509.) glabrous; leaves elliptic, cuneated at the base, short-acuminated at the apex; stipulas obovate, foliaceous, deciduous, length of the petioles; panicles rising from the forks of the branches, pedunculate, hardly shorter than the leaves; fruit ovate, striated. ♄. S. Native of French Guiana, where it was collected by Patris. Very nearly allied to *P. Mapoùria*, but differs from that species in the above characters, besides in the longer leaves, larger stipulas, and in the peduncle of the fructiferous panicle being 4 inches long.

Mapouria-like Psychotria. Shrub 5 to 6 feet.

53 P. Simìra (Rœm. et Schultes, syst. 5. p. 187.) glabrous; leaves elliptic-ovate, abruptly acuminated, with parallel veins, paler beneath; stipulas ovate, acuminated, deciduous; panicles erect, on short peduncles, one-half shorter than the leaves; berries oval. ♄. S. Native of French Guiana, in humid parts of woods. Simìra tinctòria, Aubl. guian. 1. p. 170. t. 65. P. parviflòra, Willd. spec. 1. p. 962. Bark red on the inside. Leaves 14 inches long, and 6 broad, with the nerves red beneath. Branches of the panicle short. Corolla white, with rounded segments, ex Aubl., but acute segments, ex Rich., shorter than the stamens. The bark of this shrub is used to dye silk and cotton of a red colour. *Simira* is the Guiana name of the tree.

Simira Psychotria. Shrub 10 to 12 feet.

54 P. Patrísii (D. C. prod. 4. p. 510.) glabrous; leaves elliptic-oblong, acuminated at both ends; stipulas elliptic, acutish, deciduous; panicles pedunculate, a little shorter than the leaves, having the branches and branchlets opposite; fruit ovate, striated, terminated by a short conical horn. ♄. S. Native of French Guiana, where it was collected by Patris, along with many other species. Branches terete. Leaves 5-6 inches long, and 2 or $2\frac{1}{2}$ broad. From the stipulas and habit, this species comes near to *P. Mapùria*.

Patris's Psychotria. Shrub 6 to 8 feet.

55 P. soròria (D. C. l. c.) glabrous; leaves elliptic-oblong, acuminated at both ends; stipulas triangularly-elliptic, acute, deciduous; panicles terminal, pedunculate, hardly shorter than the leaves, with the branches and branchlets opposite; fruit nearly globose, striated, truncate at the apex. ♄. S. Native of French Guiana, where it was collected by Patris. Very nearly allied to *P. Patrísii*, but the berries are fewer, and larger round, without horns, and crowned by the 5 small teeth of the calyx.

Sister Psychotria. Shrub 6 to 8 feet.

56 P. ficige'mma (D. C. prod. 4. p. 510.) glabrous; leaves oval, acuminated at both ends; stipulas oblong, acuminated, deciduous; panicles pedunculate, longer than the leaves, having the branches and branchlets opposite; fruit ovate, striated. ♄. S. Native of French Guiana, where it was collected by Patris. The buds and stipulas are oblong and acute, and very much like those of the fig-tree. Peduncle of the panicle 3 inches long. Fruit small. Allied to *P. Simìra*.

Fig-budded Psychotria. Shrub 5 to 6 feet.

57 P. racemòsa (A. Rich. act. soc. hist. nat. par. 1792. p. 107.) glabrous; leaves elliptic-oblong, acuminated at both ends, shining beneath; stipulas bifid, with the lobes acuminated; racemes terminal, pedunculate, straight, one half shorter than the leaves; rachis of the raceme angular, downy; fruit compressed, coarsely ribbed. ♄. S. Native of French Guiana. Leaves 10 inches long, and 3 broad, on petioles which are nearly an inch long. Flowers unknown.

Racemose-flowered Psychotria. Shrub.

58 P. flexuòsa (Willd. spec. 1. p. 966.) glabrous, subherbaceous; branches compressed; leaves oval, acuminated, on short petioles, membranous; stipulas bipartite, acuminated, equal in length to the petioles; panicles terminal, racemose, pedunculate, shorter than the leaves; berries globose, compressed, rather didymous. ♄. S. Native of Cayenne, in sterile places. Nonatèlia paniculàta, Aubl. guian. 1. p. 181. t. 70. f. 2. Flowers white. Berries violaceous.

Flexuous Psychotria. Shrub 2 feet.

59 P. defle'xa (D. C. prod. 4. p. 510.) glabrous; branches and peduncles compressed; leaves ovate-lanceolate, or oval-lanceolate, acuminated at the apex, and acute at the base, membranous; stipulas twin on both sides, lanceolate, hardly joined at the base; panicles pedunculate, shorter than the leaves, with reflexed compressed branchlets, which are bearded in the axils; flowers small, tetramerous. ♄. S. Native of French Guiana, where it was collected by Patris. Very nearly allied to *P. flexuòsa*, but differs in the flowers being tetramerous and tetrandrous.

Deflexed-peduncled Psychotria. Shrub 1 to 2 feet.

60 P. panicula'ta (Willd. spec. 1. p. 970.) glabrous; leaves ovate, acuminated at both ends, veiny; stipulas connate, bidentate; panicles terminal, erect; berries globose, compressed, subdidymous. ♄. S. Native of Surinam and other parts of South America.

Var. β, oblongàta (D. C. prod. 4. p. 510.) leaves oblong; panicles weak. ♄. S. Native of French Guiana, where it was collected by Patris. Nerves of the leaves and peduncles yellowish. Panicles the length of the leaves.

Panicled-flowered Psychotria. Tree, tall.

61 P. bractea'ta (D. C. prod. 4. p. 510.) glabrous; leaves oblong, acuminated, almost sessile, stiff, shining above, with revolute margins; stipulas twin on both sides, linear, acuminated, longer than the petioles, which are very short; cymes trichotomous, on short peduncles; bracteas oblong, many, under the flowers; fruit nearly globose, striated. ♄. S. Native of French Guiana, where it was collected by Patris. This is a very distinct species. Leaves 3 inches long, and 8-9 lines broad. Petioles 1-2 lines long. Peduncle of the cyme compressed, 9-10 lines long.

Bracteate-flowered Psychotria. Shrub 4 to 6 feet.

62 P. platy'poda (D. C. l. c.) glabrous; leaves oval or oblong, acuminated, with parallel nerves; stipulas connate, short, bidentate on both sides; cymes terminal, 4-parted, on very short peduncles, girded by 4 large ovate bracteas, having the branches compressed so much as to be 2-edged, the secondary branches bearing the flowers at their tops; fruit round, depressed, coarsely ribbed. ♄. S. Native of French Guiana, where it was collected by Patris. The leaves and peduncles become yellowish on drying. Leaves 5-6 inches long, and 2-3 broad. Petioles 4-6 lines long.

Broad-peduncled Psychotria. Shrub 6 to 8 feet.

63 P. bre'vipes (D. C. prod. 4. p. 511.) glabrous; branchlets compressed; leaves elliptic, acuminated at both ends, shining above; stipulas twin on both sides, linear, acuminated, hardly joined at the base; cymes irregularly branched, on short peduncles, rather bracteate; fruit roundish, compressed, profoundly ribbed. ♄. S. Native of French Guiana. Fructiferous cymes equal in length to the attenuated part of the base of the leaves. Leaves 5 inches long, and 2 broad. Petioles 1-3 lines long.

Short-peduncled Psychotria. Shrub.

* * * * *Species natives of Columbia.*

64 P. Carthagene'nsis (Jacq. amer. p. 65. t. 174. f. 22.) glabrous; leaves obovate or elliptic, rather coriaceous, attenuated at both ends; stipulas ovate, rather membranous, rufous, deciduous; peduncles elongated, corymbose, trichotomous, rising from the forks of the branches; throat of the corolla villous;

berries ovate. ♄. S. Native of Carthagena, among bushes, ex Jacq.; and of St. Domingo, ex Bertero. P. Carthagenénsis, Spreng. ex Balb. Corollas white, having the tube much exceeding the limb, which is said to be 6-7-cleft, and the stamens are 6-7, according to Jacquin. Berries red, crowned by the calyx, which is of the same colour. Willdenow says that the stipulas are emarginate; but they are probably entire and obtuse.

Carthagena Psychotria. Shrub 5 to 6 feet.

65 P.? calycìna (H. B. et Kunth, nov. gen. amer. 3. p. 356.) glabrous; branchlets compressed; leaves lanceolate or oblong, long-acuminated, narrow at the base, membranous; stipulas oblong, obtuse; corymbs pedunculate, trichotomous, spreading; calyxes cucullately spathaceous, cleft on one side. ♄. S. Native of New Granada. Calyx campanulate, 5-toothed, one half shorter than the corolla. On account of the form of the calyx, this plant does not agree with the present genus, but the fruit is unknown.

Large-calyxed Psychotria. Shrub.

66 P. salicifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 360. but not of Willd.) glabrous; branchlets compressed; leaves lanceolate, acuminated at both ends, membranous; stipulas oblong, acute, fascescent; panicles pedunculate, with opposite, much-spreading branches; fruit spherical. ♄. S. Native of New Granada.

Willow-leaved Psychotria. Shrub.

67 P. a'nceps (H. B. et Kunth, nov. gen. amer. 3. p. 360.) glabrous; branches 2-edged; leaves oblong, acuminated at both ends, shining above, scrobiculate in the axils of the veins beneath; stipulas ovate, acutish; cymes pedunculate, trichotomous, spreading; flowers sessile, usually by threes; fruit ovate. ♄. S. Native of New Granada, in temperate places, near the cataract of Tequendama.

Two-edged-branched Psychotria. Shrub.

68 P. lu'cida (H. B. et Kunth, nov. gen. amer. 3. p. 361. t. 288. but not of Willd.) glabrous; branches 2-edged; leaves lanceolate-oblong, acuminated at both ends, coriaceous, shining above; stipulas ovate, acute, deciduous; corymbs pedunculate, dichotomous, spreading; bracteoles and teeth of the calyx ciliated; fruit nearly globose. ♄. S. Native of New Granada, on the banks of the river Magdalena, near Honda. P. viburnoìdes, in Rœm. et Schultes, syst. 5. p. 189. but not of Kunth. Flowers usually by threes, sessile, about the size of those of the privet.

Shining-leaved Psychotria. Tree 20 feet.

69 P. cornifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 362.) glabrous; branchlets terete; leaves almost sessile, ovate-rhomboid, acuminated, cuneated at the base, membranous; corymbs pedunculate, terminal, bifid, divaricate; fruit roundish, compressed. ♄. S. Native on the banks of the Orinoco, near Maypures. Stipulas and flowers unknown. Perhaps a distinct genus.

Dogwood-leaved Psychotria. Shrub.

70 P. viburnoìdes (H. B. et Kunth, nov. gen. amer. 3. p. 361. but not of Willd.) glabrous; branchlets compressed; leaves oblong, acuminated at both ends, coriaceous, shining above; stipulas ovate, acute, deciduous; cymes pedunculate, of 4 rays, spreading; bracteoles and teeth of the calyx ciliated. ♄. S. Native on the banks of the Orinoco, near the cataract of Atures. Very like *P. lùcida*.

Viburnum-like Psychotria. Shrub.

71 P. Borje'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 557.) smoothish; branchlets compressed; leaves lanceolate, acuminated at both ends, membranous, with undulated margins, shining a little; stipulas ovate, acute; cymes pedunculate of 5 rays, spreading, the rays clothed with powdery down. ♄. S. Native in woods, on the banks of the Orinoco, near San-Borja. P. ligustrìna, Willd. in Rœm. et Schultes, syst. 5. p. 188. Nearly allied to *P. rugulòsa*, but the flowers are smaller, &c. Leaves glabrous on both surfaces according to Kunth, but according to Willdenow the leaves are downy underneath.

San-Borja Psychotria. Shrub.

72 P. glauce'scens (H. B. et Kunth, nov. gen. amer. 3. p. 558.) branchlets terete, hairy; leaves oblong or lanceolate-oblong, acuminated, acute at the base, with sub-undulated margins, rather coriaceous, glabrous, glaucescent beneath, foveolate in the axils of the veins beneath, and downy on the veins; stipulas ovate, acuminated; cymes pedunculate of 5 spreading rays; pedicels hairy; fruit nearly globose-elliptic. ♄. S. Native on the banks of the Orinoco, and near the city of Angostura. P. divaricàta, Willd. in Rœm. et Schultes, syst. 3. p. 191.

Glaucescent Psychotria. Shrub 10 to 15 feet.

73 P. rufe'scens (Spreng. syst. 1. p. 741.) branchlets, stipulas, peduncles, petioles, and nerves of the leaves clothed with rusty hairs; leaves obovate-oblong, acuminated, narrow at the base; stipulas oval, obtuse; cymes sessile, of 3-4 rays or branches, the rays bearing almost sessile, crowded flowers at their tops. ♄. S. Native of South America.

Var. α, *ferruginea* (D. C. prod. 4. p. 512.) branches subtrigonal; flowers conglomerate; stipulas acutish, half an inch long. ♄. S. Native of New Andalusia, near Caripe. The corolla is said to be white, with a villous throat and reflexed lobes. Fruit unknown. P. rufescens, H. B. et Kunth, nov. gen. amer. 3. p. 364. but not of Willd. Bertièra ferruginea, Willd. in Rœm. et Schultes, syst. 5. p. 227.

Var. β, *hirta* (D. C. l. c.) branchlets compressed; flowers usually by threes; stipulas obtuse. ♄. S. Native of New Granada, on the Andes, about Quindiu. P. hírta, H. B. et Kunth, nov. gen. amer. 3. p. 364. but not of Willd. Corolla hairy outside. Berry oblong.

Var. γ, *Hænkeàna* (D. C. l. c.) branchlets compressed; stipulas obtuse, hairy in the young state, and glabrous in the adult state; flowers conglomerate; corollas hairy outside; berries ovate-oblong. ♄. S. Native of Mexico. P. rufescens, Bartl.

Rufescent Psychotria. Shrub.

74 P. diervilloìdes (H. B. et Kunth, nov. gen. amer. 3. p. 358.) clothed with fine hairy tomentum; branchlets compressed; leaves ovate-acuminated, rounded at the base, membranous, glabrous above; stipulas oblong, obtuse; cymes pedunculate of 4 spreading rays; pedicels and calyxes hairy. ♄. S. Native of South America, near Angostura. Petioles glabrous. Stipulas equal. Lobes of the corolla revolutely reflexed. Fruit unknown.

Diervilla-like Psychotria. Shrub.

75 P. Orinoce'nsis (D. C. prod. 4. p. 512.) leaves on short petioles, roundish-ovate, acute, shining; stipulas 2-lobed; corymbs divaricate. ♄. S. Native on the banks of the Orinoco. P. cornifòlia, Willd. in Rœm. et Schultes, syst. 5. p. 191. but not of Kunth.

Orinoco Psychotria. Shrub.

76. P. latifòlia (Willd. in Rœm. et Schultes, syst. 5. p. 189.) leaves ovate, acute at both ends, ribbed; stipulas acutely bidentate; panicles terminal, elongated. ♄. S. Native on the banks of the Orinoco, in shady places. Humb. et Bonpl. Leaves a foot long, very broad, shining on both surfaces, downy on the veins beneath. Branches of the panicle crowded, erect, ex Spreng. syst. 1. p. 745.

Broad-leaved Psychotria. Shrub.

77 P. læviga'ta (Willd. in Rœm. et Schultes, syst. 5. p. 190.) leaves oblong-ovate, petiolate, tapering at the base, glabrous; stipulas bidentate; panicle terminal. ♄. S. Native of South

America, at the river Atabapo. Humb. et Bonpl. This is said to be the same as *Palicoùrea speciòsa*, by Spreng.

Smooth Psychotria. Shrub.

78 P. Hunde'nsis (Willd. in Rœm. et Schultes, syst. 5. p. 189.) leaves oblong, acuminated at both ends, rather membranous; stipulas oblong, obtuse; panicle trichotomously corymbose. ♄. S. Native of New Granada, on the banks of the Magdalena, near Honda, or Hunda. Palicoùrea mìtis is joined with this by Spreng. but for what reason we know not.

Honda Psychotria. Shrub.

79 Cumane'nsis (Willd. in Rœm. et Schultes, syst. 5. p. 191.) leaves oblong; stipulas ovate, acute; cymes few-flowered. ♄. S. Native of Cumana, Humb. et Bonpl; and Trinidad, G. Don. Flowers yellow.

Cumana Psychotria. Clt. 1824. Shrub 10 feet.

80 P. sessilifòlia (Willd. in Rœm. et Schultes, syst. 5. p. 191.) herbaceous; leaves oblong, acuminated at both ends; stipulas emarginately bidentate; flowers terminal, crowded, sessile. 4. S. Native on the banks of the Orinoco, Humb. et Bonpl. Herb half a foot high. Flowers white.

Sessile-flowered Psychotria. Pl. half a foot.

* * * * * *A species native of Panama.*

81 P. furca'ta (D. C. prod. 4. p. 512.) smoothish; branches bifurcate, terete; branchlets compressed; peduncles, petioles, and nerves of the leaves roughish; leaves ovate-oblong, acuminated; stipulas bidentate, small, acute; heads on short peduncles; pedicels thick, very short; bracteas 4, linear, spreading. ♄. S. Native of Panama, where it was collected by Hænke. Cephæ'lis furcàta, Bartl. in herb. Hænke. Fruit ovate-globose, compressed, furrowed. Flowers unknown. Habit of *Cephæ'lis oblónga*, but the inflorescence and fruit are like that of *P. platỳpoda*.

Forked-branched Psychotria. Shrub.

* * * * * * *Species natives of Mexico.*

82 P. biarista'ta (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 513.) glabrous; branchlets a little compressed; leaves oblong, or obovate-oblong, attenuated at both ends, coriaceous; stipulas short, broadly ovate, biaristate, deciduous; cymes on short peduncles of 3-4 rays, much shorter than the leaves; fruit nearly globose. ♄. S. Native of Mexico. Leaves 2 inches long, and 9 lines broad. Petioles 1-2 lines long.

Two-awned-stipulated Psychotria. Shrub 1 to 2 feet.

83 P. mo'llis (Poir. dict. 5. p. 702. ? Bartl. in herb. Hænke, ex D. C. prod. 4. p. 513.) branchlets nearly terete; peduncles and nerves of leaves downy; leaves elliptic-oblong, acuminated at both ends, membranous, when young downy, but in the adult state glabrous above; stipulas ovate, acutely bidentate; panicle corymbose, crowded, pedunculate, shorter than the leaves; corolla with a short tube, blunt erect lobes, and a hairy throat. ♄. S. Native of Mexico. Allied to *P. horizontàlis var. β.* P. móllis, Spreng. in herb. Balb. should be excluded from the present order. The plant of Poirett is probably distinct from that of Bartl.

Soft Psychotria. Shrub.

84 P. hebe'clada (D. C. prod. 4. p. 513.) branchlets, petioles, panicles, and nerves of leaves downy; leaves elliptic-oblong, acuminated at both ends; stipulas acutely bifid; panicles erect, ovate, with the rachi compressed, and the branches opposite. ♄. S. Native of Mexico. P. pubéscens, Bartl. in herb. Hænke. It differs from *P. pubéscens* in the stipulas being more acute, in the panicles not being corymbose, in the rachi of the panicles being compressed, and in the bracteoles being shorter. Flowers unknown. Berries globose, compressed, downy, crowned, striated in the dry state.

Hairy-branched Psychotria. Shrub.

85 P. aure'ola (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 513.) clothed with velvety down; branchlets from compressed to terete; leaves oblong-lanceolate, attenuated at both ends: veins parallel, and are as well as the nerve yellowish; stipulas broad, ovate, drawn out each into a setaceous acumen at the apex, which is sometimes undivided, and sometimes biaristate; corymbs pedunculate, trichotomous; calyx 5-toothed, and are, as well as the corollas, downy. ♄. S. Native of Mexico. Branches and leaves yellowish in the dried state. Leaves 2 or $2\frac{1}{2}$ inches long, and 9-10 lines broad. Petioles a line long.

Golden Psychotria. Shrub.

86 P. scabriu'scula (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 513.) branchlets a little compressed; young leaves and peduncles clothed with very fine down; leaves oblong-lanceolate, attenuated at both ends, at length glabrous on the upper surface; stipulas ovate, biaristate, shorter than the petioles; corymbs trichotomous, pedunculate, shorter than the leaves; fruit globosely didymous. ♄. S. Native of Mexico, about Acapulco. Allied to *P. aurèola*. Peduncles often changed into lateral elongated pseudo-axillary branches.

Roughish Psychotria. Shrub.

87 P. Mexica'na (Willd. in Rœm. et Schultes, syst. 5. p. 192.) leaves oblong, acuminated at both ends, rather membranous; stipulas bipartite, acute; panicles narrow, terminal. ♄. S. Native of Mexico. Humb. et Bonpl. This plant is referred to Palicoùrea fastigiàta by Sprengel, who is probably correct.

Mexican Psychotria. Shrub.

88 P. padifo'lia (Willd. in Rœm. et Schultes, syst. 5. p. 189.) leaves oblong, acuminated, pilose on the veins beneath; stipulas bipartite, linear-subulate; panicles corymbose, terminal. ♄. S. Native of Mexico, about Xalappa. Humb. et Bonpl.

Bird-cherry-leaved Psychotria. Shrub.

* * * * * * * *A species native of Florida.*

89 P. lanceola'ta (Nutt. in Sill. amer. journ. 5. p. 290.) branches and under sides of leaves clothed with rusty down; leaves lanceolate, acuminated at both ends; stipulas stem-clasping, roundish, deciduous, sphacelate; corymbs terminal, trichotomous from the base. ♄. S. Native of Eastern Florida. Leaves 2-3 inches long. Berries ovate, red.

Lanceolate-leaved Psychotria. Shrub.

* * * * * * * * *A species native of the Bahamas.*

90 P. unda'ta (Jacq. hort. schœnbr. 3. p. 5. t. 260. fragm. 101.) glabrous; leaves oval-lanceolate or oblong, acuminated at both ends, undulated; stipulas connate, ovate, deciduous, a little shorter than the petioles; cymes terminal, sessile, tripartite, with trichotomous branches; corolla with a naked throat, but the tube is villous at the origin of the filaments. ♄. S. Native of the Bahama Islands. Leaves acute at both ends, wavy, shining above, 3-4 inches long. Corollas white, with reflexed segments. Berries small, roundish, red.

Wavy-leaved Psychotria. Fl. May, June. Clt. 1823. Shrub 3 to 4 feet.

* * * * * * * * * *Species natives of the West India Islands.*

91 P. floribu'nda (H. B. et Kunth, nov. gen. amer. 3. p. 359.) glabrous; branchlets compressed; leaves elliptic-oblong, acuminated at both ends, coriaceous; stipulas oblong, obtuse; cymes pedunculate, of 6 rays, much branched, diffuse: the rays again divided into 4-5 rays; bracteas and calycine teeth hairy; stamens length of the lobes of the corolla. ♄. S. Native of South America, in the province of Carthagena near Turbaco? ex

Kunth; in the Island of Martinico, ex Sieb.; and of Guadaloupe, ex Perrottet.

Bundle-flowered Psychotria. Shrub.

92 P. TENUIFÒLIA (Swartz, prod. p. 43. fl. ind. occ. 1. p. 402.) glabrous; leaves oblong, acuminated at both ends, membranous; stipulas ovate, deciduous, bifid, with acuminated lobes; panicles erect, almost sessile, shorter than the leaves; throat of corolla villous. ♄. S. Native of Hispaniola, among bushes. Leaves with an obtuse acumen, ex Swartz. Panicles trichotomous. Flowers small, white. Berries oblong, glabrous.—P. glabràta, Sieb. fl. mart. no. 73. does not differ from the plant of Swartz, unless in the leaves being acutely acuminated. P. laurifòlia, Bertero, collected in Hispaniola, has the leaves acute at the apex, and the nerves of the leaves beset with rusty down underneath. In both, however, there are rufous cilia in the axils of the leaves and stipulas.

Thin-leaved Psychotria. Shrub 3 to 4 feet.

93 P. NERVÒSA (Swartz, prod. p. 43. fl. ind. occ. 1. p. 403.) glabrous; leaves ovate, acute at the base, and acuminated at the apex, veined, a little undulated; stipulas oblong, acuminated, emarginate, deciduous; corymbs tripartite, with trichotomously panicled branches; throat of corolla villous; berries oblong. ♄. S. Native of Jamaica, among bushes. P. stipulàcea, Swartz, in herb. L'Her. Branches a little compressed. Panicles terminal and axillary, shorter than the leaves. Stipulas large, rusty.

Nerved-leaved Psychotria. Shrub 5 to 6 feet.

94 P. LA'XA (Swartz, fl. ind. occ. p. 407. but not of Ruiz et Pav.) glabrous; leaves ovate, acuminated, hardly nerved, on very short petioles; stipulas ovate, acuminated, deciduous; corymbs terminal, tripartite from the base, trichotomous, having the branches and pedicels rather capillary and loose; berries oblong. ♄. S. Native of Jamaica, among bushes on the mountains. Stipulas small, subciliated. Fruit oblong, acuminated at both ends. Branches terete. Leaves 1-2 inches long.

Loose-corymbed Psychotria. Shrub 4 to 6 feet.

95 P. OLIGO'TRICHA (D. C. prod. 4. p. 514.) glabrous; leaves elliptic, acuminated at both ends, membranous, hairy in the axils of the veins; stipulas ovate, membranous, rufous, deciduous; corymbs sessile, tripartite, having the branches trichotomous; throat of corolla bearded. ♄. S. Native of Jamaica, Porto-Rico, Martinique, &c. P. horizontàlis, Spreng. in herb. Balb. It differs from *P. horizontàlis* in the nerves of the leaves being glabrous, in the throat of the corolla being bearded, not naked; and in the corymbs being sessile, not pedunculate. Very nearly allied to *P. undàta* and *P. chimarrhoides.*

Few-haired Psychotria. Shrub 4 to 6 feet.

96 P. CHIMARRHOI'DES (D. C. prod. 4. p. 514.) glabrous; leaves oblong-lanceolate, acuminated at both ends, membranous; stipulas ovate, obtuse, rusty, deciduous, length of the petioles; cymes terminal, sessile, tripartite: with the branchlets 3 times shorter than the leaves. ♄. S. Native of Guadaloupe and Trinidad, ex Sieb. fl. trin. no. 256; and of Cuba. Fruit oval, striated, crowned by the 5-toothed calyx. Leaves 3 or $3\frac{1}{2}$ inches long, and 7-9 lines broad. Very nearly allied to *P. undàta*, but differs in the leaves being flat, and one-half narrower; and in the fruit being oval, not spherical.

Chimarrhis-like Psychotria. Shrub 5 to 6 feet.

97 P. CAPITELLA'TA (D. C. prod. 4. p. 514.) branchlets compressed, glabrous; leaves elliptic, a little cuneated at the base, and acuminated at the apex, membranous, glabrous; stipulas drawn out into 2 setaceous ligulæ; peduncles terminal, hairy, bearing three nearly sessile downy bracteate heads of flowers, one-half shorter than the leaves. ♄. S. Native of Trinidad. Sieb. fl. trin. no. 236. Habit different from any other species.

Capitellate-flowered Psychotria. Shrub.

98 P. OLIGA'NTHA (D. C. l. c.) leaves oblong, cuneated at the base, nerved: nerves prominent beneath, rather roughish; stipulas bifid, with triangular acute lobes; peduncles terminal, shorter than the leaves, 2-flowered at the apex; fruit ovate. ♄. S. Native of St. Domingo. P. lineàta, Spreng. in herb. Balb.; and in syst. 1. p. 746. exclusive of the synonymes. Leaves 2-3 inches long, and 9-10 lines broad. Pedicels $1\frac{1}{2}$ inch long. Flowers unknown. Berry striated a little.

Few-flowered Psychotria. Shrub 4 to 6 feet.

99 P. PORTORICE'NSIS (D. C. prod. 4. p. 515.) branches, petioles, nerves of leaves, and peduncles clothed with rusty hairs; leaves elliptic, acuminated at both ends, and clothed with velvety down on both surfaces; stipulas ovate, large, membranous, rufous, deciduous; cymes terminal, sessile, tripartite, with the branches trichotomous; throat of corolla villous. ♄. S. Native of Porto-Rico, in woods by the sea-side, where it was collected by Bertero. P. hirsùta from Porto-Rico, Spreng. syst. 1. p. 744. It differs from *P. villòsa* and *P. hirsùta* in the inflorescence being a sessile cyme, not a pedunculate panicle.

Porto-Rico Psychotria. Shrub 5 to 6 feet.

100 P. BERTERIA'NA (D. C. prod. 4. p. 515.) leaves ovate-oblong, acuminated at both ends, glabrous above, downy on the nerves beneath, and branches of the panicle; stipulas twin on both sides, ovate, acute, hardly joined at the base; branches and branchlets of panicle opposite; tube of corolla short. ♄. S. Native of St. Domingo and Porto-Rico. Nonatèlia pubéscens, Spreng. syst. 1. p. 751. Leaves membranous, 7 inches long, and 3 inches broad. Petioles 9-10 lines long; axils of leaves somewhat ciliated. Fruit globose, furrowed.

Bertero's Psychotria. Shrub.

101 P. BRACHIA'TA (Swartz, prod. p. 45. fl. ind. occ. p. 415.) leaves oval-oblong, acuminated at both ends, glabrous; stipulas oval-oblong, bluntly bidentate; branches tetragonal; branches and branchlets of panicle opposite, spreadingly divaricate, downy; ultimate flowers by threes, girded by a double bractea. ♄. S. Native of the south of Jamaica, on high mountains, ex Swartz; and of St. Domingo, ex Bertero. Nonatèlia officinàlis, Spreng. in herb. Balb. Leaves downy on the veins beneath. Flowers dirty white. Fruit deep blue, oblong.

Brachiate-panicled Psychotria. Clt. 1793. Sh. 6 to 7 feet.

102 P. PUBE'SCENS (Swartz, prod. p. 44. fl. ind. occ. 1. p. 424.) branches, petioles, leaves (especially underneath), and panicles downy; leaves ovate, acuminated at both ends; stipulas with 2 short acute teeth; panicles cymose, spreading, length of leaves. ♄. S. Native of Jamaica and St. Domingo, in hedges and waste places. Psychotròphum, P. Browne, jam. 161. no. 5. Panicles trichotomous, with usually a sessile flower in each fork. Pedicels furnished with linear opposite bracteas. Flowers greenish yellow, downy outside; throat of corolla villous. Berries downy, roundish, didymous, black, containing bluish juice.

Downy Psychotria. Clt. 1812. Shrub 5 to 6 feet.

103 P. HORIZONTA'LIS (Swartz, prod. p. 44. fl. ind. occ. p. 410.) branches terete, horizontal, smooth; leaves ovate-lanceolate, acute, downy beneath on the nerves, as well as the petioles and panicles; stipulas small, ovate, deciduous, minute; peduncles shorter than the leaves; panicles erect, with the branches horizontal, and tripartite at the apex; throat of corolla naked. ♄. S. Native of St. Domingo, in chalky dry places. The leaves are said by Swartz to be downy beneath, and villous on the petioles and nerves. Flowers small, dirty white: anthers white. Berries oblong.

Var. β, cuspidàta (D. C. prod. 4. p. 515.) stipulas broad, short, cuspidate, marcescent; throat of corolla hairy. ♄. S.

Native of St. Domingo, where it was collected by Bertero. Perhaps a proper species.

Horizontal-leaved Psychotria. Shrub 3 to 4 feet.

104 P. corymbòsa (Swartz, prod. p. 44. fl. ind. occ. 1. p. 423.) glabrous; leaves ovate-lanceolate, acuminated, shining; stipulas bidentate: teeth lanceolate; corymbs trichotomous, erect, shorter than the leaves; peduncles and pedicels coloured; throat of corolla naked. ♄. S. Native of Jamaica, on the mountains, ex Swartz; Hispaniola, ex Spreng; and Guadaloupe, ex herb. Balb. Branches terete. Peduncles purple, as well as the bracteas, which are subulate. Corolla purplish, tubular, with a naked white throat. Berries globose, reddish. Perhaps a species of *Palicoùrea*. In the specimen collected by Bertero the tube of the corolla is 4 lines long, and the berries are roundish, didymous, and rather compressed, and crowned by the acute teeth of the calyx.

Corymbose-flowered Psychotria. Shrub 6 to 7 feet.

105 P. nu'tans (Swartz, prod. 4. p. 515.) glabrous; leaves lanceolate, acute, nerved; stipulas bidentate, marcescent, deciduous, acute; corymbs terminal, pedunculate, trichotomous, shorter than the leaves, erect when bearing the flowers, but nutant when bearing the fruit. ♄. S. Native of Hispaniola, on arid cretaceous hills. Corollas small, white, with acute segments; anthers yellow. Berries round, scarlet, size of red currants.

Nodding-corymbed Psychotria. Shrub.

106 P. conge'sta (Spreng. in herb. Balb. ex D. C. prod. 4. p. 515.) glabrous; leaves lanceolate, acute at the base, and acuminated at the apex; stipulas deciduous; panicles pedunculate, trichotomous, loose; ultimate branches of the panicle bearing 3-4 flowers in a heap; throat of the corolla bearded; anthers inclosed. ♄. S. Native of Jamaica. Leaves $2\frac{1}{2}$ inches long, and 9-10 lines broad. Petioles 2 lines long. In the axils of the leaves and stipulas there are rufous ciliæ. Panicles longer than the leaves. Flowers small.

Crowded Psychotria. Shrub.

107 P. pa'tens (Swartz, prod. p. 45. fl. ind. occ. 1. p. 419.) glabrous; leaves ovate-lanceolate, acuminated, roughish, membranous, distich; stipulas bidentate; peduncles shorter than the leaves; panicles secund, with spreading branches; throat of the corolla naked. ♄. S. Native of Jamaica, on the higher mountains, and probably of St. Domingo, ex Spreng. syst. 1. p. 746. Young branches compressed. Flowers small, white, with a reflexed limb. Berries roundish, black.

Spreading-panicled Psychotria. Shrub 4 to 5 feet.

108 P. myrtiphy'llum (Swartz, prod. p. 44. fl. ind. occ. 1. 405.) glabrous; leaves lanceolate-ovate, nerveless, shining, stiff; stipulas ovate, deciduous; branches secund; racemes compound, terminal; throat of the corolla villous; berries oblong. ♄. S. Native of the north of Jamaica, in logwood forests. Myrtiphyllum, P. Browne, jam. p. 152.—Sloane, jam. hist. 2. p. 102. t. 109. f. 2. The shrub has a habit like the myrtle. Leaves an inch long, deep green, grey beneath from numerous small dots. Branches of racemes trifid. Flowers white. Berries scarlet, with the dissepiment usually vanished at maturity.

Myrtle-leaved Psychotria. Clt. 1826. Shrub 3 feet.

109 P. parasítica (Swartz, prod. p. 44. fl. ind. occ. 1. p. 408.) plant sarmentose, radicant, and glabrous; leaves ovate, acuminated, veinless, rather succulent; stipulas stem-clasping, retuse, permanent; cymes terminal and axillary, pedunculate; throat of the corolla downy; berries nearly globose. ♄. S. Native of Martinique, Montserrat, St. Christopher, Dominica, Guadaloupe, &c., parasitical upon trees. Viscoìdes péndulum, Jacq. amer. p. 73. t. 51. f. 1. Branches pendulous. Cymes trichotomous. Flowers small, white, pedicellate. Berries round, scarlet.

Parasitical Psychotria. Fl. May, Aug. Clt. 1802. Shrub parasitical.

110 P. margina'ta (Swartz, prod. p. 43. fl. ind. occ. p. 400.) glabrous; leaves lanceolate-ovate, acute, margined with cartilaginous bristles; stipulas ovate, acuminated, entire, deciduous, length of petioles; panicles loose, pedunculate; anthers inclosed; berries ovate. ♄. S. Native of the south of Jamaica, in woods; and of Panama and Mexico. Bartl. in herb. Hænke. Psychotr. P. Browne, jam. 161. no. 6. Leaves shining above, and glaucescent beneath. Branches of panicle opposite, slender, 3-6-flowered. Corollas small, white, glabrous, with a reflexed limb. Berries black.

Marginate-leaved Psychotria. Fl. May, June. Clt. 1816. Shrub 3 to 4 feet.

111 P. hirsu'ta (Swartz, prod. p. 43. fl. ind. occ. 1. p. 396.) branches, panicles, petioles, and leaves clothed with rusty hairs; leaves lanceolate-ovate, acute; stipulas lanceolate, undivided, deciduous; panicles pedunculate, spreading; throat of corolla villous; berries ovate, downy. ♄. S. Native of the south of Jamaica, in woods of long standing. Branches of panicles trichotomous. Flowers white. Berries red.

Hairy Psychotria. Clt. 1826. Shrub 5 to 6 feet.

112 P. fœ'tens (Swartz, prod. p. 43. fl. ind. occ. 1. p. 396.) glabrous; leaves lanceolate-ovate, acute; stipulas ovate, acuminated, deciduous, entire; panicles pedunculate, much spreading, with reflexed filiform divisions; throat of corolla villous; anthers oblong, among the villi in the throat; berries oblong. ♄. S. Native of the south of Jamaica, in woods on the mountains. Panicle of 4 main branches, the ultimate branchlets bearing 3 flowers. Flowers small, white. Berries small, oblong, scarlet.

Stinking Psychotria. Shrub.

113 P. We'stii (D. C. prod. 4. p. 516.) glabrous; branches terete; leaves oblong-elliptic, attenuated at both ends, membranous; stipulas deciduous; corymbs pedunculate, trichotomous, loose, diverging, having the ultimate branchlets 3-flowered; throat of corolla naked; corolla oblong; anthers linear; fruit nearly globose, crowned by the calyx. ♄. S. Native of Porto-Rico, where it was collected by West. Leaves 4-5 inches long, and 1-2 broad. Petioles 7-8 lines long. Branches of corymb 2 inches long, but the first branches are diverging, and about an inch long. Calyx 5-toothed. Lobes of corolla acute.

West's Psychotria. Shrub.

114 P. polya'ntha (D. C. prod. 4. p. 516.) glabrous; stipulas ovate, acuminated; leaves elliptic, acuminated at both ends, stiff, membranous; panicles on long peduncles, trichotomously branched; throat of corolla bearded; stamens glabrous; anthers exserted. ♄. S. Native of St. Domingo, where it was collected by Bertero. P. laurifòlia, Spreng. in herb. Balb. Superior leaves 10 inches long, and 4 broad, pale beneath. Petioles an inch long. Common peduncle of panicle 6 inches long. Flowers very numerous, glabrous, except in the throat. Fruit unknown.

Many-flowered Psychotria. Shrub.

115 P. citrifòlia (Swartz, prod. p. 43. fl. ind. occ. 1. p. 398.) glabrous; leaves elliptic, acuminated, rather coriaceous; stipulas ovate, acuminated, permanent; peduncles short; branches of panicle opposite, trichotomous; throat of corolla villous; berries oblong. ♄. S. Native of the West India Islands. Branches compressed a little. Leaves coloured like those of the orange, 3-6 inches long. Corolla white, having the throat and segments villous. Berries large, ribbed. P. brachiàta, Spreng. in herb. Balb.

Citron-leaved Psychotria. Clt. 1793. Shrub.

116 P. laurifòlia (Swartz, prod. p. 43. fl. ind. occ. 1. p. 392.) glabrous; leaves lanceolate-ovate, thickish, shining; stipulas ovate, acuminated, deciduous; panicles cymose, erect,

trichotomous; filaments ciliated; anthers inclosed in the bearded throat; berries roundish. ♄. S. Native of Jamaica and Hispaniola. Corolla white, with acute lobes. Stipulas downy. Berries red, shining. Said to be allied to *P. glabràta*.

Laurel-leaved Psychotria. Fl. June, July. Clt. 1818. Shrub 4 to 5 feet.

117 P. Bro'wnei (Spreng. syst. 1. p. 742.) glabrous; leaves elliptic, attenuated at both ends, rather coriaceous, paler beneath; stipulas ovate, hardly mucronate, caducous, length of petioles; panicles pedunculate, trichotomous, rising from the forks of the branches; berries ovate. ♄. S. Native of Porto-Rico, St. Thomas, and Jamaica. Browne, jam. p. 160. no. 2. t. 17. f. 2. P. Asiática, Lam. ill. t. 161. f. 1. Allied to *P. Carthaginénsis*, but differs from it in the fruit being ovate, not oblong, and in the stamens being inclosed, and in the throat of the corolla being glabrous, ex icon. Browne.

Browne's Psychotria. Fl. July. Clt. 1806. Sh. 4 to 5 feet.

118 P. Balbisia'na (D. C. prod. 4. p. 517.) glabrous; leaves elliptic, acute at both ends, rather acuminated, stiffish; stipulas ovate, deciduous; peduncles rising from the forks of the branches or from their tops, equal in length to the leaves, corymbiferous and trichotomous at the apex; corolla with a villous throat, and having the lobes shorter than the tube. ♄. S. Native of Jamaica, where it was collected by Bertero. P. lùcida, Spreng. in herb. Balb. Leaves 3 inches long and $1\frac{1}{2}$ broad. Corolla glabrous, except the throat, which is villous, 3 lines long. Berries ovate.

Balbis's Psychotria. Shrub 4 to 6 feet.

119 P. revolu'ta (D. C. prod. 4. p. 517.) glabrous; leaves elliptic, tapering to both ends, coriaceous, with revolute margins; stipulas oblong, rufous and membranous, deciduous; corymbs terminal, pedunculate, trichotomous, hardly longer than the leaves; corolla with a subvillous throat, and having the lobes shorter than the tube. ♄. S. Native of St. Domingo, where it was collected by Bertero. P. glabràta, ex Hispaniola, Spreng. syst. 1. p. 745. no. 63. Leaves 2 or $2\frac{1}{2}$ inches long, and 12-15 lines broad. Petioles 3-4 lines long. Berries ovate.

Revolute-leaved Psychotria. Shrub 4 to 6 feet.

120 P. glabra'ta (Swartz, prod. p. 43. fl. ind. occ. 1. p. 390.) glabrous; leaves ovate, obtuse, shining; stipulas small, ovate, and acute, rusty, deciduous; panicle erect, with opposite branches; margin of calyx almost entire. ♄. S. Native of the interior of Jamaica, among rocks on the mountains. P. glabràta ex Jamaica, Spreng. P. Asiática α, Poir. dict. 5. p. 696. but not of Lin. Allied to *P. Asiática*, but is distinct according to Swartz. Corolla small, white, with a villous throat. Berries oblong.

Glabrous Psychotria. Fl. June, July. Clt. 1810. Shrub 4 to 6 feet.

121 P. exse'rta (D. C. prod. 4. p. 517.) glabrous; leaves oblong, bluntish, cuneated at the base, coriaceous, shining above; stipulas lanceolate, acute, rather connate at the base, deciduous; corymbs pedunculate, trichotomous, longer than the leaves; corollas glabrous; anthers exserted. ♄. S. Native of St. Domingo, where it was collected by Bertero. P. coriàcea ex Hispaniola, Spreng. syst. 1. p. 742. exclusive of the synonymes. Corolla tubular, 3 lines long, with very short bluntish lobes.

Exserted-stamened Psychotria. Shrub 3 to 4 feet.

122 P. platyphy'lla (D. C. prod. 4. p. 517.) glabrous; stipulas bipartite, with triangular acute lobes; leaves elliptic, acuminated at both ends, membranous; branchlets tetragonal; panicles racemose, rather downy, one-half shorter than the leaves, with opposite branches; throat of corolla glabrous. ♄. S. Native of Porto-Rico. P. macrophýlla, Vent. in herb. Deless. Leaves 8 inches long and 3 broad. Petioles 15-18 lines long. Flowers white.

Broad-leaved Psychotria. Shrub.

123 P. gra'ndis (Swartz, prod. p. 43. fl. ind. occ. 1. p. 417.) glabrous; leaves obovate, short-acuminated, cuneated at the base; stipulas deltoid, with revolute margins, subulate at the apex, permanent; branches angular; panicles large, pedunculate, with subverticillate branches. ♄. S. Native of Jamaica, in the interior and western parts of the island, among bushes on the mountains; and of Mexico, ex herb. Hænke. Leaves a foot and more long, and 3 inches broad. Branches of panicle compressed, usually ternately verticillate. Flowers numerous, small, white. Throat of corolla villous. Berries ovate.

Great Psychotria. Shrub 12 to 15 feet.

124 P. peduncula'ta (Swartz, prod. p. 44. fl. ind. occ. p. 427.) glabrous; leaves ovate-lanceolate, acute at the base, and acuminated at the apex, rather wrinkled; stipulas shorter than the petioles, bidentate on both sides, permanent; peduncles longer than the leaves, cymose at the apex, dense-flowered. ♄. S. Native of the interior of Jamaica, in mountain woods. P. attenuàta, Willd. Psychotròphum, P. Browne, jam. p. 160. no. 4. Branches rather angular. Branches of panicle trichotomous, approximate. Corolla large, cylindrical, yellowish, with a naked throat. Berries roundish.

Pedunculate Psychotria. Clt. 1818. Tree 16 to 20 feet.

125 P. angustifòlia (Poir. dict. 5. p. 703.) glabrous; leaves narrow-lanceolate, usually obtuse at the base, and acuminated at the apex; stipulas bidentate, acuminated; panicles erect, trichotomous at the apex, shorter than the leaves; berries globose. ♄. S. Native of St. Domingo. Flowers unknown. Nerves of leaves and pedicels yellow. Leaves 2-3 inches long, and an inch broad. Border of calyx hardly toothed. Berries globose, dark purple.

Narrow-leaved Psychotria. Shrub 4 to 6 feet.

126 P. barba'ta (Poir. dict. 5. p. 704.) plant subherbaceous, glabrous; leaves ovate, acuminated, membranous; branches compressed, rather angular; panicles pedunculate, spreading; lobes of corolla obtuse; throat of corolla villous; anthers exserted. ♄. S. Native of Martinico. Leaves 2 inches long. Ramifications of panicle tern or dichotomous. Fruit unknown.

Bearded-flowered Psychotria. Shrub.

127 P. bi'color (Bredem. ex Willd. mss. in Rœm. et Schultes, syst. 5. p. 191.) glabrous; leaves oblong-lanceolate, on short petioles; stipulas bidentate, setose; flowers panicled; peduncles copper-coloured. ♄. S. Native of Martinico, on the banks of mountain streams. Perhaps the same as *Palicoùrea cròcea*.

Two-coloured Psychotria. Shrub.

* * * * * * * * * *Species natives of South America, but in what particular localities is unknown.*

128 P. phytola'cca (Poir. dict. 5. p. 704.) glabrous; leaves ovate, short-acuminated, petiolate, rather fleshy; panicles short, cymose; flowers crowded; fruit globose. ♄. S. Native of South America, ex Poir., St. Domingo, ex herb. Desf. Leaves like those of *Phytolácca*. Flowers numerous, disposed in an irregular order.

Phytolacca-leaved Psychotria. Shrub.

129 P. coria'cea (Poir. dict. 5. p. 703.) glabrous; leaves ovate-lanceolate, very coriaceous, shining; panicles few-flowered, much shorter than the leaves, dichotomous; corolla tubular; teeth of calyx and lobes of corolla obtuse. ♄. S. Native of South America. Stems blackish. Leaves 3-4 inches long, and 2 broad. Panicles yellowish, divided into 3-4 compressed branches, which are bifurcate at the apex. Perhaps a species of *Palicoùrea*.

Coriaceous-leaved Psychotria. Fl. June, Aug. Clt. 1810. Shrub 4 to 6 feet.

130 P. arista'ta (Willd. in Rœm. et Schultes, syst. 5. p.

191.) leaves oblong, acuminated at both ends, shining above, but downy on the veins beneath; stipulas connate, aristately bidentate; panicles terminal, elongated; peduncles and pedicels hairy. ♄. S. Native of South America, where it was collected by Humb. and Bonpl., but is unknown to Kunth.

Awned-stipuled Psychotria. Shrub.

131 P. sple'ndens (Spreng. syst. 1. p. 747.) leaves lanceolate, narrowed at the base, bluntish, shining; stipulas deciduous; corymbs few-flowered, pedunculate, terminal. ♄. S. Native of South America, at the Rio Negro, where it was collected by Humb. and Bonpl., but is unknown to Kunth. P. lùcida, Willd. in Rœm. et Schultes, syst. 5. p. 189.

Glittering-leaved Psychotria. Shrub.

132 P. lamprophy'lla (Spreng. syst. 1. p. 747.) leaves narrow-lanceolate, elongated, tapering to both ends, coriaceous, shining above, quite glabrous and veinless beneath; stipulas short, caducous; panicles terminal, tripartite. ♄. S. Native of South America. P. salicifòlia, Willd. in Rœm. et Schultes, syst. 5. p. 190. The rest unknown.

Shining-leaved Psychotria. Shrub.

133 P. attenua'ta (Willd. in Rœm. et Schultes, syst. 5. p. 192.) leaves ovate-elliptic, long-acuminated, membranous; stipulas bidentate; cymes terminal. ♄. S. Native of South America, where it was collected by Humb. and Bonpl., but is unknown to Kunth. It is joined with *P. pedunculàta* by Sprengel, who is probably right.

Attenuated-leaved Psychotria. Shrub.

134 P.? dicho'toma (Willd. in Rœm. et Schultes, syst. 5. p. 518.) leaves ovate-oblong, acute; stipulas bifid; spikes dichotomous. ♄. S. Native of South America, where it was collected by Humb. and Bonpl.

Dichotomous-spiked Psychotria. Shrub.

135 P. commuta'ta (D. C. prod. 4. p. 518.) leaves elliptic, acute at both ends, rather membranous; stipulas oblong, obtuse, stem-clasping; panicle corymbose, terminal. ♄. S. Native of South America. Humb. and Bonpl. P. ellíptica, Willd. in Rœm. et Schultes, syst. 5. p. 189. but not of Ker.

Changed Psychotria. Shrub.

136 P. membrana'cea (Willd. in Rœm. et Schultes, syst. 5. p. 189.) leaves obovate-oblong, acuminated, membranous; stipulas ovate, acute. ♄. S. Native of South America, where it was collected by Humb. and Bonpl.

Membranaceous-leaved Psychotria. Shrub.

* * * * * * * * * * * *Species natives of Africa.*

137 P. Nu'bica (Caill. et Delil. pl. afr. p. 66.) leaves elliptic, glabrous above, acutish at both ends, with the nerves on the under surface prominent and downy; stipulas triangular; cymes terminal, with trifid crowded branches, which are downy, as well as the corollas; style much exserted. ♄. S. Native of the north of Africa, in Nubia, at Singue. Teeth of calyx 5, obtuse, very short. Stigma turbinate, bifid. Tube of corolla campanulate. Fruit unknown.

Nubian Psychotria. Shrub.

138 P.? psathuroìdes (D. C. prod. 4. p. 518.) glabrous; leaves oblong, acute at both ends, coriaceous, petiolate; stipulas ovate, obtuse, deciduous, 4 times shorter than the petioles; panicles terminal, shorter than the leaves, with opposite branches; calyx truncate; corolla divided beyond the middle. ♄. S. Native of the Mauritius, where it was collected by Bory de St. Vincent. The flowers are not well known; and the fruit is perfectly unknown.

Psathura-like Psychotria. Shrub.

139 P.? obtusifòlia (Lam. ill. t. 161. f. 4. Poir. dict. 5. p. 67.) glabrous; leaves obovate, cuneated, very blunt, tapering into the very short petioles; stipulas twin on both sides, somewhat concrete at the base, ending in linear points; corymbs trifid, pedunculate, much shorter than the leaves, with the branchlets bearing crowded sessile flowers at the apex. ♄. S. Native of Madagascar, where it is called *Maron-Pouton*. Leaves 4-5 inches long and 2 broad. Berries ovate, striated.

Blunt-leaved Psychotria. Shrub.

140 P. angustifòlia; shrub erect, nearly simple; leaves oval-lanceolate, entire, acuminated; flowers panicled, terminal. ♄. S. Native of Sierra Leone, on the banks of rivulets. Flowers pale red.

Narrow-leaved Psychotria. Shrub.

* * * * * * * * * * * *Species natives of Asia.*

141 P. se'rpens (Lin. mant. p. 204.) plant suffruticose, much branched, twisted, glabrous; branchlets rather compressed, but at length becoming terete; leaves ovate, acute at both ends, coriaceous; stipulas ovate, obtuse, undivided, brown, deciduous; corymbs pedunculate, trichotomous, terminal, having the peduncles and branchlets 2-edged; berries ovate. ♄. G. Native of China and the East Indies.

Serpentine-branched Psychotria. Shrub 2 to 6 feet.

142 P. Roxbu'rghii (D. C. prod. 4. p. 519.) branchlets opposite, complanate, downy, but becoming smooth at length; leaves elliptic, acuminated at both ends, membranous, shining above, downy on the nerves beneath, which are parallel; stipulas oval, about equal in length to the petioles, recurved at the apex, acutely bifid; panicles terminal, on short peduncles; pedicels downy, compressed, umbellate; lobes of calyx ciliated. ♄. S. Native of the Moluccas. P. Asiática, Lin. spec.? exclusive of the synonymes. Roxb. fl. ind. 2. p. 160. Leaves 8-10 inches long. Flowers very small, greenish. Bracteas small, lanceolate. Throat of corolla villous; anthers inclosed. Berries oval, 10-nerved (conforming to that in the figures of Gærtn. fruct. 1. t. 25. and Browne, jam. t. 17. f. 2.), deep red.

Roxburgh's Psychotria. Shrub.

143 P. sphæroca'rpa (Wall. in Roxb. fl. ind. 2. p. 161.) glabrous; branchlets compressed; leaves ovate-elliptic, acuminated, coriaceous, with parallel veins; stipulas ovate, about equal in length to the petioles, recurved at the apex, and acutely bifid; corymbs pedunculate, compact, villous; teeth of calyx subulate; berries globose, smooth. ♄. S. Native of the East Indies, on the hills near Silhet. Leaves 8-12 inches long, shining above. Flowers very small, crowded. Corolla densely bearded at the throat. Berries pale red, without ribs.

Round-fruited Psychotria. Shrub.

144 P. trunca'ta (Wall. in Roxb. fl. ind. 2. p. 162.) glabrous; axils of petioles pilose; branchlets somewhat compressed; leaves elliptic-ovate, acute, attenuated at the base, coriaceous, foveolate in the axils of the veins beneath; stipulas broad-ovate, undivided, coriaceous, deciduous; corymbs terminal, small, pedunculate, fleshy, bracteolate; limb of calyx truncate; throat of corolla bearded. ♄. S. Native of the East Indies. Leaves 6-8 inches long and 4 broad. Petioles submarginate. Backs of stipulas depressed. Flowers rather large, by threes, intermediate ones sessile.

Truncate-calyxed Psychotria. Shrub.

145 P. conna'ta (Wall. in Roxb. fl. ind. 2. p. 163.) glabrous; branchlets compressed; leaves lanceolate, acuminated, tapering much at the base, almost sessile, coriaceous; stipulas ovate, acutely cuspidate, longer than the petioles, rather recurved at the apex; corymbs terminal, ovate, on long peduncles, with the first ramifications umbellate, the rest trichotomous; bracteas connate at the base, ciliated, slightly lobed; flowers by threes, sessile; throat of corolla bearded. ♄. S. Native of the East Indies. Leaves foveolate in the axils of the nerves beneath. Peduncles rather compressed. Berries ovate, almost black, anular when dried.

Connate-bractead Psychotria. Shrub.

146 P. stipula'cea (Wall. in Roxb. fl. ind. 2. p. 164.) glabrous; leaves oblong-lanceolate, acuminated, coriaceous, nerved, tapering at the base, almost sessile, smooth; stipulas broad, triangular, expanded into foliaceous lamina at the apex; panicles terminal, trichotomous, shorter than the leaves; pedicels compressed; flowers by threes, sessile; lobes of calyx obtuse. ♄. S. Native of Pulo-Penang. Leaves 7-10 inches long, somewhat glandular in the axils of the veins beneath. On the inside of the base of the stipulas there is a tuft of hairs, which remains some time after the stipulas have fallen. Corolla with a very short tube, and a bearded throat. Stamens exserted.

Large-stipuled Psychotria. Shrub.

147 P. Reeve'sii (Wall. in Roxb. fl. ind. 2. p. 164.) glabrous; leaves oblong-lanceolate, acute at both ends, smooth, glaucous, coriaceous; stipulas broad-ovate, adpressed, with a rounded apex; panicles terminal, oval, small, with decussate branches; limb of calyx truncate; corolla short, with a densely bearded throat. ♄. G. Native of China, from which place it was sent to the botanic garden at Calcutta by Mr. Reeves. Branches beset with copious small whitish dots, having the upper extremities slightly compressed. Leaves 6-7 inches long, a little wrinkled, foveolate in the axils of the veins beneath. Panicles almost sessile. Bracteas deciduous. Flowers small, by threes, pea-green. Stamens concealed among the hairs in the throat of the corolla.

Reeves's Psychotria. Shrub.

148 P. auranti'aca (Wall. in Roxb. fl. ind. 2. p. 165.) glabrous; branches flattened; leaves lanceolate, acuminated, smooth, on short petioles; stipulas ovate, acuminated, deciduous; panicles terminal, pedunculate, erect, with whorled branches; flowers by threes, middle ones sessile; limb of calyx truncate; corolla with a long tube, and a villous throat. ♄. S. Native of Pulo-Penang, Java, and Nusa-Kambanga. Blum. bijdr. p. 962. Leaves 5-7 inches long, dotted beneath. Stipulas ending in a long subulate acumen each. Peduncles compressed. Stamens exserted. Berries obovate, as large as a cherry stone, orange-coloured, ex Wall, but ovate, and 10-ribbed according to specimens from Java.

Orange-coloured-fruited Psychotria. Shrub.

149 P. denticula'ta (Wall. in Roxb. fl. ind. 2. p. 520.) stem ascending, with a creeping base, compressed at the apex; leaves ovate, short-acuminated, coriaceous, shining; stipulas ovate, subcordate, with a toothed apex, downy outside, about equal in length to the petioles; panicles cymose, many flowered, downy; teeth of calyx subulate; corolla rather rotate. ♄. S. Native of Nipaul, in the forest of Sanko. Stem purplish, undivided, or sparingly dichotomous. Leaves from 6-9 inches long, upper surface dark green, under pallid. Stipulas villous within at the base. Panicles cymose, downy. Throat of corolla slightly hairy. Teeth of calyx subulate. Berries globular, purple, size of currants.

Denticulated-stipuled Psychotria. Shrub creeping.

150 P. adenophy'lla (Wall. in Roxb. fl. ind. 2. p. 166.) glabrous; leaves lanceolate, acuminated, shining, with parallel nerves, which are glandular in the axils; stipulas ovate, blunt, connate at the base, deciduous; racemes terminal, cylindrical, a little branched at the base; peduncles compressed; bracteas aristately acuminated. ♄. S. Native of the East Indies, in Silhet. The uppermost branches dichotomous, and a little compressed. Leaves 3-4 inches long, pallid beneath. Peduncles flattened. Flowers greenish, in heaps, almost sessile. Corolla with a short tube, a villous throat, and acute segments.

Glandular-leaved Psychotria. Shrub.

151 P.? curviflòra (Wall. in Roxb. fl. ind. 2. p. 167.) glabrous; branchlets terete; leaves lanceolate-oblong, long-acuminated, tapering much to the base, on long petioles, membranous, shining above, and pubescent on the nerves beneath, and glandular in the axils; stipulas ovate, obtuse, connate at the base, sometimes furnished with 1-2 teeth at the apex, with a series of adpressed hairs within their insertion, deciduous; racemes small, terminal, oval, compact, on short peduncles, much shorter than the leaves; corolla long, slender, tubular, with an incurved border. ♄. S. Native of Pulo-Penang. Petioles long. Racemes smooth, consisting of opposite approximate more or less compound fascicles of long sessile flowers. Corollas nearly an inch long, with lanceolate acute lobes, and a naked throat. Anthers exserted. Filaments inserted near the middle of the corolline tube. Perhaps a species of *Chasàlia* or *Palicoùrea*.

Curved-flowered Psychotria. Shrub.

152 P. ophioxyloìdes (Wall. in Roxb. fl. ind. 2. p. 168.) smooth, climbing, dichotomous; leaves lanceolate, on short petioles, acuminated; stipulas ovate, drawn out at the apex into an acumen, which is often bifid; corymbs small, terminal; corollas long, slender, tubular, with incurved lobes. ♄. S. Native of Silhet, in the East Indies. Leaves smooth, acute at the base, about 5 inches long. Perhaps a species of *Chasàlia* or *Palicoùrea*.

Snake-wood-like Psychotria. Shrub cl.

153 P. polyneu'ra (D. C. prod. 4. p. 520.) glabrous; branchlets and peduncles compressed; leaves elliptic-ovate, short-acuminated, coriaceous, with usually 20 pairs of opposite lateral nerves; stipulas ovate, drawn out into a long setaceous acumen, deciduous; corymbs terminal, pedunculate, one half shorter than the leaves; limb of the calyx with 5 short teeth; corolla short, with a smoothish throat. ♄. S. Native of Nipaul, where it was collected by Wallich. It agrees with *P. aurantìaca* in the stipulas, but differs from that plant in the short corollas, &c.; and from *P. nervòsa* in the teeth of the calyx being acute, not obtuse, nor membranous.

Many-nerved-leaved Psychotria. Shrub.

154 P. Wallichia'na (Spreng. cur. post. p. 79.) leaves oval, acuminated, serrulated, nerved, glabrous; stipulas simple; teeth of the calyx roundish, membranous; panicles terminal, glomerate. ♄. S. Native of Nipaul, Wallich. P. nervòsa, D. Don, prod. fl. nep. p. 137. but not of Swartz.

Wallich's Psychotria. Shrub.

155 P. vagina'lis (D. C. prod. 4. p. 520.) glabrous; leaves ovate-oblong, cuspidate at the apex, attenuated at the base; stipulas entire, foliaceous, combined into a sheath-like tube, which is bifid at the apex, having the lobes bidentate at the apex, in front of the leaves; panicles terminal, pedunculate, downy, with the rachis compressed, and the branchlets opposite; limb of the calyx broadly campanulate, truncate. ♄. S. Native of Ceylon. Ophióxylon arbòreum, Kœn. in herb. Royen. Bracteas short, acuminated, spreading. Fruit unknown. Perhaps a species of *Chiocócca*.

Sheathed-stipuled Psychotria. Shrub.

156 P. Malaya'na (Jack, in mal. misc. 1. no. 1. p. 3.) leaves broad-lanceolate; stipulas undivided; panicles terminal, corymbose; throat of the corolla bearded. ♄. S. Native of Pulo-Penang, where it is called *Byumbaba* by the Malays. Corolla white, with a greenish limb.

Malay Psychotria. Shrub.

157 P. tortìlis (Blum. bijdr. p. 958.) stem herbaceous, creeping at the base; leaves ovate-oblong, attenuated, smooth above, reticulated beneath, and rather tomentose; stipulas ovate, bifid; cymes compound, pedunculate, axillary, rarely terminal; flowers secund; pyrenæ 1-ribbed. ♄. 4. S. Native of Java, on the mountains, in humid places. Berries globose, ribbed. Perhaps belonging to the first section of the genus.

Twisted-stemmed Psychotria. Pl. creeping.

158 P. DIVE'RGENS (Blum. bijdr. p. 959.) leaves oblong-lanceolate, acuminated at both ends, coriaceous, glabrous above, pallid beneath, and downy on the veins; stipulas bifid, ciliated, hardly shorter than the petioles; corymbs terminal, trichotomous; corollas funnel-shaped; drupes oval, dry, ribbed. ♄. S. Native of Java, on the higher mountains, in woods. P. divaricàta, Blum. cat. hort. buit. p. 53. but not of Swartz.

Diverging Psychotria. Shrub.

159 P. LU'RIDA (Blum. bijdr. p. 959.) leaves lanceolate-oblong, acuminated, rather membranous, glabrous; stipulas broad-ovate, short, bidentate, adpressed; corymbs terminal, trichotomous; flowers densely crowded, sessile; calyxes obsoletely 5-toothed, and are, as well as the peduncles, coloured; tube of the corolla elongated; drupes globose. ♄. S. Native of the West of Java, frequent in humid, shady places. Peduncles thickened at length. Pyrenæ 1-ribbed on the back, and fenestrate inside. Nearly allied to *P. corymbòsa* and *P. sphærocárpa*.—There is a variety of this with oblong-lanceolate leaves.

Lurid Psychotria. Shrub.

160 P. GANDARUSSÆFO'LIA (Blum. bijdr. p. 960.) leaves on short petioles, linear-lanceolate, acuminated at both ends, membranous, glabrous; stipulas ovate, acute, bidentate; cymes terminal and axillary, dense, trifid. ♄. S. Native of the Island of Java, in the province of Bantam, among bushes. Leaves 5 inches long, and 6-7 lines broad.

Gandarussa-leaved Psychotria. Shrub.

161 P. MONTA'NA (Blum. bijdr. p. 960.) leaves oblong, acuminated at both ends, membranous, glabrous; stipulas intra-axillary, membranous, clasping the petioles; flowers terminal, umbellately corymbose; limb of the calyx urceolate, obsoletely 5-toothed; corolla with a short sub-cylindrical tube; drupes elliptic globose; pyrenæ wrinkled, with one furrow on the back. ♄. S. Native of Java, on the mountains.

Mountain Psychotria. Shrub.

162 P. ROSTRA'TA (Blum. bijdr. p. 961.) leaves on short petioles, oblong-lanceolate, much acuminated, membranous, glabrous; stipulas short, rather connate; corymbs pedunculate, dichotomous, or trichotomous; calyxes obsoletely 5-toothed; corolla with a short cylindrical tube; drupes nearly globose; pyrenæ smooth, obsoletely 1-ribbed. ♄. S. Native of Java, in shady places, on Mount Salak. Allied to *P. montàna* and *P. tetrándra*.

Beaked Psychotria. Shrub.

163 P. TETRA'NDRA (Blum. bijdr. p. 961.) leaves on short petioles, oblong, acuminated at both ends, membranous, glabrous, reticulated beneath; stipulas short, acute; corymbs pedunculate, terminal; flowers tetrandrous; drupes nearly globose, ribbed in the dry state. ♄. S. Native of Java, in woods on Mounts Salak and Seribu, &c. Sides of the leaves unequal.

Tetrandrous-flowered Psychotria. Shrub.

164 P. RHINOCERO'TIS (Reinw. in Blum. bijdr. p. 961.) leaves cuneate-oblong, acute, coriaceous, glabrous above, tomentose beneath; corymbs terminal, tomentose; stipulas bifid, or trifid; flowers capitate; tube of the corolla sub-campanulate; drupes ovate-globose, furrowed in the dried state. ♄. S. Native of Java and Nusa-Kambanga, in humid parts of woods.

Rhinoceros Psychotria. Shrub.

165 P. ROBU'STA (Blum. bijdr. p. 962.) leaves obovate, or cuneate-oblong, acuminated, coriaceous, glabrous; stipulas intra-axillary, acuminated, connate at the base, and clasping the petioles; panicles terminal, with whorled branches; limb of the calyx urceolate, obsoletely 5-toothed; tube of the corolla short, cylindrical. ♄. S. Native of Java, on the mountains. P. latifòlia, Blum. cat. hort. buit. p. 54. but not of Willd.

Robust Psychotria. Shrub.

166 P. VIRIDIFLÒRA (Reinw. in Blum. bijdr. p. 963.) leaves oblong-lanceolate, acuminated at both ends, membranous, glabrous; stipulas ovate, obtuse, with membranous margins, ciliated at the base; corymbs terminal, divaricately trichotomous; calyxes downy; tube of the corolla short, cylindrical; drupes nearly globose, somewhat 10-ribbed in the dry state. ♄. S. Native of Java, in humid places among bushes. Allied to *P. stipulàcea*, Wall.

Green-flowered Psychotria. Shrub.

167 P. SYLVA'TICA (Blum. bijdr. p. 963.) leaves on long petioles, oblong-lanceolate, acuminated, glabrous; stipulas ovate, bluntish, membranous at the top, clasping the petioles; corymbs terminal, trichotomous, glabrous; tube of the corolla short, cylindrical; drupes elliptic-globose, ribbed when dry. ♄. S. Native of Java, in mountain woods. Allied to *P. viridiflòra*.

Wood Psychotria. Shrub.

168 P. EXPA'NSA (Blum. bijdr. p. 963.) leaves elliptic-oblong, acuminated at both ends, membranous, connate at the base; cymes pedunculate, terminal, 3-5-parted; flowers sub-umbellate; calyx obsoletely 5-toothed; tube of the corolla short, cylindrical. ♄. S. Native of Java, at the foot of Mount Salak. Leaves rather large.

Expanded Psychotria. Shrub.

169 P. LAXIFLÒRA (Blum. bijdr. p. 964.) stem radicant and climbing; leaves on short petioles, elliptic-oblong, attenuated at both ends, membranous, glabrous; stipulas connate; corymbs tripartite, loose; tube of the corolla somewhat campanulate; drupes nearly globose, furrowed when dry. ♄. S. Native of Java, in mountain woods.

Lax-flowered Psychotria. Shrub.

170 P. SARMENTÒSA (Blum. bijdr. p. 964.) stem radicant and climbing; leaves on short petioles, lanceolate, acuminated at both ends, finely veined, coriaceous, glabrous; stipulas connate; corymbs terminal, divaricate, trichotomous; tube of the corolla funnel-shaped; drupes elliptic-globose, furrowed when dry. ♄. S. Native of the west of Java, in woods on the higher mountains. Allied to *P. parasítica*, Swartz.

Sarmentose Psychotria. Shrub.

171 P. LEUCOCA'RPA (Blum. bijdr. p. 964.) stem radicant and climbing; leaves on short petioles, oblong-lanceolate, acuminated at both ends, coriaceous, glabrous, terminal ones verticillately approximate; stipulas connate; corymbs terminal, trifid; flowers capitate; drupes globose; pyrenæ smooth on the back. ♄. S. Native of Java, in woods on the mountains of Seribu. Allied to *P. sarmentòsa*.

White-fruited Psychotria. Shrub.

172 P. PAUCIFLÒRA (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 522.) glabrous; branchlets compressed; leaves narrow-oblong, acute, tapering much at the base, rather coriaceous, glaucescent; stipulas lanceolate, elongated, deciduous; corymbs terminal, trifid to the base, having the branches bearing from 1 to 3 flowers; calyx truncate; fruit obovate. ♄. S. Native of the Island of Luzon. Colour of the leaves and habit almost of *P. álba*.

Few-flowered Psychotria. Shrub.

173 P. IXOROÌDES (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 522.) glabrous; branchlets compressed; leaves oblong, tapering much at the base, short-acuminated at the apex, glaucescent, hardly veined beneath; stipulas triangularly ovate, acute, deciduous; corymbs terminal, downy, pedunculate, trifid, with compact many-flowered branches; limb of the calyx with 5 short acute teeth; fruit globose. ♄. S. Native of the Island of Luzon.

Ixora-like Psychotria. Shrub.

174 P. MARIA'NA (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 522.) glabrous; branches and peduncles compressed; leaves oval-oblong or obovate, bluntish, attenuated at the base, rather coriaceous; stipulas caducous; cymes pedunculate, terminal,

shorter than the leaves, twice trifid; flowers sessile in the forks, and on the tops of the branchlets of the cyme; limb of the calyx campanulate, truncate, or bluntly toothed, and at length cleft irregularly. ♄. S. Native of Marianne Island. Corolla short, campanulate, but obovate in the bud state. Fruit unknown.

Marianne Psychotria. Shrub.

175 P. membranifòlia (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 522.) glabrous; leaves ovate-oblong and oval, short-acuminated, membranous, veiny beneath; stipulas membranous, acutely bidentate, erose; panicles terminal, contracted, corymb-formed, almost sessile, much shorter than the leaves; anthers exserted. ♄. S. Native of the Islands of Luzon and Sozogon, in the Philippine Archipelago. The leaves in the specimens from the Island of Luzon are more oblong and more acuminated at both ends than those from Sozogon.

Membrane-leaved Psychotria. Shrub.

176 P. linea'ris (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 522.) branches terete, and are, as well as the panicles, petioles, and leaves, especially on the nerves on the under surfaces, beset with rusty hairs; leaves long-linear, glabrous above; stipulas membranous, ovate, acuminated, caducous; flowers crowded in terminal fascicles, on short pedicels; calyx rather truncate; corolla villous; fruit obovate. ♄. S. Native of the Island of Manilla, near Sozogon.

Linear-leaved Psychotria. Shrub.

177 P. Manille'nsis (Bartl. in herb. Hænke, ex D.C. prod. 4. p. 522.) glabrous; branchlets rather compressed; leaves elliptic-oblong, acuminated, attenuated at the base, rather coriaceous, of a different colour beneath; stipulas ovate, acute, combined into a short ring at the base, deciduous; corymbs tripartite, hardly pedunculate, with elongated branches, which are twice trifid at the apex; fruit ovate-oblong. ♄. S. Native of the Island of Manilla, near Sozogon.

Manilla Psychotria. Shrub.

* * * * * * * * * * * * * *Species natives of Australia.*

178 P. collìna (Labill. sert. caled. p. 47. t. 47.) glabrous; branches nearly terete; leaves lanceolate-oblong, attenuated at both ends; stipulas ovate, caducous; corymbs terminal, on short peduncles, shorter than the leaves, trichotomous; peduncles compressed; style bifid beyond the middle; berries roundish. ♄. S. Native of New Caledonia.

Hill Psychotria. Shrub.

179 P. loniceroìdes (Sieb. nov. holl. exsic. no. 263.) every part of the plant is clothed with rusty hairs; leaves elliptic or oblong, acutish at both ends; stipulas lanceolate, acuminated, deciduous; panicles terminal, a little shorter than the leaves, with opposite distant branches, which are trifid, or twice trifid at the apex, with a sessile flower in each fork; bracteas ovate, acute; berries ovate, crowned by the 5-toothed calyx. ♄. S. Native of New Holland. It is very like *P. hirsùta* of Swartz, with which it is joined by Sprengel, in his cur. post., but is still very distinct.

Honeysuckle-like Psychotria. Shrub.

180 P. speciòsa (Forst. prod. no. 89.) arboreous; leaves oblong-lanceolate; involucrum terminal, usually 3-flowered. ♄. S. Native of Otaheite. Cephæ'lis speciòsa, Spreng. syst. 1. p. 749.

Showy Psychotria. Shrub.

181 P. daphnoìdes (Cunningh. in bot. mag. 3228.) shrub dichotomous, glabrous; branches very leafy at ends; leaves obovate; stipulas nearly orbicular, bidentate, small; corymbs terminal, few-flowered; mouth of corolla villous. ♄. G. Native of New Holland. Flowers pure white.

Daphne-like Psychotria. Fl. April. Clt. 1829. Shrub.

Cult. All the species of Psychotria are of the most easy culture and propagation. They grow best in a mixture of loam, peat and sand; and cuttings will strike root readily, if planted in sand, with a hand-glass over them. Some of them bear handsome foliage, but the flowers of all are insignificant.

CLXXII. ANTO'NIA (named in compliment to the Archduke Antony of Austria, a promoter of botany). Pohl, pl. bras. 2. p. 13. t. 109.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an oblong-cylindrical tube, which is covered by scales, and a 5-parted limb. Corolla funnel-shaped, with a bearded throat, and a 5-parted limb; segments lanceolate, acute, at length reflexed. Stamens 5, exserted, bearded at the base. Style long, filiform, thickened towards the apex; stigma bifid, obtuse. Berries oblong, 2-celled.—Shrub middle-sized. Leaves decussately opposite. Stipulas interpetiolar. Cymes terminal, many-flowered. Flowers by threes, white.

1 A. ova'ta (Pohl, l. c. 2. p. 14. t. 109.) leaves ovate-elliptic, quite glabrous, as well as the branches. ♄. S. Native of Brazil, among bushes in dry places, about Joze de Tocantins, in the province of Goyaz.

Ovate-leaved Antonia. Shrub 5 feet.

Cult. For culture and propagation see *Psychotria* above.

CLXXIII. PALICOU'REA (Aublet does not give the meaning of this word). Aubl. guian. 1. p. 173. t. 66. H. B. et Kunth, nov. gen. amer. 3. p. 365. St. Hil. pl. rem. bras. p. 230. D. C. prod. 4. p. 524.—Palicùrea ad Galvània, Rœm. et Schultes, syst. 5. p. 11.—Galvània, Vell. et Vand. fl. bras. et Rœm. script. p. 89. t. 6. f. 7.—Stephànium, Schreb. gen. no. 308.—Psychótria species, Juss. Willd.—Psychótria species, Galvània, and Colladònia, Spreng.

Lin. syst. *Pentándria, Monogýnia.* All as in Psychótria, but differing in the corolla being tubular, nearly cylindrical, curved or gibbous on one side at the base, shortly 5-cleft at the apex, and bearded beneath the middle inside. Teeth of the calyx and lobes of the corolla sometimes rather unequal.—Glabrous shrubs, all natives of America. Leaves opposite, rarely verticillate, usually large. Stipulas connected in various ways. Panicles terminal, sometimes elongated, sometimes thyrsoid, and sometimes cymose, sessile, but usually pedunculate. Corollas yellow or white. Anthers exserted or inclosed, either inserted in the bottom, middle, or upper part of the tube of the corolla. Flowers variable, rarely with a 3-celled ovarium and 3-lobed stigma.

§ 1. *Flowers corymbose or cymose.*

1 P. Sellowia'na (D. C. prod. 4. p. 525.) glabrous; branches terete; leaves elliptic, acute at both ends, with undulated margins, on long petioles; stipulas bluntly bidentate, with a large blunt recess; panicles cymose, fastigiate, with angularly compressed branches; corollas glabrous; stamens inclosed; fruit roundish-ovate. ♄. S. Native of Brazil, about Rio Janeiro, where it was collected by Sello. P. fastigiàta, Cham. et. Schlecht. in Linnæa. 4. p. 16. but not of Kunth.

Sello's Palicourea. Shrub 6 to 8 feet.

2 P. fastigia'ta (H. B. et Kunth, nov. gen. amer. 3. p. 368. but not of St. Hil.) glabrous; branchlets rather tetragonal; leaves elliptic, or ovate-oblong, acuminated, acute at the base, membranous; stipulas bidentate; corymbs pedunculate; flowers on long pedicels, somewhat fastigiate, glabrous; fruit ovate, nearly globose. ♄. S. Native on the banks of the Orinoco, near Atures. Psychótria fastigiàta, Spreng. syst. 1. p. 742. exclusive of the synonyme of Willd.

Fastigiate-flowered Palicourea. Shrub 6 to 8 feet.

3 P. tabernæfòlia (D. C. prod. 4. p. 525.) glabrous; branches terete; leaves large, soft, lanceolate, acuminated, petiolate; stipulas unknown; panicles almost cymose, short; segments of the calyx subulate; tube of the corolla slender, with

lanceolate lobes. ♄. S. Native of St. Domingo. Psychótria tabernæfòlia, Poir. dict. 5. p. 704. Flowers cream-coloured, hardly half an inch long.

Tent-leaved Palicourea. Shrub 4 to 6 feet.

4 P. hebea'ntha (D. C. l. c.) glabrous; branches terete; leaves elliptic-oblong, acuminated, acute at the base; stipulas twin on both sides, acute, small, hardly joined by a ligula; panicles pedunculate, terminal; peduncles trichotomous, compressed; corollas bluntly 4-cleft, clothed with powdery tomentum. ♄. S. Native of Brazil.

Hairy-flowered Palicourea. Shrub.

5 P. Marcgra'vii (St. Hil. pl. rem. bras. p. 281. t. 22. f. a.) branchlets somewhat tetragonal; leaves oblong, acuminated, bluntish at the base, on short petioles; stipulas trifid?; cymes pedunculate, downy; rachis and branches angular; corollas cylindrical, with 5 very short blunt teeth, clothed with papillose tomentum. ♄. S. Native of Brazil, on the edges of woods. Erva do rato, Marcg. bras. 60. f. 2. Galvània, no. 2. Vell. mss. ex St. Hil. Galvània Vellòsii, Rœm. et Schultes, syst. 5. p. 193. Peduncles of a coppery scarlet colour. Corollas of a yellowish copper colour at the base, and purple at the apex.

Var. β, *pubéscens* (D. C. prod. 4. p. 525.) leaves downy beneath. ♄. S. Native along with the species. St. Hil. l. c. and Cham. et Schlecht. in Linnæa. vol. 4.

Marcgrave's Palicourea. Shrub 2 to 3 feet.

6 P. apica'ta (H. B. et Kunth, nov. gen. amer. 3. p. 367. t. 285.) glabrous; branches terete; leaves oblong, short-acuminated, narrow at the base, coriaceous; stipulas connate, bidentate, longer than the petioles; panicles cymose, sessile; corolla glabrous; fruit rather turbinate, crowned by a permanent urceolus. ♄. S. Native of Caraccas, on Mount Silla de Caraccas. Psychótria lineàta, Willd. in Rœm. et Schultes, syst. 5. p. 191. Corolla evidently ventricose at the base. Fruit sometimes 3-celled, and the stigma trifid.

Crowned-fruited Palicourea. Fl. Ju. Aug. Clt. 1824. Shrub 4 to 6 feet.

7 P. Pave'tta (D. C. prod. 4. p. 525.) glabrous; branches terete; leaves ovate-lanceolate, acuminated, thin, nerved; stipulas membranous, bidentate; corymbs terminal, pedunculate, with brachiate trichotomous branches; corolla funnel-shaped, curved a little; anthers inclosed; fruit roundish, didymous. ♄. S. Native of Jamaica, on the mountains in woods. Psychótria Pavétta, Swartz, prod. 45. Lam. ill. t. 161. f. 3. Pavétta pentándra, Swartz, fl. ind. occ. 1. p. 233. Céstrum nervòsum, Mill. dict.—Sloane, hist. jam. 2. t. 202. f. 2.—Plum. ed. Burm. t. 156. f. 1. Flowers white, very sweet-scented, with spreading acute lobes. This is certainly not a species of *Pavétta*, from the style not being exserted, nor a *Psychótria*, from the tube of the corolla being elongated and a little curved.

Pavetta-like Palicourea. Shrub 2 to 3 feet.

8 P. tinctòria (Rœm. et Schultes, syst. 5. p. 194.) glabrous; leaves oblong, acuminated, coriaceous, foveolate in the axils of the veins beneath; stipulas lanceolate, connate at the base; panicles on short peduncles, sub-corymbose, brachiate; throat of the corolla bearded; filaments hairy; fruit roundish. ♄. S. Native of Peru, in forests on the Andes, ex Ruiz et Pav.; and at Guayaquil, ex Hænke. Psychótria tinctòria, Ruiz. et Pav. fl. per. 2. p. 62. t. 211. f. a. Spreng. syst. 1. p. 745. exclusive of the synonyme of Bartl. in herb. Hænke. Stipulas glandular at the base. Peduncles rather tetragonal. Bracteas small, acute. Flowers sessile, usually by threes. Calyx yellowish. Corollas white or cream-coloured, with a reflexed limb. Fruit globose, rufescent. This species yields a red dye.

Var. β; leaves ovate. ♄. S. Native about Guayaquil, ex Hænke.

Dyers' Palicourea. Tree 18 to 28 feet.

9 P. xanthìna (D. C. prod. 4. p. 525.) glabrous; branches terete; leaves ovate or oval-lanceolate, acute at the base, acuminated at the apex, membranous, on short petioles; stipulas very short, somewhat bidentate; corymbs pedunculate, terminal, rarely axillary, trichotomous, bractless; corollas downy on the outside, curved; anthers a little exserted. ♄. S. Native of French Guiana, where it was collected by Patris. Branches and peduncles yellow. Berries nearly globose, didymous, ribbed.

Yellow Palicourea. Shrub 5 to 6 feet.

10 P. punícea (D. C. prod. 4. p. 526.) glabrous; branchlets nearly terete, rufescent; leaves oblong-lanceolate, acute, shining on both surfaces; stipulas twin on both sides, subulate, connected by a short ligula; panicles corymbose, pedunculate, of a scarlet colour; corollas urceolate; berries roundish, didymous. ♄. S. Native of Peru, in forests on the Andes. Psychótria punícea, Ruiz et Pav. fl. per. 2. p. 62. t. 42. f. a. Leaves 9 inches long, undulated. Bracteas subulate. Flowers glomerate. Corolla of a purplish scarlet colour, with a short tube, and ovate acute segments.

Scarlet-corymbed Palicourea. Shrub 6 feet.

11 P. cròcea (Rœm. et Schultes. syst. 5. p. 193.) glabrous; leaves ovate or oval-lanceolate, acuminated, stiffish; stipulas connected by a short ligula, twin on both sides, linear, acuminated, one half shorter than the petioles; panicles corymbose, terminal; corollas obconically tubular; anthers exserted from the tube, but shorter than the limb; berries rather didymous. ♄. S. Native of Porto-Rico, Trinidad, Cuba, Guadaloupe, &c. Psychótria cròcea, Swartz, fl. ind. occ. p. 429. Sieb. fl. trin. no. 28. Meyer, esseq. 1. p. 105.?—Browne, jam. t. 13. f. 1. Leaves with prominent veins. Panicles and peduncles saffron coloured.

Saffron-coloured-panicled Palicourea. Fl. June, July. Clt. 1823. Shrub 4 to 6 feet.

12 P. pedunculòsa (D. C. prod. 4. p. 526.) glabrous; leaves elliptic-oblong, acuminated at both ends, and somewhat cuspidate at the apex, stiffish; stipulas oval, deciduous; panicles corymbose, on long peduncles, with opposite branches; corolla funnel-shaped, glabrous, with revolute lobes; fruit ovate-globose. ♄. S. Native of French Guiana, where it was collected by Patris. Psychótria pedunculòsa, Rich, act. soc. hist. nat. par. 1792. p. 107.? Palicùrea Cayennénsis, Desv. in Ham. prod. fl. ind. occ. p. 29.?

Long-peduncled Palicourea. Shrub 4 to 6 feet.

13 P. chiona'ntha (D. C. l. c.) glabrous; leaves ovate, ending in a short point at the apex, hardly acute at the base, stiffish; stipulas oval, at length deciduous; panicles corymbose, pedunculate, shorter than the leaves, with opposite branches; corolla funnel-shaped, glabrous on the outside; anthers exserted; fruit obovate, pear-shaped, ribbed. ♄. S. Native of Brazil, about Bahia, where it was gathered by Salzmann, G. Don, &c. Corollas snow-white, tubular, with linear-lanceolate lobes, and a villous throat. Stigma bifid. Lobes compressed.

Snow-flowered Palicourea. Shrub 4 to 6 feet.

14 P. umbella'ta (D. C. l. c.) glabrous; branches trigonal or tetragonal; leaves elliptic-oblong, acuminated, attenuated at the base, stiff, nerved, on short petioles; stipulas connected, sheathing, short, coriaceous, with 2 short teeth on both sides; corymbs pedunculate, sub-umbellate, composed of 5-7 branches, which rise almost from the same point, and are corymbosely branched at their tops; calyx acutely 5-toothed. ♄. S. Native of French Guiana, where it was collected by Patris. On the same branch there is often opposite leaves, or 3-4 in a whorl. Stigma 3-cleft in many of the flowers.

Umbellate-corymbed Palicourea. Shrub 4 to 6 feet.

§ 2. *Flowers panicled.*

* *Leaves disposed in whorles.*

15 P. triphy'lla (D. C. prod. 4. p. 526.) glabrous; leaves 3 in a whorl, elliptic-oblong, acuminated at both ends, hardly petiolate; stipulas twin on both sides, linear-subulate, hardly joined at the base, longer than the petioles; racemes terminal, pedunculate, downy, somewhat paniculate, longer than the leaves. ♄. S. Native of French Guiana, where it was collected by Patris. Leaves 4-5 inches long, and 1½ broad. Raceme, along with the peduncle, 6 inches long. Fruit rather compressed, coarsely ribbed. Corolla unknown, hence the genus is doubtful.

Three-leaved Palicourea. Shrub.

16 P. verticilla'ta (D. C. l. c.) branchlets tetragonal, glabrous; leaves 4 in a whorl, lanceolate-oblong, quite glabrous, on short petioles; stipulas bifid; panicles pedunculate, downy; rachis of the panicle triquetrous, and the branchlets are angularly compressed; corollas glabrous; fruit orbicularly ovate. ♄. S. Native of the south of Brazil, in woods. P. longifòlia, St. Hil. pl. rem. bras. p. 232. t. 22. f. b. Corollas yellow. Stamens inclosed.

Whorled-leaved Palicourea. Shrub 4 to 6 feet.

17 P. quadrifòlia (Rudge, pl. guian. p. 27. t. 42.) stem tetragonal; leaves 4 in a whorl, oblong-lanceolate, acuminated; stipulas intrafoliaceous, sheathing; corymbs many-flowered; peduncles a little shorter than the leaves. ♄. S. Native of French Guiana.

Four-leaved Palicourea. Shrub.

18 P. tetraphy'lla (Cham. et Schlecht. in Linnæa. 4. p. 17.) branchlets bluntly tetragonal, smooth; leaves 4 in a whorl, ovate, or lanceolate-oblong, attenuated at both ends, stiffish, on short petioles, glabrous above, and downy beneath; stipulas bifid, with the lobes lanceolate, acute, and ciliated; panicles terminal, pyramidal, large, pedunculate, downy; corollas glabrous on the outside. ♄. S. Native of tropical Brazil.

Tetraphyllous Palicourea. Shrub 4 to 6 feet.

* * *Leaves opposite, more or less petiolate.*

19 P. macróbotrys (D. C. prod. 4. p. 527.) branchlets terete, glabrous; leaves long-lanceolate, acuminated, clothed with velvety down beneath; stipulas twin on both sides, hardly connected at the base, ovate-lanceolate; panicles elongated, much longer than the leaves, clothed with velvety down; rachi somewhat tetragonal. ♄. S. Native of Peru, on the Andes, in forests at Cuchero and Chinchao, et Ruiz et Pav.; and on the mountains about the Guanocco, ex herb. Hænke. Psychótria macróbotrys, Ruiz et Pav. fl. per. 2. p. 57. t. 203. f. a. Bartl. in herb. Hænke. Spreng. syst. 1. p. 744. Rœm. et Schultes, syst. 5. p. 184. Leaves 6 inches long. Stipulas glandular at the base. Panicles purplish, a foot long. Bracteas small, subulate. Corollas small, yellow, villous inside at the insertion of the stamens, and having the segments edged with purple. Berries ovate, dark blue, a little compressed.

Long-racemed Palicourea. Shrub 10 to 12 feet.

20 P. macroca'rpa (H. B. et Kunth, nov. gen. amer. 3. p. 369.) branches terete, glabrous; leaves obovate-oblong, short-acuminated, cuneated at the base, rather coriaceous, glabrous above, and hairy on the veins beneath; stipulas bifid, glabrous; panicles pedunculate, spreading; corollas glabrous; fruit nearly globose. ♄. S. Native of New Granada, in hot places. Psychótria anacardifòlia, Willd. in Rœm. et Schultes, syst. 5. p. 190. Distinct from *P. macróbotrys*, with which it is joined by Sprengel.

Long-fruited Palicourea. Shrub 6 to 7 feet.

21 P. amethy'stina (D. C. prod. 4. p. 527.) branchlets somewhat tetragonal, rather hairy; leaves oblong-lanceolate, acuminated, glabrous above, and villous on the nerves and veins beneath; stipulas connected together almost to the middle into a sheath, and drawn out into 2 subulate teeth on each side; panicles hairy, a little longer than the leaves; bracteoles subulate; fruit oval. ♄. S. Native of Peru, in forests on the Andes at Pillao and Huassa-Huassi. Psychótria amethýstina, Ruiz et Pav. fl. per. 2. p. 57. t. 203. f. b. Glands 7 in the axils of each stipula. Corollas tubular, blue. Berries ovate, blue.

Blue-berried Palicourea. Shrub 10 to 12 feet.

22 P. longibractea'ta (D. C. prod. 4. p. 527.) branchlets slightly tetragonal, smoothish; leaves oblong, acuminated, on short petioles, clothed with villous down on both surfaces; stipulas connate at the base a little way, twin on both sides, linear, acuminated; panicles longer than the leaves, hairy; bracteoles elongated, rather foliaceous; berries roundish, compressed. ♄. S. Native of Panama. P. amethýstina β longibracteàta, Bartl. in herb. Hænke. Very like *P. amethy'stina*, but differs in the petioles being 1-2 lines long, not 11-12; and in the stipulas not being glandular at the base, and connected only a very short way. Berries globose, blue. Corollas blue?

Long-bractead Palicourea. Shrub 6 to 8 feet.

23 P. obova'ta (D. C. l. c.) branchlets bluntly tetragonal; leaves obovate, acuminated, large, veiny, downy on the nerves and veins beneath; stipulas connected, ovate, with 2 short blunt lobes on each side; panicles thyrsoid, downy, brachiate, longer than the leaves; calyx ciliated; corolla tubular; berries globose. ♄. S. Native of Peru, on the Andes in forests at Chinchao and Pillao. Psychótria obovàta, Ruiz et Pav. fl. per. 2. p. 58. t. 204. f. a. Leaves a foot long. Stipulas glandular at the base. Corollas purple, villous inside. Berries purple, almost globular.

Obovate-leaved Palicourea. Shrub 8 to 10 feet.

24 P. mìtis (D. C. l. c.) branchlets bluntly tetragonal; leaves lanceolate, acute at both ends, very soft and probably velvety above, and glabrous beneath; stipulas connate at the base, ovate, emarginate, with very blunt teeth; panicles divaricate, hardly longer than the leaves; corollas funnel-shaped. ♄. S. Native of Peru, in forests on the Andes at Pillao and Chacahuassi. Psychótria mìtis, Ruiz et Pav. fl. per. 2. p. 60. t. 208. f. b. Leaves 4-10 inches long. Peduncles tetragonal. Flowers sessile. Bracteas subulate. Corolla yellow, with a hairy throat. Anthers linear, shorter than the corolla.

Mild-leaved Palicourea. Shrub.

25 P. la'xa (Rœm. et Schultes, syst. 5. p. 195.) glabrous; branchlets tetragonal; leaves oblong, acuminated, shining above; stipulas smooth, bifid, with ovate obtuse lobules; panicles long, loose, when in flower erect, but when bearing the fruit pendulous; bracteas long, reflexed. ♄. S. Native of Peru, on the Andes in forests. Psychótria láxa, Ruiz et Pav. fl. per. 2. p. 61. t. 212. f. b. but not of Swartz. Psychótria lùteo-viréscens, Pers. ench. 1. p. 208. Psychótria brachiàta, Dietr. Leaves 9 inches long. Peduncles compressed. Corolla greenish-yellow. Berries ovate, didymous, purplish-green.

Loose-flowered Palicourea. Shrub 8 to 10 feet.

26 P. hyacinthiflòra (Rœm. et Schultes, syst. 5. p. 194.) glabrous; branchlets bluntly tetragonal; leaves large, obovate, acuminated; stipulas bifid, with the lobes ovate, obtuse; panicles length of leaves; peduncles brachiate; bracteas small, ovate; corolla funnel-shaped, with long revolute lobes. ♄. S. Native of Peru, on the Andes in forests. Psychótria hyacinthiflòra, Ruiz et Pav. fl. per. 2. p. 62. t. 213. f. a. Psych. hyacinthoìdes, Pers. ench. 1. p. 208. Panicles purple. Corolla violaceous. Stamens inclosed in the middle of the tube. Berries roundish, ovate, of a bluish violet colour.

Hyacinth-flowered Palicourea. Shrub 10 to 12 feet.

27 P. cœru'lea (Rœm. et Schultes, syst 5. p. 194.) glabrous;

leaves lanceolate, acuminated, spreadingly deflexed; stipulas ovate, undivided, one-half shorter than the petioles; branches of panicle opposite, lower and ultimate ones rising from the axils; flowers crowded at the tops of the branches of the panicle; corolla funnel-shaped, with revolute lobes; berries turbinate. ♄. S. Native of Peru, on the Andes in forests at Vitoc. Psy. cœrùlea, Ruiz et Pav. fl. per. 2. p. 62. t. 213. f. b. Branchlets terete. Leaves 8-9 inches long. Corollas yellowish. Stamens inserted below in the middle of the tube. Berries blue, pear-shaped, size of peas.

Blue-berried Palicourea. Shrub 9 to 10 feet.

28 P. sulphu'rea (D. C. prod. 4. p. 528.) glabrous; branchlets bluntly tetragonal; leaves obovate-cuneated, terminating in a short blunt point, coriaceous, nerved, shining above; stipulas bluntly 2-lobed, somewhat connected at the base; panicle loose, rather longer than the leaves; corollas funnel-shaped; fruit roundish. ♄. S. Native of Peru, on the Andes in forests. Psychótria sulphùrea, Ruiz et Pav. fl. per. 2. p. 58. t. 203. f. a. Leaves yellowish, 6 inches long. Bracteas subulate. Corolla sulphur-coloured, having the tube villous inside below the throat. The shrub is very villous, and affords a yellow dye, which is used by the natives in the places of its natural growth.

Sulphur-coloured-flowered Palicourea. Shrub 10 to 12 feet.

29 P. flave'scens (H. B. et Kunth, nov. gen. amer. 3. p. 366.) branchlets rather tetragonal, villous; leaves oblong, acuminated, narrowed at the base, rather coriaceous, downy or hairy above, and clothed with golden yellow hairy tomentum beneath, and particularly so on the nerves; stipulas villous, combined, bidentate: teeth subulate; panicles sessile: corollas hairy. ♄. S. Native of Peru, in temperate places. Psychótria flavéscens, Spreng. syst. 1. p. 744.

Yellowish Palicourea. Shrub 8 to 10 feet.

30 P. thyrsiflòra (D. C. prod. 4. p. 528.) glabrous; branchlets bluntly tetragonal; leaves lanceolate, acute; stipulas twin on both sides, short, tooth-formed, connected by a ligula; panicles thyrsoid, brachiate, longer than the leaves; berries ovate. ♄. S. Native of Peru, on the Andes in forests at Cuchero. Psychótria thyrsiflòra, Ruiz et Pav. fl. per. 2. p. 57. t. 204. f. b. Leaves 5 inches long. Stipulas tridentate, the middle tooth ovate ciliated, and the lateral ones subulate. Calyxes yellowish. Corollas yellow, villous inside. Berries ovate, dark purple.

Thyrse-flowered Palicourea. Shrub 10 to 12 feet.

31 P. alpi'na (D. C. prod. 4. p. 528.) branchlets tetragonal; leaves ovate-lanceolate, membranous, reticulated, a little ciliated; petioles downy; stipulas twin on both sides, linear, rather ciliated, connected by a short ligula; panicles terminal, erect, usually shorter than the leaves; corollas terete, elongated, diaphanous; anthers inclosed in the throat. ♄. S. Native of Jamaica, on the Blue Mountains. Psychótria alpìna, Swartz, prod. p. 44. fl. ind. occ. p. 431. The leaves and branches are said to be glabrous. Peduncles rufescent. Corolla rather ventricose at the base, yellow, red, purple, and white. Berries nearly globose.

Alpine Palicourea. Shrub.

32 P. eria'ntha (D. C. prod. 4. p. 528.) branchlets terete; leaves elliptic, acute at the base, acuminated at the apex, glabrous above, hairy on the petioles and nerves beneath; stipulas twin on both sides, subulate, joined by a membrane; panicles terminal; calyx acutely 5-toothed, glabrous; corolla tubular, very hairy outside. ♄. S. Native of St. Domingo. Psychótria alpìna, Poir. dict. 5. p. 702. exclusive of the synonyme of Desf.

Woolly-flowered Palicourea. Shrub 8 to 10 feet.

33 P. speciòsa (H. B. et Kunth, nov. gen. amer. 3. p. 368.) branches glabrous, terete; leaves oblong, acuminated, acute at the base, membranous, roughish, shining; stipulas glabrous; panicles pedunculate, with angular branches, which are as well as the corollas downy. ♄. S. Native of New Granada, near Santa Anna. Form of stipulas and fruit unknown. According to Sprengel, this is the same as Psychótria lævigàta, Willd. but not of Kunth.

Showy Palicourea. Shrub 6 to 8 feet.

34 P. elli'ptica (H. B. et Kunth, nov. gen. amer. 3. p. 369.) branchlets tetragonal, smoothish; leaves roundish-elliptic, acute, rounded at the base, coriaceous, stiff, glabrous above, and hairy or downy beneath; panicles on short peduncles, with short dichotomous smoothish branches; corollas glabrous. ♄. S. Native on the banks of the Orinoco. Psychótria circinàta, Willd. in Rœm. et Schultes, syst. 5. p. 190. ex Spreng. syst. 1. p. 744.? Distinct from Psychótria ellíptica of Ker. and Willd.

Elliptic-leaved Palicourea. Shrub.

35 P. longiflòra (D. C. prod. 4. p. 528.) branches terete, smooth; leaves ovate-lanceolate, acuminated, large, coriaceous, rather downy beneath, on short petioles; panicles one-half shorter than the leaves, with alternate horizontal branches; corolla with a very long tube, which is attenuated at the base, and short straightish lobes. ♄. S. Native of Cayenne. Psychótria longiflòra, Poir. dict. 5. p. 104. but not of Willd. Nerves of leaves and branches of panicle yellowish. Stipulas unknown. In the specimens of the plant preserved in the royal museum at Paris, the leaves appear to be quite glabrous on both surfaces. Leaves 6-8 inches long.

Long-flowered Palicourea. Shrub.

36 P. Dominge'nsis (D. C. prod. 4. p. 529.) glabrous; branches terete; leaves ovate-lanceolate, acute, shining, petiolate; panicles terminal, usually twin; flowers sessile, cylindrical, incurved; berries shining. ♄. S. Native of St. Domingo, on the banks of mountain streams in shady humid places. Psychótria Domingénsis, Jacq. amer. p. 66. Leaves 5 inches long. Corollas white. Berries dark, shining, with a watery pulp.

St. Domingo Palicourea. Shrub 5 to 6 feet.

37 P. tinifòlia (D. C. prod. 4. p. 529.) glabrous; branches terete; leaves obovate-oblong, acute, reticulately veined beneath, rather coriaceous, shining; stipulas bifid, obtuse; panicles stiff, with angular thickened branches; corollas salver-shaped; stamens inclosed. ♄. S. Native of South America. Psychótria tinifòlia, Willd. in Rœm. et Schultes, syst. 5. p. 190. Colladònia tinifòlia, Spreng. syst. 1. p. 516. and 757. Berries 3-celled, 3-seeded, probably from the same cause as those of *Palicòurea apicàta*.

Laurestine-leaved Palicourea. Shrub.

38 P. croceoìdes (Desf. in Ham. prod. fl. ind. occ. p. 29.) leaves broad-ovate, acuminated, attenuated at the base, shining, quite glabrous; panicles on long peduncles. ♄. S. Native of the Antilles. Branches saffron-coloured, as in *P. cròcea*, to which it is very nearly allied, but differs in the flowers being smaller and fewer, and in the nerves of the leaves being common, not parallel. The stipulas, flowers, and fruit remain undescribed.

Crocea-like Palicourea. Shrub 4 to 6 feet.

39 P. cocci'nea (D. C. prod. 4. p. 529.) glabrous; leaves elliptic-oblong, acuminated at both ends, rather membranous; stipulas twin on both sides, setaceous, connected by a short ligula; panicles elongated, contracted; corolla with a short cylindrical tube, and an erect limb; anthers inclosed; berries roundish. ♄. S. Native of St. Domingo and Porto-Rico. Psychótria coccínea, Poir. pl. exsic. Very nearly allied to *P. cròcea*, and is probably often confused with it, but differs in the corollas and fruit being smaller, in the branches of the panicle being erect and spreading, and usually alternate, in the stipulas being shorter and thinner, &c.

Scarlet Palicourea. Shrub 4 to 6 feet.

40 P. longifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 369.)

glabrous; branches terete; leaves lanceolate-oblong, acuminated, acute at the base, membranous, shining; stipulas caducous; panicles sessile; corollas smoothish. ♄. S. Native of New Granada, near Santa Anna. This is a very distinct plant from Psychótria longiflòra, Willd., with which it has been confounded by Sprengel in his syst. 1. p. 744.

Long-leaved Psychotria. Shrub.

41 P. angustifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 367.) branchlets hairy; leaves oblong-lanceolate, acuminated, acute at the base, membranous, stiff, discoloured, glabrous, rather hairy on the nerves and veins; stipulas glabrous, bidentate: teeth subulate; panicles pedunculate, hairy; corollas hairy; fruit nearly globose, didymous. ♄. S. Native of South America, on the banks of the Orinoco or Rio Negro. Psychótria stenophýlla, Spreng. syst. 1. p. 744.

Narrow-leaved Palicourea. Shrub.

42 P. nicotianæfòlia (Cham. et Schlecht. in Linnæa. 4. p. 18.) branchlets, panicles, stipulas, and under surfaces of leaves clothed with minute down; leaves ovate-lanceolate, acuminated at both ends, membranous, glabrous above; stipulas truncate, drawn out into 2 lanceolate-linear teeth each; panicles elongated, contracted; corollas tubular, downy on the outside while young. ♄. S. Native of equinoxial Brazil. Segments of the corolla rather unequal, pilose at the apex. There are also 5 fascicles of hairs in the tube of the corolla. Berries nearly orbicular, flattened.

Tobacco-leaved Palicourea. Shrub 6 to 8 feet.

43 P. calophy'lla (D. C. prod. 4. p. 529.) glabrous; branches terete; leaves oblong, acute at the base, acuminated at the apex, on short petioles; stipulas combined at the base, twin on both sides, lanceolate, acuminated; panicles erect, contracted, shorter than the leaves, with very short few-flowered downy branchlets; corollas clothed with powdery tomentum. ♄. S. Native of French Guiana, where it was collected by Patris. Leaves 6-8 inches long, and 2 or $2\frac{1}{2}$ broad. Nearly allied to *P. nicotianæfòlia*, but differs in the leaves being glabrous beneath, in the different form of the stipulas. The lobes of the stipulas appear as if they were verticillate, 2 being axillary, and the other 2 between the petioles.

Beautiful-leaved Palicourea. Shrub 5 to 6 feet.

44 P. petiola'ris (H. B. et Kunth, nov. gen. amer. 3. p. 370.) glabrous; leaves elliptic-oblong, acuminated, cuneated at the base, membranous, on long petioles: stipulas connate, acutely bifid at the apex; panicles erect, clothed with very minute down; calyx glabrous, with acutish lobes. ♄. S. Native of New Andalusia, on Mount Tumiriquiri. Psychótria petiolàris, Spreng. syst. 1. p. 745. Corolla unknown. Leaves 6-7 inches long. Petioles 1 or $1\frac{1}{2}$ inch long. Panicles 3-4 inches long. Said to be nearly allied to *P. Guianénsis*.

Petiolar Palicourea. Tree 60 feet.

45 P. Guiane'nsis (Aubl. guian. 1. p. 173. t. 66.) glabrous; leaves oval, short-acuminated, hardly acute at the base, membranous, petiolate; stipulas bluntly bifid, rather connate, at length distinct, intrafoliaceous; panicles much-branched, erect; corollas cylindrical, mealy outside. ♄. S. Native of French Guiana, in woods. Psychótria Palicùrea, Swartz, fl. ind. occ. p. 433. Stephànium Guianénse, Gmel. syst. veg. p. 368. Semìra Palicùrea, Poir. dict. 7. p. 196. Leaves a foot long, and 5-6 inches broad. Flowers sweet-scented, scarlet. Tube of corolla a little inflated, and curved.

Guiana Palicourea. Shrub 7 to 8 feet.

46 P. Hænkea'na (D. C. prod. 4. p. 530.) branchlets bluntly tetragonal; leaves petiolate, elliptic, acute at the base, and very blunt at the apex, or hardly cuspidate, glabrous, velvety beneath on the middle nerve and veins; stipulas triangular, acute; panicles terminal, pedunculate, much branched, equal in length to the leaves, with opposite or alternate spreading branches; corollas glabrous. ♄. S. Native of Peru, on the mountains about the Guanocco, where it was collected by Hænke. Cinchòna Hænkeàna, Bartl. in herb. Hænke. Corollas purplish, 4 lines long. Fruit unknown. Habit very like that of *P. Guianénsis*.

Hænke's Palicourea. Shrub 6 to 8 feet.

47 P. barbine'rvia (D. C. prod. 4. p. 530.) branches terete, glabrous; leaves oval, acute at the base, cuspidate at the apex, stiffish, glabrous, with the nerves rather prominent beneath, and bearded on both sides; stipulas intrafoliaceous, adpressed, very blunt, somewhat 2-lobed; panicles pedunculate, rather longer than the leaves, large, much branched, having the rachis angular, and the branchlets somewhat verticillate, spreading, and many-flowered; corollas clothed with powdery tomentum. ♄. S. Native of Porto-Rico, and probably of St. Domingo. Psychótria macrophýlla and Psych. lùtea, Spreng. in herb. Balb. A very beautiful species, nearly allied to *P. Guianénsis*, but very distinct. The nerves of the leaves become naked at length.

Bearded-nerved Palicourea. Shrub 6 to 7 feet.

48 P. costa'ta (H. B. et Kunth, nov. gen. amer. 3. p. 366.) branchlets villous; leaves oblong, acuminated, acute at the base, membranous, glabrous, discoloured beneath, and hairy on the nerves and veins; stipulas hairy, bifid, with the segments linear, and about equal in length to the petioles; panicles pedunculate, hairy; corollas hairy on the outside, and bearded inside. ♄. S. Native of South America, on the banks of the Orinoco and Rio Negro. Said to be nearly allied to *Psychótria reticulàta*. Perhaps the same as Psychótria aristàta, Willd. in Rœm. et Schultes, syst. vol. 5. to which it is referred by Sprengel.

Ribbed-leaved Palicourea. Shrub.

49 P. no'xia (Mart. reis. ex Linnæa. 5. p. 39.) glabrous; leaves membranous, oblong, acuminated, rounded at the base on short petioles; panicles divaricate; pedicels usually trifid; corollas velvety. ♄. S. Native of Brazil. The rest unknown, as in the following species.

Poisonous Palicourea. Shrub.

50 P. sònans (Mart. l. c.) glabrous; leaves coriaceous, oblong, attenuated at both ends, acuminated or retuse; racemes subcorymbose, disposed into a large pyramidal panicle. ♄. S. Native of Brazil. Corollas velvety.

Sounding Palicourea. Shrub.

51 P. diure'tica (Mart. l. c.) leaves with thickened revolute margins, velvety beneath between the ribs and veins; racemes disposed into a subcorymbose panicle; flowers clothed with fine velvety down. ♄. S. Native of Brazil.

Diuretic Palicourea. Shrub.

52 P. officina'lis (Mart. l. c.) shrub clothed with harsh yellow down in every part; leaves narrow-elliptic, on short petioles, acute or rounded at the apex, with a mucrone, tapering a little at the base; corymbs disposed into a coarctate panicle. ♄. S. Native of Brazil.

Officinal Palicourea. Shrub.

53 P. aura'ta (Mart. l. c. p. 40.) leaves 4 in a whorl, membranous, stiffish, oblong or obovate, on long petioles, bluntish, glabrous, of a golden yellow colour beneath; racemes disposed in a coarctate panicle; corollas clothed with fine velvety down. ♄. S. Native of Brazil.

Eared Palicourea. Shrub.

54 P. stre'pens (Mart. l. c.) bark corky; leaves coriaceous, stiff, glabrous on both surfaces, almost sessile, broad-ovate, obtuse at both ends, with thickened revolute margins, yellowish beneath; corymbs disposed into a pyramidal panicle; corollas clothed with fine velvety down. ♄. S. Native of Brazil. Perhaps the same as *P. rígida?*

Rattling Palicourea. Shrub.

**** Leaves opposite, sessile.*

55 P. rí'gida (H. B. et Kunth, nov. gen. amer. 3. p. 370.) glabrous; branches bluntly tetragonal; leaves elliptic, acutish, rounded at the base, almost sessile, coriaceous, shining: stipulas twin on both sides, connected by a short ligula, almost linear, acute; panicles on long peduncles, spreading; corollas clothed with very fine down; stamens exserted. ♄. S. Native of New Andalusia, on arid mountains, tropical Brazil, and at Caraccas. Cham. et Schlecht. in Linnæa. 4. p. 15. Psychótria rígida, Willd. in Rœm. et Schultes, syst. 5. p. 192. Psych. byrsophýlla and Psych. rígida, Spreng. syst. 1. p. 747. and 745. and perhaps P. strépens, Mart. Flowers yellow, varying from pentamerous to hexamerous.

Stiff Palicourea. Fl. Aug. Sept. Clt. 1820. Shrub 3 feet.

Cult. For culture and propagation see *Psychótria*, p. 599.

CLXXIV. CHASA'LIA (in honour of D. Chasal, once governor of the Mauritius, a great lover of natural history). Comm. mss. Juss. mem. mus. 6. p. 379. A. Rich. mem. soc. hist. nat. par. 5. p. 166. t. 16. f. 1. D. C. prod. 4. p. 531.—Psychótria, Coffèa, and Nonatèlea species, Sieb.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an ovate tube, and an urceolate rather tubular limb, with an entire or 5-toothed border; lobes or teeth joined together at length. Corolla with an elongated terete equal tube, and 5 short acutish erect or spreading lobes, which are usually callous at the apex, and valvate in æstivation. Anthers 5, inserted in the middle or top of the tube of the corolla, inclosed or sometimes a little exserted. Stigmas 2, linear. Berries ovate, crowned by the limb of the calyx, containing 2 pyrenæ, hardly ribbed even in the dry state; pyrenæ coriaceously-chartaceous or horny, oblong, marked by a furrow inside, convex on the outside, and furnished by a longitudinal crest in the middle, which is extended beyond the base, 1-seeded. Seed erect, with the transverse section arched, lunate, and compressed. Embryo at the base of a horny albumen.—Glabrous shrubs, all natives of the Mauritius. Leaves opposite or 3 in a whorl. Stipulas ovate, undivided or combined into a 4-cleft sheath. Flowers tubular, crowded and sessile on the tops of the branches, or disposed in terminal panicled corymbs. This genus differs from *Psychótria* in the corolla being elongated, and from *Palicoùrea* in the corolla not being gibbous at the base, and from both in the urceolate or campanulate calyx. The habit is that of *Gærtnèra*, but the characters are very different.

** Flowers sessile, and crowded on the tops of the branches. Leaves opposite.—Chasàlia, Juss.*

1 C. capita'ta (D. C. prod. 4. p. 531.) leaves opposite, oval, or obovate, terminating in a very short point; stipulas ovate, acuminated, permanent, longer than the petioles; flowers disposed in spicate heads at the tops of the branches, fascicled, sessile. ♄. S. Native of the Mauritius. Psychótria capitàta, Sieb. fl. maur. no. 56. Corolla tubular, 8-10 lines long, with acute hardly open lobes. Leaves 2 inches long, and 12-15 lines broad. Stipulas 8-9 lines long. Fruit unknown. Perhaps the same as Chasàlia Commersònii described by Jussieu.

Capitate-flowered Chasalia. Shrub.

*** Flowers disposed in terminal panicled corymbs. Leaves opposite.*

2 C. psychotrioìdes (D. C. prod. 4. p. 531.) leaves opposite, obovate-oblong, bluntish, coriaceous, cuneated at the base, on very short petioles; stipulas ovate, obtuse, about equal in length to the petioles; panicles corymbose, pedunculate: rachis and branches compressed, opposite. ♄. S. Native of the Mauritius. Psychótria? Sieb. fl. maur. 2. no. 57. Internodes half an inch long. Leaves 2½ to 3 inches long, and 15 lines broad. Corolla in the unexpanded state 7 lines long. Calyx bluntly 5-toothed.

Psychotria-like Chasalia. Shrub.

3 C. coffeoìdes (D. C. l. c.) leaves opposite, oblong, bluntish, cuneated at the base; stipulas ovate, acute, a little longer than the petioles; panicles terminal, pedunculate, somewhat corymbose, with the rachi and peduncles compressed, and the branches opposite. ♄. S. Native of the Mauritius. Coffèa capitàta, Sieb. fl. maur. exsic. no. 335. Leaves 3½ to 4 inches long, and 12-15 lines broad. Stipulas 5 lines long. Calyx with 5 acute short teeth. Corolla in the unexpanded state 5 lines long.

Coffee-like Chasalia. Shrub.

4 C. Fontane'sii (D. C. l. c.) leaves opposite, obovate-oblong, bluntish, attenuated at the base; stipulas oval, obtuse, deciduous, shorter than the petioles; panicles terminal, pedunculate, rather corymbose, with the rachi and branches compressed. ♄. S. Native of the Mauritius, and probably of the island of Bourbon. Coffèa cymòsa, Willd. in Rœm. et Schultes, syst. 5. p. 201.? Very nearly allied to *C. coffeoìdes*, but the stipulas are different. Petioles 4-6 lines long. Fruit ovate, crowned by the calyx. Flowers unknown.

Desfontaines's Chasalia. Shrub.

5 C. stipula'cea (D. C. prod. 4. p. 532.) leaves opposite, obovate, acutish, cuneated at the base; stipulas combined in the middle into a 4-cleft sheath, equal in length to the petioles or longer than them: lobes acuminated, 2 of which are within the leaves, and 2 between the leaves; corymbs terminal, trichotomous, with elongated branches, which bear a head of the flowers each at their tops. ♄. S. Native of the Mauritius. Psychótria, Sieb. fl. maur. 2. no. 271. Leaves 6 inches long. Corolla 6-7 lines long. Limb of calyx short, 5-toothed.

Large-stipuled Chasalia. Shrub.

6 C. divarica'ta (D. C. l. c.) leaves opposite, obovate-oblong, acutish, cuneated a long way at the base, and petiolate; stipulas ovate, obtuse, membranous, deciduous, 2 or 3 times shorter than the leaves; panicles corymbose, one-half shorter than the leaves; lobes of corolla short, acute, straight. ♄. S. Native of the Mauritius. Coffèa divaricàta, Tausch. ex Sieb. fl. maur. 2. p. 271. in herb. Dunant. Mussæ'nda lanceolàta, Poir. dict. 4. p. 392.? and hence the Chasàlia Bourbòniæ, Comm.? Leaves 5-6 inches long, and 15 lines broad. Petioles about an inch long. Calyx urceolate, bluntly and shortly 5-toothed. Corolla 6 lines long.

Divaricate Chasalia. Shrub.

**** Flowers disposed in terminal panicled corymbs. Leaves 3 in a whorl.*

7 C. Borya'na (D. C. prod. 4. p. 532.) leaves 3 in a whorl, elliptic, acute at both ends, on long petioles; stipulas deciduous; panicles trichotomous, a little shorter than the leaves; lobes of corolla short, ovate, spreading; anthers exserted a little from the throat; calyx subtruncate. ♄. S. Native of the Mauritius and the Island of Bourbon, where it was collected by Bory de St. Vincent. Sieb. fl. maur. 2. no. 253. Petioles 12-16 lines long. Leaves 4 inches long and 2 broad, with the nerves often white. Corolla 6 lines long.

Bory de St. Vincent's Chasalia. Shrub.

8 C. grandifòlia (D. C. l. c.) leaves 3 in a whorl, elliptic, acuminated at both ends, rather membranous, on long petioles; stipulas ovate, acuminated, rather longer than the petioles; panicles thyrsoid, terminal, on short peduncles. ♄. S. Native of the Mauritius. Psychótria grandifòlia, Sieb. fl. maur. 2. no. 55. but not of Rœm. et Schultes. Branchlets bluntly trigonal. Petioles 7-10 lines long. Leaves 5 inches long and 1½ broad.

Limb of calyx short, hardly 5-toothed. Corolla 10-12 lines long. Anthers at the throat.

Great-leaved Chasalia. Shrub.

9 C. clusiæfòlia (D. C. l. c.) leaves 3 in a whorl, obovate-oblong, obtuse, coriaceous, attenuated at the base; stipulas twin on both sides, ovate, obtuse, adpressed, shorter than the petioles; peduncles rising by threes from the tops of the branches, angularly compressed, and densely corymbose at the apex; bracteas numerous, short. ♄. S. Native of the Mauritius. Nonatèlia? clusiæfòlia, Reich. in Sieb. fl. maur. no. 89. Branchlets angular. Leaves 2-3 inches long and 1 or 1½ broad. Petioles 6 lines long. Bracteas one at the base of each pedicel, and 2 on each. Corolla 5 lines long in the unexpanded state.

Var. β; leaves opposite. ♄. S. Growing along with the species.

Clusia-leaved Chasalia. Shrub.

Cult. For culture and propagation see *Psychótria*, p. 599.

CLXXV. JA'CKIA (named in memory of the late William Jack, a surgeon in the service of the East India Company, whose well known indefatigable labours in natural history have long ago entitled him to the highest respect). Wall. in Roxb. fl. ind. 2. p. 321. D. C. prod. 4. p. 621.

Lin. syst. *Pentándria, Monogýnia.* Limb of calyx unilateral, trifid. Corolla funnel-shaped, with a filiform tube, and a campanulate 5-cleft border; segments lanceolate, valvate in æstivation. Anthers filiform, sessile in the throat of the corolla, semi-exserted. Style long, hairy in the middle; stigma 2-lobed. Capsule? crowned by 3 large unilateral wings, 1-celled, and 1-seeded?—Tree tall. Leaves large, opposite, on short petioles, elliptic-obovate, cuspidate, clothed with rusty hairs beneath, as well as the branches, which are obscurely quadrangular. Stipulas combined, sheathing, fringed, interpetiolar. Panicles large, axillary, opposite, pendulous, on very long peduncles, hairy, and villous, with spreading opposite slender branches, each terminated by a corymb of crowded subdichotomous spikes. Peduncles slender, compressed, partial ones each supported by a pair of ample fringed connate bracteas, which sometimes grow out at the margins into opposite small floral leaves. Flowers white, inodorous, sessile, alternate, disposed in short unilateral spikes, and each flower is supported by an oval densely villous toothed permanent bractea, and these bracteas are somewhat imbricated on the back of the spikes.

1 J. orna'ta (Wall. in Roxb. fl. ind. 2. p. 321. pl. asiac. rar. 3. p. 68. t. 293.) ♄. S. Native of the East Indies, in several of the small islands in the immediate vicinity of Singapore. A very large branching umbrageous tree. Leaves 6 to 10 or even 14 inches long, crowded at the tops of the branches.

Decked Jackia. Tree large.

Cult. See *Psychótria*, p. 599. for culture and propagation.

Subtribe II. Cephæli'deæ (the plants contained in this subtribe agree with the genus *Cephæ'lis* in the flowers being disposed in involucrated heads). D. C. prod. 4. p. 532.—Cephælídeæ, Cham. et Schlecht. in Linnæa. 4. p. 133. Flowers disposed in fasciculate heads; the heads involucrated by bracteas.

CLXXVI. CEPHÆ'LIS (from κεφαλη, *kephale*, a head; in reference to the disposition of the flowers in heads). Swartz, prod. p. 45. fl. ind. occ. p. 435. t. 10. A. Rich. mem. soc. hist. nat. Par. 5. p. 172. D. C. prod. 4. p. 532.—Cephæ'lis and E'vea, Juss. mem. mus. 6. p. 402. exclusive of syn. 2. and 5.—Tapagòmea and Evèa, Aubl. guian. 1. p. 157. and 100. Juss. gen. 258. Poir. dict. 7. p. 515.—Callicócca, Schreb. gen. no. 316.—Cephæ'leis, Vahl, eclog. 1. p. 19.

Lin. syst. *Pentándria, Monogýnia.* Calyx with an obovate tube, and a very short 5-toothed limb. Corolla funnel-shaped, with 5 small bluntish lobes. Anthers inclosed. Stigma bifid, usually exserted. Berries obovate, oblong, 2-celled, 2-seeded, crowned by the vestiges of the calyx.—Shrubs and herbs, natives of America. Leaves ovate, acute, petiolate. Stipulas twin on both sides, free or combined, and sometimes bidentate or bipartite. Heads of flowers terminal or axillary, sessile or pedunculate, involucrated by 2-8 bracteas, which are disposed in a cruciately opposite manner; there are also bracteoles or paleæ among the flowers.—Perhaps the species with dry berries, and those with fleshy berries, ought to be separated into distinct genera. Perhaps *E'vea* is properly joined with this genus, notwithstanding its tetrandrous flowers. Probably *Carapíchea* might be joined with this genus, but for its exserted stamens.

Sect. I. Tapogòmea (Tapogomo is the Guiana name of the first species). D. C. prod. 4. p. 533. Heads of flowers involucrated by 2 large spreading connate coloured bracteas.

1 C. tomentòsa (Willd. spec. 1. p. 977.) branches, petioles, peduncles, leaves, and involucra hairy; stipulas acuminated, villous; heads of flowers on long peduncles; leaves of involucrum broad, ovate-cordate, wide at the apex. ♄. S. Native of Guiana, Trinidad, and probably of Mexico (if C. cyanocárpa, Moc. et Sesse, fl. mex. icon. ined. be the same,) in open spaces of woods, and about way sides. Tapogòmea tomentòsa, Aubl. guian. 1. p. 160. t. 61. Cephæ'leis tomentòsa, Vahl, eclog. 1. p. 19. Callicócca tomentòsa, Gmel. syst. 1. p. 371. Peduncles axillary and terminal. Bracteas or involucrum scarlet, or of a vermilion-colour, large, sometimes long-acuminated, and sometimes only cuspidate. Branches obscurely tetragonal. Berries striated, ex Aubl., but blue and smooth according to the fig. in fl. mex. There are therefore 2 species probably confused. In Trinidad we have seen this shrub growing in great abundance, and where it makes a very elegant appearance from its scarlet bracteas; the flowers, as far as we can remember, are brownish, and the berries bluish.

Woolly Cephælis. Fl. June, Sept. Clt. 1825. Sh. 4 feet.

2 C. puni'cea (Willd. spec. 1. p. 977.) quite glabrous; stipulas obtuse; heads of flowers on long peduncles; leaves of involucrum obtuse, longer than the heads. ♄. S. Native of Jamaica. Cephæ'lis punícea, Vahl, eclog. 1. p. 19. Tapogòmea punícea, Poir. dict. 7. p. 585. Leaves oblong or elliptic, acuminated at both ends, 3-5 inches long. Branches reddish. Petioles villous at the base while young. Stipulas twin on both sides, joined to the middle. Peduncles rising between 2 branchlets, furrowed, reddish. Leaves of involucrum scarlet, cordate, ovate.

Scarlet-involucred Cephælis. Fl. June, Sept. Clt. 1820. Shrub 4 to 6 feet.

3 C. ela'ta (Swartz, prod. p. 45. fl. ind. occ. p. 437.) quite glabrous; stipulas obtuse; heads of flowers globose, on long peduncles; leaves of involucrum obtuse, hardly equal in length to the heads. ♄. S. Native of the south of Jamaica, on the high mountains; and of Guadaloupe. Callicócca elàta, Gmel. syst. 1. p. 372. Tapogòmea elàta, Poir. dict. 7. p. 585. Branchlets tetragonal. Leaves oblong, 6 inches long. Stipulas bidentate. Leaves of involucrum large, roundish, cordate, concave, purplish red. Paleæ among the flowers small, stiff, and coloured. Corolla with a villous throat.

Tall Cephælis. Clt. 1793. Shrub 12 to 15 feet.

4 C. ruelliæfòlia (Cham. et Schlecht. in Linnæa. 4. p. 134.) every part of the plant is clothed with short hairs; leaves broad-lanceolate, acute, attenuated at both ends, on short petioles, membranous; stipulas triangular, bifid at the apex; heads of flowers terminal, almost sessile, solitary or by threes; floral leaves connate and dilated; bracteas reticulately nerved, lanceo-

late, longer than the calyx. ♄. S. Native of equinoxial Brazil.

Ruellia-leaved Cephælis. Shrub 4 to 5 feet.

Sect. II. Callico'cca (from καλλιστος, *kallistos*, the most beautiful, and κοκκος, *kokkos*, a berry; the berries are blue or purplish). D. C. prod. 4. p. 533. Heads of flowers involucrated by distinct ovate or oblong erectly adpressed bracteas.

* *Shrubs. Heads of flowers pedunculate.*

5 C. justiciæfòlia (Rudge, pl. guian. 1. p. 28. t. 43.) glabrous; branches dependent, knotted; leaves oval-lanceolate; stipulas truncate, bidentate; heads on long peduncles, involucrated by broad-lanceolate bracteas; calyx nearly entire. ♄. S. Native of Guiana, on the banks of rivers. Peduncles downy. Bracteas fulvous. Corolla with a bearded throat. Flowers sessile on a disk formed by the bases of the bracteas.

Justicia-leaved Cephælis. Shrub 6 to 8 feet.

6 C. stipula'cea (Blum. bijdr. p. 1005.) stem suffruticose, nearly simple; leaves cuneate-oblong, acuminated, glabrous; stipulas semiorbicular; heads on very short peduncles, axillary, and terminal, involucrated by roundish bracteas. ♄. S. Native of Java, on the mountains. Stipulas large, membranous. Margin of calyx truncate, entire. Berries dry, 2-celled, compressed, the commissure drawn out into a prominent angle on both sides.

Stipulaceous Cephælis. Shrub 1 to 2 feet.

7 C. ligula'ris (Rich. mss. ex D. C. prod. 4. p. 533.) glabrous; leaves petiolate, oval, acutish; stipulas broad, emarginate; peduncles compressed, solitary, involucrated by 9-10 ligular bracteas; calyx hardly 5-toothed. ♄. S. Native of French Guiana. Schradèra ligulàris, Rudge, pl. guian. 1. p. 29. t. 815. Tratt. tab. t. 84. According to Richard, the ovarium is 2-celled, and the cells 1-seeded, and therefore it is a true species of *Cephæ'lis*.

Ligular-bractead Cephælis. Shrub.

8 C. salicifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 376.) glabrous; leaves almost sessile, lanceolate, acuminated. shining; stipulas subulate, combined at the base; heads of flowers pedunculate, terminal, involucrated by 4 ovate-cordate leaves or bracteas. ♄. S. Native of New Andalusia, in arid places on Mount Cocollar. Involucrum green. Branches compressed while young.

Willow-leaved Cephælis. Tree 20 feet.

9 C. gla'bra (Willd. spec. 1. p. 979.) branches terete, clothed with rufous villi while young; leaves ovate-oblong, acute, glabrous, downy on the veins beneath; stipulas bipartite, acute; heads pedunculate, terminal, rather hairy. ♄. S. Native of French Guiana, in open places. Tapogòmea glàbra, Aubl. guian. 1. p. 168. t. 68. Callicócca glàbra, Gmel. syst. 1. p. 372. Corollas and berries blue.

Glabrous Cephælis. Shrub 2 to 3 feet.

10 C. bracteoca'rdia (D. C. prod. 4. p. 534.) branches terete, clothed with velvety down while young, but glabrous in the adult state; leaves elliptic-oblong, tapering to both ends, downy on the veins beneath; stipulas twin on both sides, subulate, joined a little way at the base; heads of flowers pedunculate, terminal, downy, involucrated by 4-6 acute bracteas, which are cordate at the base. ♄. S. Native of French Guiana, where it was collected by Patris; and of Brazil, in the province of Bahia by Salzmann.

Var. α; bracteas acuminated, purplish.—Native of Guiana.

Var. β; bracteas pale, less acuminated. Native of Brazil, at Bahia. Corollas flesh-coloured.

Var. γ; bracteas pale, hardly acuminated, rather ovate at the base.—Native of Guiana.

Heart-bractead Cephælis. Shrub 2 to 3 feet.

11 C. ambi'gua (D. C. prod. 4. p. 534.) branches terete, downy, compressed while young; leaves elliptic-oblong, tapering to both ends, downy on the veins beneath; stipulas twin on both sides, subulate, joined together a little way at the base; heads pedunculate, terminal, smoothish, involucrated by 4-6 bracteas, which are hardly cordate at the base, and very blunt at the apex. ♄. S. Native of Brazil, near Bahia, in shady valleys, where it was collected by Salzmann. Involucrum violaceous.

Ambiguous Cephælis. Shrub 2 to 3 feet.

12 C. cròcea (Meyer, esseq. p. 107.) glabrous; branches rather tetragonal; leaves ovate, short-acuminated at both ends; stipulas linear, twin; heads terminal, globose, on short peduncles, involucrated by 8 oblong-linear bracteas, and without any paleæ among the flowers. ♄. S. Native of Dutch Guiana, at Essequebo. Corolla saffron-coloured, villous outside. Leaves of involucrum ciliated, yellowish.

Saffron-coloured-flowered Cephælis. Shrub.

13 C. Humboldtia'na (Cham. et Schlecht. in Linnæa. 4. p. 136.) glabrous; leaves elliptic-lanceolate, tapering to both ends, on short petioles, firm and shining; stipulas tooth-formed on both sides at the base of the petioles; heads terminal, pedunculate, nearly globose, loose; bracteas membranous, nerved: outer ones roundish-ovate: inner ones more acute. ♄. S. Native of South America, at Javita, in shady places.

Humboldt's Cephælis. Shrub.

14 C. dicho'toma (Rudge, pl. guian. 1. p. 29. t. 44.) glabrous; branches dichotomous; leaves on short petioles, ovate-lanceolate; stipulas bidentate; heads terminal, on short peduncles, involucrated by nearly orbicular bracteas. ♄. S. Native of French Guiana, and of Brazil, near the river Ilheos, if C. dichótoma, Nees et Mart. nov. act. bonn. 12. p. 17. be the same. Bracteas fulvous. Calyx obsoletely 5-cleft. Fruit furrowed, as in the genus *Psychótria*.

Dichotomous Cephælis. Shrub 6 to 8 feet.

15 C. Swa'rtzii (D. C. prod. 4. p. 534.) glabrous; branchlets rather tetragonal; leaves ovate-lanceolate, acuminated, nerved, petiolate; stipulas broad, combined, acuminated, at length ciliated; heads terminal, globose, pedunculate, involucrated by 5 ovate concave bracteas; paleæ among the flowers obtuse. ♄. S. Native of the West India Islands, and of St. Lucia, &c. C. violàcea, Swartz, prod. p. 45. fl. ind. occ. 439. exclusive of the synonymes. Peduncles an inch long, quadrangular. Corollas bluish. Berries blue. Bracteas violaceous. It differs from the true *C. violàcea* in the heads of the flowers being pedunculated, in the stipulas being ciliated, and in the paleæ among the flowers being obtuse.

Swartz's Cephælis. Shrub 4 to 6 feet?

16 C. Maranhame'nsis; leaves broad-oblong, acuminated, membranous, glabrous; heads of flowers terminal and axillary. ♄. S. Native of Maranham, on the banks of rivulets. Shrub branched. Flowers violaceous.

Maranham Cephælis. Shrub 4 feet.

17 C. ferrugínea; climbing, villous; leaves oblong-lanceolate, acuminated, rusty beneath, petiolate; peduncles axillary, elongated, villous; heads involucrated by many leaves. ♄. S. Native of Sierra Leone, on the banks of rivulets.

Rusty Cephælis. Shrub cl.

18 C. peduncula'ta (Salisb. par. lond: 2. t. 99.) stem terete, swelled below the joints; leaves oblong-lanceolate, glabrous, tapering to both ends; stipulas twin on both sides, combined almost to the top, keeled; heads of flowers pedunculate, terminal, or in the forks of the branches; outer bracteas repandly toothed; calyx bearded; segments of calyx horned on the back. ♄. S. Native of Sierra Leone. Flowers white.

Peduncled Cephælis. Fl. Feb. Clt.? Shrub 2 feet.

19 C. coria'cea; leaves oblong, coriaceous, dark green; heads on long peduncles, involucrated by many leaves. ♄. S. Native of Sierra Leone, on the edges of woods.

Coriaceous-leaved Cephælis. Shrub 2 to 3 feet.

* * *Shrubs. Heads of flowers sessile.*

20 C. viola'cea (Willd. spec. 1. p. 977. exclusive of the synonyme of Swartz.) glabrous; branches nearly terete; leaves oval, acuminated, on short petioles; stipulas broad, somewhat concrete, obtuse, rather scarious at the apex; heads of flowers terminal, globose, sessile, declinate, involucrated by 5 ovate-roundish bracteas; paleæ among the flowers acute. ♄. S. Native of French Guiana, in woods, in humid places. Tapogòmea violàcea, Aubl. guian. 1. p. 157. t. 60. Leaves 3-5 inches long. Bracteas and corollas violaceous. Berries blue, angular.

Violaceous-flowered Cephælis. Shrub.

21 C. nu'da (Cham. et Schlecht. in Linnæa. 4. p. 135.) glabrous; leaves elliptic-lanceolate, sub-acuminated, membranous, on short petioles; stipulas small, twin, on both sides acute; heads terminal, sessile, few-flowered, involucrated by pellucid, membranous bracteas. ♄. S. Native of Brazil, near Rio Janeiro.

Naked Cephælis. Shrub 4 to 6 feet.

22 C. muscòsa (Swartz, prod. p. 46. fl. ind. occ. p. 442.) glabrous; leaves ovate-oblong, attenuated at both ends, on short petioles; stipulas sheathing, bidentate on both sides; heads terminal, almost sessile, involucrated by numerous oblong bracteas; paleæ among the flowers toothed. ♄. S. Native of Martinique, in mountain woods, and by river sides. The same plant has been found in French Guiana, Trinidad, about the Havannah, in Cuba, &c. Morínda muscòsa, Jacq. amer. p. 65. t. 35. Tapogòmea muscòsa, Poir. dict. 7. p. 587. Leaves 3-4 inches long. Stipulas rusty. Corollas white. The branches are always covered with moss.

Mossy Cephælis. Tree 15 feet.

23 C. axilla'ris (Swartz, prod. p. 45. fl. ind. occ. p. 441.) glabrous; leaves petiolate, oblong, acuminated at both ends; stipulas ovate, combined, membranous, obtuse; heads axillary, sessile, globose, involucrated by 4-6 bracteas; paleæ among the flowers ovate, obtuse. ♄. S. Native of the West India Islands, as of St. Christopher, Guadaloupe, &c. Tapogòmea axillàris, Poir. dict. 7. p. 585.

Axillary-flowered Cephælis. Fl. April, May. Clt. 1816. Shrub 4 feet.

24 C. oblónga (D. C. prod. 4. p. 535.) glabrous; branches dichotomous, terete; leaves oblong, tapering to both ends, on short petioles; stipulas acuminated at length, truncate, ciliated; heads terminal, sessile, involucrated by 4 oblong bracteas. ♄. S. Native of French Guiana. Branches purplish. Leaves painted with white above, as in *C. purpùrea*, 2-3 inches long, and an inch broad. Berries almost dry, striated, much smaller than peas.

Oblong-leaved Cephælis. Shrub.

25 C. prunifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 377.) bracteas terete, downy; leaves oblong, acute, mucronate, glabrous, shining; stipulas bidentate: teeth furrowed; heads terminal, sessile, involucrated by 4 spatulate ciliated bracteas. ♄. S. Native of South America, in shady places on the banks of the Orinoco, near the cataract of Maypures. Involucrum green. Corollas blue. There is a variety of this species with tetramerous flowers, hence the genus *Evèa* has been joined with Cephæ'lis.

Plum-leaved Cephælis. Shrub.

26 C. fra'grans (Hook. et Arn. in Beech. voy. pt. bot. p. 64. t. 13.) flowers tetrandrous; branchlets compressed; leaves broad-oval, obtuse, coriaceous, glabrous, reticulately veined, on short petioles; stipulas ovate, acuminated; peduncles bibracteolate at the base; bracteas heart-shaped; flowers by threes, sessile. ♄. G. Native of Elizabeth Island, one of the Society Islands. It seems to approach *C. speciòsa*, Sprengel, from Otahiti. Corollas red.

Fragrant Cephælis. Tree 20 feet.

27 C. Eve'a (D. C. prod. 4. p. 535.) glabrous; branchlets rather tetragonal; leaves oval-oblong, on short petioles; stipulas oblong, undivided; heads axillary, sessile, involucrated by 4 ovate, obtuse bracteas; flowers tetramerous and tetrandrous. ♄. S. Native of French Guiana, in woods, where it is called *Eve* by the natives. Evèa Guianénsis, Aubl. guian. 1. p. 100. t. 39. Lam. ill. t. 59. dict. 2. p. 392. Cephæ'lis tetrándra, Willd. spec. 1. p. 979. Paleæ among the flowers acute. Corollas white.

Evea Cephælis. Shrub.

* * * *Herbaceous plants.*

28 C. purpu'rea (Willd. spec. 1. p. 978.) stems creeping, ascending, hispid from rufescent hairs at the tops; leaves oblong, acuminated, hispid on the nerves beneath, and ciliated on the edges; stipulas twin, hispid; heads terminal, almost sessile, involucrated by 2 oblong bracteas, which are, as well as the paleæ among the flowers, ciliated. ♃. H. S. Native of French Guiana, in woods, and of Maranham. Tapogòmea purpùrea, Aubl. guian. 1. p. 162. t. 63. f. 3. Callicócca purpùrea, Gmel. syst. 1. p. 371. Leaves painted with a white line above. Corollas and berries purple.

Purple-flowered Cephælis. Fl. April, June. Pl. creeping.

29 C. a'lba (Willd. spec. 1. p. 978.) stems creeping, hairy; leaves broad-ovate, acute, petiolate, villous; stipulas lanceolate; heads terminal, sessile, involucrated by 5 ciliated bracteas. ♃. S. Native of French and Dutch Guiana, in woods, Meyer, esseq. p. 106. Tapogòmea álba, Aubl. guian. 1. p. 164. t. 62. f. 4. Callicócca álba, Gmel. syst. 1. p. 371. Leaves of involucra rufescent. Corolla reddish on first expanding, but almost immediately afterwards becoming white. Berries red.

White-flowered Cephælis. Pl. creeping.

30 C. Ipecacua'nha (A. Rich, bull. fac. med. 1818. pol. 4. p. 92. dict. sc. med. vol. 26. with a figure) stems ascending at first, but at length becoming erect, rather downy at the apex; leaves oblong-ovate, scabrous above, and clothed with fine down beneath; stipulas setaceously cleft; heads terminal, pedunculate, erect at first, but at length becoming pendulous, involucrated by 4 subcordate bracteas. ♃. S. Native of Brazil, in woods and valleys on the mountains. Tuss. in Desv. journ. bot. 4. p. 247. Mart. mat. med. bras. 1. p. 4. t. 1. St. Hil. pl. usuel. bras. t. 6. Steph. et Church. 2. t. 62. C. emética, Pers. ench. 1. p. 203. exclusive of the synonymes Callicócca Ipecacuánha, Brot. in Lin. trans. 6. p. 137. t. 11. Ipecacuánha officinàlis, Arrud. disc. p. 44. ex. St. Hil.—Pis. bras. 231.—Marcgr. bras. 17. Root creeping, annular, brown or greyish, and is the Ipecacuanha of the shops of Europe, and the Poyas of those of Brazil. Leaves crowded at the tops of the stems, which are simple, and obscurely tetragonal. Flowers white, downy outside.

Although the root of ipecacuanha has been long employed as a valuable article of the Materia Medica, yet the botanical characters of the plant which produced it remained unknown till Professor Brotero, of Coimbra, determined the genus to which it ought to be referred, with the assistance of observations made in Brazil, on living plants, by Bernardo Gomez, a resident medical botanist. The plant is a native of moist woods near Pernambuco, Bahia, Rio Janeiro, and other provinces of Brazil. It is called *Ipecacuanha* by the natives of some parts of Brazil;

Poaia do Matto by those of the southern provinces; and *Cipo* by others, which is the name often given to it by the Portuguese settlers. The root is simple, or a little branched, and furnished with a few short radicles, irregularly bent, externally brown, wrinkled from rings.

It appears that a native of Brazil, whose name was Michael Tristan, was the first who brought ipecacuanha into use. He speaks of it as a remedy for dysentery. Piso afterwards describes it, and speaks of two sorts (hist. nat. bras. p. 101.), the white and brown, which he says were given for fluxes, and as vomits. But we are indebted to Helvetius for bringing it into general use, under the patronage of Louis XIV., from whom he received a thousand pounds, to reveal the secret medicine with which he so successfully treated dysentery. Besides the brown ipecacuanha, there is another sort, brought from Brazil, which varies in appearance from the former; and some have supposed that these differences are owing to accidental circumstances, such as the place of growth, the kind of soil, &c.; but, on the authority of M. Gomez, the common brown ipecacuanha of the shops, is yielded to be *Cephæ̀lis ipecacuánha*, while the white is the root of *Richardsònia scàbra* and *R. ròsea*, which is exported largely to Portugal. Besides these, the name of ipecacuanha, which, in the language of South America, means vomiting root, is given to various species of *Cynánchum*, *Asclèpias*, *Euphórbia*, *Dorstènia*, and *Ruéllia;* and with regard to their comparative power, De Candolle says that vomiting is produced by 22 grains of *Cynánchum;* by 24 of *Psychótria emética;* by from 60 to 72 of *Vìola calceolària;* and by from 1 to 3 drachms of *C. ipecacuánha*. Linnæus, in a paper published in the third volume of "Amœnitates Academicæ," gave ipecacuanha, as a trivial name, to a species of *Euphórbia*, a native of Virginia and Carolina, the root of which is there used as an emetic. But this was soon discovered not to be real ipecacuanha. In his second "Mantissa" he gave the trivial name to a species of *Viòla*, a native of Brazil, the root of which he supposed to be the white ipecacuanha of the shops. De Candolle, in a paper published in the "Bulletin des Sciences par la Société Philomatique," and republished entire in the "Nouveau Dictionnaire d' Histoire Naturelle," says there are three species of *Viola* which produce the white ipecacuanha; the *V. calceolària*, a native of Guiana and the Antilles; the *V. ipecacuánha*, and the *V. parviflòra*, both natives of Brazil. The roots of these, and especially the last, are sometimes mingled in common with the true, or brown, ipecacuanha; but they are a fraudulent adulteration, and do not possess its active properties. They may be distinguished by their colour, but most certainly by the size of the woody part, which in these is always considerably thicker than the bark; whereas in the true ipecacuanha it is much less, and, as described by Brotero, is only a fibre.

The *black* or *striated Ipecacuanha* (*Psychótria emética*) is exported from Carthagena to Cadiz, and is also said to be the Peruvian *grey ipecacuanha*. The root is black within and without, fusiform, articulated, striated, and not annulated. The *white ipecacuanha* is described by Gomez to be the root of *Richardsònia scàbra;* it is of a dirty white, and turns brown by drying; it is simple, or a little branched, often 5 or 6 lines thick, 3 inches long and upwards, variously twisted, and tapering at its extremities, with transverse annular rugosities, larger than those of the brown ipecacuanha. The common *brown ipecacuanha* is exported from Rio Janeiro to Portugal. Its colour varies from different degrees of grey and brown; but it is characterized by being contorted, wrinkled, and unequal in thickness; having a thick brittle bark, deeply fissured transversely, covering a central, very small white wood, so as to give the idea of a number of rings strung upon a thread.

Qualities and chemical properties.—Powdered ipecacuanha has a sickly odour, and a bitterish acid taste; and on those who pulverize it, sometimes excites such powerful effects as to produce nausea, faintings, and spitting of blood. It has been subjected to various chemical investigations, and Dr. Irvine ascertained that it contains a gum resin. MM. Pellitier and Magendie, while pursuing their investigation on ipecacuanha, discovered that the power of the various kinds of ipecacuanha depended on a peculiar principle, to which the name emetine has been given; and they think that it might upon all occasions be substituted with advantage, being much more active than ipecacuanha itself, without possessing its disagreeable taste and smell. The latter quality resides in a greasy substance, quite distinct from its emetine virtue; for M. Caventon swallowed it with impunity to the extent of 6 grains.—All vegetable astringents, as infusion of galls and vegetable acids, weaken or destroy the power of ipecacuanha; and Dr. Irvine found that half a drachm, administered in 2 ounces of vinegar, had little effect.

Medical properties and uses.—The utility of ipecacuanha is generally known, and properly appreciated. As an emetic, it operates in doses of from 5 to 30 grains, surely and efficiently, without depressing the system at large, like many other emetics, or injuring the mucous membrane of the stomach; it is therefore to be preferred as a mere evacuant of that organ; and it can be given in the fullest doses with perfect safety, and without exciting much nausea. Its power as an emetic has been rather undervalued in one particular view; for if opium be taken, recourse is generally had to violent remedies, which, by simple contact with the stomach, when in a torpid condition, cannot fail to produce injurious results. Ipecacuanha is sometimes employed in a full dose after the accession of a paroxysm of intermittent fever; and, by destroying the link which held the chain of diseased sympathies together, it has often succeeded in cutting short the disease. Paroxysms of spasmodic asthma also often yield to the same treatment; and in the more chronic form of that disease, small doses advantageously produce both expectoration and perspiration. In chronic dysentery and diarrhœa, it is a most useful medicine in small doses. Given in doses of half a grain, it promotes secretion in the lining membrane of the bowels, whereby a healthy condition is eventually re-established, and is, therefore, frequently prescribed in cases of dyspepsia, attended by a foul tongue. Small nauseating doses are advantageously given to subdue uterine and pulmonary hæmorrhages; and combined with opium, the effects of both appear to be modified; so that under the name of Dover's powders, doses of from 5 to 10 grains form one of the most powerful and useful sudorifics that can be employed for acute or chronic rheumatism, and for eruptive diseases that are disposed to recede. Nauseating doses of ipecacuanha are also useful for hooping-cough, epilepsy and aneurosis. Two kinds of emetine are obtained from ipecacuanha—the coloured emetine and pure emetine; the latter is white and powdery, not acted on by the air, whereas coloured emetine is deliquescent. The cases in which emetine may be given, are the same as those in which ipecacuanha is indicated. Pure emetine is much more powerful than the coloured. Two grains are sufficient to kill a large dog. The officinal preparations are Pulvis ipecacuanhæ, Compositu and Vinum ipecacuanhæ. Pectoral lozenges of emetine are useful in chronic pulmonary catarrhs, hooping-cough, obstinate diarrhœas, &c.

Ipecacuanha Cephælis. Pl. $\frac{1}{2}$ to 1 foot.

31 C. ru'bra (Hoffm. ex Willd. mss. in Rœm. et Schultes, syst. 5. p. 214.) stem dichotomous, kneed; leaves ovate, acuminated, petiolate, glabrous above, and downy beneath; stipulas sheathing, bidentate; heads terminal, on short peduncles, involucrated by 6 unequal bracteas. ♃. H. S. Native of Brazil. Roots creeping. Veins of leaves purple. Stems flexuous, tumid at the joints.

Red-veined-leaved Cephælis. Pl. 1 foot.

32 C. colora'ta (Hoffm. ex Willd. mss. in Rœm. et Schultes, syst. 5. p. 213.) stems herbaceous, simple, glabrous; leaves oblong, tapering at both ends, roughish beneath; stipulas furnished with 2 bristles on each side; heads terminal, on short peduncles. ♃. S. Native of Brazil. Stems thickened at the joints.

Coloured Cephælis. Pl. 1 foot.

33 C. pube'scens (Hoffm. l. c.) stem simple, herbaceous, downy; leaves elliptic, acute at both ends, downy at the veins; heads pedunculate, terminal, involucrated by many leaves. ♃. S. Native of Brazil, at Bahia.

Downy Cephælis. Pl. $\frac{1}{2}$ to 1 foot.

34 C. Hoffmanseggia'na (Rœm. et Schultes, syst. 5. p. 214.) stem herbaceous, branched; branches dichotomous or trichotomous; leaves oblong, narrowed at both ends, acuminated; heads terminal, surrounded by a 4-leaved involucrum. ♃. S. Native of Brazil. C. dichótoma, Willd. rel. but not of Rudge. Nearly allied to *C. rùbra*, but the stems are much taller.

Hoffmansegg's Cephælis. Pl. 2 feet.

† *Species not sufficiently known.*

35 C. gemmiflòra (Willd. rel. and Schultes, syst. 5. p. 213.) leaves obovate, tapering at both ends, glabrous; heads globose, twin, on long peduncles, involucrated. ♄. S. Native country unknown.

Bud-flowered Cephælis. Shrub.

36 C.? bidenta'ta (Humb. ex Willd. rel. in Rœm. et Schultes, syst. 5. p. 214.) leaves oblong, acuminated, glabrous; heads globose, terminal; involucrum 2-leaved, bidentate. ♃. S. Native of Sierra Leone.

Bidentate-involucred Cephælis. Pl.?

Cult. See *Psychòtria*, p. 599. for the culture and propagation of the shrubby species; and *Geophìla*, p. 609. for those of the herbaceous kinds.

CLXXVII. CARAPI'CHEA (*Carapiche* is the Caribbean name of the first species). Aubl. guian. 1. p. 167. t. 68. D. C. prod. 4. p. 536. Cephæ'lis species, Willd. Juss. Euròthia, Neck. elem.

Lin. syst. *Pentándria*, *Monogýnia*. All as in *Cephæ'lis*, except in the anthers and stigmas, which are a little exserted. Berries dry, bipartible, angularly furrowed, crowned by the small limb of the calyx; nuts or pyrenæ 1-seeded, smooth on the outside, not striated, as in *Cephæ'lis*.—Glabrous shrubs, with rather nodose branches. Leaves petiolate, oval, acuminated. Stipulas twin on both sides, combined at the base, and therefore bidentate. Heads of the flowers rising from the axils of the upper leaves, on short peduncles, deflexed, girded by 4 acute bracteas. Corollas white. According to Willdenow, Jussieu, and Richard, this genus should only form a section of *Cephæ'lis*.

1 C. Auble'tii (D. C. prod. 4. p. 536.) stipulas almost distinct, biglandular at the base; the 2 exterior bracteas of the heads elongated and acuminated, and the 2 interior ones short and mucronate. ♄. S. Native of French Guiana, in woods, where it is called *Carapiche* by the natives. C. Guianénsis, Aubl. guian. 1. p. 168. t. 68. Callicócca Guianénsis, Gmel. syst. 1. p. 372. Cephæ'lis involucràta, Willd. spec. 1. p. 979. Tapogòmea Carapíchea, Poir, dict. 7. p. 587. Leaves lanceolate, glabrous. Flowers small, white. Berries small, capsular.

Aublet's Carapichea. Fl. June, Sept. Clt. 1826. Shrub 5 to 7 feet.

2 C. Patrísii (D. C. prod. 4. p. 536.) stipulas combined, bidentate at the apex; bracteas of the heads of the flowers nearly equal, ovate, acute. ♄. S. Native of French Guiana, where it was collected by Patris. Stems terete, dichotomous. Leaves oval-lanceolate, acute at the base, and acuminated at the apex. Heads on very short peduncles, hardly larger than peas. Corolla white, hairy on the inner part of the limb. Anthers linear, exserted.

Patris's Carapichea. Shrub 5 to 6 feet.

Cult. See *Psychótria*, p. 599. for culture and propagation.

CLXXVIII. SUTE'RIA (named after John Rudolph Suter, a professor at Bern in Switzerland; author of Flora Helvetica, &c.). D. C. prod. 4. p. 536.—Cephæ'lis species of Lindl.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with an ovate tube, and a tubular angular limb, which is 5 times longer than the ovarium, having an unequally 5-toothed border. Corolla salver-shaped, with a terete tube, a naked throat, and 5 oval-oblong lobes. Anthers sessile, inclosed. Stigma bilamellate. Fruit 2-celled, 2-seeded.—A glabrous shining shrub, with terete branches. Leaves almost sessile, oblong-lanceolate. Stipulas ovate, deciduous. Heads of flowers axillary, almost sessile, usually 6-flowered, surrounded by ovate-foliaceous bracteas. Paleæ among the flowers linear. Corollas white, almost like those of jasmine, sweet-scented.—This genus differs from *Cephæ'lis* in the form of the calyx.

1 S. calyci'na (D. C. prod. 4. p. 536.) ♄. S. Native of Brazil. Cephæ'lis calycìna, Lindl. coll. t. 21.

Large-calyxed Suteria. Fl. April, May. Clt. 1816. Shrub 3 to 4 feet.

Cult. For culture and propagation see *Psychótria*, p. 599.

CLXXIX. GEO'PHILA (from $\gamma\eta$, *ge*, the earth, and $\phi\iota\lambda\epsilon\omega$, *phileo*, to love; the species creep on the surface of the earth, and the stems never rise beyond it). D. Don, prod. fl. nep. p. 136. but not of Berg. D. C. prod. 4. p. 537.—Psychótria species, Lin.—Cephæ'lis species, Kunth.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx with an obovate tube, and a 5-parted limb; segments linear, spreadingly recurved. Corolla tubular, with a pilose throat, and 5 oval somewhat recurved lobes. Anthers 5, inclosed. Stigma bifid. Berry ovoid, angularly ribbed, crowned by the calyx, 2-celled, 2-seeded.—Perennial depressed creeping herbs. Leaves petiolate, cordate, similar to those of some species of *Viola*. Stipulas solitary on both sides, undivided. Peduncles rising from the axils of the ultimate leaves, terminal, solitary, bearing many flowers at the apex. Flowers almost sessile, umbellate, involucrated by bracteas, which are shorter than the flowers.

1 G. renifórmis (Cham. et Schlecht. in Linnæa. 4. p. 137.) petioles hairy above; leaves reniform, obtuse, with the lobes at the base approximate; bracteas linear; peduncles 4-6-flowered, shorter than the leaves. ♃. S. Native of South America, in shady places; as of Jamaica, Porto-Rico, Cuba, about the Orinoco, Brazil, Guiana, Society Islands, &c. Psychótria herbàcea, Lin. spec. p. 245. Jacq. amer. t. 46. Tuss. ant. t. 8. Psychótrophum herbàceum, Browne, jam. p. 161. Cephæ'lis renifórmis, H. B. et Kunth, nov. gen. amer. 3. p. 377. Flowers white. Berries red. There are varieties of this with downy or glabrous stems and leaves. Leaves always glabrous beneath.

Kidney-shaped-leaved Geophila. Fl. April, June. Clt. 1793. Pl. creeping.

2 G. viola'cea (D. C. prod. 4. p. 537.) petioles hairy above; leaves cordate-reniform, obtuse, glabrous, with the lobes approximate at the base; umbels few-flowered, almost sessile between the ultimate pair of leaves; bracteas linear-lanceolate. ♃. S. Native of Cayenne and Guiana, in woods (Aubl.); and of the Isthmus of Panama (Hænke). Psychótria violàcea, Aubl. guian.

1. p. 145. t. 55. Bartl. in herb. Hænke, but not of Willd. Very nearly allied to *G. renifórmis*, but the petioles are shorter, the umbels are hardly pedunculate, the corollas violaceous, and the berries blue.

Violaceous-flowered Geophila. Pl. creeping.

3 G. diversifòlia (D. C. prod. 4. p. 537.) petioles and peduncles clothed with short hairs or down; leaves reniformly cordate, rounded or acute, glabrous on both surfaces, paler beneath, with the lobes at the base approximate; heads 2 or few-flowered; bracteas linear-lanceolate, downy. ♃. S. Native of Java, on the mountains; and probably of Malabar and Silhet, &c. if the Karinta-Tali, Rheed. mal. 10. t. 21. be the same. Psychótria herbàcea, Roxb. fl. ind. 2. p. 161. and therefore G. renifórmis, D. Don, prod. fl. nep. p. 136. Cephæ'lis diversifòlia, Blum. bijdr. p. 1004. Flowers white? Berries red?

Diverse-leaved Geophila. Pl. creeping.

4 G. violæfòlia (D. C. l. c.) petioles hairy above; leaves roundish-cordate, acutish, glabrous on both surfaces, with the lobes at the base divaricate; peduncles about equal in length to the petioles; bracteas lanceolate; umbels 6-9-flowered. ♃. S. Native of New Granada, on the banks of the river Magdalena, in humid places. Cephæ'lis violæfòlia, H. B. et Kunth, nov. gen. amer. 3. p. 379. Psychótria hederàcea, Willd. in Rœm. et Schultes, syst. 5. p. 191. Corolla white, glabrous, 4 times longer than the calyx.

Violet-leaved Geophila. Pl. creeping.

5 G. macrópoda (D. Don, prod. fl. nep. p. 136.) petioles roughish; leaves cordate, acute, glabrous; peduncles length of leaves; bracteas linear-lanceolate; umbellules 3-6-flowered. ♃. S. Native of Peru, in groves, along the tract of Pillao to Izcutuna. Psychótria macrópoda, Ruiz et Pav. fl. per. 2. p. 63. t. 211. f. b. Psych. cordifòlia, Dietr. gærtn. lex. 1. p. 618. Berries dark purple. Seeds smooth.

Long-peduncled Geophila. Pl. creeping.

6 G. gra'cilis (D. Don, l. c.) petioles striated, beset with retrograde hairs at top; leaves cordate, acute, rather pilose above; peduncles length of petioles; bracteas subulate; umbels 6-9-flowered. ♃. S. Native of Peru, in forests at Pillao and Pueblo-Nuevo. Psychótria grácilis, Ruiz et Pav. fl. per. 2. p. 63. t. 211. f. c. Corollas pale-violaceous, glabrous inside. Berries ovate, blackish. Seeds trisulcate.

Slender Geophila. Pl. creeping.

Cult. A mixture of vegetable mould and sand, or peat and sand, is the best soil for the species of *Geóphila;* and they are easily increased by detaching their creeping stems.

CLXXX. PATA'BEA (the Guiana name of the first species). Aubl. guian. 1. p. 111. t. 45. Juss. gen. p. 208. mem. mus. 6. p. 401. exclusive of the synonymes. Lam. ill. t. 65. H. B. et Kunth, nov. gen. amer. 3. p. 375.—Cephæ'lis species, Willd. Spreng.

Lin. syst. *Tetra-Hexándria, Monogýnia.* Calyx with an obovate-globose tube, and a very short entire or 4-toothed limb, rarely 5-6-toothed. Corolla with a short nearly terete tube, and 4-6 oblong spreading lobes. Stamens 4-6; anthers sessile within the throat. Stigma bluntly bifid. Berries globose, crowned by the nearly closed calyx, smooth, 2-celled, 2-seeded. —Glabrous shrubs, natives of South America. Leaves on short petioles, oval or ovate, acuminated at the apex. Stipulas broad at the base, and subulate at the apex. Flowers sessile, crowded into heads in the axils of the leaves or tops of the branches. Heads propped by 4 small binately opposite bracteas. This genus differs from *Psychótria* in the capitate inflorescence, in the smooth berries, and in the number of the floral parts being usually quaternary.

1 P. cocci'nea (Aubl. l. c.) stipulas undivided; leaves oval, acute at the base; heads of flowers sessile; flowers tetramerous; throat of corolla naked. ♄. S. Native of French Guiana, in the woods of Orapu. Lam. ill. no. 1464. t. 65. Cephæ'lis sessiliflòra, Willd. spec. 1. p. 979. Flowers red.

Scarlet Patabea. Shrub 4 to 5 feet.

2 P.? tenuiflòra (D. C. prod. 4. p. 538.) leaves oblong, acute at both ends, membranous; stipulas 4, lanceolate-linear, connate at the base; heads of flowers some sessile, and others pedunculate; corolla with a naked throat, linear lobes, and a slender tube; limb of calyx truncate. ♄. S. Native of French Guiana, where it was collected by Patris. Leaves 5-6 inches long and 1½ broad. Bracteas small. Fruit unknown.

Slender-flowered Patabea. Shrub 4 to 5 feet.

3 P.? a'lba (H. B. et Kunth, nov. gen. amer. 3. p. 375.) leaves ovate, rounded at the base; stipulas bifid at the apex; cymes pedunculate; flowers pentamerous and hexamerous; throat of corolla villous. ♄. S. Native of South America, on the banks of the Orinoco, near Maypures, and San Fernando. Cephæ'lis cymòsa, Spreng. syst. 1. p. 749. Psychótria Maypurénsis, Willd. rel. in Rœm. et Schultes, syst. 5. p. 190.? ex Spreng. Calyx violaceous. Corollas white.

White-flowered Patabea. Shrub.

Cult. See *Psychotria*, p. 599. for culture and propagation.

CLXXXI. SALZMA'NNIA (named after M. Salzmann, a collector of plants in Mauritania, and afterwards in Brazil). D. C. prod. 4. p. 617.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an oval tube, and a cupular very bluntly 4-toothed or sinuated permanent limb. Corolla with a short tube, and 4 oblong lobes. Alabastra tetragonal. Stamens with very short filaments, and very long anthers. Style 1, undivided, or the lobes are combined. Berry dry, crowned by the limb of the calyx, 1-celled in the adult state by abortion, compressed, oval, 1-seeded. Seed compressed.—A glabrous Brazilian shrub. Branches at first tetragonal, but terete in the adult state. Stipulas truncate, very short. Leaves opposite, ovate, on short petioles, shining above, and as if they were varnished. Peduncles axillary, opposite, very short, bearing dense heads composed of 10-12 flowers, girded by 2-4 ovate foliaceous bracteas. Flowers sessile within the bracteas, white. This genus appears to come nearest to *Cephæ'lis*, from which it differs in the very long anthers, in the compressed fruit, and in habit.

1 S. ni'tida (D. C. prod. 4. p. 617.) ♄. S. Native of Brazil, about Bahia on arid hills. Corolla a line and a half long. Leaves 1¼ inch long and 1 broad, obtuse.

Shining-leaved Salzmannia. Shrub 5 to 6 feet.

Cult. See *Psychótria*, p. 599. for culture and propagation.

Tribe X.

SPERMACO'CEÆ (this tribe contains plants agreeing with the genus *Spermacòce* in particular characters). Cham. et Schlecht. in Linnæa. 3. p. 309. A. Rich. mem. soc. hist. nat. Par. 5. p. 147. D. C. prod. 4. p. 538. Stigma bilamellate (f. 109. *b.*). Fruit dry or hardly fleshy, usually of 2, rarely of 3-4 1-seeded mericarps or nuts, which are sometimes combined, and sometimes separating from each other, indehiscent or dehiscing in various ways. Albumen between fleshy and horny. —Shrubs or herbs. Leaves opposite. Stipulas membranous at the base, and usually of many bristles at the apex.

Subtribe I. CEPHALA'NTHEÆ (this subtribe only contains the genus *Cephalánthus*). D. C. prod. 4. p. 538. Flowers and fruit crowded and sessile, upon globose receptacles. Fruit divisible into 2 parts.

CLXXXII. CEPHALA'NTHUS (from κεφαλη, *kephale*, a head, and ανθος, *anthos*, a flower; in allusion to the flowers being disposed in globular heads). Lin. gen. no. 113. Gærtn. fruct. 2. t. 86. Lam. ill. t. 59. Juss. mem. mus. 6. p. 402. Rich. diss. with a figure. D. C. prod. 4. p. 538.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an obversely pyramidal tube, and an angular 4-toothed limb. Corolla with a slender tube, and a 4-cleft limb; lobes erectish. Stamens 4, short, inserted in the upper part of the tube, hardly exserted. Style much exserted; stigma capitate. Fruit inversely pyramidal, crowned by the limb of the calyx, 2-4? celled, and separating into 2-4? parts; cells or parts 1-seeded, indehiscent, and sometimes empty by abortion. Seeds oblong, terminating in a little callous bladder. Albumen somewhat cartilaginous. Embryo inverted in the albumen, with a superior radicle.—Shrubs, with terete branches. Leaves opposite or 3 in a whorl. Stipulas short, distinct, or a little combined. Peduncles naked, rising from the axils of the upper leaves, or from the tops of the branches. Heads globose, in consequence of the flowers being sessile, and seated on a spherical piliferous receptacle.—This genus is badly defined, and should probably be reduced to the American species, which have the fruit 2-celled and 2-seeded, and the rest should probably be thrown back into the genus *Spermacòce*.

Sect. I. Platanoce'phalus (from πλατανος, *platanos*, the plane-tree, and κεφαλη, *kephale*, a head; the heads of flowers resemble those of the plane-tree). D. C. prod. 4. p. 538.—Platanocéphalus, Vaill. act. acad. par. 1722. Glands none in the calyx nor corolla.—American species.

1 C. occidenta'lis (Lin. spec. 138.) leaves opposite or 3 in a whorl, ovate or oval, acuminated; peduncles much longer than the heads, usually by threes at the tops of the branches. ♄. S. Native of North America, from Canada to Florida, in marshy places. Duham. arb. 1. t. 54. Schkuhr, handb. t. 21. and t. 5. b. fruit. Lois. herb. amat. t. 272.—Pluk. alm. 336. t. 77. f. 4. C. oppositifòlius, Mœnch. meth. p. 487. Petioles reddish next the branches. Heads of flowers globular, size of a marble. Flowers whitish-yellow. There are varieties of this species having the branchlets and young leaves either glabrous or downy.

Var. β, *brachýpodus* (D. C. prod. 4. p. 539.) leaves elliptic-oblong, 3 in a whorl, on short petioles. ♄. G. Native of the North of Mexico, near Rio de la Trinitè and Bejar, where it was collected by Berlandier. Petioles 3-4 lines long. There are varieties of this with either glabrous or downy branches.

Western Button-wood. Fl. July, Aug. Clt. 1735. Shrub 6 to 8 feet.

2 C. Sara'ndi (Cham. et Schlecht. in Linnæa. 2. p. 610. and 4. p. 147.) leaves opposite or 3 in a whorl, oblong, acuminated, on very short petioles; peduncles hardly longer than the heads, 3-5-together at the tops of the branches. ♄. S. Native of the south of Brazil, where it is called *Sarandi* by the natives, and where it was collected by Sello; common on the coasts of La Plata and Caraccas; and of Peru, ex Hænke. Búddlea glabràta, Spreng. syst. 1. p. 431. ex Cham. et Schlecht. in Linnæa. Glabrous. Leaves lanceolate or ovate-lanceolate, red beneath while young, and hairy in the axils of the secondary veins. Heads of flowers verticillate in the axils of the upper leaves, and umbellate at the tops of the branches, much smaller than those of the first species.

Sarandi Button-wood. Shrub 10 to 15 feet.

3 C. salicifòlius (Humb. et Bonpl. pl. equin. 2. p. 63. t. 98.) leaves opposite or 3 in a whorl, linear-lanceolate, on very short petioles; heads of flowers on long peduncles, terminal, solitary. ♄. S. Native of Mexico, near Acapulco. Stipulas linear-subulate, permanent, twin on both sides. Heads of flowers white.

Willow-leaved Button-wood. Shrub 10 feet.

Sect. II. Naucleoìdes (from *Nauclea* and *idea*, like; the species resemble species of the genus *Nauclèa*). D. C. prod. 4. p. 539. Glands in the recesses between the lobes of the calyx and corolla.—Indian species.

4 C. naucleoìdes (D. C. prod. 4. p. 539.) leaves opposite or 3-4 in a whorl, ovate-lanceolate, acuminated, on short petioles, villous beneath, and on the branchlets; stipulas intrafoliaceous, acuminated; heads terminal, subverticillate. ♄. S. Native of the East Indies, in Silhet. Nauclèa tetrándra, Roxb. fl. ind. 2. p. 125. Peduncles terminal, from 3 to 4 in whorled panicles. Flowers yellow, intermixed with filiform clavate scales. Capsules turbinate, 2-celled, 2-seeded; the cells 2-valved. According to Cham. et Schlecht. in Linnæa. 4. p. 147. this species is more nearly allied to *Cephalánthus* than to *Nauclèa*, from the tetramerous flowers, and single seeded cells of the fruit.

Nauclea-like Button-wood. Tree 10 to 20 feet.

† *Asiatic species not sufficiently known, and probably ought to be excluded from the genus altogether.*

5 C.? pilu'lifer (Lam. dict. 1. p. 679.) leaves opposite, approximate, ovate, bluntly acuminated, smooth on very short petioles; peduncles axillary, leafy, a little shorter than the leaves. ♄. S. Native of the East Indies. Fruit and number of the parts of the flowers unknown. Leaves hardly 2 inches long. Heads of flowers hardly the size of peas.

Pill-bearing Button-wood. Shrub.

6 C.? piluliflòrus (Willd. mss. in Rœm. et Schultes, syst. 3. p. 525.) leaves elliptic, tapering to both ends, bluntish; heads of flowers terminal and axillary, numerous. ♄. S. Native of Asia. The rest unknown.

Pill-flowered Button-wood. Shrub.

7 C.? orienta'lis (Rœm. et Schultes, syst. 3. p. 105. but not of Lin.) arboreous; leaves opposite or 3 in a whorl, ovate, acuminated, reflexed, glabrous; peduncles terminal, divided; fruit baccate. ♄. S. Native of China. C. occidentàlis, Lour. coch. p. 67. but not of Lin. Acródryon orientàle, Spreng. syst. 1. p. 386. A large tree. Flowers white, tetramerous, and tetrandrous. Berries 1-seeded, red, edible. Perhaps a species of *Morînda*. According to Sprengel, this with the following species will constitute a distinct genus, which he has called *Acródryon*.

Eastern Button-wood. Tree large.

8 C.? angustifòlius (Lour. coch. p. 67.) arboreous; leaves opposite, lanceolate-linear; heads of flowers terminal; lobes of calyx subulate, beset with glandular hairs; fruit baccate. ♄. G. Native of Cochin-china. Acródryon angustifòlium, Spreng. syst. 1. p. 386. Receptacle of flowers villous. Flowers pale, tetramerous and tetrandrous. Berries roundish, crowned, 2-celled, 1-seeded, aggregate into a globose head. Perhaps a species of *Morînda*, or perhaps will form a distinct genus along with the preceding species.

Narrow-leaved Button-wood. Tree.

†† *The two following species should be removed from the order altogether.*

9 C.? procu'mbens (Lour. coch. p. 67.) stem procumbent; leaves alternate, ovate-lanceolate, tomentose; racemes terminal, interrupted; flowers 5-cleft, dioecious. ♄. G. Native of Cochinchina. Stílbe procúmbens, Spreng. syst. 1. p. 418. Flowers violaceous. The female flowers on a naked globular receptacle. Flowers numerous, on long peduncles, forming a ball or head. Stigma simple. This plant ought evidently to be excluded from the order, but it is hardly a species of *Stílbe*.

Procumbent Button-wood. Shrub procumbent.

10 C.? monta'nus (Lour. coch. 67.) arboreous; leaves alternate, ovate, acuminated, rough above, and tomentose beneath; peduncles axillary, solitary; flowers apetalous, dioecious, 4-cleft; seeds or fruit pappose. ♄. G. Native of China. Flowers green, on solitary axillary peduncles, forming round heads, on naked globular receptacles.

Mountain Button-wood. Tree large.

Cult. The first species, *C. occidentàlis*, being hardy, is a very proper plant for the fronts of shrubberies. It thrives best in a peat soil; and is readily increased by layering, or by ripened cuttings under a hand-glass. The rest of the species being tender, their culture and propagation are the same as that recommended for *Psychótria*, p. 599.

Subtribe II. EUSPERMACO'CEÆ (the genera contained in this subtribe agree with *Spermacòce* in the distinct flowers, and divisible fruit). D. C. prod. 4. p. 540.—Spermacòceæ, H. B. et Kunth, nov. gen. amer. 3. p. 341. Flowers distinct. Fruit dry, usually separable into 2 parts, rarely into 3 or 4 parts.

CLXXXIII. DEMOCRI'TEA (so named from Democritis, an ancient philosopher). D. C. prod. 4. p. 540.

Lin. syst. *Pentándria, Monogýnia.* Calyx with a turbinate rather angular tube, and 5 lanceolate acute stiff lobes. Corolla, stamens, and stigma unknown. Fruit adnate to the tube of the calyx and membranous pericarp at first, but at length becoming ruptured, 2-seeded, 2-celled while young, but at length only 1-celled from the dissepiment having vanished. Seeds free within the pericarp, flat inside, and convex outside. Albumen fleshy. Embryo erect, central.—A Chinese shrub, with the habit of *Serissa*. Flowers unknown; but the calyx and fruit are very different from those of *Serissa*. Branches terete, white, when young rather downy. Leaves opposite. Sheaths short, combined with the petioles a little, and bearing each 3 stiff bristles. Flowers in fascicles at the tops of the branches.

1 D. serissoìdes (D. C. prod. 4. p. 540.) ♄. G. Native of China, where it was collected by Sir George Staunton.

Serissa-like Democritea. Shrub 1 to 2 feet.

Cult. A mixture of loam, peat, and sand will be the best soil for this little shrub; and cuttings will be easily rooted in sand under a hand-glass.

CLXXXIV. O'CTODON (from *οκτω, octo*, eight, and *οδους οδοντος, odous odontos*, a tooth; in allusion to the limb of the calyx, which is 8-toothed). Thonn. in Schum. pl. guin. p. 74. D C. prod. 4. p. 540.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a clavately obovate tube, and an 8-toothed limb; teeth very short, obtuse. Corolla campanulate, 4-cleft; lobes acute, beset with a few glandular hairs inside. Stamens inserted in the bottom of the tube of the corolla. Stigma globose, obsoletely bifid. Capsule turbinate, obsoletely tetragonal, 2-celled, 2-valved, dehiscing at the dissepiment; cells 1-seeded; valves semi-bifid inside. Seeds oblong.—An erect branched glabrous herb, about a foot high. Stems tetragonal. Leaves filiform, elongated, acute. Stipulas sheathing, furnished with 3-4 bristles on each side, which are shorter than the sheath. Heads of flowers verticillate, terminal and axillary ones nearly equal, roundish.—Very nearly allied to *Borrèria*; but differs from it in the calyx being 8-toothed, and in the other characters indicated above.

1 O. filifòlium (Thonn. l. c.)—Native of Guinea, where it was collected by Thonning, and in the waters of the Senegambia and Gala by Leprieur and Perrottet. Spermacòce filifòlia, Perr. et Lepr. mss.

Thread-leaved Octodon. Pl. 1 foot.

Cult. See *Spermacòce* for culture and propagation.

CLXXXV. BORRE'RIA (named after William Borrer, F.L.S. &c. one of our first British botanists). Meyer, esseq. p. 79. Cham. et Schlecht in Linnæa. 3. p. 310. Spreng. neue entd. 2. p. 144. but not of Ach.—Bigelòwia, Spreng. syst. 1. p. 394. but not of his neue entd. nor of others.—Chlorophỳtum and Spermacòce, Pohl, in litt.—Spermacòce species, Lin. Lam. Spreng. A. Rich.—Grulhamánnia, Neck. elem. no. 338.?

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an ovate tube, and a permanent limb, which is parted into 2-4 teeth. Corolla salver-shaped or funnel-shaped, 4-lobed. Stamens 4, exserted or inclosed. Stigma bifid or undivided. Capsule crowned by the limb of the calyx, 2-celled, opening from the apex at the dissepiment when mature, but without any free dissepiment; coccæ or nuts 1-seeded, opening by a longitudinal chink inside. Seeds ovate-oblong, marked in front by a longitudinal furrow.—Herbs or subshrubs, nearly all natives of the hotter parts of America. Stems and branches usually tetragonal. Leaves opposite, or the young ones are disposed in fascicles in the axils of the old ones, and therefore appearing verticillate. Stipulas joined with the petioles, more or less sheathing, fringed by many bristles. Flowers disposed in verticillate heads in the axils of the leaves, or on the tops of the branches, rarely cymose or corymbose, small, white, rarely blue.

§ 1. *Flowers disposed in axillary and terminal verticillate heads: the terminal heads are girded by floral leaves, which are longer than them.*

* *Teeth of calyx only 2.*

1 B. globularioìdes (Cham. et Schlecht. in Linnæa. 3. p. 312.) plant shrubby, erect, glabrous; branches somewhat tetragonal; leaves narrow-lanceolate, acuminated, with scabrous margins, paler beneath; bristles of stipulas longer than the sheath; heads of flowers globose, terminal or lateral; calyx bidentate; genitals exserted. ♄. S. Native of equinoxial Brazil. Spermacòce fruticòsa, Pohl, in litt. Heads of flowers a little larger than peas. Flowers 3 times the size of those of *B. verticillàta*, white. Capsule glabrous; nuts opening but slowly.

Globularia-leaved Borreria. Shrub 1 to 1½ foot.

2 B. verticilla'ta (Meyer, esseq. p. 83.) plant suffruticose, glabrous; branchlets tetragonal; leaves linear-lanceolate, acuminated, opposite, but appearing verticillate from the fascicles of young leaves in the axils; bristles of stipulas length of sheath; whorles of flowers globose, terminal, and axillary; capsule glabrous, oval, small, crowned by the bidentate calyx. ♄. S. Native of Jamaica, Guiana, Brazil, Caraccas, Trinidad, &c. Spermacòce verticillàta var. Americàna, Lin. spec. p. 148. exclusive of the synonymes. Bigelòwia verticillàta and B. commutàta, Spreng. syst. 1. p. 404. Spermacòce mucronàta, Nees, hor. berl. p. 49. and Spermacòce stellàta, Willd. herb. ex Cham. et Schlecht. in Linnæa. 3. p. 311. Spermacòce verticillàta, Swartz, Pohl, Nees, and Willd., but not of Burm. Flowers white. Calyx sometimes furnished with accessory teeth. Seeds granular.

Var. β; leaves more crowded, and much shorter. ♄. S. Native of Brazil, in dry places at Rio Janeiro.

Whorled-flowered Borreria. Fl. June, July. Clt. 1732. Sh. 2 to 3 feet.

3 B. Kohautia'na (Cham. et Schlecht. in Linnæa. 3. p. 311.) plant suffruticose, glabrous; branchlets tetragonal; leaves oblong-linear, bluntish, mucronate, opposite, but appearing verticillate from clusters of young ones in their axils; bristles of stipulas shorter than the sheath; whorles of flowers globose, terminal, and axillary; capsule downy, crowned by the bidentate calyx. ♄. S. Native of Senegal and Gambia; and probably

of Madagascar and the East Indies. B. verticillàta, Sieb. seneg. no. 10. Spermacòce verticillàta, Lin. spec. 148. var. Africàna, Spermacòce globòsa, Schum. pl. guin. p. 73. Dill. hort. elth. 2. f. 348. Flowers white. Nearly allied to *B. verticillàta*.

Kohaut's Borreria. Fl. Ju. Aug. Clt. 1732. Shrub 1 to 2 ft.

4 B. stri'cta (Meyer, esseq. p. 83. t. 1. f. 1-3. fr.) stems herbaceous, suffruticose at the base, twiggy, glabrous, smooth, tetragonal at the apex; leaves linear, acute, petiolate, opposite or falsely verticillate; bristles of stipulas shorter than the sheath, which is downy; whorls of flowers globose, terminal, and axillary; capsule glabrous, oblong, crowned by the 2 subulate teeth of the calyx. ♄. S. Native of Porto-Rico, where it was collected by Ledru and Wydler. Flowers white. Nearly allied to *B. verticillàta*, but differs in the capsule being twice longer. Lower leaves almost lanceolate-linear, rather scabrous on the margins at the top: upper ones usually with revolute margins.

Straight Borreria. Shrub ¼ to 1 foot.

5 B. dicho'toma (Cham. et Schlecht. in Linnæa. 3. p. 348.) stem suffruticose, rather compressed, tetragonal; branchlets dichotomous; leaves lanceolate, acutely mucronate, glabrous, with serrulated margins; stipulas hairy, ciliated, with bristles at the apex; heads or whorles of flowers terminal and axillary; capsule scabrous from dots, glabrous, obovate, crowned by the 2 ovate-lanceolate teeth of the calyx. ♄. S. Native of Peru, near Ayavaca, (Diòdia glàbra, Willd. herb.), and on Mount Tanqueragua (Knóxia dichótoma, Willd. herb.). Spermacòce dichótoma, H. B. et Kunth, nov. gen. amer. 3. p. 348. Flowers white.

Dichotomous-branched Borreria. Shrub 1 to 2 feet.

6 B. podoce'phala (D. C. prod. 4. p. 542.) stem branched, tetragonal, glabrous, rather downy at the nodi; leaves linear, glabrous, opposite, or falsely verticillate, almost veinless, with revolute margins; bristles of stipulas 5-7, longer than the sheath, which is downy; heads of flowers globose, and as if they were pedunculate, in consequence of the lateral branches being naked, except the 4 floral leaves surrounding each head; capsule oblong, glabrous, crowned by the 2 subulate calycine teeth. ♃. S. Native of Mexico or of Cuba. This species differs from all the others in the heads of flowers being on long tetragonal peduncles, which are 1-2 inches long, naked and glabrous, sometimes rising from the forks of the branches, then solitary, and sometimes from the axils of the leaves, then opposite.

Stalked-headed Borreria. Pl. 1 foot.

7 B. di'stans (Cham. et Schlecht. in Linnæa. 3. p. 340.) stems herbaceous, erect, tetragonal, having the angles beset with retrograde prickles; leaves lanceolate, glabrous, with serrulately scabrous margins; stipulas hairy, ciliated with bristles; whorles of flowers capitate, remote; capsule oblong, villous at the top, crowned by the 2 subulate teeth of the calyx. ♃. S. Native of Mexico. Spermacòce dístans, H. B. et Kunth, nov. gen. amer. p. 344. Spermacòce apiculàta, Willd. herb. Spermacòce aculeàta, Schlecht. in Schultes, syst. 3. p. 531. Flowers white. Very nearly allied to *B. verticillàta*. Corolla funnel-shaped, a little longer than the calyx.

Distant-whorled Borreria. Pl. 1 foot.

8 B. densiflòra (D. C. prod. 4. p. 542.) stem erect, tetragonal, glabrous; leaves linear, with revolute margins, 1-nerved, glabrous; bristles of stipulas 7-9, longer than the sheath; whorles of flowers dense, sessile, 2-3 axillary, and the terminal one globose, and larger than the axillary ones; floral leaves 4-6, reflexed; capsule linear-oblong, villous at the apex, crowned by the 3 subulate calycine teeth. ♄. S. Native of Jamaica. Spermacòce longifòlia, L'Her. herb. but not of Aubl. Superior leaves 2 inches long, and 1-2 lines broad. Corollas small, glabrous.

Dense-flowered Borreria. Shrub 1 to 2 feet.

9 B. spinòsa (Cham. et Schlecht. in Linnæa. 3. p. 340.) stem erect, herbaceous, simple, glabrous, somewhat tetragonal, with the angles a little muricated; leaves lanceolate-linear, acuminated, attenuated at the base, glabrous, with roughish margins: the mid-rib drawn out into a prickle-formed tubercle at the apex; stipulas membranous, bristly; whorles of flowers capitate, axillary ones 2-3, and the terminal one surrounded by an 8-leaved involucrum; capsule oblong, downy at the apex, crowned by the 2 subulate teeth of the calyx. ♄. S. Native of the south of Jamaica, in fields; and of Martinique and Mexico. Spermacòce spinòsa, Lin. spec. 148. exclusive of the syn. of Jacq. Swartz, obs. p. 45. Flowers white.

Spiny-leaved Borreria. Pl. 1 ft.

10 B. Neesia'na (D. C. prod. 4. p. 542.) glabrous, erect; stems herbaceous, tetragonal; leaves lanceolate, acute, scabrous on the mid-rib and margins; bristles of the stipulas 5, ciliated; whorles of flowers twin, one of them terminal; calycine teeth 2, setaceous; throat of the corolla closed with hairs. ♃. S. Native of Brazil. Spermacòce linifòlia, Nees. hor. berl. p. 49. but not of Vahl. Spermacòce Neesiàna, Schultes, mant. 3. p. 209. Flowers white. The same as *B. Bogoténsis*, according to Sprengel, but doubtful according to Cham. et Schlecht. in Linnæa. 3. p. 311.

Nees's Borreria. Pl. 1 foot.

11 B. re'pens (D. C. prod. 4. p. 542.) stems herbaceous, creeping, dichotomous, low, tetragonal, with the angles winged and pilose, and the sides striated; leaves oblong, acute, attenuated at the base, glabrous; bristles of stipulas shorter than the sheath, which is villous; heads of flowers roundish, sessile in the forks, and at the tops of the branches, and nearly in the axils of all the leaves; capsule ovate, rather villous, crowned by the 2 acute teeth of the calyx. ♃. S. Native of the Mauritius. Bigelòwia parviflòra, Sieb. fl. maur. exsic. no. 144. but not of Spreng. Flowers white.

Creeping Borreria. Pl. creeping.

12 B. mínima (D. C. prod. 4. p. 542.) plant glabrous, herbaceous, small, sparingly branched; stems tetragonal; leaves oblong-linear, acuminated at both ends; bristles of the stipulas rather shorter than the sheath; heads of flowers terminal, involucrated by 4 leaves; calycine teeth 2, subulate. ⊙. S. Native of Brazil, where it was collected by Pohl. Herb a finger high, erect, or ascending. Corolla and mature fruit unknown.

Least Borreria. Pl. ¼ foot.

* * *Teeth of the calyx* 4.

13 B. radia'ta (D. C. prod. 4. p. 542.) stem herbaceous, erect, branched, terete, hispid from spreading hairs; leaves oblong-linear, acuminated, glabrous, glaucous, smooth, margined by a vein, 1-nerved; bristles of the stipulas longer than the sheath, which is villous; heads of flowers terminal, depressed, girded by 12-16 radiant floral leaves; capsule oblong, downy at the apex, crowned by the 4 short, linear-subulate teeth of the calyx. ⊙. S. Native of Senegal, in sandy places, at Gala and Walo. Spermacòce radiàta, Sieb. pl. sen. exsic. no. 8. Flowers white. A very distinct species, agreeing in habit with *B. spinòsa*. Keel or mid-rib of the leaves smooth, and much exserted.

Ray-involucred Borreria. Pl. 1 foot.

14 B. aspe'rula (D. C. prod. 4. p. 543.) stem herbaceous, erect, glabrous, rather tetragonal; leaves oblong-linear, acute, glabrous, having the keel rather prickly from small stiff teeth; bristles of the stipulas longer than the sheath, which is membranous; heads of flowers many: verticillate; calycine teeth 4, 1 or 2 of which are often deciduous, shorter than the ovarium, which is rather pilose. ⊙. S. Native of Brazil, about Bahia, in dry pastures, where it was collected by Salzmann.

Roughish Borreria. Pl. 1 foot.

15 B. subula'ta (D. C. prod. 4. p. 543.) plant herbaceous,

glabrous, erect, sparingly branched; stem tetragonal; leaves linear-subulate, with rather scabrous margins; bristles of the stipulas the length of the sheath; heads of flowers terminal, girded each by an erect 8-leaved involucrum; corolla tubular, glabrous; anthers exserted; teeth of the calyx 4, lanceolate, unequal, 2 of which are one half smaller than the other 2. ⊙. S. Native of Mexico. Spermacòce subulàta, Pav. ined. Flowers white.

Subulate-leaved Borreria. Pl. 1 foot.

16 B. gracíllima (D. C. prod. 4. p. 543.) plant glabrous, herbaceous, slender, sparingly branched; branches rather tetragonal; leaves linear-subulate; stipulas lanceolate, undivided, or furnished with 3 bristles; heads of flowers terminal, on long peduncles, girded by 2-leaved involucra. ⊙. S. Native of Brazil, where it was collected by Pohl. Flowers and fruit hardly known. Habit very much like that of *B. subulàta*.

Very slender Borreria. Pl. $\frac{1}{2}$ to 1 foot.

17 B. pusílla (D. C. prod. 4. p. 543.) stem herbaceous, slender, simple or branched, tetragonal, hispid under the nodi, the rest glabrous; leaves linear-lanceolate, acute, glabrous, pale beneath; bristles of the stipulas exceeding the whorles; heads of flowers small, 2-3 of them axillary, and one terminal; involucra 4-6-leaved; capsule oval, hairy, crowned by the 3-4 linear-subulate teeth of the calyx. ⊙. S. Native of Nipaul, in the valley. Spermacòce pusílla, Wall. fl. ind. 1. p. 379. Bigelòwia pusílla, Spreng. syst. 1. p. 405. Spermacòce triándra, Ham. ex D. Don, prod. fl. nep. p. 134. Flowers white. Very like *B. ténera* and *B. pùmila*, but differs from them in the calycine teeth being usually 3.

Small Borreria. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

18 B. te'nera (D. C. l. c.) stem herbaceous, erect, branched, tetragonal, slender, hardly scabrous; leaves linear, acute, glabrous; bristles of stipulas shorter than the sheath, which is glabrous; whorles of flowers dense, 3 of them axillary, and 1 terminal, the latter larger, sessile, and involucrated by 4-6 leaves; capsule oval, smoothish, crowned by the 3-4 linear-subulate calycine teeth. ⊙. S. Native of Brazil. Spermacòce ténera, Pohl, in litt. Flowers white. Very nearly allied to *B. pùmila*, but differs in its smoothness, and in the axils of the leaves being nearly all floriferous, and in the leaves being almost always 3 times shorter.

Tender Borreria. Pl. $\frac{1}{4}$ foot.

19 B. pu'mila (D. C. l. c.) stem herbaceous, slender, tetragonal, beset with retrograde pili; leaves linear, acuminated, with revolute margins, scabrous above, and glabrous beneath, 1-nerved; bristles of the stipulas longer than the sheath, which is scabrous; heads of flowers terminating the stem and axillary branches, rarely axillary; involucra 6-8-leaved; capsule oval, downy at the apex, crowned by the glabrous, subulate teeth. ⊙. H. Native of Brazil, where it was collected by Pohl. Herb with a slender root, and a stem 6 inches high. Superior leaves 15 lines long, and a line broad.

Dwarf Borreria. Pl. $\frac{1}{2}$ foot.

20 B.? te'nuis (D. C. l. c.) stem slender, tetragonal, erect, sparingly branched, downy, especially on the angles; leaves lanceolate-linear, acute, downy on both surfaces, scabrous; bristles of the stipulas stiff, a little longer than the sheath, which is villous; whorles of flowers capitate, 1-2 of them axillary, and 1 terminal; involucrum 2-leaved; calycine teeth 4, glabrous, unequal; anthers inclosed. ⊙. F. Native of Brazil, where it was collected by Pohl. Spermacòce ténuis, Pohl, in litt. Herb 6-7 inches high, indurated at the base. Fruit unknown, but from habit it is judged to be a species of *Borrèria*.

Slender-stemmed Borreria. Pl. $\frac{1}{2}$ foot.

21 B. cupula'ris (D. C. l. c.) stem herbaceous, erect, simple, rather angular, downy, and rather scabrous; leaves oval-oblong, acuminated, petiolate, glabrous; upper stipulas broad-connate, cup-shaped, furnished with 9-10 bristles on each side, which are shorter than the sheath; heads of flowers 2, 1 axillary, and 1 terminal and larger; capsule oval, downy at the apex, crowned by the 4 oblong teeth of the calyx. ⊙. F. Native of Brazil, where it was collected by Pohl. Spermacòce pusílla, Pohl. in litt. but not of Wall. Herb 5-6 inches high. Flowers densely crowded in the cups formed by the stipulas, white.

Cupular-stipuled Borreria. Pl. $\frac{1}{2}$ foot.

22 B. ocymoìdes (D. C. prod. 4. p. 544.) stem herbaceous, branched, tetragonal, with the angles hairy and winged; leaves ovate, tapering into the petioles at the base, acutish, glabrous; bristles of the stipulas few, rather shorter than the sheath; whorles of flowers axillary, sessile, dense; capsule small, ovate, crowned by the 2-4 small teeth of the calyx. ⊙. H. Native of the East Indies. Spermacòce ocymoìdes, Burm. fl. ind. 34. t. 13. f. 1. but the angles of the stems are said to be glabrous.

Basil-like Borreria. Pl. $\frac{1}{2}$ foot.

23 B. ramispa'rsa (D. C. prod. 4. p. 544.) smoothish; stem herbaceous, dichotomous, tetragonal; leaves oval-oblong, acute at both ends; bristles of the stipulas membranous, pale, longer than the sheath; whorles of flowers capitate in nearly all the axils, and on the tops of the branches, equal in size, sessile, girded by 2-4 leaves; capsule small-ovate, smoothish, crowned by the teeth of the calyx, of which 2 are larger and subulate, and 2 small. ⊙? F. Native of Brazil, where it was collected by Pohl. Angles of the stems, nerves of the leaves, and the base of the calyxes downy, the rest of the herb glabrous. Flowers white.

Scattered-branched Borreria. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

24 B. parviflòra (Meyer, esseq. p. 83. t. 1.) stem herbaceous, erect, tetragonal, with the angles usually hairy, and a little winged below; leaves oval-oblong, tapering to both ends, rather hairy beneath while young, and at length scabrous on the margins; bristles of the stipulas longer than the sheath; whorles of flowers axillary and terminal, dense, small, involucrated by 2-4 leaves; capsule ovate, crowned by the 4 short subulate calycine teeth. ⊙. F. Native of the West Indies, as of Porto Rico, Guadaloupe, St. Domingo, &c.; and of Peru. Spermacòce áspera, Vahl, ecl. p. 10. but not of Aublet. Spermacòce læ'vis from Guadaloupe, and Sperm. áspera from Hispaniola, Spreng. syst. 1. p. 401. ex herb. Balb. Perhaps *Spermacòce læ'vis*, Lam. is identical with this plant. This species, with many others, is very intricate, but is nearly allied to *B. ramispársa*. It differs from *B. áspera*, Aublet, in the much less scabrous stem, in the shorter leaves, and in the smaller whorles of flowers. Flowers white. *Bigelòwia áspera*, Sieb. is a distinct plant from this. Bristles of the stipulas pilose.

Small-flowered Borreria. Pl. 1 to 2 feet.

25 B.? ala'ta (D. C. prod. 4. p. 544.) stems herbaceous, diffuse, radicant, branched, glabrous, tetragonal, with winged angles; leaves smooth oval, acuminated; bristles of the stipulas longer than the sheath; heads of flowers terminal, girded by 4 leaves; style bifid to the middle. ⊙. F. Native of French Guiana, at the river Aroura. Spermacòce alàta, Aubl. guian. 1. p. 60. t. 22. f. 7. Flowers white. Fruit divisible into 2, 1-seeded, dehiscent nuts. It is nearly allied to *B. Bartlingiàna*, but the structure of the fruit and flowers is doubtful. Superior leaves sessile, rather cordate at the base. Stamens didymous, 2 of which are shorter than the corolla. Corollas rather large, blue.

Winged-stemmed Borreria. Pl. creeping.

26 B. Bartlingia'na (D. C. prod. 4. p. 544.) stem herbaceous, diffuse, radicant, tetragonal, with winged pilose angles,

and the sides between the wings are lined with parallel veins; leaves oval, acutish, beset with bristle-like hairs on both surfaces; whorles of flowers sessile, glomerate, axillary ones numerous, and one terminal, girded by 4 leaves; capsule nearly globose, pilose, crowned by the 4 lanceolate teeth of the calyx. ⊙. F. Native of Mexico. Bigelòwia alàta, Bartl. in herb. Hænke, but differs from *B. alàta* in the wings of the stem being hispid, in the leaves being hispid and much less acute, in the axillary whorles, &c.

Bartling's Borreria. Pl. creeping.

27 B. Tampica'na (D. C. l. c.) plant glabrous, diffuse, branched, herbaceous; branches tetragonal, with smooth angles; leaves oblong-linear, acute, 1-nerved, scabrous on the mid-rib, but not on the margins; whorles of flowers capitate from nearly all the axils, and from the tops of the stems, sessile, involucrated by 4-8 leaves; capsules small, ovate, glabrous, crowned by the 4 short subulate teeth of the calyx. ♃. G. Native of Mexico, at Tampico de Tamaulipas, where it was collected by Berlandier. Very nearly allied to *B. parviflòra*, but the nuts of the fruit are dissimilar, one of them bearing 3 of the calycine teeth, and the other 1.

Tampico Borreria. Pl. 1 foot.?

28 B. diffu'sa (D. C. l. c.) glabrous; stem diffuse, dichotomous, rather tetragonal; leaves linear, with revolute margins; stipulas setiferous; whorles of flowers capitate, axillary, and terminal, globose, rather compound; floral leaves 4-8, reflexed; capsule oval, smoothish, crowned by the 4 short, subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacòce diffùsa, Pohl, in litt. but not of Kunth. Corollas small, smoothish, white.? Capsule small, membranous, whitish.

Diffuse Borreria. Pl. diffuse.

29 B. remotifòlia (D. C. l. c.) stem slender, tetragonal, rather hairy; leaves oblong-linear, almost sessile, acute, scabrous above and on the margins, but downy beneath; bristles of the stipulas downy, a little longer than the sheath, which is villous; whorles of flowers capitate, terminal ones on long peduncles, a very few axillary; lobes of the calyx 4, narrow, acute, unequal, glabrous.—Native of Brazil, where it was collected by Pohl, in litt. but not of Ruiz et Pav.

Remote-leaved Borreria. Pl. ½ to ¾ foot.

30 B. díscolor (Bartl. in herb. Hænke, under *Bigelòwia*, ex- D. C. prod. 4. p. 545.) stem herbaceous, branched, quite glabrous, tetragonal, having the angles winged a little; leaves oval-oblong, or oblong-lanceolate, acute, scabrous above, and clothed with yellowish down beneath; bristles of the stipulas many, longer than the leaves; whorles of flowers axillary, and terminal, small, girded by 2 leaves; capsule nearly globose, rather downy, crowned by the 4 lanceolate teeth of the calyx.—Native of the Island of Manilla, near Sorzogon, where it was collected by Hænke.

Discoloured-leaved Borreria. Pl. 1 to 2 feet.?

31 B.? cornifòlia (D. C. prod. 4. p. 545.) stem herbaceous, erect, tetragonal, tomentose; leaves petiolate, oblong, acute, with scabrous margins, and having the veins downy beneath; stipulas villous, of many bristles; whorles of flowers dense, 1 axillary, and 1 terminal, the latter girded by 4 leaves; calyx villous, with 4 equal teeth; anthers exserted. ⊙. F. Native of Brazil. Spermacòce cornifòlia, Fisch. in Nees. hor. berl. p. 50. Link. enum. hort. berl. 1. p. 132. Cham. et Schlecht. Linnæa. 3. p. 313. Allied to *B. brachystemonoìdes*, but the fruit is unknown.

Dogwood-leaved Borreria. Fl. May, Ju. Clt. 1819. Pl. 1 ft.

32 B.? Wydleria'na (D. C. l. c.) stem herbaceous, ascending, elongated, rather tetragonal, with the angles rather hairy; leaves elliptic-oblong, attenuated at both ends, glabrous above, and downy on the nerves beneath; bristles of the stipulas 7, shorter than the sheath; whorles of flowers 2-3, axillary, distant, almost immersed in the stipular sheaths, and terminal, pedunculate, larger than the axillary ones; involucrum of 4 spreading leaves.—Native of Porto Rico, where it was collected by Wydler. Flowers while young densely crowded, intermixed with a number of bristles. Very like the following and preceding.

Wydler's Borreria. Pl. ascending.

33 brachystemonoìdes (Cham. et Schlecht. in Linnæa. 3. p. 314.) stems suffruticose at the base, erect, tetragonal, scabrous from retrograde hairs; leaves elliptic-lanceolate, acute, scabrous on both surfaces, and on the margins while young, but glabrous above in the adult state; bristles of the stipulas longer than the sheath, which is villous; heads of flowers terminal, girded by 4 leaves; capsule oblong-conical, villous upwards, crowned by the 2 acute teeth of the calyx, and 1-2 accessory ones. ♄. S. Native of the south of Brazil. Flowers white?

Brachystemon-like Borreria. Shrub 1 to 2 feet.

34 B. capitella'ta (Cham. et Schlecht. in Linnæa. 3. p. 319.) stems fistular; leaves petiolate, ovate, lined, acuminated, rather pilose on both surfaces; bristles of the stipulas 5-7; whorles of flowers axillary and terminal; capsules oblong, elliptic, hairy at the top, crowned by the teeth of the calyx, which are 3 times shorter than it.—Native of New Granada, near Santa Fe de Bogota. Spermacòce capitellàta, Willd. in Rœm. et Schultes, syst. 3. p. 530. H. B. et Kunth, nov. gen. amer. 3. p. 349. but not of Sprengel. Flowers white.? Said to be allied to *B. scabiosoìdes*. Involucrum clothed with pili.

Small-headed Borreria. Pl. 1 foot.

35 B. scabiosoìdes (Cham. et Schlecht. in Linnæa. 3. p. 318.) stems fistular, terete, glabrous; leaves lanceolate, acute, on short petioles, with a few oblique veins, and scabrous margins; teeth of the stipulas 3-5, ending in a bristle each, shorter than sheath; heads of the flowers terminal, hemispherical, involucrated by 2-6 leaves; capsule glabrous, oblong, crowned by the 2-4 hairy teeth of the calyx.—Native of equinoctial Brazil. The part of the involucrum girding the flowers is pilose both inside and outside.

Scabious-like Borreria. Pl. ½ foot.

36 B. capita'ta (D. C. prod. 4. p. 545.) stems shrubby at the base, prostrate; branches ascending, rather tetragonal, villous; leaves lanceolate, with scabrous margins, smoothish on both surfaces; bristles of the stipulas longer than the sheath; heads of flowers 2, one axillary, and the other terminal and larger, involucrated by 4 leaves; corolla glabrous, tubular; anthers exserted; capsule glabrous, turbinate, crowned by the 4 lanceolate teeth of the calyx. ♄. S. Native of Peru, on the declivities of the mountains. Spermacòce capitàta, Ruiz et Pav. fl. per. 1. p. 61. t. 91. f. b. Branches purplish. Leaves sessile. Flowers white; anthers reddish.

Capitate-flowered Borreria. Shrub 1 foot.

37 B. Ature'nsis (Cham. et Schlecht. in Linnæa. 3. p. 345.) plant shrubby, erect; branchlets tetragonal, roughish; leaves narrow-linear, glabrous, with serrulated margins; stipulas hairy, ciliated with bristles; heads of flowers terminal, rarely lateral; capsule hairy, oblong, crowned by the 4 linear-subulate, ciliated teeth of the calyx. ♄. S. Native on the banks of the Orinoco, near Atures. Spermacòce Aturénsis, H. B. et Kunth, nov. gen. amer. 3. p. 345. Flowers white. Allied to *B. verticillàta*. Corolla funnel-shaped, a little longer than the calyx.

Atures Borreria. Shrub 1 to 2 feet.

38 B. eryngoìdes (Cham. et Schlecht. in Linnæa. 3. p. 316.) glabrous; stems herbaceous, erect, tetragonal, almost simple; leaves linear, acute, with revolute margins; bristles of the stipulas 5, longer than the sheath; whorles of flowers nearly globose, terminal and axillary; capsule downy, elliptic, crowned

by the 4 nearly equal teeth of the calyx, and with a small accessory tooth between each of these. ♃. S. Native of the south of Brazil and Buenos Ayres. Heads small. Leaves an inch long, and a line broad. Seed oblong, granular.

Eryngo-like Borreria. Pl. 1 foot.

39 B. SATUREIÆFÒLIA (Cham. et Schlecht. in Linnæ. 3. p. 313.) stem shrubby, erect, smoothish; branchlets tetragonal; leaves linear-lanceolate, acute, glabrous, with somewhat revolute edges; bristles of the stipulas rather downy, longer than the sheath; whorles of flowers semi-globose, axillary, and terminal, the latter the largest; capsule glabrous, crowned by the 4 elongated calycine teeth, which are furnished with short pili in the recesses. ♄. S. Native of equinoctial Brazil. Said to be allied to *B. suavèolens*, but the flowers are smaller, the involucral leaves are larger, and the stature is smaller, &c.

Savory-leaved Borreria. Shrub 1 foot.

40 B. SUAVE'OLENS (Meyer, esseq. p. 81. t. 1.) glabrous; stem shrubby, erect, much branched; branchlets slightly tetragonal; leaves linear, pungent, opposite, and falsely verticillate; bristles of the stipulas stiff, rather shorter than the sheath; whorles of flowers globose, a few axillary, and a larger terminal one, which is involucrated by 8 leaves; corolla glabrous, with acuminated lobes; capsule ovate, glabrous, crowned by the 4 teeth of the calyx, and 4 small accessory ones in the recesses between the others. ♄. S. Native of Dutch Guiana, in shady places, at Arrowabichkreck. Bigelòwia suavèolens, Spreng. syst. 1. p. 404. exclusive of the variety from Porto Rico, and probably that from Brazil. Corolla funnel-shaped, ex Meyer. Stamens exserted.

Sweet-scented Borreria. Shrub 1 to 2 feet.

41 SIDERÌTIS (Cham. et Schlecht. in Linnæa. 3. p. 201.) plant scabrous from hairs; stem tetragonal, having the angles a little winged; leaves ovate-oblong, sessile, marked by 4 nerves on both sides; bristles of the stipulas shorter than the sheath, which is pilose; whorles of flowers axillary, at length globose; lobes of the corolla bearded outside; capsule pilose, ovate, crowned by the 4 teeth of the calyx. ♃. S. Native of equinoctial Brazil. Plant probably procumbent.

Sideritis-like Borreria. Pl. procumbent.

42 B. SCA'NDENS (D. C. prod. 4. p. 546.) stem shrubby at the base, ascending, weak, rather scandent, branched; branches tetragonal, striated, rather scabrous along the angles; leaves ovate, glabrous, tapering into the petioles a little; bristles of the stipulas few, shorter than the sheath; heads of flowers small, terminal, girded by 4 leaves; capsule oval, glabrous, crowned by the 4 teeth of the calyx. ♃. S. Native of Guadaloupe, where it was collected by Bertero. Diòdia sarmentòsa, from Guadaloupe, Spreng. syst. 1. p. 405. Spermacòce scándens, Gmel. syst. 235.—Sloan. jam. hist. 1. t. 28. f. 4. A. It differs from *Diòdia sarmentòsa*, in the leaves being glabrous and more ovate, in the heads being terminal, and in the fruit being dehiscent.

Climbing Borreria. Shrub cl.

43 B. AFFÌNIS (D. C. prod. 4. p. 546.) stems herbaceous, tetragonal, having the angles scabrous from pili; leaves oblong-lanceolate, acuminated, tapering to the base, scabrous from scattered pili above, and more so along the veins beneath; bristles of the stipulas yellow, 7-9, longer than the sheath; whorles of flowers sessile, axillary, and terminal, the latter involucrated by 2-4 leaves; capsule oval, glabrous, crowned by the 4 subulate teeth of the calyx, and 4 smaller subulate accessory ones in the recesses between the others.—Native of Brazil, where it was collected by Pohl. Spermacòce affìnis, Pohl, in litt.

Allied Borreria. Pl. 1 foot.

44 B. MICROPHY'LLA (D. C. prod. 4. p. 456.) glabrous; stems herbaceous, ascending, tetragonal; leaves lanceolate-linear, acute; bristles of the stipulas 7-9, longer than the sheath; whorles 10-12-flowered in nearly all the axils, and at the tops of the stem and branches, all equal in size, the latter girded by 4-6 leaves; capsule oval, downy, crowned by the 4 subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacòce microphýlla, Pohl, in litt. Leaves 7-8 inches long, and $1\frac{1}{2}$ to 2 broad.

Small-leaved Borreria. Pl. ascending.

45 B. RUBRO-STIPULA'TA (D. C. l. c.) stem herbaceous, straight, almost simple, tetragonal, having the angles beset with retrograde villi; leaves oblong-linear, acute at both ends, opposite, or falsely verticillate; bristles of the stipulas 7-9, stiffish, coloured, glabrous, longer than the sheath, which is downy; whorles of flowers capitate, 3-4 axillary, and one terminal, the latter the largest, and girded by 4 leaves; teeth of the calyx 4; anthers exserted. ⊙. S. Native of Brazil, where it was collected by Pohl. Spermacòce rubro-stipulàta, and Sperm. fasciculàta, Pohl, in litt. Spermacòce Brasiliénsis, Spreng. syst. 1. p. 402. Fruit unknown.

Red-stipuled Borreria. Pl. $\frac{1}{2}$ to 1 foot.

46 B. ELONGA'TA (D. C. prod. 4. p. 547.) stem herbaceous, branched; branches elongated, hairy, terete; leaves oblong-lanceolate, acuminated, downy on both surfaces; bristles of the stipulas longer than the sheath, which is villous; whorles of flowers capitate, 1-2 axillary, and a nearly globose terminal one, which is involucrated by 5-6 leaves; teeth of the calyx 4, acute, short.—Native of Brazil, where it was collected by Pohl. Spermacòce verticillàta, Pohl. in litt. Branches a foot high. Leaves usually in fascicles in the axils. Fruit unknown, and therefore the plant is referred to *Borrèria* from habit only.

Elongated-branched Borreria. Pl. 1 to 2 feet.

47 B. FERRUGÍNEA (D. C. prod. 4. p. 547.) stem herbaceous, hard, erect, branched; branches tetragonal, hairy; leaves oblong, acute, obliquely 3-4-nerved, scabrous above, and pale beneath and scabrous on the nerves from hairs; bristles of the stipulas the length of the sheath; whorles of flowers globose, terminal, and axillary; capsule downy, crowned by the 4 subulate teeth of the calyx. ♄. S. Native of Brazil, in elevated pastures in the provinces of Minas Geraes and St. Paul. Spermacòce furrugínea, St. Hil. pl. usuel. bras. no. 13. t. 13. Spermacòce globòsa, Pohl, in litt. The hairs on the branches and nerves of the leaves are rust coloured. Corollas rose-coloured, violaceous, or white, with the lobes pilose at the apex. Heads of flowers one half larger than those of *B. verticillàta*, which it is very like. The plant is called *Poaya* and *Poaya do praya* at Cape Frio. The roots are of a brown colour, and are used as *Ipecacuanha*.

Rusty Borreria. Pl. 1 to 2 feet.

48 B. SPHÆ'RICA (D. C. l. c.) stem suffruticose at the base? branched, terete, glabrous; leaves oblong-linear, acute, scabrous above, pale and villous beneath; bristles of the stipulas longer than the sheath, which is villous; heads of flowers globose, terminal, and axillary; capsule oblong, glabrous, crowned by the 4 subulate ciliated teeth of the calyx. ♄. S. Native of Cayenne. Very like *B. ferrugínea*, but differs from it in the branches being smoothish, in the leaves being less nerved, in the involucral leaves being 4, larger and reflexed, and in the capsules being twice the length.

Spherical-headed Borreria. Shrub 1 to 2 feet.

49 B. LUTE'SCENS (D. C. prod. 4. p. 547.) stem terete, simple, clothed with dense soft hairs, but with retrograde down at the apex; leaves sessile, lanceolate, acuminated, villous on both surfaces, furnished with 4 oblique nerves on each side; bristles of the stipulas stiffish, rufous, much longer than the sheath, which is almost obsolete; whorles of flowers dense, sessile,

1-2 axillary, and a terminal globose one, which is involucrated by reflexed bracteas; capsule oblong, villous at the apex, crowned by the 4 subulate, glabrous teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacòce lutéscens, Pohl, in litt. Allied to *B. ferrugínea*.

Lutescent Borreria. Pl. 1 foot.

50 B. Hænkea'na (D. C. l. c.) stem erect, sub-herbaceous, straight, branched, tetragonal, with the angles hairy at the apex; leaves linear, acute, rather scabrous, with rather revolute edges; bristles of the stipulas longer than the sheath; heads of flowers globose, terminal, girded by 4-leaved reflexed involucra; capsule obovate, roughish, crowned by the 4 lanceolate teeth of the calyx.—Native of Mexico and Peru. Bigelòwia psyllioìdes, Bartl. in herb. Hænke. Spermacòce tenùior, Pav. ined. but not of Lin. It differs from *B. psyllioìdes* in the involucrum being reflexed, in the heads being one half larger, in the limb of the calyx being divided into 4 lobes to the base, not to the middle.

Hænke's Borreria. Pl. 1 foot.

51 B. strictíssima (D. C. l. c.) stem and branches straight, tétragonal, clothed with powdery down under the nodi; leaves linear, acute, glabrous, almost veinless, opposite, and in axillary fascicles; bristles of the stipulas 5-7, stiff, longer than the sheath; whorles of flowers capitate, sessile, 1-2 of which are axillary, and a larger terminal globose one, which is girded by 2-4 leaves; capsule oblong, glabrous, crowned by the 4 short subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacòce strictíssima, Pohl, in litt. Allied to *B. suavèolens*, but differs from that species in the calyx being without accessory teeth. Corolla unknown.

Very straight Borreria. Pl. 1 to 2 feet.

52 B. tene'lla (Cham. et Schlecht. in Linnæa. 3. p. 317.) stem suffruticose at the base, erect, nearly terete, clothed with retrograde adpressed villi; leaves oblong-linear, acuminated, clothed with small down above, and scabrous on the nerves and margins, having a few oblique nerves on both sides; bristles of the stipulas longer than the sheath, which is downy; heads of flowers globose, terminal, surrounded by 4 reflexed leaves; capsules oblong, hairy at top, crowned by the hairy 4-toothed calyx. ♄. S. Native of equinoctial Brazil.

Var. β, angustifòlia (D. C. prod. 4. p. 547.) plant weak; leaves narrow-linear; heads size of peas; floral leaves spreading. ♄. S. Native of Brazil, where it was collected by Pohl; and along the banks of the Orinoco, by Humboldt and Bonpland. Spermacòce longisèta, Pohl, in litt. Spermacòce tenélla, H. B. et Kunth, nov. gen. amer. 3. p. 345. Sperm. capitàta, Willd. herb. Sperm. Orinocénsis, Willd. in Rœm. et Schultes, syst. 3. p. 531.

Var. γ, lavandulæfòlia (D. C. prod. 4. p. 548.) stem at first clothed with fine velvety down, but at length becoming glabrous; leaves linear, with rather revolute margins; bristles of the stipulas very long; heads of the flowers hemispherical, depressed, involucrated by 4 spreading leaves. ♄. S. Native of Brazil, where it was collected by Pohl. Spermacòce lavandulæfòlia, Pohl, in litt.

Weak Borreria. Shrub ½ to 1 foot.

53 linoìdes (D. C. prod. 4. p. 458.) quite glabrous; stem suffruticose at the base, erect; branches tetragonal; leaves linear, acutish, with revolute edges; stipulas ending in 1-3 stiff, setaceous points; axillary heads few, or wanting, and 1 terminal and sub-globose, the latter involucrated by 2-4 reflexed floral leaves; corolla glabrous; capsule oval, glabrous, crowned by the 4 short teeth of the calyx. ♄. S. Native of Brazil, where it was collected by Pohl. Spermacòce linoìdes, Pohl, in litt. Anthers exserted.

Flax-like Borreria. Shrub 1 foot.

54 B.? psyllioìdes (H. B. et Kunth, nov. gen. amer. 3. p. 346. t. 278. under *Spermacòce*) stem suffruticose, erect, tetragonal, branched, scabrous from retrograde bristles; leaves linear-lanceolate, hairy on both surfaces, with serrulately scabrous edges; bristles of stipulas longer than the sheath; heads of flowers terminal, involucrated by 6-8 radiant floral leaves; calyx funnel-shaped, 4-cleft to the middle. ♄. S. Native of Mexico, near Ario. Fruit unknown, but from habit it is evidently a species of *Borrèria*. Very nearly allied to *B. strictíssima* and *B. Hænkeàna*. It differs from all the rest of the species in the calyx being divided to the middle.

Fleawort-like Borreria. Shrub 1 to 2 feet.

55 B. flave'scens (D. C. prod. 4. p. 548.) plant diffuse, quite glabrous, suffruticose at the base; branchlets tetragonal; leaves oblong, acute, attenuated at the base; bristles of stipulas 3-5, longer than the sheath; axillary whorles of flowers few, and one terminal and larger than the axillary ones, the latter involucrated by 2-4 floral leaves; capsule oval, crowned by the lanceolate teeth of the calyx. ♄. S. Native of Brazil, where it was collected by Pohl. Spermacòce flavéscens, Pohl, in litt. The whole herb is yellowish. The nuts of the immature fruit appear almost indehiscent; it is, therefore, perhaps a species of *Diòdia*, with the habit of *Borrèria*.

Yellowish Borreria. Shrub diffuse.

56 B. sca'brida (D. C. l. c.) stem erect, tetragonal, scabrous on the angles; leaves lanceolate, acute, with 4 oblique nerves on both sides, scabrous above, and pilose on the nerves beneath; bristles of stipulas 5, stiffish, longer than the sheath; whorles of flowers capitate, sessile, terminal, and axillary, approximate; corolla glabrous; capsule oblong, glabrous, crowned by the 4 subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacòce scábrida, Pohl, in litt. Corollas one half smaller than in *B. asclepiàdea*.

Scabrous Borreria. Pl. 1 to 2 feet.?

57 B. Asclepia'dea (Cham. et Schlecht. in Linnæa. 3. p. 320. under *Bigelòwia*) plant smoothish, suffruticose at the base; stems erect, tetragonal, glabrous, but downy at the apex, having the angles winged; leaves lanceolate, acute, glabrous, obliquely 4-nerved on both sides; bristles of stipulas 3, longer than the sheath, the middle one the longest; whorles of flowers loosely capitate, terminal, and axillary; lobes of corolla lanceolate, bearded a little; capsule elliptic, crowned by the 4 elongated, acuminated teeth of the calyx. ♄. S. Native of the south of Brazil Stipulas 2, revolute.

Var. β, glabérrima (D. C. prod. 4. p. 548.) stems and corollas glabrous; stipulas furnished with one bristle each. ♄. S. Native of equinoctial Brazil.

Asclepias-like Borreria. Shrub 1 to 2 feet.

58 B. Perrotte'tii (D. C. l. c.) stem herbaceous, tetragonal, with rather rough angles; leaves oblong-lanceolate, acuminated at both ends, scabrous above, and downy beneath, obliquely nerved; bristles of stipulas 9, hispid, longer than the sheath; flowers axillary, verticillate, sessile; capsule oblong, compressed, crowned by the 4 lanceolate acute connivent teeth of the calyx.—Native of French Guiana, where it was collected by Perrottet. Perhaps Sperm. áspera, Aubl. guian. 1. p. 59. t. 22. f. 6. not of Vahl, but in the present plant the branches are nearly glabrous.

Perrottet's Borreria. Pl. 1 foot.?

59 B. nervòsa (Pohl, in litt. under Chlorophytum, ex D. C. prod. 4. p. 548.) the whole plant clothed with scabrous pubescence; stems erect, tetragonal, striated; leaves lanceolate, or oval-lanceolate, acute, obliquely 4-5-nerved on both sides; stipulas cleft into 3-5 linear, acute ligulæ; whorles of flowers axillary and terminal, sessile; lobes of calyx 3-4, longer than the ovarium, lanceolate, acuminated, scabrous, a little toothed at

the apex. ♃. S. Native of Brazil, where it was collected by Pohl. Perhaps the same as Spermacòce Poàya, var. pubéscens, St. Hil. &c.

Nerved-leaved Borreria. Pl. 1 foot.

60 B. prate'nsis (Pohl. in litt. under Chlorophỳtum, ex D. C. prod. 4. p. 548.) quite glabrous; stem tetragonal, erect, almost simple, with the angles a little winged; leaves sessile, oblong, acute, with 6-7 prominent veins on each side; stipulas triangular, 3-4-toothed at the apex: teeth acute, middle one the largest; heads of flowers axillary and terminal: lower ones on short peduncles, the rest sessile; lobes of calyx 4, lanceolate-linear; lobes of corolla smoothish; stamens exserted. ♃. S. Native of Brazil, where it was collected by Pohl. Corolla very like that of *B. Poàya* when dry. Perhaps the same as Spermacòce gentianoìdes, St. Hil. pl. us. bras. no. 12. in a note.

Meadow Borreria. Pl. 1 foot.

61 B. Poa'ya (D. C. prod. 4. p. 549.) quite glabrous; stem herbaceous, simple, tetragonal; leaves sessile, oblong-elliptic, acute, obliquely 6-nerved on both sides of the mid-rib; stipulas cleft into many long bristles; whorles of flowers capitate, sessile, few axillary, and a larger terminal one; lobes of calyx 4, lanceolate-linear, acute, longer than the ovarium; corolla smoothish; anthers exserted. ♃. S. Native of Brazil, in elevated pastures, in the mine provinces frequent. Spermacòce Poàya, var. α, St. Hil. pl. us. bras. no. 12. t. 12. Corolla blue, with the lobes rather hairy above. The roots are white, and are substituted with success in place of Ipecacuanha. The leaves are at first sweet, but afterwards acid, and a decoction of them is used in the cure of cholic.

Poaya Borreria. Pl. $\frac{1}{2}$ to 1 foot.

62 B. platyphy'lla (D. C. prod. 4. p. 549.) the whole plant is scabrous from stiff hairs; stem herbaceous, erect, simple, tetragonal, having the angles a little winged; leaves lanceolate, acute, attenuated at the base, obliquely 4-5-nerved on both sides; stipulas ending in 5-7 very long scabrous bristles; whorles of flowers sessile, capitate, many axillary, and one terminal, which is hardly larger than the rest; lobes of calyx 4, lanceolate-linear, subulate, scabrous, longer than the ovarium. ♃. S. Native of Brazil, where it was collected by Pohl. Spermacòce latifòlia, Pohl, in litt. but not of Aubl. Bristles of stipulas 6 lines long. Very nearly allied to *B. Poàya*, but differs in being hispid. Corolla unknown.

Broad-leaved Borreria. Pl. $\frac{1}{2}$ to 1 foot.

63 B.? gymnoce'phala (D. C. prod. 4. p. 549.) stem branched, tetragonal, striated, furrowed, and glabrous between the angles: and the angles are winged a little, and rough from being serrulated; leaves ovate, acute, attenuated at the base, glabrous, obliquely nerved; bristles of stipulas 7-9, longer than the sheath; whorles of flowers nearly globose, many axillary, and one terminal, which is naked from the abortion of the floral leaves; teeth of calyx 2-3, conically subulate.—Native of Brazil. This plant is probably generically distinct from *Borrèria*. Stem tetragonal and smooth between the heads. Corollas small. Anthers inclosed.

Naked-headed Borreria. Pl. 1 foot.?

64 B. cymòsa (Cham. et Schlecht. in Linnæa. 3. p. 323.) shrubby, glabrous; branches flexuous, tetragonal; leaves elliptic-lanceolate, acuminated, coriaceous, on short petioles; stipulas interpetiolar, connate, drawn out on both sides into 5 linear segments, the middle segment the longest; heads of flowers 3 at the top of each stem, and the lateral ones pedunculated and almost leafless; capsule smoothish, crowned by the 4 lanceolate-linear teeth of the calyx. ♄. S. Native of Brazil, in the province of Rio Janeiro. Spermacòce cymòsa, Spreng. syst. 1. p. 403. Leaves 3 inches long, and one broad. Corollas hairy outside. Inflorescence rather panicled.

Cymose-headed Borreria. Shrub 2 to 3 feet.

§ 2. *Flowers solitary, or in axillary fascicles.*

65 B. virga'ta (Cham. et Schlecht. in Linnæa. 3. p. 324.) branches fistular, tetragonal, with downy angles; leaves lanceolate, tapering to both ends, glabrous on the margins, and scabrous at the nerves beneath; upper stipulas undivided, the rest downy, and furnished with 5-9 bristles; flowers glomerate in every other axil; capsules downy, elliptic, crowned by the irregularly 2-6-toothed calyx. ♃. S. Native of Brazil, about Rio Janeiro.

Twiggy Borreria. Pl. $1\frac{1}{2}$ foot.

66 B. saponariæfòlia (Cham. et Schlecht. in Linnæa. 3. p. 325.) glabrous; stem prostrate, tetragonal, fistular, branched: leaves sessile, acuminated, with scabrous margins; lower ones obovate, upper ones lanceolate: bristles of stipulas 1-3, hairy, the middle one the largest; flowers solitary in every axil; capsule glabrous, oblong-elliptic, crowned by the 2 primary and the 2 accessory teeth of the calyx.—Native of Brazil.

Soap-wort-leaved Borreria. Pl. prostrate.

67 B. a'rida (D. C. prod. 4. p. 549.) stems simple, erectish, tetragonal, downy, glabrous at the apex; leaves linear, acute, scabrous on the nerve beneath at the apex, with revolute serrately scabrous edges; bristles of stipulas 5-7, stiffish, longer than the sheath; flowers 2-3 together, axillary, sessile; capsule oval-oblong, rather downy, crowned by the 2 subulate teeth of the calyx.—Native of Porto Rico, in arid places by the sea side, where it was collected by Bertero. Bigelòwia suavèolens, from Porto Rico, Spreng. syst. 1. p. 416. but is very distinct from the true *B. suavèolens*.

Arid Borreria. Pl. 1 foot.

§ 3. *Flowers disposed in cymes, or corymbose-cymes. Floral leaves small. Corollas campanulately funnel-shaped. Seeds marked by a crest inside, probably in all. Perhaps a proper genus.*

68 B. ericoìdes (Cham. et Schlecht. in Linnæa. 3. p. 326.) shrubby, erect, glabrous; branchlets tetragonal; leaves linear, bluntish, 1-nerved, opposite, or in whorled fascicles: bristles of stipulas 3-5, shorter than the sheath; cymes terminal, 3-4-forked; floral leaves small; capsule cylindrically turbinate, crowned by the 4 elliptic teeth of the calyx. ♄. S. Native of equinoctial Brazil. Corolla short, funnel-shaped, glabrous outside, and villous in the throat. Habit of a heath.

Heath-like Borreria. Shrub $\frac{1}{2}$ to 1 foot.

69 B. anthospermoìdes (D. C. prod. 4. p. 550.) glabrous; branches twiggy, tetragonal; leaves linear, acutish, nerveless; bristles of stipulas many, stiff, longer than the sheath; corymbs small, terminal, crowded; lobes of calyx 4, narrow, acute. ♄. S. Native of South America, near Santa Fe de Bogota. Habit of *B. stipulàta*, with the inflorescence of *B. ericoìdes*. Mature fruit unknown.

Anthospermum-like Borreria. Pl. 1 foot.

70 B. eupatorioìdes (Cham. et Schlecht. in Linnæa. 3. p. 327.) shrubby, downy; branches bluntly tetragonal; leaves ovate-oblong, acute, lined; bristles of stipulas equal in length to the sheath; cymes terminal, compact, trichotomous; floral leaves small; capsule oblong, downy, crowned by the 4 ovate teeth of the calyx. ♄. S. Native of Equinoctial Brazil. Corolla campanulately funnel-shaped, downy outside.

Eupatorium-like Borreria. Shrub 1 foot.

71 B. centranthoìdes (Cham. et Schlecht. in Linnæa. 3. p. 328.) plant herbaceous, smoothish; stem ascending, fistular, bluntly tetragonal; leaves elliptic-lanceolate, attenuated at both ends, rather scabrous; bristles of stipulas 5-7, hardly longer than the sheath; cymes terminal, fastigiate, pedunculate; floral leaves small; capsule hairy, obconically cylindrical, crowned by

the 4 ovate teeth of the calyx. ♃. S. Native of the south of Brazil.

Var. β, angustifòlia (Cham. et Schlecht. l. c.) the whole plant canescent from hairs; leaves oblong-lanceolate, much more nerved than those of the species. ♃. S. Native of the south of Brazil.

Centranthus-like Borreria. Pl. 1 to 2 feet.

72 B. Pohlia'na (D. C. prod. 4. p. 550.) branches hairy, compressed; leaves lanceolate, acuminated, lined, downy above, and rather hairy on the nerves beneath; bristles of stipulas length of sheath, which is villous; corymbs trichotomous, terminal, crowded; tube of calyx canescent from hairs; lobes of calyx 4, lanceolate; corolla hairy inside.—Native of Brazil, where it was collected by Pohl. Hydrophỳlax pusíllum, Pohl, in litt. Fruit unknown, but the plant has a habit very different from *Hydrophỳlax*, and appears to be nearly allied to *B. eupatorioìdes* and *B. centranthoìdes*.

Pohl's Borreria. Pl. 1 foot.

73 B. angustifòlia (Cham. et Schlecht. in Linnæa. 3. p. 330.) plant herbaceous, erect, glabrous; stem tetragonal; leaves lanceolate-linear, with revolute edges, having 2-3 veins on each side of the mid-rib; bristles of stipulas twice the length of the sheath, which is downy; cymes trichotomous, contracted; floral leaves small; capsule oblong-cylindrical, glabrous, crowned by the 4 lanceolate teeth of the calyx. ♃. S. Native of Equinoctial Brazil. Corolla short, glabrous outside.

Narrow-leaved Borreria. Shrub 1 foot.

74 B. corymbòsa (Bartl. in herb. Hænke, under Bigelòwia, ex D. C. prod. 4. p. 550.) glabrous; stem suffruticose, terete, erect; leaves lanceolate, acuminated, lined with veins, which are smooth, as well as the margins; bristles of stipulas longer than the sheath; corymbs terminal, trichotomous; capsule obovate-oblong, glabrous, crowned by the 4 lanceolate teeth of the calyx. ♄. S. Native of Peru, on the mountains. Spermacòce corymbòsa, Ruiz et Pav. fl. per. 1. p. 60. t. 91. f. a. but not of Lin. Spermacòce Peruviàna, Pers. ench. 1. p. 124. Hedyòtis Spermacòcea, Domb. herb. The leaves of the figure in fl. per. are one half broader than those of the specimens collected by Pavon and Hænke.

Corymbose-flowered Borreria. Shrub 1 to 2 feet.

75 B. verbenoìdes (Cham. et Schlecht. in Linnæa. 4. p. 550.) plant herbaceous, erect, smoothish; stem tetragonal at bottom; leaves narrow-lanceolate, very acute, scabrous on the margins above; bristles of stipulas longer than the sheath; cymes terminal, di-trichotomous, with a lateral flower; floral leaves small; capsule almost cylindrical, glabrous, crowned by the 4 lanceolate teeth of the calyx. ♃. S. Native of the south of Brazil. Herb very variable in habit, sometimes glabrous, and sometimes downy. Leaves linear, or lanceolate; lower ones usually ovate, petiolate. Corolla short, tubular, clothed with pruinose down outside.

Vervain-like Borreria. Pl. 4 feet.

76 B. valerianoìdes (Cham. et Schlecht. in Linnæa. 3. p. 335.) plant herbaceous, erect; stem tetragonal, fistular, glabrous at the base, but scabrous from retrograde bristles at the apex; leaves lanceolate, acute: lower ones somewhat spatulate, with the nerves all scabrous from hairs: bristles of stipulas longer than the sheath, which is rather scabrous; cymes terminal, large, trichotomous; floral leaves small; capsule nearly cylindrical, roughish, crowned by the 4 narrow-linear teeth of the calyx. ♃. S. Native of Equinoctial Brazil. Corolla glabrous; lobes acute, bearded with stiff hairs at the apex.

Valerian-like Borreria. Pl. 3 to 4 feet.

77 B. la'xa (Cham. et Schlecht. l. c. p. 337.) plant herbaceous, erect; stem fistular, tetragonal, with opposite, spreading branches; leaves lanceolate, attenuated at both the ends, loose, membranous, with scabrous edges; bristles of stipulas glabrous, length of the sheath, which is downy; cymes terminal, somewhat trichotomous; floral leaves small; capsule elliptic, rather truncate, crowned by the 4 narrow, acute teeth of the calyx. ♃. S. Native of the south of Brazil.

Loose-leaved Borreria. Pl. 2 feet.

78 B.? equisetoìdes (Cham. et Schlecht. l. c. p. 338.) glabrous; root woody; stems herbaceous, erect, contracted at the nodi, bluntly tetragonal? leaves narrow-linear, straight, almost filiform, with revolute, scabrous edges; stipulas fuscescent, ciliated with bristles; cymes terminal and axillary, crowded. ♃. S. Native of the south of Brazil. Habit of the plant elegant; but the fruit being unknown, it is very doubtful whether it belongs to the present genus.

Horse-tail-like Borreria. Pl. 3 feet.

§ 4. *Flowers umbellate; umbels cymose or capitate.*

79 B. umbella'ta (Spreng. neu. entd. 2. p. 144.) stem herbaceous, branched, somewhat tetragonal, shining; leaves lanceolate, tapering to both ends, glabrous; stipulas setose, connate at the base; umbels pedunculate, semi-globose, axillary, and terminal; capsule obconical, downy, crowned by the 4 acute teeth of the calyx. ♃. S. Native of Brazil, within the tropic. Cham. et Schlecht. in Linnæa. 3. p. 338. Bigelòwia umbellàta, Spreng. syst. 1. p. 405. Corolla small, white. Herb clothed with very fine down while young.

Umbellate-flowered Borreria. Pl.

80 B.? aralioìdes (Cham. et Schlecht. in Linnæa. 3. p. 339.) glabrous; stem herbaceous, erect, fistular, tetragonal, branched at the top; leaves lanceolate, acuminated, on short petioles, rather coriaceous; bristles of stipulas few, shorter than the sheath; cymes umbellate, terminal, downy, with tetragonal branchlets; calyx glabrous, acutely 4-toothed; anthers exserted.—Native of Equinoctial Brazil. Allied to *B. umbellàta*, but is twice the size in all its parts. Fruit unknown, therefore the genus is doubtful.

Aralia-like Borreria. Pl. 2 feet.

† *Species not sufficiently known.*

81 B. adsce'ndens (Cham. et Schlecht. in Linnæa. 3. p. 340.) glabrous; stems ascending; leaves linear-lanceolate, acute; stipulas toothed: teeth bristly.—Native of Madagascar. Spermacòce adscéndens, Willd. in Rœm. et Schultes, syst. 3. p. 523.

Ascending Borreria. Pl. ascending.

82 B. vagina'ta (Cham. et Schlecht. l. c. p. 340.) stem suffruticose, and is as well as the branches, terete and glabrous; leaves lanceolate: stipulas connate; lower ones sheathed: fruit hispid.—Native of St. Domingo. Spermacòce vaginàta, Willd. in Rœm. et Schultes, syst. 3. p. 531. Bigelòwia vaginàta, Spreng. syst. 1. p. 405.

Sheathed Borreria. Shrub 1 foot.?

83 B. linifòlia (D. C. prod. 4. p. 551.) stem herbaceous, tetragonal, rather villous on the angles; leaves linear-lanceolate, acute, on short petioles, villous, with scabrous margins; bristles of stipulas rather shorter than the flowers: whorles of flowers axillary and terminal; the latter globose, and girded by 4 leaves: anthers exserted; calyxes clothed with cinereous villi.—Native of Cayenne. Spermacòce linifòlia, Vahl, ecl. 1. p. 8. but not of Nees. Bigelòwia linifòlia, Spreng. syst. 1. p. 404. Fruit unknown. Anthers blue.

Flax-leaved Borreria. Pl. 1 foot.

Cult. The species of *Borrèria* are of most easy culture. A light soil suits them best; and cuttings of the perennial and shrubby kinds strike root readily in the same kind of soil, in heat. The annual kinds require the treatment of other tender annuals.

CLXXXVI. SPERMACO'CE (from *σπερμα*, *sperma*, a *seed*, and *ακωκη*, *akoke*, a point; in allusion to the capsule being crowned by the calycine points). Meyer, fl. esseq. p. 79. Cham. et Schlecht. in Linnæa. 3. p. 355. D. C. prod. 4. p. 552.—Spermacòce species, Lin. Lam. Spreng. &c.—Spermacòce, Covèlia, and Chenocárpus, Neck. elem. no. 336, 337? and 339.

LIN. SYST. *Tetrándria*, *Monogýnia*. Calyx with an ovate or turbinate tube, and a 2-4-lobed limb (f. 108. *a*. *b*.), and sometimes accessory teeth in the recesses of the primary lobes. Corolla salver-shaped, or funnel-shaped, 4-lobed (f. 108. *c*.). Stigma bifid or undivided. Capsule crowned by the limb of the calyx (f. 108. *f*.), which is often obliterated, 2-celled; nuts 1-seeded, dividing into 2 parts from the apex: the one part closed by the adnate dissepiment, and the other open. Seed oval-oblong, marked inside by a longitudinal furrow.—Herbs or subshrubs. Branches or stems usually tetragonal. Leaves opposite. Stipulas combined with the petioles, sheathing, fringed by numerous bristles. Flowers axillary, sessile, crowded, verticillate, or semi-verticillate, white, red, or blue.—The fruit of this genus is drawn with great character in Gærtn. fruct. 1. t. 25.—The fruit of a great number of the plants still preserved in this genus being unknown, many of them will yet be expelled, when proper specimens can be procured.

* *Species natives of America.*

1 S. TENU'IOR (Lin. spec. p. 147.) stems herbaceous, branched; branches tetragonal, with the angles smooth or scabrous; leaves lanceolate, on very short petioles, rather scabrous above and on the margins; bristles of stipulas hardly longer than the sheath; flowers disposed in sessile axillary fascicles, semi-verticillate; stamens inclosed; capsule oval, usually hairy, crowned by the 4 short, acute calycine teeth. ⊙. F. Native of the West India Islands, as of Jamaica, Martinico, Porto-Rico, Cuba, St. Domingo, &c., as well as of Peru, Panama, Carolina, very frequent. S. lanceolàta and S. dichótoma, Willd. in herb. S. parviflòra, Salisb. prod. p. 60.—Dill. elth. p. 370. t. 359. Lam. ill. t. 62. f. 1. There are varieties of this species (ex Swartz, obs. p. 43.) with smooth, pubescent, and straight or ascending stems; narrow and broader leaves; whorled or solitary flowers; smooth or hispid fruit, having one of the parts or nuts bearing 3 of the calycine teeth, and the other bearing only one. The varieties are so numerous, and run so gradually into each other, as hardly to be distinguished, many specimens of which are to be found in herbaria, under various names, from their different habits; as *P. assúrgens*, Spreng. syst. 1. p. 402. a native of Porto-Rico, but not of the fl. per.; and *Sperm. longifòlia*, Bartl. in herb. Hænke, &c. Some specimens are suffruticose at the base, and others are herbaceous. Perhaps the whole form a congeries of species, of which some may be ultimately distinguished from each other. The flowers in most of the varieties are of a white or pink colour, and one is said to have yellow flowers.

Slender Spermacoce. Fl. June, Aug. Clt. 1792. Pl. 1 to 3 ft.

2 S. PORTORICE'NSIS (Balb. in herb. Bert. ex D. C. prod. 4. p. 552.) stem herbaceous, glabrous, tetragonal; leaves elliptic-oblong, acuminated at both ends, on very short petioles, glabrous; stipulas rather downy, having the bristles longer than the sheath; flowers axillary, sessile, crowded, semi-verticillate; fruit oval, rather downy, somewhat truncate at the apex.—Native of Porto-Rico, where it was collected by Bertero. Perhaps sufficiently distinct from *S. tenùior*.

Porto-Rico Button-weed. Pl. 1 to 2 feet.

3 S. LONGIFÒLIA (Aubl. guian. 1. p. 59. t. 21.) stem herbaceous, glabrous, dichotomous, and are, as well as the branches, acutely tetragonal; leaves oval-oblong, tapering to both ends, on short petioles, scabrous above between the nerves and on the margins, and pilose on the nerves beneath; stipulas downy, bearing each 5-7 bristles, and short hairs between these bristles; whorles axillary, few-flowered; fruit ovate, downy, crowned by the 4 short teeth of the calyx. ♄. S. Native of French Guiana. S. fruticòsa, Poir. Flowers white. Stems reddish.

Long-leaved Button-weed. Shrub.

4 S. CÆRU'LEA (Pohl. in litt. ex D. C. prod. 4. p. 552.) stem herbaceous, almost tetragonal, downy; leaves elliptic-oblong, acute, petiolate, glabrous, downy on the nerves beneath; stipulas downy, bearing 5-7 bristles, which are a little longer than the sheath; flowers axillary, sessile, crowded, semi-verticillate; fruit oval, downy, truncate at the apex.—Native of Brazil, where it was collected by Pohl. Flowers blue. Very nearly allied to *S. tenùior*, but is very distinct.

Blue-flowered Button-weed. Pl. 1 to 2 feet?

5 S. RIPA'RIA (Cham. et Schlecht. in Linnæa. 3. p. 355.) quite glabrous; stems loose, fistular, tetragonal, suffrutescent at the base; leaves lanceolate, acute, with scabrous margins; bristles of stipulas 5, longer than the sheath; flowers terminal in the upper axils, disposed in whorled heads; stamens almost inclosed; capsule ovate, glabrous; teeth of calyx 6-7, acute, at length obliterated. ♃. S. Native of Brazil, on the banks of the Rio Negro.

River-side Button-weed. Pl. 1 foot.

6 S. HEBECA'RPA (D. C. prod. 4. p. 553.) stem herbaceous, tetragonal, nearly naked, downy; the rest of the plant smoothish: leaves ovate, acute, tapering to the base, glabrous above, but downy on the nerves beneath while young; bristles of stipulas many, rather shorter than the sheath, which is downy: heads of flowers verticillate, 1-2 axillary, and one terminal; the latter girded by 4 very unequal leaves: fruit downy, truncate at the apex.—Native of South America, about Caraccas, where it was collected by Vargas. Both the nuts of the fruit being dehiscent, it is therefore rather an ambiguous species.

Var. β, angústior (D. C. prod. 4. p. 553.) leaves lanceolate, and are, as well as the stems, glabrous.—Native of St. Domingo, where it was collected by Bertero.

Downy-fruited Button-weed. Pl. 1 foot?

7 S. DIFFU'SA (H. B. et Kunth, nov. gen. amer. 3. p. 343.) stems suffruticose, procumbent, terete, hairy; leaves lanceolate, scabrous from retrograde hairs on both surfaces, with the margins serrately scabrous; stipulas hairy, ciliated with bristles: whorles of flowers axillary, sessile, and one larger terminal; the latter girded by 4 leaves: capsule smoothish, globose, crowded by the 4 teeth of the calyx, 2 of which are linear-subulate, and longer than the other 2. ♄. S. Native of South America, in the province of Varino, at the river Atures. Flowers white. Said to be allied to *S. tenùior*, and therefore it is probably a true species of *Spermacòce*.

Diffuse Button-weed. Shrub procumbent.

8 S. SUFFRUTE'SCENS (Jacq. schoenbr. t. 322.) stem suffrutescent at the base, rather diffuse, branched, tetragonal, glabrous; leaves ovate-lanceolate, acuminated, lined, with scabrous margins; stipulas furnished with bristles: whorles of flowers dense, sessile, axillary, and terminal; the latter girded by 4 leaves: lobes of corolla villous at the apex; genitals exserted; stigma capitate; fruit turbinate, hispid, crowned by the 4-cleft calyx. ♄. S. Native country unknown. S. suffruticòsa, Spreng. syst. 1.

FIG. 108.

400. S. tetragòna, hort. berol. Leaves pilose above? Flowers pale red.

Suffrutescent Button-weed. Fl. June, Aug. Clt. 1824. Pl. ½ foot.

9 S. LINEA'RIS (H. B. et Kunth, nov. gen. amer. 3. p. 343.) stem suffruticose, obsoletely tetragonal, clothed with hairy down; leaves linear, scabrous above and on the margins, hairy beneath; stipulas hairy, ciliated with bristles; whorles many-flowered, sessile, axillary; corollas glabrous; stigma rather capitate, exserted; capsule oblong, hispid at top; teeth of calyx 4, ovate-lanceolate. ♄. S. Native on the banks of the Orinoco. Corollas white. Bigelòwia lineàris, Spreng. syst. 1. p. 405.

Linear-leaved Button-weed. Shrub 1 foot.?

* * *Species natives of Africa.*

10 S. PALMETO'RUM (D. C. prod. 4. p. 553.) plant herbaceous, ascending, branched; stem tetragonal, hairy; branchlets compressed; leaves oval-lanceolate, scabrous above and lined, hairy beneath and nerved; stipulas villous, with the bristles shorter than the sheath; flowers 5-6 together on both sides, sessile, axillary, verticillate; fruit rather hairy, obovate; teeth of calyx, 4, short, subulate, at length deciduous.—Native every where about the Gambia, at the roots of palm-trees, in humid places, where it was collected by Leprieur and Perrottet. Allied to *S. tenùior*. Perhaps Diòdia scàbra, Schum. pl. guin. p. 76.?

Palm-tree Button-weed. Pl. 1 foot.

11 S.? PILO'SA (D. C. prod. 4. p. 553.) stem herbaceous, tetragonal, with blunt, pilose angles; leaves ovate, acute, scabrous on both surfaces; bristles of stipulas distant, longer than the sheaths; whorles sessile, many-flowered; fruit ovate, crowned by the 4 reflexed, acute lobes of the calyx.—Native of Guinea. Diòdia pilòsa, Schum. pl. guin. p. 76.

Pilose Button-weed. Pl. 1 foot.

12 S. PHYLLOCE'PHALA (D. C. l. c.) plant erect, glabrous, sparingly branched; stems tetragonal; leaves linear, 1-nerved: floral ones dilated at the base; bristles of stipulas 3-5 on each side, longer than the sheath; heads of flowers axillary, verticillate, very few, and a large terminal one, the latter surrounded by long, squarrose leaves; fruit solitary in the axils of the floral leaves, crowded from the floral leaves being clustered; seeds large, shining. ⊙. S. Native of the west coast of Africa, at Kouma and Walo, where it was collected by Perrottet and Leprieur. Seeds 2 lines long, almost like those of *Psyllium*.

Leaf-headed Button-weed. Pl. 1 foot.

13 S. STACHY'DEA (D. C. prod. 4. p. 554.) plant erect, nearly simple, villous; stem tetragonal; branchlets compressed; leaves linear, acute, floral ones dilated at the base; bristles of stipulas 5-7, longer than the sheath, which is velvety; heads of flowers verticillate, numerous, surrounded by 6-8 aggregate, squarrose leaves; flowers solitary in the axils of the leaves, and aggregate only from the leaves being crowded; lobes of calyx linear-subulate, nearly the length of the fruit; seeds large, shining. ⊙. S. Native of the west coast of Africa, among stones, at Bakel, where it was collected by Leprieur. Plant about a foot high. Leaves 3 inches long, and nearly 4 lines broad. Bristles of stipulas blackish. Seed 2 or 2½ lines long, larger than any other of the genus.

Stachys-like Button-weed. Pl. 1 foot.

14 S. GALEO'PSIDIS (D. C. prod. 4. p. 554.) erect, branched; stem tetragonal, hairy; leaves lanceolate-linear, rather scabrous on both surfaces; bristles of stipulas longer than the sheath, which is velvety; flowers axillary, few, sub-verticillate; fruit large, velvety, longer than the subulate, calycine lobes. ⊙. S. Native of Senegambia, at Dagana, in sandy places. Allied to *S. Ruélliæ*, but very distinct. Herb about a foot high. Leaves 15-16 lines long, and 3 broad, pale beneath. Stipulas yellowish. Fruit larger than in any other species of the genus, almost like that of a species of *Diòdia*, but is membranous and dehiscent. Seeds large.

Galeopsis-like Button-weed. Pl. 1 foot.

15 S. RUE'LLIÆ (D. C. l. c.) erect, branched; stem tetragonal, hispid; leaves lanceolate-linear, acuminated, clothed with rough down on both surfaces; heads many, verticillate, axillary; bristles of stipulas many, 3 times longer than the sheath, which is downy; valves of fruit at length opening widely at the apex; lobes of calyx subulate, rather longer than the fruit. ⊙. S. Native of Equinoctial Africa, in sandy places at Bakel, where it was collected by Leprieur. Stem a foot high. Leaves 3 inches long, and 5-6 lines broad. Mature fruit nearly as in the genus *Ruélliæ*. Seed a line and a half long.

Ruellia-like Button-weed. Pl. 1 foot.

16 S. CHÆTOCE'PHALA (D. C. l. c.) stem erect, simple, terete at the base and glabrous, and tetragonal at the apex, with the angles scabrous; leaves linear-elongated, acuminated, glabrous; bristles of stipulas 5-7, subulate, longer than the sheath, which is villous; heads verticillate, surrounded by many leaves, and the many bristles of the stipulas; fruit pale, membranous, downy at the apex; lobes of calyx subulate, shorter than the fruit. ⊙. S. Native of Equinoctial Africa, in Gala, among rocks at Bakel, where it was collected by Leprieur. Plant 1½ foot high. Leaves 3 inches long, and 3 lines broad. Bristles of stipulas rufous. Capsules whitish. Seeds a line long.

Bristly-headed Button-weed. Pl. 1½ foot.

* * * *Species natives of the Mauritius and Madagascar.*

17 S. FLAGELLIFÓRMIS (Poir. dict. 7. p. 314.) stem herbaceous, terete, glabrous, simple, erectish; leaves glabrous, oblong-lanceolate, acute, revolute on the margins at the base, and therefore petiole-formed; stipulas broad-cupshaped, having the bristles rather shorter than the sheath; flowers axillary, few, sessile, verticillate; capsule ovate, puberulous, crowned by the 4 slender acute teeth of the calyx. ⊙. S. Native of the Mauritius and Bourbon. S. flagellàris, Willd. in Rœm. et Schultes, syst. 3. p. 532. ex Cham. et Schlecht. in Linnæa. 3. p. 357. Hedyòtis verticillàta, Lam. ill. no. 1423. exclusive of the synonymes of Desf.

Whip-formed Button-weed. Pl. 1 foot.

18 S. MURICULA'TA (D. C. prod. 4. p. 554.) glabrous; stem herbaceous, tetragonal, having the angles just under the nodi rough from small tubercles; leaves elliptic-lanceolate, acuminated at both ends, scabrous above; bristles of stipulas longer than the sheath, which is very short; flowers disposed in sessile, glomerate whorles in the axils of the leaves; fruit ovate, downy, crowned by the 2-4 very short, acute, calycine teeth, but is at length nearly naked.—Native of the Mauritius and Bourbon. Allied to *S. tenùior;* but the angles of the stem are not downy, but scabrous from tubercles.

Muriculated-stemmed Button-weed. Pl. 1 to 1½ foot.

19 S. SERPYLLIFÒLIA (Willd. in Rœm. et Schultes, syst. 3. p. 532.) plant diffuse, scabrous; leaves elliptic, with revolute margins; whorles few-flowered.—Native of Madagascar. A true species of Spermacòce ex Cham. et Schlecht. in Linnæa. 3. p. 357. but the rest is unknown.

Wild-thyme-leaved Button-weed. Pl.

* * * * *Species natives of India.*

20 S. STRI'CTA (Lin. fil. suppl. p. 120.) stem herbaceous, straight, erect, scabrous at the angles; leaves linear-lanceolate, lined, scabrous; stipulas ciliately fringed; whorles of flowers axillary, remote, globose; fruit obovate-globose, rather membranous at the base, and hispid at the apex, crowned by the 4

lobes of the calyx. ⊙. S. Native of the East Indies. S. stricta, Roxb. fl. ind. 1. p. 376. S. lasiocárpa, R. Br. in Wall. cat. no. 832. Bigelòwia stricta, Spreng. syst. 1. p. 404. Flowers white.

Var. β, latifòlia (D. C. prod. 4. p. 555.) leaves ovate-lanceolate, rather scabrous above.—Native of Java, about Tugu. Bigelòwia stricta, Blum. bijdr. p. 945.

Straight Button-weed. Fl. June, July. Clt. 1820. Pl. ½ to 1 foot.

21 S. Burma'nni (D. C. prod. 4. p. 555.) stem tetragonal, branched, slender, rather pilose on the angles; leaves oblong-linear, acuminated at both ends, scabrous above, and on the margins; bristles of stipulas glabrous, about the length of the sheath, which is villous; flowers axillary, sessile, few, somewhat verticillate, almost inclosed in the stipular sheaths; fruit ovate, rather hairy, crowned by the 4 acute teeth of the calyx.—Native of the East Indies. S. corymbòsa, Burm. fl. ind. p. 34. but not of Lin. Allied to *S. flagellifórmis*. Flowers white.

Burmann's Button-weed. Pl.

22 S. scabe'rrima (Blum. bijdr. p. 946.) stem herbaceous, branched, climbing; branches quadrangular, having the angles beset with retrograde down; leaves oval-lanceolate, rough above, and on the veins beneath; stipulas pubescent, furnished with bristles, which are a little longer than the sheath; stamens exserted; fruit glabrous, crowned by the 4 lobes of the calyx.—Native of Java, in humid places about Buitenzorg. Habit of *S. tenùior*.

Very-scabrous Button-weed. Pl. climbing.

23 S. hi'spida (Lin. mant. p. 558.) plant herbaceous, erect, hoary; stem tetragonal, hispid; leaves obovate, a little mucronate, hispid on both surfaces, and on the margins; bristles of stipulas length or longer than the sheath; flowers 1-3-together, axillary, sessile, opposite or somewhat verticillate; stamens length of corolla; capsule ellipsoid, hairy, crowned by the 4 teeth of the calyx. ⊙. S. Native of the East Indies.—Murr. comm. goett. 3. p. 77. t. 5. Cham. et Schlecht. in Linnæa. 3. p. 355. S. rígida, Salisb. prod. p. 60.—Burm. zeyl. t. 20. f. 3. Corollas turbinate, violaceous. Stamens purplish.

Hispid Button-weed. Fl. Aug. Sept. Clt. 1781. Pl. 1½ foot.

24 S. sca'bra (Willd. spec. 1. p. 572.) stem herbaceous, diffuse, terete, or slightly tetragonal, scabrous from pili; leaves obovate, obtuse or acute, undulated, scabrous on both surfaces, and on the margins; bristles of stipulas rather longer than the sheath, which is downy; flowers few, axillary, verticillate; stamens exserted; capsule ovate, rather hairy, crowned by the 4 lanceolate teeth of the calyx. ⊙. F. Native of Coromandel, ex Roxb.; of Malabar, ex Rheed. mal. 9. t. 76.; and of the Island of Timor. Roxb. fl. ind. 1. p. 377. S. hírta, Rottl. in nov. act. nat. cur. berl. 1803. p. 95. Flowers small, purple.

Rough Button-weed. Fl. June, July. Clt. 1818. Pl. diffuse.

25 S. articula'ris (Lin. fil. suppl. p. 119. exclusive of the synonymes,) plant herbaceous, diffuse; stems tetragonal, pilose above at the angles; leaves elliptic-lanceolate, hardly acute, clothed with rough pubescence on both surfaces, and on the margins; bristles of stipulas longer than the sheath, which is downy; flowers 2-4, axillary, sessile; capsule oval, downy, crowned by the 4 teeth of the calyx. ⊙. F. Native in sandy places on the shores of Coromandel. Roxb. fl. ind. 1. p. 378. Allied to *S. hispida*. Stem reddish. Flowers white. Branches procumbent.

Jointed-branched Button-weed. Pl. procumbent.

26 S. Brunònis (Wall. cat. no. 822.) stems herbaceous, erect, tetragonal, glabrous; leaves lanceolate, acute, sessile, glabrous, with serrulated scabrous edges; stipulas bifid and trifid, or multifid; heads of flowers terminal, rarely axillary: the former involucrated by 2 long leaves, and sometimes also 2 small ones. ♃. S. Native of Kamaon. Flowers white. Perhaps a species of *Borrèria*.

Brown's Button-weed. Pl. 1 to 2 feet.

27 S. longicau'lis (R. Br. in Wall. cat. no. 826.) plant scabrous; stem elongated, tetragonal, with scabrous angles; leaves oblong and obovate-oblong, opposite, and falsely verticillate, scabrous; bristles of stipulas longer than the sheath; flowers axillary, few, verticillate. ♃. S. Native of the Burmese Empire, at Prome; and of Singapore.

Long-stemmed Button-weed. Pl. 2 to 3 feet, diffuse.

28 S. Ava'na (R. Br. in Wall. cat. no. 828.) stems tetragonal, scabrous on the angles; leaves elliptic or obovate-elliptic, acute, attenuated at the base, rather scabrous, serrulated on the margins; bristles of stipulas longer than the sheath; flowers axillary, sessile, somewhat verticillate. ♃. S. Native of the Burmese Empire, at Ava. Very nearly allied to the preceding.

Ava Button-weed. Pl. 1 to 2 feet.

29 S. te'nera (R. Br. in Wall. cat. no. 833.) plant glabrous, diffuse; leaves lanceolate, tapering to both ends, petiolate, smooth; flowers axillary, verticillate; bristles of stipulas longer than the sheath. ⊙. F. Native of the East Indies. S. ocymoìdes, Heyne, but not of Burm.

Pliant Button-weed. Pl. diffuse.

30 S. compre'ssa (Wall. cat. no. 6187.) plant diffuse, densely clothed in every part with woolly scabrous hairs; leaves ovate or oblong, acute; stipulas bristly; heads of flowers axillary and terminal, verticillate; fruit compressed, crowned by the teeth of the calyx. ♃. S. Native of Silhet, in the East Indies.

Compressed-fruited Button-weed. Pl. procumbent.

† *Species not sufficiently known.*

* *Species natives of Asia.*

31 S. flexuòsa (Lour. coch. p. 79.) stem shrubby, flexuous, nearly terete, procumbent; leaves ovate-lanceolate, obliquely-nerved, thick; stipulas bristly; whorles of flowers globose; capsule of 2 2-horned nuts. ♄. G. Native of Cochin-china, in hedges and among bushes. Corollas white, with revolute segments.

Flexuous Button-weed. Shrub procumbent.

32 S.? hedyoti'dea (D. C. prod. 4. p. 555.) stem tetragonal, glabrous; leaves lanceolate; stipulas rhomboid; thyrse brachiate; bracteas subulate; corolla tomentose inside; anthers linear; stigma capitate; capsule ovate, crowned by the 4-toothed calyx; cells 1-seeded. ♄. S. Native of the East Indies. Hedyòtis fruticòsa, Retz, obs. 2. p. 8. and probably also of Lin. If the cells of the fruit are truly 1-seeded, it is a true *Spermacòce*. All the synonymes cited by authors for this plant are very doubtful.

Hedyotis-like Button-weed. Pl.

33 S. procu'mbens (Lin. syst. veg. p. 124.) stems herbaceous, procumbent, angular; leaves linear; corymbs lateral, opposite, pedunculate, surrounded by many-leaved involucra; stamens exserted.—Native of the East Indies. S. corymbòsa, Lin. spec. p. 149. but not of others. Stamens longer than the corolla.

Procumbent Button-weed. Pl. procumbent.

34 S.? semiere'cta (Roxb. fl. ind. 1. p. 377.) stems tetragonal, ascending, bent in various ways, with rather hispid angles; branches brachiate, alternately smaller; leaves ovate, acuminated, on short petioles, scabrous; stipulas of many bristles; whorles of flowers small, compact; genitals inclosed; capsule turbinate, pilose.—Flowers small, white. Native of Sumatra. S. Roxburghiàna, Wall. cat. no. 6186. Fruit not sufficiently known.

Half-erect Button-weed. Pl. ½ foot.

35 S.? costa'ta (Roxb. fl. ind. 1. p. 376.) plant diffuse, very villous; leaves broad-lanceolate or oblong, nerved; stipulas

usually furnished with 3 bristles; flowers axillary, disposed in small proliferous crowded umbels; stamens protruding beyond the corolline tube. ♂. S. Native of the Moluccas. Perhaps the same as S. cristàta, Willd. in Rœm. et Schultes, syst. 3. p. 530.? Flowers pale, pink.

Ribbed-leaved Button-weed. Pl. diffuse.

36 S.? na'na (Roxb. fl. ind. 1. p. 375.) stem erect, simple, nearly terete, smooth; leaves petiolate, lanceolate, smooth; flowers axillary or terminal, sessile, crowded.—Native of the Island of Hominoa. Plant hardly half a foot high.

Dwarf Button-weed. Pl. ½ foot.

37 S.? linea'ta (Roxb. fl. ind. 1. p. 375. but not of Blume,) plant erect, branched, pilose; leaves on short petioles, lanceolate-linear, acuminated, lined; stipulas triangular, furnished with bristles; peduncles axillary, trichotomous; flowers capitate; stamens exserted.—Native of the Moluccas. The rest unknown.

Lined-leaved Button-weed. Pl. 1 foot.

38 S.? Philippe'nsis (Spreng. syst. 1. p. 401.) stem erect, and is as well as the leaves rough; stipulas toothed; stamens exserted; fruit glabrous.—Native of the Philippines. The rest unknown.

Philippine Button-weed. Pl. 1 foot?

* * *Species natives of the West India Islands.*

39 S. læ'vis (Lam. ill. no. 1435. Poir. dict. 7. p. 313. but not of Roxb.) glabrous; stem erect, nearly terete, with opposite spreading branches; leaves lanceolate, acuminated, on short petioles; flowers sessile, somewhat verticillate; capsules smooth, obtuse.—Native of St. Domingo, where it was collected by Martin. Sloane, hist. 1. p. 94. f. 2. Said to be nearly allied to *S. tenùior*. Flowers numerous.

Smooth Button-weed. Fl. May, July. Clt. 1820. Pl. 1 foot.

40 S.? stella'ta (Rœm. et Schultes, syst. 3. p. 530.) flowers terminal, capitate; leaves linear, verticillate.—Native of St. Domingo, where it was collected by Poiteau. The rest unknown.

Stellate-leaved Button-weed. Pl. 1 foot?

41 S.? rota'ta (Poit. in Rœm. et Schultes, syst. 3. p. 275.) glabrous; stems diffuse, ascending, quadrangular; leaves ovate, mucronate; bristles of stipulas few, naked, short; flowers in capitate whorles; teeth of calyx villous.—Native of St. Domingo, where it was collected by Martin. Poir. dict. 7. p. 312. Whorles of flowers the size of a pea.

Rotate Button-weed. Pl. diffuse.

42 S.? remòta (Lam. ill. 1. no. 1436.) stems straight, rather tetragonal, and downy; leaves linear-lanceolate, very rough, canescent beneath, shorter than the internodes; whorles of flowers dense, distant; capsules obtuse, villous.—Native of St. Domingo, where it was collected by Martin. Poir. dict. 7. p. 312. Leaves more than an inch long.

Remote-whorled Button-weed. Pl. 1 foot?

43 S.? ocymifòlia (Willd. in Rœm. et Schultes, syst. 3. p. 530.) branchlets and under sides of leaves downy; bristles of stipulas longer than the whorles of flowers; stamens inclosed.—Native of the West Indies. S. decídua, Bosc. The rest unknown.

Basil-leaved Button-weed. Pl. 1 foot.

44 S.? obscu'ra (D. C. prod. 4. p. 556.) glabrous; stem herbaceous, tetragonal; leaves ovate-oblong, attenuated at both ends, lined; stipulas connate, ciliated with bristles; whorles of flowers globose; corollas villous inside; stamens exserted.—Native of Cuba and Hispaniola. S. capitellàta, Spreng. neu. entd. 3. p. 46. exclusive of the synonymes. Fruit unknown.

Obscure Button-weed. Pl. 1 foot.?

* * * *Species natives of Brazil.*

45 S.? strigòsa (Thunb. et Otto, pl. bras. no. 23. ex flora, 1821. p. 602. but not of Sims,) stem branched, pilose; leaves ovate, hairy; flowers verticillate.—Native of Brazil.

Strigose Button-weed. Pl. 1 foot.

46 S.? elli'ptica (Thunb. et Otto, pl. bras. no. 22. ex flora, 1821. p. 602.) stem simple, glabrous; leaves elliptic, glabrous; flowers axillary.—Native of Brazil.

Elliptic-leaved Button-weed. Pl. 1 foot.

47 S.? cephalòtes (Willd. in Rœm. et Schultes, syst. 3. p. 531.) stem herbaceous, scabrous, branched; leaves lanceolate, acuminated, tapering to the base, veiny; heads of flowers terminal, involucrated, hairy; stamens exserted.—Native of Brazil. Leaves quite glabrous, ex Spreng. neu. entd. 2. p. 144. but rough, ex Spreng. syst. 1. p. 402. Fruit unknown.

Headed Button-weed. Pl. 1 foot?

48 S. assu'rgens (Ruiz et Pav. fl. per. 1. p. 60. t. 92.) stem ascending, branched, tetragonal, having the angles rough; leaves lanceolate, lined, with rough margins; stipulas sheathing, ciliated; whorles of flowers axillary, small, sessile and terminal: the latter about equal in size to the axillary ones, and girded by a 2-leaved involucrum. ♃. S. Native of Peru, about Lima and Huanaco, in waste places, ex Ruiz et Pav.; and of Brazil, on the road to Felisbert, ex Nees et Mart. nov. act. bonn. 12. p. 11. Stem purplish. Leaves ovate, lanceolate. Calyx purplish. Corollas white or reddish. Said to be allied to *S. Portoricénsis*. —Compare Feuill. per. 3. p. 23. t. 40.

Assurgent Button-weed. Pl. 1 to 1½ foot.

* * * * *Species natives of Peru, Bogota, and Chili.*

49 S.? inconspi'cua (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 557.) plant suffrutescent; branches ascending, somewhat hexagonal, glabrous at bottom, but clothed with powdery down at top; leaves linear-oblong, acuminated at both ends, glabrous, with scabrous edges; bristles of stipulas longer than the sheath; heads of flowers terminal, girded by 4-leaved involucra; teeth of calyx 4, nearly equal, acuminated. ♄. S. Native of Peru, on the mountains. Branches truly tetragonal, but 2 of the sides are very narrow, and the other 2 are broader, convex, and almost keeled in the centre of the convex part; therefore they are said to be somewhat hexagonal. The habit is that of *Borrèria*, but the fruit is unknown.

Inconspicuous Button-weed. Shrub ascending.

50 S.? gra'cilis (Ruiz et Pav. fl. per. 1. p. 61. t. 92. f. a.) plant herbaceous, glabrous; stem erect, tetragonal, slender branched; leaves lanceolate, acuminated, with scabrous margins; stipulas sheathing, ciliated by bristles; whorles of flowers axillary and terminal, small, sessile; fruit hispid. ⊙. H. Native of Peru, on the mountains. Flowers white. It is probably a species of *Borrèria* from the fruit being crowned by the 4 teeth of the calyx; but the habit is almost that of *S. tenùior*.

Slender-branched Button-wood. Pl. ½ foot.

51 S.? Oldenla'ndiæ (D. C. prod. 4. p. 557.) plant glabrous; stem herbaceous, much branched, creeping, filiform; branches opposite; leaves ovate, on very short petioles, shining; peduncles 1-flowered, solitary; fruit hispid.—Native of Chili, in humid places and about springs. Oldenlándia uniflòra, Ruiz et Pav. fl. per. 1. p. 57. but not of Lin. Perhaps a true species of *Spermacòce* from the cells of fruit being 1-seeded.

Oldenlandia-like Button-weed. Pl. creeping.

52 S.? humifu'sa (Willd. in Rœm. et Schultes, syst. 3. p. 530. H. B. et Kunth, nov. gen. amer. 3. p. 349.) stem suffruticose, procumbent, tetragonal, glabrous, with ciliately-serrulated margins; stipulas downy, ciliated by bristles; heads of flowers lateral and axillary, pedunculate; limb of calyx tetragonally-

urceolate, sinuately-quadrifid. ♄. S. Native near Santa Fe de Bogota. Corolla, genitals, and fruit unknown.

Trailing Button-weed. Shrub procumbent.

53 S.? ERIÓCLADA (D. C. prod. 4. p. 557.) plant suffruticose, ascending; branches rather angular, clothed with hairy tomentum; leaves oblong, acuminated, very scabrous on both surfaces, almost veinless, with serrately scabrous edges, and sometimes mucronate at the apex; bristles of stipulas glabrous, length of sheath, which is villous; heads of flowers terminal, girded by 4 leaves; teeth of calyx 4, equal; stamens exserted. ♄. S. Native of Peru. S. scabérrima, Bartl. in herb. Hænke, but not of Blume. Fruit unknown, and therefore the genus is doubtful. The habit is that of *Borrèria*.

Var. β, linearifòlia (D. C. prod. 4. p. 557.) leaves linear, distinctly mucronate. ♄. S. Native of Peru.

Woolly-branched Button-weed. Shrub ascending.

* * * * * *Species natives of Guiana.*

54 S.? SEXANGULA'RIS (Aubl. guian. 1. p. 61. t. 22. f. 8.) plant glabrous, prostrate; stem flexuous, prostrate, hexagonal; leaves ovate, acute, petiolate; heads of flowers terminal; anthers in the throat.—Native of Guiana, on the banks of rivers. S. hexagòna, Willd. spec. 1. p. 569. Flowers small, blue. Perhaps a species of *Borrèria* nearly allied to *B. alàta*.

Six-angled-stemmed Button-weed. Pl. prostrate.

55 S.? PROSTRA'TA (Aubl. guian. 1. p. 58. t. 20. f. 3.) glabrous; stem herbaceous, prostrate, oppositely branched, tetragonal; leaves almost sessile, elliptic, acute, smooth; flowers verticillate.—Native of Guiana, on the banks of rivers. Flowers small. Leaves pale green.

Prostrate Button-weed. Pl. prostrate.

56 S.? RADI'CANS (Aubl. guian. 1. p. 58. t. 20. f. 4.) glabrous; stem herbaceous, alternately branched, prostrate, radicant; leaves almost sessile, lanceolate, acute; flowers verticillate. ♃. S. Native of Guiana, on the banks of the river Orapu. The rest unknown.

Rooting Button-weed. Fl. July. Clt. 1803. Pl. creeping.

57 S.? CŒRULE'SCENS (Aubl. guian. 1. p. 57. t. 19. f. 2.) stem simple, straight, tetragonal; leaves ovate, acute, rather hairy, smooth; bristles of stipulas about equal in length to the flowers; flowers verticillate; stamens exserted.—Native of Guiana and Cayenne, on the edges of fields. Vahl. eclog. 1. p. 9. Corollas blue. Fruit unknown.

Bluish-flowered Button-weed. Pl. 1 to 2 feet.

58 S. LATIFÒLIA (Aubl. guian. 1. p. 56. t. 19. f. 1.) glabrous; stem, erect, herbaceous, tetragonal; leaves ovate, acuminated, petiolate, rough; bristles of stipulas hispid, a little longer than the sheath; flowers axillary, verticillate; limb of calyx 4-toothed, rather villous, as well as the capsules, which are ovate.—Native of Guiana and Cayenne by way sides. Lam. ill. t. 62. f. 2. Probably a species of *Borrèria* or *Mitracárpum*. Flowers white.

Broad-leaved Button-weed. Fl. July. Clt. 1803. Pl. 2 to 3 feet.

* * * * * * *Species natives of Mexico.*

59 S. POLYCE'PHALA (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 558.) stem herbaceous, erect, branched, quadrangular, villous; leaves ovate-lanceolate, acuminated, pilose on both surfaces, lined with veins beneath; bristles of stipulas longer than the sheath, hairy; heads of flowers terminal, nearly globose, girded by 4-leaved involucra; teeth of calyx subulate, nearly equal; stamens exserted.—Native of Mexico. Perhaps a species of *Borrèria*.

Many-headed Button-weed. Pl. 2 to 3 feet.

60 S.? ECHIOÌDES (H. B. et Kunth, nov. gen. amer. 3. p. 344.) stem herbaceous, tetragonal, erect, hispid; leaves lanceolate, acuminated, petiolate, hispid on both surfaces; stipulas hispid, ciliated by bristles; whorles of flowers nearly globose, axillary and terminal. ♃. S. Native of Mexico, near Campeche. There is a variety of this with glabrous stems, and narrower less hispid leaves.

Buglos-like Button-weed. Pl.

61 S.? DIVERSIFÒLIA (H. B. et Kunth, nov. gen. amer. 3. p. 341.) plant herbaceous, erect, with tetragonal branches, which are scabrous from retrograde bristles; leaves linear, with remotely scabrously serrulated margins: the lower ones minute and oblong-elliptic; stipulas smoothish, fringed by bristles; heads of flowers terminal; calyx 2-4-toothed; capsules hispid. ⊙. F. Native of Mexico. Knóxia símplex, Willd. in Rœm. et Schultes, syst. 3. p. 532. Perhaps a species of *Borrèria*. Flowers white.

Diverse-leaved Button-weed. Pl.

62 S.? RECLINA'TA (Nees, hor. berl. p. 50.) plant glabrous, ascending, herbaceous; leaves lanceolate, acute, smooth, veinless; stipulas downy, furnished with 5 bristles each; heads terminal, dense, hemispherical, supported by 2 leaves; calyx and fruit glabrous. ♃. S. Native of Mexico. Fruit unknown.

Reclinate Button-weed. Pl. ascending.

* * * * * * * *Species natives of North America.*

63 S.? LASIA'NTHA (Rafin. fl. lud. p. 76.) stem weak; branches diffuse; leaves sessile, oblong, acute, nerved: nerves scabrous; flowers verticillate; corolla woolly inside.—Native of Louisiana.

Woolly-flowered Button-weed. Pl. diffuse.

64 S.? GLA'BRA (Michx. fl. bor. amer. 1. p. 82.) plant glabrous, procumbent; leaves ovate-lanceolate; whorles many-flowered. ⊙. H. Native of North America, on the banks of the Ohio and Mississippi. Diòdia glàbra, Pers. ench. 1. p. 124. Flowers white, longer than those of *S. tenùior*. Fruit unknown.

Glabrous Button-weed. Fl. July, Aug. Clt. 1823. Pl. procumbent.

65 S.? INVOLUCRA'TA (Pursh, fl. amer. sept. 1. p. 105.) plant very hispid, herbaceous, erect; stem alternately branched; leaves ovate-lanceolate, acuminated, hairy on both surfaces; stipulas of many bristles; heads terminal, involucrated; tube of corolla very long; stamens exserted.—Native of Carolina. Flowers white. Leaves rather broad. According to Sprengel this is a variety of *Crùsea rùbra*. Fruit unknown.

Involucrated-flowered Button-weed. Pl. 1 foot.

Cult. See *Borrèria*, p. 618. for culture and propagation.

CLXXXVII. HEXASE'PALUM (from ἑξ, *hex*, six, and σεπαλον, *sepalon*, an alteration of πεταλον, a sepal; in reference to the limb of the calyx being 6-parted, indicating its being composed of six sepals). Bartl. in herb. Hænke, ex D. C. prod. 4. p. 561.

Lin. syst. *Tetrándria, Monogy'nia*. Calyx with an oblong obpyramidal tube, and a 6-parted limb; lobes narrow, nearly equal, acute, permanent. Corolla campanulately funnel-shaped, with an obconical tube, and 4 lanceolate acute lobes, which are valvate in æstivation. Stamens 4, shorter than the lobes of the corolla. Fruit oblong, dry, ribbed, divisible into 2 parts at the dissepiments: the dissepiment being double, both the parts of the fruit or nuts are closed, and 1-seeded.—A small ascending much branched glabrous shrub, with diffuse flexuous compressed branches. Leaves opposite, long-linear, acute, with the margins hardly scabrous. Stipulas sheathing, furnished with many bristles, which are equal in length to the sheath, intermixed with very short ciliæ. Flowers axillary, solitary, sessile, larger than in any other genus belonging to the tribe *Spermacòceæ*.

1 H. ANGUSTIFÒLIUM (Bartl. l. c.) ♄. S. Native of Mexico,

in Real del Monte, where it was collected by Hænke. Leaves $1\frac{1}{2}$ to 2 inches long, and a line broad. Corolla 6 lines long. Ovarium 3 lines long.

Narrow-leaved Hexasepalum. Shrub 2 to 3 feet.

Cult. See *Borrèria*, p. 618. for culture and propagation.

CLXXXVIII. DIO'DIA (from *διοδος, diodos*, a passage; the greater part of the species grow by way sides, hence the name). Lin. gen. no. 122. Gærtn. fruct. 1. p. 121. t. 25. Meyer, esseq. p. 81. Cham. et Schlecht. in Linnæa. 3. p. 341. D. C. prod. 4. p. 561.—Diòdia and Spermacòce species of authors.

Lin. syst. *Tetrándria, Monogy'nia.* Calyx with an obovate or ovate tube, which is usually 8-nerved; limb dentately parted; teeth sometimes 2, sometimes 4, equal or unequal, cruciately disposed, rarely more than 4. Corolla funnel-shaped, with a 4-lobed limb. Stamens 4, exserted or inclosed. Style bifid or undivided. Fruit 2-celled, crowned by the calyx, divisible into 2 1-seeded indehiscent parts or nuts. Seeds erect in the cells, furrowed in the front.—Herbs or subshrubs, all natives of America except one species. Branches terete or tetragonal. Leaves opposite, or falsely verticillate from axillary fascicles. Flowers small, white, disposed in various ways in the different sections.

Sect. I. Eudiòdia (from *eu*, well, and *Diodia;* this section is considered to contain the true species of the genus). D. C. prod. 4. p. 561. Capsules crustaceous or somewhat fleshy; having the mericarps or nuts separate, without any dissepiment between them.—Flowers axillary, sessile, opposite; or 2 or more on each side verticillate.

* *Calyx bidentate.—Diòdia, Gron. Lin. Michx. Pursh.*

1 D. Virgi'nica (Lin. spec. 151.) glabrous in every part; stems procumbent, nearly terete; leaves lanceolate; lobes of stipulas linear-subulate; corollas rather hairy inside; fruit ovate-oblong, glabrous, crowned by the 2 lanceolate lobes of the calyx. ♃. F. Native from Virginia to Carolina, in humid sandy places. Jacq. icon. rar. 1. t. 29. Lam. ill. t. 63. Pursh, fl. sept. amer. 1. p. 105. Stems reddish, smooth. Flowers white.

Virginian Diodia. Fl. June, July. Clt. 1820. Pl. proc.

2 D. tetragòna (Walt. fl. virg. p. 87. Ell. sketch. 1. p. 190.) stems procumbent, rather angular, smoothish; leaves ovate-cordate; lobes of stipulas linear-subulate; corollas hairy inside; fruit rather hairy, crowned by the 2 lobes of the calyx. ♃. F. Native of Carolina, frequent in humid places. D. Virgínica, Michx. fl. 1. p. 81. ex Ell. Flowers white.

Tetragonal-stemmed Diodia. Pl. procumbent.

3 D. hirsu'ta (Pursh, fl. amer. sept. 1. p. 106.) plant very hairy; stems procumbent, tetragonal; leaves linear-lanceolate; lobes of stipulas setaceous; corolla densely bearded inside; fruit ovate, hairy, crowned by the 2 linear-subulate lobes of the calyx. ♃. F. Native of Georgia, Louisiana, and Carolina, in sandy fields. Ell. sketch. 1. p. 191. D. híspida, Muhl, cat. ex Ell. D. oblónga, Rafin. fl. lud. p. 80.? Flowers white. Stem much branched.

Hairy Diodia. Pl. procumbent.

4 D. si'mplex (Swartz, fl. ind. occ. 1. p. 226.) stems herbaceous, erectish, smooth, simple; leaves oblong-lanceolate, glabrous; lobes of stipulas linear-subulate; fruit ovate-oblong; limb of calyx bidentate: teeth linear. ♃.? F. Native of Jamaica, on the higher mountains. Leaves ciliated on the margins while young. Flowers sessile, solitary, axillary, white.

Simple-stemmed Diodia. Pl. 1 to $1\frac{1}{2}$ foot.

5 D. verticilla'ta (Vahl, symb. 2. p. 28.) glabrous; stem herbaceous, simple, erect, smooth; leaves lanceolate, attenuated at both ends, with scabrous margins; stipulas ciliated; flowers verticillate; fruit linear, crowned by the 2 calycine teeth.—Native of the Island of Santa Cruz. The leaves are said to be in whorles within the stipulas, hence they are probably in axillary fascicles. Flowers white, in axillary and terminal whorles: the latter the largest. It is probably a species of *Borrèria* from the terminal whorl of flowers being larger than the axillary ones.

Whorled-flowered Diodia. Fl. June, July. Clt. 1821. Pl. 1 foot.

6 D. villòsa (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 562.) stem herbaceous, declinate, tetragonal, villous; leaves lanceolate, acuminated, scabrous above and on the margins, hairy beneath, and obliquely nerved; bristles of stipulas scabrous, longer than the sheath; whorles axillary, sessile, 10-12-flowered; fruit ovate, easily separated into 2 parts, crowned by the 2 teeth of the calyx.—Native of New Spain. Spermacòce declinàta, Pavon, ined. Habit of *Spermacòce tenùior*, but the fruit is composed of 2 indehiscent nuts, each crowned by one calycine tooth.

Villous Diodia. Pl. declinate.

** *Calyx 4-toothed.*

7 D. te'res (Walt. car. p. 87.) stem terete, velvety, procumbent; leaves linear-lanceolate, clothed with velvety down; lobes of stipulas setaceous, longer than the fruit; corolla bearded inside; fruit ovate, downy, crowned by the 4 lanceolate calycine lobes. ☉. H. Spermacòce diodìna, Michx. fl. amer. bor. 1. p. 82. Torr. fl. un. st. 1. p. 170. Leaves with scabrous edges and keel. Flowers white, solitary, sessile.

Terete-stemmed Diodia. Pl. procumbent.

8 D. hyssopifòlia (Cham. et Schlecht. in Linnæa. 3. p. 342.) plant suffruticose, branched; branches nearly terete, hairy; leaves linear, acute, glabrous, glaucescent; bristles of stipulas equal in length to the fruit; whorles usually 6-flowered; fruit obovately turbinate, downy. ♄. S. Native on the banks of the Orinoco, near San Borja in hot places. Spermacòce hyssopifòlia, H. B. et Kunth, nov. gen. amer. 3. p. 342. Willd. in Rœm. et Schultes, syst. 3. p. 532. Said to be allied to *D. tères*. Flowers white.

Hyssop-leaved Diodia. Shrub.

9 D. prostra'ta (Swartz, fl. ind. occ. 1. p. 228.) stem suffruticose, subdivided; branches prostrate, tetragonal, filiform, rather hairy at the apex; leaves linear, rather hairy, with revolute edges; lobes of stipulas setaceous, intermixed with pili, which rise from the sheath; fruit ovate, downy, crowned by the 4 short lobes of the calyx. ♄. S. Native of Jamaica. D. procúmbens, Swartz in herb. L'Her. D. prostràta, Spreng. exclusive of the species from Hispaniola. Flowers white.

Var. β, longisèta (D. C. prod. 4. p. 562.) bristles of stipulas longer than the sheath; branches hispid. ♄. S. Native of Mexico. D. prostràta, Bartl. in herb. Hænke, ex D. C. l. c.

Prostrate Diodia. Fl. June, July. Clt. 1818. Sh. prostrate.

10 D. Dominge'nsis (D. C. prod. 4. p. 563.) glabrous; branches and stems procumbent, tetragonal, filiform; leaves linear, with revolute margins; bristles of stipulas stiff.—Native of St. Domingo, where it was collected by Bertero. Diòdia prostràta, ex Hispaniola, Spreng. syst. 1. p. 406. Flowers and fruit unknown, and therefore the genus to which it belongs is doubtful. Nearly allied to *D. prostràta*.

St. Domingo Diodia. Shrub procumbent.

11 D. sca'ndens (Swartz, fl. ind. 1. p. 230.) stem suffruticose, climbing; branches very long, tetragonal, smoothish; leaves ovate-lanceolate, scabrous, at length rather muricated above; bristles of stipulas stiffish; fruit ovate-oblong, crowned by the 4 lanceolate calycine teeth. ♄. S. Native of St. Domingo. Leaves muricated above, almost as in boragineous plants. Flowers white, sessile, 4-6-together, axillary.

Climbing Diodia. Shrub cl. 8 to 10 feet.

12 D. sarmentòsa (Swartz, fl. ind. occ. 1. p. 231.) stem climbing, suffruticulose, tetragonal, villous, particularly on the angles; leaves oval-oblong, acute, scabrous from muricæ, rûgosely nerved in the adult state; bristles of stipulas stiffish; fruit oval, rather tetragonal, crowned by the 4 lanceolate teeth of the calyx. ♄. S. Native of Jamaica, Porto-Rico, St. Thomas, &c. Spermacòce ràdula, Spreng. neu. entd. 2. p. 144. Schultes, mant. 3. p. 207. but not of Willd.—Diòdia sarmentòsa è Guadalupa, Spreng. syst. 1. p. 405. is a species of *Borrèria*. Flowers solitary, axillary, white. Corolla with a tetragonal tube.

Twiggy Diodia. Fl. June, Aug. Clt. 1821. Shrub cl.

13 D. latiflòra (D. C. prod. 4. p. 563.) stems suffruticose; branches nearly terete, clothed with velvety down; leaves lanceolate, acutely awned, rather downy above, and scabrous beneath from hispid down; bristles of stipulas numerous, long; corolla campanulately funnel-shaped, with a broad glabrous throat, and acute rather ciliated lobes; fruit obovate-globose, crowned by the 4 linear teeth of the calyx. ♄. S. Native of St. Domingo. Spermacòce barbàta, Spreng. in herb. Balb. but not of Lam. D. scándens, Vahl, herb. ex Puer. Very nearly allied to *D. scándens*, and probably only a variety of it. Corolla 5 lines long, obconical, white.

Broad-flowered Diodia. Shrub cl.

14 D. grandiflòra (D. C. prod. 4. p. 563.) stems twiggy, flexuous, sparingly branched, tetragonal, glabrous, hardly pilose at top; leaves linear, cuspidate, glabrous on both surfaces, with serrulately scabrous margins, ciliated at the base; bristles of stipulas equal in length to the fruit; flowers axillary, sessile, opposite; corolla glabrous; fruit obovate-globose, rather hairy, crowned by the 4 lanceolate, acuminated, unequal calycine teeth. ♄. S. Native of St. Domingo, where it was collected by Bertero. Spermacòce grandiflòra, Spreng. neu. entd. 3. p. 45. syst. 1. p. 400. Flowers white. Nuts of fruit truly indehiscent. Allied to *D. scándens* and *D. latiflòra*.

Great-flowered Diodia. Shrub.

15 D. confe'rta (D. C. prod. 4. p. 563.) stem ascending; branches hairy, almost tetragonal; leaves ovate, acuminated, terminated by a long hair each, sessile, with serrulately scabrous edges, hairy beneath; bristles of stipulas numerous, stiff, longer than the sheath. ♄. S. Native of Brazil, where it was collected by Schott. Spermacòce conférta, Schott. ex Pohl, in litt. Fruit not seen, but from its analogy with *D. polysèta* it has been placed in this genus.

Crowded-flowered Diodia. Shrub 3 to 4 feet.

16 D. seti'gera (D. C. prod. 4. p. 563.) stem ascending, suffruticose at the base, somewhat tetragonal, hairy; leaves sessile, ovate-lanceolate, subcordate at the base, and terminating in a bristle at the apex, ciliated on the nerve and margins: the ciliæ largest towards the base; bristles of stipulas longer than the sheath, which is smoothish; fruit nearly globose, ribbed, glabrous, crowned by the 4 teeth of the calyx. ♄. S. Native of Brazil, about Bahia, in arid places, where it was collected by Salzmann. Corolla blue, with acuminated lobes.

Bristle-bearing Diodia. Shrub ascending.

17 D.? barba'ta (D. C. l. c.) plant procumbent, scabrous; branches tetragonal, downy; leaves lanceolate, villous; bristles of stipulas long; flowers few, axillary.—Native of St. Domingo. Spermacòce barbàta, Lam. ill. no. 1437. Poir. dict. 7. p. 314. Allied to *D. longiflòra* and *D. longisèta*, but the fruit is unknown. The flowers are said to be small. Leaves hardly an inch long: superior ones disposed in fascicles.

Bearded Diodia. Pl. procumbent.

18 D. polyse'ta (D. C. l. c.) branches or stems simple, twiggy, rather tetragonal, hispid from long spreading stiff hairs; leaves lanceolate, acute, hispid from long spreading pili; bristles of stipulas numerous, long, stiffish; fruit 2-3-together, axillary, roundish, crowned by the 4 small teeth of the calyx. ♄. S. Native of Porto-Rico.

Many-bristled Diodia. Shrub.

19 D. mari'tima (Schum. pl. guin. p. 75.) stems prostrate, tetragonal, with furrowed sides, and scabrous angles; leaves oval or oblong, having the margins scabrous from serrulations, rather downy or hairy on both surfaces; bristles of stipulas stiffish; fruit oval-oblong, crowned by the 4 lanceolate teeth of the calyx. ♃. S. Native of Guinea, along the coast in the sand. Flowers white.

Var. β, *commutàta* (D. C. prod. 4. p. 564.) leaves glabrous on both surfaces. ♃. S. Native of Porto-Rico, in the sand by the sea side, where it was collected by Bertero and Wydler. Spermacòce commutàta, Schultes, mant. 3. p. 208. There are varieties of this plant with either elongated or tufted branches, and having the axils of the leaves naked, or bearing fascicles of leaves or branches, and with the leaves flat, or nervosely furrowed.

Var. serrulàta (D. C. prod. 4. p. 564.) stem erectish; margins of leaves evidently serrulated. ♃. H. Native of equinoxial Africa, in the kingdom of Waree. Spermacòce serrulàta, Beauv. fl. d'ow. 1. p. 39. t. 23. Nerves of leaves reddish. Flowers axillary, sessile, verticillate.

Sea-side Diodia. Pl. prostrate.

20 D. ri'gida (Cham. et Schlecht. in Linnæa. 3. p. 341.) stem suffruticose, creeping, quadrangular, hairy; leaves lanceolate, piliferous at the apex, stiff, with serrulated margins, hairy beneath; stipulas hairy, ciliated at the apex; fruit obovate, glabrous, crowned by the 4 linear-subulate teeth of the calyx. ♄. S. Native of the Spanish Main, near Caraccas; of St. Domingo; Brazil, in the province of Para, and of the Society Islands. Spermacòce rígida, H. B. et Kunth, nov. gen. amer. 3. p. 342. Sperm. apiculàta and Sperm. rígida, Willd. in Schultes, syst. 3. p. 531. Sperm. setòsa, Willd. herb. but not of Schultes. Flowers white.

Stiff Diodia. Shrub creeping.

21 D. articula'ta (D. C. prod. 4. p. 564.) glabrous; stem shrubby, terete, nodose; leaves linear, acute at both ends, with rather revolute edges, also smooth on the margin and mid-rib; bristles of stipulas stiff, shorter than the sheath; whorles 6-8-flowered; fruit obovate-oblong, crowned by the 4 calycine teeth. ♄. S. Native of Brazil, where it was collected by Pohl. Spermacòce articulàta, Pohl, in litt. Leaves in axillary fascicles, hence they appear in whorles, very like those of *Hippùris*.

Jointed-stemmed Diodia. Shrub.

22 D. rosmarinifòlia (Pohl, in litt. ex D. C. prod. 4. p. 564.) stem herbaceous, erect, simple, terete, hairy; leaves linear, ending in a long hair each, with rather revolute edges, glabrous, but scabrous from serrulations on the margins and nerve below; bristles of stipulas very long; fruit oval, crowned by the 4 calycine teeth. ☉. F. Native of Brazil, where it was collected by Pohl. This is a very distinct species, having the ciliæ of the stipulas half an inch long, about half the length of the leaves.

Rosemary-leaved Diodia. Pl. ½ to 1 foot?

23 D. areno'sa (D. C. prod. 4. p. 564.) stem decumbent, branched, tetragonal, rather scabrous above; leaves lanceolate-linear, sessile, acuminated, with revolute edges, rather scabrous on both surfaces; bristles or ciliæ of stipulas longer than the sheath; whorles 8-10-flowered; fruit obovate-globose, scabrous from down, crowned by the 4 calycine teeth. ♄. ♃. S. Native of Brazil. Spermacòce arenòsa, Pohl, in litt. Nuts of fruit indehiscent. If Spermacòce ciliàris, Pav. in herb. Moric, be the same it is also a native of New Spain.

Sand Diodia. Pl. decumbent.

24 D. multiflo'ra (D. C. prod. 4. p. 564.) stem and branches long and twiggy, compressedly tetragonal, hairy; leaves lanceolate, sessile, acute, lined, beset with stiff villi on both sur-

faces; bristles of stipulas longer than the sheath, reflexed under the heads of flowers; whorles 15-20-flowered, nearly in all the axils; fruit obovate, rather downy, crowned by the 4 calycine teeth.—Native of Brazil. Fruit easily separated into 2 parts; the parts or nuts closed.

Many-flowered Diodia. Pl.

25 D. muricula'ta (D. C. prod. 4. p. 564.) stem ascending; branches tetragonal, hairy; leaves sessile, ovate, cuspidate, reflexed below the whorles of flowers, beset with strigæ above, and villi on the nerves beneath; bristles of stipulas longer than the sheath; fruit nearly globose, downy, crowned by the 4 calycine teeth. ♃. ♄. S. Native of Brazil, about Bahia, in dry places. Allied to *D. multiflòra*.

Muriculated Diodia. Pl. ascending.

26 D. di'scolor (D. C. l. c.) stem suffruticose, downy, rather ascending, tetragonal; leaves lanceolate, acuminated at both ends, glabrous, rough, canescent beneath; bristles of stipulas 7-11, ciliated; fruit hairy, brittle, crowned by the 4-5 hispid teeth of the calyx. ♄. S. Native of Surinam. Spermacòce díscolor, E. Meyer, nov. act. bonn. 12. p. 786. Flowers white. Allied to D. ràdula, but distinct, ex Cham. et Schlecht. in Linnæa. 3. p. 342.

Discoloured-leaved Diodia. Shrub 1 to 1½ foot.

27 D. hispi'dula (A. Rich. in herb. mus. Par. ex D. C. prod. 4. p. 565.) stem erect, tetragonal, glabrous; leaves oblong-lanceolate, acute, glabrous; bristles of stipulas 7, stiff, straight, longer than the sheath; spikes many, interrupted, at the tops of the branches, with hardly any leaves; flowers 2-4 in a kind of whorl, sessile at the stipulas; tube of calyx scabrous from bristles; lobes of calyx 4, 2 of them longer than the other 2; nuts or mericarps rather membranous, closed, one of which bears 3 of the calycine lobes, and the other only one.—Native of Brazil.

Hispid Diodia. Pl. 1 to 2 feet?

28 D. radi'cans (Cham. et Schlecht. in Linnæa. 3. p. 350.) stem radicant, oppositely branched, tetragonal, glabrous; leaves lanceolate, acute, obliquely nerved, smoothish, pale beneath; fruit ovate, sessile, crowned by the 4 lanceolate lobes of the calyx. ♄. S. Native of St. Domingo, where it was collected by Poiteau. Spermacòce radìcans, Willd. herb. but not of Aubl. Flowers large, axillary, solitary, white?

Rooting Diodia. Shrub creeping.

*** *Calyx* 5-10-*toothed.*

29 D. ra'dula (Cham. et Schlecht. in Linnæa. 3. p. 342.) stem herbaceous, weak, tetragonal, smoothish; leaves ovate-lanceolate, acute, lined, scabrous above, and downy on the nerves beneath; stipulas downy, ciliated; whorles 6-10-flowered; calyx unequally 5-10-toothed, ciliated; fruit didymous. ♃. S. Native of Brazil, in the provinces of Para and Rio Janeiro. Spermacòce ràdula, Willd. in Rœm. et Schultes, syst. 3. p. 531. This probably belongs to a different genus from the calyx.

Rasp-leaved Diodia. Pl. 3 feet.

Sect. II. Dasyce'phala (from δασυς, *dasys*, thick, and κεφαλη, *kephale*, a head; the flowers are disposed in dense thick heads). D. C. prod. 4. p. 565. Capsules membranous, having the mericarps or nuts probably subdehiscent inside at length. Flowers disposed in heads.—This is probably a section of the genus *Borrèria*, or a proper genus.

30 D. palu'stris (Cham. et Schlecht. in Linnæa. 3. p. 347.) stem herbaceous, glabrous, erect, simple, tetragonal, with winged scabrous angles; leaves elliptic, rather cuneated, obtuse, but apiculated; bristles of stipulas 7-9, long; heads of flowers axillary, rather pedunculate; limb of calyx 4-toothed. ♃. S. Native of Brazil. Flowers white.

Marsh Diodia. Pl. 1 to 2 feet.

31 D. dasyce'phala (Cham. et Schlecht. l. c. p. 348.) plant glabrous, herbaceous, ascending, rather woody at the base; branches tetragonal; leaves lanceolate, on short petioles, rather glaucescent, with scabrous margins; bristles of stipulas 5-7, hardly longer than the sheath; heads terminal, globose, girded by 4 leaves; calyx hairy, bidentate. ♃. S. Native of the south of Brazil. Flowers white.

Thick-headed Diodia. Pl. ½ to 1 foot.

32 D. ala'ta (Nees et Mart. nov. act. bonn. 12. p. 11.) stem erect, glabrous, dichotomous at the base, tetragonal; angles membranous, spinulose; leaves ovate, cuspidate, glabrous, with scabrous edges; bristles of stipulas 7-8, long; whorles of flowers terminal, naked, globose; fruit obovate, crowned by the 2 oblong-lanceolate teeth of the calyx. ☉. S. Native of Brazil, about the river Ilheos. Probably a species of *Borrèria*.

Winged-stemmed Diodia. Pl. 1½ foot.

33 D. Bogote'nsis (Cham. et Schlecht. in Linnæa. 3. p. 347.) plant suffruticose; branches quadrangular, scabrous; leaves oblong-lanceolate, glabrous, serrulated on the margins, and on the middle nerve beneath; heads of flowers terminal, rarely nearly axillary; fruit glabrous, obovate, crowned by the 4 scabrous teeth of the calyx. ♄. S. Native near the town of Santa Fe de Bogota. Spermacòce Bogoténsis, H. B. et Kunth, nov. gen. amer. 3. p. 347. Willd. in Rœm. et Schultes, syst. 3. p. 530. Corolla white, having the throat, and upper part of the tube bearded.

Bogota Diodia. Shrub procumbent.

34 D. indeco'ra (D. C. prod. 4. p. 565.) plant decumbent or ascending, much branched, glabrous; stem tetragonal, scabrous along the angles; leaves oblong-linear, acuminated, glabrous, opposite, or falsely verticillate; bristles of stipulas longer than the sheath; heads of flowers terminal, girded by 4 leaves; fruit oval-oblong, glabrous, crowned by the 4 teeth of the calyx.—Native of Mexico, at the Cordillera de Cuchilagua, where it was collected by Berlandier. Perhaps the immature fruit is indehiscent. Perhaps a species of *Borrèria*.

Indecorous Diodia. Pl. decumbent.

Cult. For culture and propagation see *Borrèria*, p. 618.

CLXXXIX. TRI'ODON (from τρεις, *treis*, three, and οδους οδοντος, *odous odontos*, a tooth; the axis remains after the nuts of the fruit have fallen, and is tridentate at top). D. C. prod. 4. p. 566.—Diòdia species, Cham. et Schlecht. in Linnæa. 3. p. 343.

Lin. syst. *Tetrándria, Monogy'nia.* Calyx with a turbinate tube, and a 2-4-toothed limb, and sometimes with accessory teeth. Corolla short, funnel-shaped, 4-cleft. Stigma bifid. Capsule chartaceous, 2-celled, crowned by the calyx, containing 2 indehiscent 1-seeded nuts; having the axis, along with the lateral nerves, remaining after the nuts have fallen, and therefore the axis appears tridentate.—Much branched glabrous shrubs, natives of Brazil, with acutely tetragonal branches. Leaves opposite and falsely verticillate, oblong or linear; floral ones small. Flowers axillary or terminal at the tops of the branches, small, disposed in spikes or fascicles. It differs from *Diòdia* in the axis of fruit being permanent and tridentate; and in habit.

1 T. anthospermoìdes (Cham. et Schlecht. in Linnæa. 3. p. 343. under *Diòdia*) shrubby, much branched, glabrous, downy at top while young; branches acutely tetragonal; leaves sessile, linear, acute, opposite, or falsely verticillate; bristles of stipulas longer than the sheath; flowers usually by threes in the axils of the upper leaves, and appear almost spicate from the upper leaves being nearly abortive; calyx hairy, with many teeth. ♄. S. Native of Equinoctial Brazil.

Anthospermum-like Triodon. Shrub.

2 T. glomera'tus (D. C. prod. 4. p. 566.) shrubby, much branched, glabrous; branchlets acutely tetragonal; leaves oblong-linear, opposite, and falsely verticillate; bristles of stipulas short; flowers disposed in fascicles at the tops of the branches; teeth of calyx 4, on the top of the fruit, 2 large, and 2 nearly obliterated. ♄. S. Native of Brazil. Diòdia Brasiliénsis, Spreng. syst. 1. p. 406. Rùbia glomeràta, Pohl, in litt. Nearly allied to *T. polymórpha, var. a*, but differs in the bristles of the stipulas being one-half shorter, in the branchlets being glabrous, and in the flowers being in terminal fascicles.

Glomerate-flowered Triodon. Shrub.

3 T. polymórpha (Cham. et Schlecht. in Linnæa. 3. p. 344. under *Diòdia*) shrubby, much branched, glabrous; branches tetragonal; leaves petiolate, oblong-linear, opposite, and falsely verticillate; bristles of stipulas rather longer than the sheath; flowers axillary and terminal, few; calyx bidentate, and sometimes with 2 accessory teeth. ♄. S. Native of Brazil. Fruit as in *T. anthospermoìdes*, to which it is very nearly allied.

Var. a, microphýllus (Cham. et Schlecht, l. c.) tops of plant downy; leaves smaller and firmer; calyx hairy, 4-toothed. ♄. S. Native of Brazil, in the province of Rio Janeiro, in dry, exposed places.

Var. β, intermèdius (Cham. et Schlecht. l. c.) smoothish; leaves flat, softish; calyx glabrous, 4-toothed. ♄. S. Native of the south of Brazil.

Var. γ, macrophýllus (Cham. et Schlecht. l. c.) glabrous; internodes elongated; leaves flat, thinner and larger; calyx glabrous, bidentate. ♄. S. Native of the south of Brazil.

Polymorphous Triodon. Shrub $1\frac{1}{2}$ foot.

Cult. The species of *Trìodon* will grow in any good, light soil; and cuttings of them will strike root readily in the same kind of soil, under a hand-glass in heat.

CXC. CRU'SEA (in honour of G. Cruse, M.D., who has written on the rubiaceous plants of the Cape of Good Hope). Cham. et Schlecht. in Linnæa. 5. p. 165. D. C. prod. 4. p. 566. but not of Rich.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a didymous, ovate tube, and with the limb contracted at the base, and profoundly cleft at the apex, but not parted; lobes 4, linear-subulate, elongated, hairy, and 4 small accessory ones between these. Corolla salver-shaped, with a long tube, which is obconical at the apex; a naked throat, and a 4-lobed limb. Stamens exserted. Style longer than the stamens, bifid at the apex. Fruit composed of 2 indehiscent, 1-seeded nuts, which at length separate from the axis, which is permanent, flat, membranous, and retaining the calyx at its apex.—Herbs which are sometimes suffruticose at the base, erect or ascending. Leaves opposite, ovate-lanceolate. Stipulas sheathing, ciliated with bristles. Flowers red, disposed in capitate, terminal umbels, which are girded by involucra.

1 C. caloce'phala (D. C. prod. 4. p. 567.) stem terete, herbaceous, villous; leaves oblong-lanceolate, acuminated, with rather oblique nerves, of which 2 rise near the base on both sides; bristles of stipulas 7-9, hispid. ⊙. H. Native of Mexico. Spermacòce capitàta, Moc. et Sesse. fl. mex. icon. ined. but not of fl. per. Spermacòce hírta, Pav. ined. but not of Lin. Stamens longer than the lobes of the corolla. Corolla 4 lines long, red.

Beautiful-headed Crusea. Pl. 2 feet.

2 C. rù'bra (Cham. et Schlecht. in Linnæa. 5. p. 165.) stem tetragonal, herbaceous, hispid; branches opposite; leaves ovate, acuminated, hairy, with the nerves oblique on both sides of the mid-rib; bristles of stipulas 7-9, hispid. ⊙. H. Native of Vera Cruz and Cuba. Crucianélla híspida, Mill. dict. no. 4. Spermacòce rùbra, Jacq .hort. schoenbr. 3. p. 3. t. 256. Spermacòce longiflòra, H. B. et Kunth, nov. gen. amer. 3. p. 271. Spermacòce strigòsa, Sims, bot. mag. t. 1558. but not of Thunb. Spermacòce rùbra and S. strigòsa, Poir. Schultes. Flowers red or purple.

Red-flowered Crusea. Fl. July, Aug. Clt. 1766. Pl. 2 to 3 feet.

3 C. coccínea (D. C. prod. 4. p. 567.) stem tetragonal, suffruticose at the base, glabrous; leaves ovate-lanceolate, acuminated, petiolate, glabrous, with 3 nerves on both sides of the mid-rib; bristles of stipulas 3, glabrous, the middle one the longest. ♄. S. Native of New Spain. Spermacòce coccínea, Pavon, in herb. Dunant. Corollas scarlet, larger than in any other plant belonging to the tribe *Spermacòceæ*; it is even an inch long. Alabastra and lobes of the corolla beset with bristles on the outside; the rest of the corolla glabrous. Style exserted beyond the tube of the corolla. Fruit unknown; but the plant agrees in habit with the other species of the genus.

Scarlet-flowered Crusea. Pl. 1 to 2 feet.

4 C. brachyphy'lla (Cham. et Schlecht. in Linnæa. 5. p. 165.) stem nearly terete, fistular, clothed with rather retrograde hairs; leaves broad-ovate, on short petioles, of a different colour beneath, beset with scattered hairs above, and along the nerves beneath; heads of flowers terminal, involucrated by leaves; lobes of calyx triangular.—Native of Mexico, on Serra Colorado, where it was collected by Schiede and Deppe. Nearly allied to *C. rùbra*, but differs in the characters indicated above, and in the fruit being much smaller, and nearly terete, not globose. Flowers red, smaller and shorter than in *C. rùbra*.

Short-leaved Crusea. Pl. 2 feet.

Cult. The annual species should be treated as other tender annuals, by being raised in a frame, and afterwards planted out in the open ground in May. The shrubby species should be treated in the manner recommended for *Trìodon* above.

CXCI. RICHARDSO'NIA (named by Kunth, in memory of Richard Richardson, an English botanist of the 16th century). Kunth, in mem. mus. 4. p. 430. nov. gen. amer. 3. p. 350. D. C. prod. 4. p. 567. but not of Neck.—Richárdia, Lin. gen. no. 439. Gærtn. fruct. 1. t. 25. A. Rich. mem. soc. hist. nat. Par. 5. p. 154. t. 14. f. 5. Schultes, syst. 7. p. 85. but not of Kunth. —Schièdea, Bartl. in herb. Hænke, but not of Cham. et Schlecht. nor of A. Rich.

Lin. syst. *Tri-Hexándria, Monogy'nia.* Calyx with a subglobose tube, and a 6-7-parted limb; teeth or lobes unequal, without any accessory ones. Corolla funnel-shaped, with an obconical tube, and a spreading, 3-6-lobed limb; lobes valvate in æstivation. Stamens equal in number to the lobes of the corolla; filaments exserted. Style 3-4-cleft at the apex. Stigmas rather capitate. Capsule containing 3-4 indehiscent, membranous, 1-seeded nuts, crowned by the permanent calyx, which at length becomes circumcised at the base, and falls off, leaving the nuts naked. Seeds peltate. Albumen between fleshy and horny. —Diffuse, decumbent herbs, natives of America. Roots almost simple, rather woody, with thick bark, which is wrinkled transversely; those of many of the species are used in various parts of the world as substitutes for Ipecacuanha. Leaves opposite, ovate. Stipulas of many bristles. Flowers capitate at the tops of the branches, each head involucrated by the 4 uppermost leaves.

§ 1. *Calyx 6-7-lobed.*

1 R. sca'bra (St. Hil. pl. us. bras. 8. t. 8. Mart. spec. mat. med. bras. p. 10. t. 9. f. 13. root.) stems hairy; leaves ovate, or ovate-lanceolate, rarely oblong, acutish, with scabrous margins; bristles of stipulas shorter than the sheath; heads many-flowered; lobes of calyx triangular, ciliated; segments of

corolla pilose at the apex. ♃. S. Native of Brazil, at Rio Janeiro, in sandy, cultivated fields, and by way sides; also of New Granada, in dry, sandy places near Ibague, and at Vera-Cruz; as well as of Peru, about Lima and Cercado, &c., Sweet, fl. gard. t. 91. Richárdia scàbra, Lin. spec. 470. Richárdia pilòsa, Ruiz et Pav. fl. per. 3. p. 50. R. scàbra and R. pilòsa, Pers. ench. 1. p. 392. R. pilòsa, H. B. et Kunth, nov. gen. amer. 3. p. 350. t. 279. Spermacòce hexándra, A. Rich. hist. nat. spec. p. 13. and 31. R. Brasiliénsis, Gom. mem. ipec. p. 31. t. 2. Virey, journ. pharm. 1820. p. 257. with a figure. Hayn. arzn. 8. t. 21. Spermacòce hirsùta, Rœm. et Schultes, syst. 7. p. 85. Corolla white, twice the length of the calyx. The roots are horizontal, and white, and are used as a substitute for Ipecacuanha, in the province of Rio Janeiro, where it grows in great plenty, under the name of *Poaya do Campo*. It is the Ipecacuánha amylàce ou blanc, Merat. dict. med. 26. p. 13. and therefore the white Ipecacuanha of the shops.

Scabrous Richardsonia, or White Ipecacuanha. Fl. Sept. Clt. 1814. Pl. procumbent.

2 R. ro'sea (St. Hil. pl. us. bras, no. 7. t. 7.) stems hispid, very hairy at the tops; leaves ovate-lanceolate, mucronately acute, with scabrous margins; bristles of stipulas longer than the sheath; heads few-flowered; lobes of calyx 6, linear, rather hispid; corolla ventricose, having the segments pilose on the outside. ♃. S. Native of Brazil, in dry, sandy places. R. emética, Mart. spec. mat. med. bras. p. 11. t. 9. f. 19. Cham. et Schlecht. in Linnæa. 3. p. 351. R. ròsea and R. emética, Schultes, syst. 7. p. 87. Corolla rose-coloured, 3 times longer than the lobes of the calyx. Roots black, twisted, and are used as a substitute for Ipecacuanha in the neighbourhood of Joao del Rey, in Brazil, where it is cultivated in great quantities for that purpose, under the name of *Poaya do Campo*, and are, along with the roots of *R. scàbra*, imported into Europe.

Rose-flowered Richardsonia. Pl. procumbent.

3 R. grandiflo'ra (Cham. et Schlecht. in Linnæa. 3. p. 351.) plant ascending; stems hispid from bristles; leaves lanceolate, acute, scabrous from bristles; bristles of stipulas rather longer than the sheath; heads few-flowered; segments of the calyx lanceolate, acuminated; corolla glabrous. ♃. S. Native of the south of Brazil. Roots like that of *R. ròsea*. Corolla white, tipped with red. Stamens 6.

Great-flowered Richardsonia. Pl. decumbent.

4 R. latera'lis (D. C. prod. 4. p. 568.) erect, stem hispid from spreading hairs; leaves oblong-lanceolate, muriculated above, and pilose beneath; bristles of stipulas longer than the sheath; heads of flowers small, 3 times shorter than the bracteas, which are ovate-lanceolate, and hispid beneath at the base; lobes of calyx 6, subulate, longer than the tube. ♃. S. Native of Brazil, where it was collected by Pohl. Spermacòce lateràlis, Pohl, in litt. Very nearly allied to *R. divérgens*, but the fruit is unknown, and is therefore a doubtful species of the genus.

Lateral Richardsonia. Pl. 1 to 2 feet.

5 R. dive'rgens (D. C. prod. 4. p. 568.) plant erect, hispid from bristles in every part; leaves linear-lanceolate, acuminated; bristles of stipulas longer than the sheath; heads small, 3 times shorter than the bracteas, which are lanceolate; limb of calyx very hispid, 6-cleft; fruit of 4 tubercularly muricated nuts. ♃. S. Native of Brazil, Pohl; and near Bahia, in cultivated places, Salzmann. Spermacòce divérgens, Pohl, in litt. Corolla white.

Diverging Richardsonia. Pl. 1 to 2 feet.

6 R. spa'rsa (D. C. prod. 4. p. 568.) the whole plant hispid from bristles; branches trichotomous; leaves linear-lanceolate, acuminated; bristles of stipulas equal in length to the sheath: heads either from the forks of the branches or from their tops; the latter one-half shorter than the bracteas, which are lanceolate; limb of calyx very hispid, 6-cleft; fruit of 4 tubercularly muricated nuts. ♃. S. Native of Brazil, Pohl; at Bahia, in dry pastures, Salzmann. Spermacòce spársa, Pohl, in litt. Flowers white.

Scattered Richardsonia. Pl. 1 to 2 feet.

§ 2. *Calyx 4-lobed, very rarely 3-5-lobed.*

7 R. stella'ris (Cham. et Schlecht. in Linnæa. 3. p. 352.) plant decumbent, twisted; stem hairy; leaves lanceolate, acuminated, hairy; bristles of stipulas 5, much longer than the sheath; heads hemispherical; segments of the calyx 4, oblong; corolla glabrous, about equal in length to the calycine teeth. ⊙. F. Native of Brazil, in the province of Cisplatine. Flowers 3-4-parted, white?

Starry Richardsonia. Pl. decumbent.

8 R. humistra'ta (Cham. et Schlecht. l. c. 3. p. 354.) plant trailing, flexuous; stems clothed with canescent hairs; leaves ovate-lanceolate, acute, clothed also with canescent hairs; bristles of stipulas 3-6, equal in length to the sheath; heads hemispherical; segments of calyx 4, oval; corolla glabrous, rather longer than the lobes of the calyx. ♃. S. Native of Brazil, in the province of Monte Video. Flowers small, tetramerous and pentamerous.

Trailing Richardsonia. Pl. trailing.

9 R. adsce'ndens (D. C. prod. 4. p. 549.) stems ascending, villous; leaves oblong, attenuated at both ends, scabrous from pubescence on both surfaces; heads terminal, on long peduncles; leaves of involucrum ovate, hardly exceeding the flowers; calycine segments 5, acute; corolla tubular, downy outside at the tops of the lobes, the rest glabrous. ♃. S. Native of Mexico. Spermacòce adscéndens, Pav. in herb. Moric. Richárdia villòsa, Moc. et Sesse, fl. mex. icon. ined., in which the corolla is more coloured.

Ascending Richardsonia. Pl. ascending.

10 R. Hænkea'na (D. C. prod. 4. p. 569.) stems trailing, tufted, twisted, creeping, suffruticose, hairy; leaves oblong, villous; bristles of stipulas shorter than the sheath; heads of flowers flattish; lobes of calyx 4, ovate, acutish; corolla subrotate. ♃.? S. Native of Mexico, where it was collected by Hænke. Schièdea Mexicàna, Bartl. in herb. Hænke.

Hænke's Richardsonia. Pl. trailing.

Cult. The species of this genus will thrive in any light soil; and cuttings of them strike root readily in the same kind of soil, under a hand-glass, in a little heat.

CXCII. KNO'XIA (named after Robert Knox, who lived many years in Ceylon, and published a relation of it in 1781). Lin. gen. no. 123. Gærtn. fruct. 1. p. 121. t. 25. Lam. ill. t. 59. A. Rich. mem. soc. hist. nat. Par. 5. p. 152. t. 15. f. 1. but not of P. Browne.—Spermacòce species, Roxb. Willd. and others.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an ovate, rather ribbed tube, and 4 small unequal teeth, which are permanent, and erectly connivent on the fruit. Corolla salver-shaped, with a terete tube, a usually bearded throat, and a 4-lobed limb. Anthers at the throat. Stigma 2-lobed. Fruit 2-celled, usually separated from the base to the apex at the dissepiment into 2 indehiscent, 1-seeded nuts, which are sometimes, however, combined at the base, and separating slowly, having the axis filiform, and remaining as in umbelliferous plants. Seeds ovate, triquetrous, erect. Albumen fleshy. Embryo erect.—Herbs or sub-shrubs, natives of the East Indies. Stems terete or tetragonal. Leaves opposite, and falsely verticillate from axillary fascicles. Stipulas undivided, or of few bristles, joined with the base of the petioles. Cymes as in the plants belonging

to the order *Valeriàneæ*, terminal, sessile, or pedunculate, having their branches becoming elongated and spike-formed, after flowering.

1 K. ZEYLA'NICA (Lin. spec. p. 151.) stem erect, glabrous, nearly terete; leaves lanceolate, almost sessile, glabrous; branches of cyme 1-3, very long, spicate, erect; tube of corolla much longer than the calycine teeth; throat of corolla bearded; stigma exserted.—Native of Ceylon. Burm. fl. ind. 34. t. 13. f. 2. Lam. ill. t. 59. f. 1. Corolla 6 lines long. Fruit easily separated into 2 parts from the base.

Ceylon Knoxia. Fl. July, Aug. Clt. 1826. Pl. 1 foot.

2 K. SUMATRE'NSIS (D. C. prod. 4. p. 569.) stem suffruticose, erect, tetragonal, tomentose; leaves lanceolate, remote, villous, on short petioles; corymbs terminal, compound; tube of corolla gibbous, short. ♄. S. Native of the East Indies, among the Circars, and probably of Sumatra and Velore, as well as of Nipaul and Kamaon. Spermacòce Sumatrénsis, Retz, obs. 4. p. 23. Roxb. fl. ind. 1. p. 372. Knóxia strícta, Gærtn. fruct. 1. p. 122. t. 25. Knóxia corymbòsa, Willd. spec. 1. p. 582.? but the fruit is not separable into 2 parts as in the following. Knòxia móllis, R. Br. in Wall. cat. no. 820. Flowers small, white.

Sumatra Knoxia. Fl. July, Aug. Clt. 1818. Sh. 2 to 3 ft.

3 K. TE'RES (D. C. l. c.) stem suffruticose, erect, branched, terete, villous; leaves lanceolate, villous; corymb terminal, compound, with opposite branches, which at length become spike-formed; tube of corolla terete, straight, with the throat very villous, and hiding the anthers; style twice the length of the corolla. ♄. S. Native of the East Indies, in woods at Koorg. Spermacòce tères, Roxb. fl. ind. 1. p. 373. K. umbellàta, Banks, herb. ex Roxb.

Terete-stemmed Knoxia. F. June, Aug. Clt. 1820. Shrub 2 to 3 feet.

4 K. EXSE'RTA (D. C. l. c.) stem suffruticose, stiff, villous in the younger parts; leaves lanceolate, petiolate, remote; corymbs terminal, compound; stamens exserted; style bifid, exserted; fruit ovate, hardly separable into 2 parts. ♄. S. Native of the East Indies, on the Circars, and of Nipaul. Spermacòce exsérta, Roxb. fl. ind. 1. p. 374. This is only, perhaps, a var. of K. tères, according to Roxb.

Exserted-stamened Knoxia. Shrub 1 foot.

5 K. GLA'BRA (D. C. l. c.) stem suffruticose, terete, glabrous; erect; leaves linear-lanceolate, smooth; corymbs axillary, compound; style pilose; stigma clavate; capsule globular, smooth. ♄. S. Native of Pulo-Penang. Habit almost of a grass, or *Bamboo*. Spermacòce glàbra, Roxb. fl. ind. 1. p. 374. but not of Mich. Spermacòce insulàris, Spreng. syst. 1. p. 404. Corolla campanulate, cream-coloured.

Glabrous Knoxia. Shrub 1 foot.

6 K. LÆ'VIS (D. C. prod. 4. p. 570.) stem herbaceous, stiff, terete, smooth; leaves almost sessile, lanceolate, glabrous; corymbs terminal; corolla funnel-shaped, with a bearded throat and hidden anthers; stigma bifid. ♂. ex Roxb.; ⊙. ex Lesch. S. Native of Bengal. Spermacòce læ'vis, Roxb. fl. ind. 1. p. 374. Sperm. Roxburghiàna, Schultes, mant. 3. p. 199. Sperm. Roxbúrghii, Spreng. syst. 1. p. 404. Leaves 3 inches long, and 6 lines broad. Flowers large, pink.

Smooth Knoxia. Fl. July, Aug. Clt. 1818. Pl. 1 foot.

7 K. HEYNEA'NA (D. C. prod. 4. p. 570.) stem obsoletely tetragonal, rather roughish; leaves lanceolate, ribbed, with scabrous margins, rough from dots on both surfaces; corymbs terminal, trichotomous.—Native of the East Indies. Knóxia species, Heyne. Spermacòce corymbòsa, Roth, nov. spec. p. 98. Rœm. et Schultes, syst. 3. p. 278. but not of Lin. nor Burm. Very nearly allied to *K. Sumatrénsis*.

Heyne's Knoxia. Pl. 1 foot.

8 K. LINEA'TA (D. C. l. c.) downy; stem herbaceous, branched a little, erect, villous; leaves ovate-lanceolate, with parallel veins; bristles of stipulas pilose; cymes corymbose, pedunculate, tripartite, axillary, and terminal; stamens inclosed. ⊙.? S. Native of Java, among grass, about Rompien. Spermacòce lineàta, Blum. bijdr. p. 947. but not of Roxb.

Lined-leaved Knoxia. Pl. 1 foot.

9 K. WIGHTIA'NA (Wall. cat. no. 6184.) plant glabrous; stem and branches slightly tetragonal; leaves lanceolate, mucronate, almost sessile; corymbs terminal, compound, with spike-formed branches. ♄. S. Native of the East Indies. Spermacòce, Wight, herb.

Wight's Knoxia. Shrub 2 to 3 feet.

10 K. PLANTAGÍNEA (Wall. pl. rar. asiat. 1. t. 32.) stems herbaceous, almost simple, rising in numbers from the root, which is fusiform: radical leaves long-lanceolate, pilose; cauline ones distant, narrower; flowers terminal, sub-capitate: one or two of the calycine teeth are elongated; tube of corolla very long. ♃. S. Native of the Burmese Empire, on the mountains. Flowers blue.

Plantain-like Knoxia. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Crùsea*, p. 627.

CXCIII. PSYLLOCA'RPUS (from ψυλλος, *psyllos*, a flea, and καρπος, *karpos*, a fruit; in allusion to the colour and shape of the seeds). Mart. nov. gen. et spec. bras. 1. p. 44. t. 28. D. C. prod. 4. p. 570. but not of Pohl.

LIN. SYST. *Tetrándria, Monogy'nia*. Calyx with a turbinate tube, and an 8-toothed limb; teeth subulate, 6 of which are very short, and the other 2 opposite, linear, and elongated. Corolla funnel-shaped, with a bearded throat, and a 4-lobed acutish limb. Anthers 4, inclosed. Stigma emarginately 2-lobed. Capsule crowned by the teeth of the calyx, compressed from the back of the carpels, 2-celled, having the dissepiment parallel with the valves; cells 1-seeded. Seeds oval, or orbicular, winged, much compressed, fixed to the centre of the dissepiment. Embryo straight, in the axis of thin albumen.—Small Brazilian shrubs, with twiggy, tetragonal branches. Leaves opposite, and often fasciculately verticillate from clusters of the leaves in the axils of the opposite ones. Stipulas joined with the petioles, forming a sheath, ciliated with bristles. Flowers axillary or terminal.

1 P. ERICOÌDES (Mart. l. c. p. 45. t. 28. f. 1.) suffruticose, almost simple at the bottom, glabrous; leaves 8-12, verticillate, shorter than the internodes; flowers terminal, sub-capitate. ♄. S. Native of Brazil, in the province of Minas Geraes, at Bandeinha, near Tejuco. Branches slender, twiggy. Corollas pale blue. Calyx glabrous.

Heath-like Psyllocarpus. Shrub 1 to 2 feet.

2 P. LARICOÌDES (Mart. l. c. p. 45. t. 28. f. 2.) a much-branched, glabrous shrub; leaves opposite, approximate, setaceous, clustered in the axils, and therefore falsely verticillate; flowers terminal, disposed in something like spikes. ♄. S. Native of Brazil, in the provinces of Minas Geraes and Bahia, in dry mountainous places. Cham. et Schlecht. in Linnæa. 3. p. 357. P. larícinus, Spreng. cur. post. p. 39. Branches erectly spreading. Corollas pale blue. Calyx glabrous.

Var. β, *densifòlius* (Mart. l. c.). ♄. S. Native of Brazil, on Serra de Itambe.

Larch-like Psyllocarpus. Shrub 1½ to 2 feet.

3 P. ASPARAGOÌDES (Mart. l. c. p. 46.) a glabrous shrub, with twiggy branches; leaves disposed in verticillate fascicles, very slender, and setaceous; peduncles terminal, elongated, naked; flowers capitate. ♄. S. Native of Brazil, in the province of Minas Geraes, near Piedade. Branches twiggy. Corollas small, white. Calyx glabrous.

Asparagus-like Psyllocarpus. Shrub 1 to 2 feet.

4 P. THYMBROÌDES (Mart. l. c. p. 46.) shrub much branched; branches squarrose, downy; leaves downy, in fascicles; flowers terminal, somewhat spicate; calyxes hairy. ♄. S. Native of Brazil, in the province of Minas Geraes, on Serra de Gran Mogol. Flowers azure blue.

Thymbra-like Psyllocarpus. Shrub 1 to 2 feet.

Cult. See *Richardsònia*, p. 628. for culture and propagation.

CXCIV. MITRACA'RPUM (from μιτρα, *mitra*, a girdle, or ring, and καρπος, *karpos*, a fruit; in allusion to the fruit being cut round about in the middle). Zuccar. in Rœm. et Schultes, syst. 3. p. 210. (1827.). Cham. et Schlecht. in Linnæa. 3. p. 358. A. Rich. mem. soc. hist. nat. par. 5. p. 151. t. 14. f. 4. D. C. prod. 4. p. 571.—Crùsea, Cham. in litt. 1829.—Schizángium, Bartl. in herb. Hænke.—Staurospérmum, Thonn. in Schum. pl. guin. (1827.) p. 73.—Spermacòce species of authors.

LIN. SYST. *Tetrándria, Monogýnia.* Calyx with an ovate tube, and a 4-toothed, permanent limb; 2 of the teeth are usually larger than the other 2, which are always small, or nearly obsolete. Corolla salver-shaped, with a terete tube, which is furnished near the base inside with a circular line of hairs, a glabrous throat, and a 4-lobed limb. Anthers exserted, or inclosed. Stigma bifid. Capsule membranous, crowned by the calyx, 2-celled, circumcised round the middle. Seeds solitary in the cells, basilar, partly fixed to the dissepiment.—Herbs or sub-shrubs, with the habit of *Spermacòce*, all natives of America, except one species from Africa. Leaves opposite. Stipulas combined with the petioles a little way, and ending in many bristles. Flowers in dense, verticillate, axillary and terminal heads, the latter always involucrated by 4 leaves. Corollas white.

§ 1. *Two of the calycine teeth are large, and two small.*

* *Suffruticose and herbaceous perennial plants.*

1 M. HUMBOLDTIA'NUM (Cham. et Schlecht. in Linnæa. 3. p. 358. t. 3. f. 1.) erect; branches nearly terete, downy while young, but glabrous in the adult state; leaves linear-oblong, or lanceolate, pubescent or hairy on both surfaces; stipulas with 5 stiff bristles on each side, naked at the apex; flowers disposed in dense verticillate heads; heads numerous, distant, terminal and axillary ones alike; the two large teeth of the calyx are subulate, and ciliated. ♄. S. Native of New Spain, on Silla de Caraccas; and of Brazil, in sand by the sea-side, at Rio Janeiro. The specimens from Caraccas are more hairy than the Brazil plant, which is trailing. Spermacòce frígida, Willd. in Rœm. et Schultes, 3. p. 531. Kunth, nov. gen. 3. p. 349. Flowers white.

Humboldt's Mitracarpum. Pl. 2 to 3 feet.

2 M. SELLOWIA'NUM (Cham. et Schlecht. in Linnæa. 3. p. 361.) stem diffuse, much branched, clothed more or less with white hairs; leaves oblong or lanceolate, sessile, cuspidate, scabrous on both surfaces; stipulas cleft into many stiff bristles, membranous and villous at the base; heads terminal, dense, involucrated by 4 leaves, which are 2 or 3 times longer than the head. —Native of Brazil, about Rio Grande do Sul, Monte Video, &c.; in the Pampas of Buenos Ayres and Cordova. Capsule glabrous. The 2 larger teeth of the calyx are scabrous, erect, and subulate, with a very few additional denticulations. Flowers white. Leaves varying from 2 to 4 lines broad. Stem usually very villous, but sometimes almost glabrous, as well as the leaves.

Sello's Mitracarpum. Pl. diffuse.

3 M. SALZMANNIA'NUM (D. C. prod. 4. p. 571.) stems diffuse, much branched, hispid from spreading stiffish hairs; leaves ovate-lanceolate, scabrous on both surfaces, setigerous at the apex; stipulas villous, membranous at the base, cleft into many stiffish bristles; flowers disposed in dense, verticillate heads, the ultimate or terminal head round, and involucrated by 2-4 leaves, which are hardly longer than the head. ♃. S. Native of Brazil, in sand by the sea-side, at Bahia, where it was collected by Salzmann. Very like *M. Sellowiànum*, but differs in the characters indicated, as well as in the seeds being paler and one-half smaller. Flowers white.

Salzmann's Mitracarpum. Pl. diffuse.

4 M. SCHIZA'NGIUM (D. C. prod. 4. p. 572.) suffruticose; branches sub-tetragonal, downy; leaves oblong-lanceolate, acuminated, scabrous on both surfaces, and on the margins; stipulas villous and membranous at the base, cleft in many stiff bristles: heads of flowers terminal and axillary, verticillate; the former involucrated by 4 leaves. ♄. S. Native of Mexico, where it was collected by Hænke. Schizángium dùrum, Bartl. in herb. Hænke. Leaves 24-27 lines long, and 4 broad. Teeth of calyx acuminated, scabrous. Flowers white.

Cut-capsuled Mitracarpum. Shrub diffuse.

5 M. CUSPIDA'TUM (D. C. prod. 4. p. 572.) stems ascending, branched, downy; leaves linear, cuspidate by a straight mucrone, almost veinless, glabrous; bristles of stipulas 3-5, stiff, longer than the sheath; heads of flowers hemispherical, terminal, 3-4 times shorter than the bracteas; calyx with 2 cuspidate teeth, and 3-4 nearly abortive ones. ♃. S. Native of Monte Video; and of Chili, at Maldanado, in the Banda Oriental. Stem hardly a hand high, suffruticose at the base. Heads of flowers 4 lines in diameter. Floral leaves 9 lines long, and a line broad. Tube of the corolla almost double the length of the calycine teeth. Flowers white.

Cuspidate-leaved Mitracarpum. Pl. ascending.

6 M. VIRGA'TUM (Cham. et Schlecht. in Linnæa. 3. p. 363.) stem suffruticose, erect, and are, as well as the branches, terete and glabrous: leaves linear, very narrow, flaccid; stipulas of two colours, ciliated; corollas long, tubular; stamens exserted. ♄. S. Native of Brazil. Spermacòce virgàta, Willd. in Rœm. et Schultes, syst. 3. p. 281. and 531. mant. 3. p. 205. Spreng. syst. 1. p. 401. Flowers white. Leaves 6-8 in a whorl, according to Link, but are probably only in axillary fascicles.

Twiggy Mitracarpum. Shrub 1 foot.

7 M. DIFFU'SUM (Cham. et Schlecht. in Linnæa. 3. p. 363.) stems suffruticose, procumbent, terete, hairy; leaves lanceolate, beset with retrograde asperities on both surfaces, and serrulately ciliated on the margins; flowers capitate and verticillate; the 2 larger lobes of the calyx exceeding the corolla, which is salver-shaped; capsule smoothish. ♄. S. Native of South America, in woods about the Orinoco and Apure. Flowers white; stamens exserted; seeds oblong.

Diffuse Mitracarpum. Shrub diffuse.

8 M. SAGRÆA'NUM (D. C. prod. 4. p. 572.) plant suffruticose, twisted and tufted, clothed with fine down; leaves oblong: heads of flowers axillary and terminal, the latter girded by 4 leaves: lobes of calyx 4, 2 large concave and blunt, and 2 small. ♄. S. Native of Cuba, near the Havannah, where it was collected by Ramon de La Sagra. Flowers white. Seeds brown, hollow in front, and marked by 4 small rays.

Ramon de La Sagra's Mitracarpum. Shrub tufted.

9 M. SENEGALE'NSE (D. C. prod. 4. p. 572.) glabrous; stem erect, suffruticose at the base, rather tetragonal; leaves oblong, acuminated at both ends: stipulas furnished with 2-3 teeth on both sides; flowers disposed in capitate whorles; calyx with 4 teeth, 2 long and acute, and 2 small. ♄.? ⊙.? F. Native of Senegal, on the banks of the river at Walo, where it was collected by Bacle, Perrottet, and Leprieur; and in other parts of Guinea, by Thonning. Oldenlándia verticillàta, Bacle, in litt. Staurospérmum verticillàtum, Thonn. in Schum. pl. guin. p. 73. Flowers white. Seeds small, nearly globose, pale, umbilicate in

front, and marked by 4 rays. Perhaps the same as M. scàbrum, Zuccar. in Rœm. et Schultes, syst. 3. p. 210. which was found about Fort Louis.

Senegal Mitracarpum. Shrub.

* * *Annual plants.*

10 M. TORRESIA'NUM (Cham. et Schlecht. in Linnæa. 3. p. 360. t. 3. f. 2.) stem erect, simple, somewhat tetragonal, rather pilose on the angles; leaves elliptic-lanceolate, attenuated at the base, membranous, rather downy on both surfaces; stipulas membranous, with white villous bristles; flowers disposed in capitate whorles, the terminal one usually formed of 2 combined heads, and girded by 4 leaves. ⊙. F. Native of Guajan and Marianne Islands. Flowers white.

Torres's Mitracarpum. Pl. $2\frac{1}{2}$ foot.

11 M. VILLÒSUM (Cham. et Schlecht. in Linnæa. 3. p. 363.) stem erectish, sparingly branched, slightly tetragonal, villous; leaves oval-lanceolate, downy; stipulas membranous, cleft into many bristles; heads of flowers axillary, verticillate, and terminal, the latter girded by 4 leaves; anthers inclosed. ⊙. F. Native of Jamaica. Spermacòce hírta, Jacq. icon. rar. t. 308. and probably of Lin. Spermacòce villòsa, Swartz, obs. p. 45. Corolla white. Anthers yellow. Seeds pale, somewhat tubercular on the back, and marked by a cruciate furrow in front.

Villous Mitracarpum. Fl. June, July. Clt. 1816. Pl. $\frac{1}{2}$ to 1 foot.

12 M. HÍRTUM (D. C. prod. 4. p. 572.) stem erect, branched, scabrous, tetragonal; leaves ovate-lanceolate, clothed with hairy pubescence; stipulas membranous, with many bristles: axillary heads of flowers verticillate; terminal ones girded by 4 leaves; anthers exserted. ⊙. F. Native of Jamaica, in dry, grassy places; and of the Society Islands. Spermacòce hírta, Swartz, obs. p. 45. Very like *M. villòsa*, but differs in being more branched, in the anthers being exserted and blue, and in the seeds being smaller, blacker, and concave in front, not with 4 rays.

Hairy Mitracarpum. Fl. June, July. Clt. 1818. Pl. $\frac{1}{2}$ to 1 foot.

13 M. FISCHE'RI (Cham. et Schlecht. 3. p. 363.) stem erect, hairy, tetragonal; leaves oblong, attenuated at the base, acute, downy from very short hairs; stipulas ciliated; flowers densely capitate, terminal; teeth of calyx 4, lanceolate, acute, a little shorter than the corolla. ⊙. F. Native of Jamaica. Spermacòce Fischèri, Link. enum. 1. p. 132. Spermacòce adscéndens, Fisch. ined. Corollas white. Habit of Spermacòce áspera, Aubl.

Fischer's Mitracarpum. Fl. May, June. Clt. 1821. Pl. 1 foot.

14 M. STYLÒSUM (Cham. et Schlecht. in Linnæa. 3. p. 363.) stem decumbent, terete, glabrous; leaves oblong-lanceolate, attenuated at the base; bristles of stipulas long; flowers disposed in dense whorles; the two large teeth of the calyx are subulate at the apex; style exserted. ⊙. F. Native of Manilla. Spermacòce stylòsa, Link. enum. 1. p. 132. Spermacòce crassifòlia, Hortul. Capsule membranous, glabrous. Corollas white. Seed orbicular, with a mark like the letter x engraven on the front, somewhat 4-lobed, of a pale, dirty colour.

Long-styled Mitracarpum. Fl. May, June. Clt. 1819. Pl. 1 foot.

§ 2. *Calyx with 4 nearly equal acutish teeth.*

15 M. NEGLE'CTUM (D. C. prod. 4. p. 573.) plant glabrous, dichotomous; leaves oblong-linear, acute, almost veinless; bristles of stipulas 3, stiff, longer than the sheath; heads of flowers terminal, 3 times shorter than the bracteas; calyx glabrous, with 4, hardly acute teeth, which are a little shorter than the corolla. —Native of Brazil, where it was collected by Pohl. Spermacòce neglécta, Schott ex Pohl, in litt. Heads of flowers 5 lines in diameter. Floral leaves about an inch long, and 2 lines broad.

Neglected Mitracarpum. Pl.?

† *Species not sufficiently known.*

16 M. SQUARRO'SUM (Cham. et Schlecht. in Linnæa. 3. p. 363.)—Native of Cuba, on rocks about Havannah. Spermacòce squarròsa, Poepp. Nearly allied to *M. Sellowiànum*, but differs in its smoothness.

Squarrose Mitracarpum. Pl.

Cult. See *Borreria*, p. 618. for culture and propagation.

CXCV. CRUCKSHA'NKSIA (named after Mr. Cruckshanks, the original discoverer of the plant, and a particular friend of both Hooker and Arnott). Hook. et Arn. in bot. misc. 3. p. 361. but not of Hook. in bot. misc. vol. 2. t. 90.

LIN. SYST. *Pentándria, Monogy'nia.* Calyx with a globose subdidymous tube, and a 5-toothed limb; teeth usually furnished with an accessory small subulate tooth on each side; one or two of the teeth are usually expanded into large reticulated pedunculate roundish membranous wings. Corolla salver-shaped, with an elongated tube, a 5-cleft spreading limb, and a glabrous throat. Stamens 5, exserted, inserted in the mouth of the corolla. Filaments club-shaped, acute; anthers linear-oblong, fixed by the base. Style filiform, a little longer than the tube of the corolla; stigma bifid, pilose: the divisions linear and acute. Capsule membranous, globose, subdidymous, crowned by the more or less widened calycine segments, 2-celled, 4-valved; cells 2-seeded; valves ovate, very concave, boat-shaped, 1-nerved in the middle, separable from the thin membranous white dissepiment. Seeds large, obovate, black, tubercled, very deeply furrowed on the inside at the hylum. Albumen horny. Embryo central, very much curved; cotyledons flat; radicle nearly terete, inferior, elongated.—The whole plant is more or less pubescent. Root perennial, dividing into many stems at the neck. Stems herbaceous, terete, ascending, flexuous, branched. Leaves obovate-lanceolate, acute, tapering into the petiole, stipulate; stipulas interpetiolar, broad-subulate, free, or joined more or less. Bracteas involucra-formed, simple or tripartite, furnished with small subulately toothed stipulas at the base on both sides. Peduncles terminal and axillary. Flowers disposed into a rather large depressed cyme: having the corolla and calycine wings yellow.

1 C. HYME'NODON (Hook. et Arn. l. c.)—Native of Chili, about Coquimbo. There are varieties with hoary or less pubescent leaves. This most extraordinary plant has little of the general appearance of any of the *Rubiàceæ*, although in its most striking peculiarities, the dilatation of some of the calycine teeth into disproportionably large orbicular, or somewhat reniform petiolate wings, it has an affinity with *Mussæ'nda*. Its place in the order is, however, near *Spermacòce* and *Mitracárpum*.

Membrane-toothed Cruckshanksia. Pl.

Cult. See *Richardsònia*, p. 628, for culture and propagation.

CXCVI. STAE'LIA (this genus is dedicated to the illustrious Baron Augustus de Stael Holstein). Cham. et Schlecht. 3. p. 364. t. 3. f. 3. D. C. prod. 4. p. 573.

LIN. SYST. *Tetrándria, Monogy'nia.* Calyx with an ovate tube, and only 2 subulate teeth, with hardly any accessory ones. Corolla funnel-shaped, with a slender tube, and a 4-lobed acute limb. Stamens 4, exserted. Stigma 2-lobed. Capsule membranous, 2-celled, 2-valved, with an entire permanent dissepiment; valves concave, crowned each by a calycine tooth, cut at the

base by a line from the dissepiment, and therefore falling asunder. Seed solitary, fixed to the dissepiment.—Brazilian herbs, with terete stems. Leaves glabrous, linear, opposite, and in axillary fascicles. Stipulas membranous, narrow, of many bristles, or acutely 3-lobed. Axillary heads of flowers verticillate, and the terminal ones globose. Allied to *Mitracárpum*.

1 S. THYMOÌDES (Cham. l. c.) stem much branched, ascending, puberulous; stipulas acutely 3-lobed; whorles of flowers few. ♃. S. Native of the south of Brazil. Leaves 5 lines long, and hardly a line broad. Corolla purple. Heads of flowers size of small peas.

Thyme-like Staelia. Pl. ¼ to ¾ foot.

2 S. GALIOÌDES (D. C. prod. 4. p. 573.) stems glabrous, sparingly branched, twiggy, elongated; stipulas of many bristles; whorles of flowers few.—Native of Brazil, where it was collected by Pohl. Spermacòce galioìdes, ex Pohl, in litt. Leaves an inch long, and half a line broad. Whorles of flowers distant at the top of the stem.

Galium-like Staelia. Pl. ½ foot.

3 S. REFLE'XA (D. C. l. c.) stems smoothish, much branched; branches twiggy; leaves linear, with rather revolute margins; stipulas tridentate; whorles in nearly all the axils; floral leaves reflexed.—Native of Brazil, where it was collected by Pohl. Spermacòce refléxa, Pohl, in litt. Whorles 20-30 on each branch. Leaves 4 lines long.

Reflexed-leaved Staelia. Pl. ½ to 1 foot.

Cult. See *Richardsònia*, p. 628. for culture and propagation.

CXCVII. TESSIE'RA (named after M. Tessier, who has written on the diseases of wheat, and the effects of light upon plants, &c.). D. C. prod. 4. p. 574.

LIN. SYST. *Tetrándria, Monogy'nia*. Calyx with an ovate tube, and a 4-lobed limb; lobes nearly equal, without any accessory ones. Corolla funnel-shaped, with a glabrous throat, and a 4-lobed limb. Stamens hardly exserted. Stigma 2-lobed. Capsule 2-celled, 2-valved, with an entire oval deciduous dissepiment; valves concave, crowned by the teeth of the calyx, falling asunder from being cut vertically along the dissepiment. Seeds solitary in the cells, fixed to the middle dissepiment.—American herbs, clothed in every part, except the corollas, with tomentum or wool. Leaves opposite, sessile, lined by the nerves. Stipulas cleft into many bristles. Flowers axillary, sessile, few, verticillate, bracteolate.—This genus is nearly allied to *Staèlia* from the structure of the fruit, but to *Borrèria* or *Diòdia* from habit.

1 T. LANÍFERA (D. C. prod. 4. p. 574.) plant clothed with long white wool; stem or branches twiggy, terete.—Native of Brazil, where it was collected by Pohl. Diòdia or Spermacòce lanífera, Pohl, in litt.

Wool-bearing Tessiera. Pl.

2 T. LITHOSPERMOÌDES (D. C. prod. 4. p. 574.) plant suffruticose, erectish, branched, grey in every part from crowded short velvety down; fruit at length glabrous. ♄.? ♃.? S. Native of Mexico, where it was collected by Hænke. Spermacòce lithospermoìdes, Bartl. in herb. Hænke.

Lithospermum-like Tessiera. Pl. 1 foot.?

Cult. For culture and propagation, see *Richardsònia*, p. 628.

CXCVIII. GAILLO'NIA (evidently named after some person of the name of Gaillon, of whom we know nothing). A. Rich. mem. soc. hist. nat. par. 5. p. 153. t. 15. f. 34. D. C. prod. 4. p. 574.

LIN. SYST. *Pent-Heptándria, Monogýnia*. Calyx with an ovate tube, and a 5-7-lobed permanent limb; teeth unequal. Corolla funnel-shaped, with a terete tube, and a 5-7-lobed limb; lobes oblong. Stamens 5-7, exserted from the throat, but shorter than the corolline lobes. Style filiform, thickened at the apex; stigma 2-lobed. Fruit egg-shaped, almost naked at the apex, containing 2 separable, 1-seeded, indehiscent nuts.—Hard, oppositely-branched herbs, velvety from fine down in every part, as also on the corollas. Leaves linear, ending in a callous mucrone, opposite, bearing twin stipulas on both sides, which are sometimes short and truly stipula-formed, and sometimes long and foliaceous, and in the latter case appearing like those of *Gàlium*. Flowers some in the forks of the branches, sessile, solitary, and naked, and others sessile at the tops of the branches, between the 2 superior leaves.—Habit of *Aspérula*, with a velvety aspect. This genus ought probably to be placed among *Rubiàceæ*, sect. *Stellàtæ*.

1 G. OLIVE'RII (Rich. l. c.) stem multiple, brachiate, and as if it was articulated; branches opposite; leaves distinct at the base, linear-subulate, spinescent at the apex; stipulas leaf-formed, distinct from the leaves. ♄.? ♃.? F. Native of Persia, between Teheran and Ispahan, where it was collected by Olivier and Bruguiere.

Olivier's Gaillonia. Pl. ½ foot.?

2 G. BRUGUIE'RII (A. Rich. l. c.) stem multiple; leaves linear-lanceolate. ♄.? ♃.? S. Native along with the preceding, and probably only a broad-leaved variety of it.

Bruguiere's Gaillonia. Pl. ½ foot.?

3 G. SZOWÍTZII (D. C. prod. 4. p. 574.) stem branched at top; branches erect: leaves subulate; upper ones connate at the base, and adhering to the stipulas, and therefore appearing trifurcate and trispinose at the apex. ♃. F. Native of Persia, in very arid, stony places near Nekhitcheven, where it was collected by Szowitz.—A very distinct species.

Szowitz's Gaillonia. Pl. ½ foot.

Cult. The species of *Gaillònia* should be grown in pots, half filled with pot-sherds, in a mixture of sand and peat, and placed among other alpine plants. They may be increased either by cuttings or seeds.

CXCIX. MACHAO'NIA (named after Machaon, an eminent hero and physician, who, with his brother Podalyrius, accompanied the Grecian army in the expedition against Troy, and performed great services among the troops). Humb. et. Bonpl. pl. equin. 1. p. 101. t. 29. H. B. et Kunth, nov. gen. amer. 3. p. 350. Juss. mem. mus. 6. p. 382. Cham. et Schlecht. in Linnæa. 4. p. 2. A. Rich. mem. soc. hist. nat. par. 5. p. 161. D. C. prod. 4. p. 574.

LIN. SYST. *Pentándria, Monogýnia*. Calyx with an obovate tube, and a small 5-parted limb. Corolla funnel-shaped, 5-cleft, with a short tube, and a villous throat. Stamens 4, inserted in the throat, exserted; anthers rather cordate. Stigma bipartite. Capsule oblong-cuneated, rather tetragonal, crowned by the limb of the calyx, 2-celled, separable into 2, 1-seeded, indehiscent, ligneous-coriaceous, trigonal nuts, which are fixed internally to the linear axis beneath its apex. Seeds solitary in the cells, pendulous. Radicle superior. Albumen fleshy.—Shrubs or trees natives of South America. Leaves opposite, petiolate, acuminated. Stipulas interpetiolar, solitary on both sides. Panicles sub-corymbose, terminal. Flowers white, hardly larger than those of *Aspérula*.

1 M. ACUMINA'TA (Humb. et Bonpl. pl. equin. t. 29.) unarmed; leaves ovate-elliptic, short-acuminated, downy on both surfaces. ♄. S. Native in the town of Guayaquil, by way sides, where it is called *Ceiba-blanca* by the natives. H. B. et Kunth, nov. gen. amer. 3. p. 350. Flowers white.

Acuminated-leaved Machaonia. Tree 25 feet.

2 M. BRASILIE'NSIS (Cham. et Schlecht. in Linnæa. 4. p. 2.) unarmed; leaves oblong-lanceolate, acuminated, having the veins downy beneath. ♄. S. Native at the mouth of the Amazon, about Gran-Para. Cinchòna Brasiliénsis, Hoffmanseg. ex Willd. mss. in Humb. berl. mag. p. 119. Rœm. et Schultes,

syst. 5. p. 13. Flowers white. Salzmann collected a plant which is, perhaps, referrible to the present species, on the hills about Bahia, in Brazil, in which the stem is scandent; the branches tetragonal, and villous on the angles; the panicles terminal; the flowers small, white; and the throat of the corolla villous.

Brazilian Machaonia. Shrub cl.?

3 M. spinòsa (Cham. et Schlecht. in Linnæa. 4. p. 2.) branchlets spinescent; leaves elliptic-lanceolate, acuminated at both ends, glabrous. ♄. S. Native of Brazil. Flowers white.

Spinose Machaonia. Shrub or tree.

Cult. See *Richardsònia*, p. 628. for culture and propagation.

Subtribe III. PUTORIE'Æ (the plants contained in this tribe agree with the genus *Putòria* in having fleshy, indivisible fruit). D. C. prod. 4. p. 575. Fruit rather fleshy, not separable into parts.

CC. SERI'SSA (a name given by Dioscorides, but the meaning is unknown). Comm. in Juss. gen. (1789.) p. 209. mem. mus. 6. p. 395. Lam. ill. t. 151. f. 3. Blum. bijdr. p. 969. A. Rich. mem. soc. hist. nat. Par. 5. p. 161. D. C. prod. 4. p. 575.—Dysòda, Lour. (1790.) coch.—Buchòzia, L'Her. diss. with a figure.—Lýcium species, Lin. fil. and Thunb.

Lin. syst. *Tetra-Pentándria*, *Monogýnia*. Calyx with an obovate tube, and a 5, rarely 4-cleft limb; lobes short, and sometimes with a few accessory teeth between them. Corolla funnel-shaped, with the tube hairy inside, and a 5, rarely 4-parted limb; lobes induplicate in æstivation: hence they are somewhat trifid at the apex. Stamens 5, rarely 4. Anthers exserted, linear. Style inclosed; stigma bifid. Berry nearly globose, 2-celled, 2-seeded, crowned by the limb of the calyx, ex Rich.—A small shrub, glabrous in every part except the young branches, which are whitish. Leaves small, almost sessile, opposite, and generally in axillary fascicles, having an ungrateful scent when bruised. Stipulas combined with the petioles, and ciliately fringed on the margins. Flowers terminal, in fascicles, almost sessile, white.—The fruit is described by Blume and Jussieu as many-seeded.

1 S. fœ'tida (Comm. l. c.). ♄. G. Native of China, Japan, Cochin-china, and other places of the East. Lýcium Japónicum, Thunb. fl. jap. p. 93. t. 17. Curt. bot. mag. 361. Lýcium fœ'tidum, Lin. fil. suppl. 150. Lýcium I'ndicum, Retz, obs. 2. p. 12. Dysòda fasciculàta, Lour. coch. p. 146. Buchòzia caprosmoìdes, L'Her. diss. with a figure. Dysòda fœ'tida, Salisb. prod. p. 60. Spermacòce fruticòsa, Desf. hort. Par. A small bushy shrub, with small dark-green, shining, myrtle-like leaves, and white single or double flowers, which are reddish outside. The plant from Japan differs from that of China, according to Blume, in the hairs on the inside of the throat of the corolla being geniculated, not clavate.

Fetid Serissa. Fl. May, Sept. Clt. 1787. Shrub 2 to 3 feet.

Cult. This little shrub grows well in a mixture of loam, peat, and sand; and cuttings root readily in sand, with a handglass over them.

CCI. ERNO'DEA (from *ερνωδης*, *ernodes*, branched; the shrub is much branched). Swartz, prod. p. 29. fl. ind. occ. 1. p. 223. t. 4. Schreb. gen. no. 1718. Juss. mem. mus. 6. p. 373. Gærtn. fil. carp. 3. p. 94. t. 196. A. Rich. mem. soc. hist. nat. Par. 5. p. 156. t. 15. f. 2 D. C. prod. 4. p. 575.

Lin. syst. *Tetra-Hexándria*, *Monogýnia*. Calyx with an ovate tube, and a 4-6-parted limb; lobes oblong-linear, acute, erect, permanent. Corolla salver-shaped, with a terete, somewhat tetragonal tube, a naked throat, and 4-6 lanceolate, revolute lobes, ex Rich; but circinnately convolute according to others. Stamens with the filaments free from the upper part of the tube, longer than the corolla; anthers acute, erect. Style longer than the stamens; stigma emarginate. Berry roundish, crowned by the calyx, bisulcate, 2-celled, containing two 1-seeded pyrenæ, or nuts. Seeds peltate, ex Rich, fixed by a longitudinal chink in the middle. Albumen cartilaginous. Embryo erect, with foliaceous cotyledons.—A decumbent shrub, native of America. Leaves opposite, almost sessile, lanceolate or elliptic. Flowers axillary, pale yellow, sessile.

1 E. littora'lis (Swartz, l. c.). ♄. S. Native of Jamaica, Porto Rico, Guadaloupe, and others of the West India Islands, on the sea shore, Vahl, symb. 2. p. 28.—Knóxia, Browne, jam. 140. no. 1. Thymelæ'a, Sloane, hist. jam. 2. p. 93. t. 169. f. 1-2. Berries yellow. In fl. mex. the flowers are painted white, and the berries reddish; it is, therefore, perhaps a distinct species. Stipulas surrounding the branch ciliated.

Sea-shore Ernodea. Shrub decumbent.

Cult. See *Richardsònia*, p. 628. for culture and propagation.

CCII. CU'NCEA (meaning unknown to us). Ham. in D. Don, prod. fl. nep. p. 135. A. Rich. mem. soc. hist. nat. Par. 5. p. 157. D. C. prod. 4. p. 576.

Lin. syst. *Tetrándria*, *Monogýnia*. Limb of calyx small, 4-toothed. Corolla with a short tube, a 4-cleft limb, and a throat closed by villi; lobes or segments of the limb roundish. Anthers 4, linear, sessile, inclosed. Stigma bifid, exserted. Berry 2-celled, 2-seeded, crowned by the calyx.—Herb perennial. Stem erect, branched, terete, tomentose. Leaves opposite, petiolate, nerved downy on both surfaces, 2-3 inches long; lower ones elliptic; upper ones lanceolate, mucronate. Stipulas twin, tripartite, with the lobes setaceous. Cymes terminal, compound, trichotomously branched, many-flowered. Flowers small, yellow.

1 C. trífida (Hamilt. l. c.). ♃. F. Native of Nipaul.

Trifid-bractead Cuncea. Pl. 1½ foot.

Cult. For culture and propagation, see *Richardsònia*, p. 628.

CCIII. HYDROPHI'LAX (from *ὑδωρ*, *hydor*, water, and *φυλαξ*, *phylax*, a keeper, or guardian; the plant always grows by the sea-side). Lin. fil. suppl. p. 126. Lam. ill. 76. f. 1. A. Rich. mem. soc. hist. nat. Par. p. 158. D. C. prod. 4. p. 576.—Seríssus, Gært. fruct. 1. p. 118. t. 25.

Lin. syst. *Tetrándria*, *Monogýnia*. Calyx with an ovate, angular tube, and a 4-parted, permanent limb (f. 109. *a.*); teeth acute, erect. Corolla campanulately funnel-shaped, 4-lobed (f. 109. *a.*). Anthers 4, sessile in the throat, exserted, linear-oblong (f. 109. *f.*). Stigma roundly 2-lobed (f. 109. *b.*). Berry dry, corky, angular, lanceolate, crowned by the calyx, 2-celled (f. 109. *c.*). Seeds solitary in the cells, oblong, bisulcate inside, with hard albumen, and a straight embryo.—Glabrous, creeping herbs. Stems terete. Leaves opposite, ovate-oblong, fleshy, joined with the stipulas into a cupular toothed sheath at the base. Flowers axillary sessile, usually by twos, pale lilac.—This genus is very nearly allied to *Diòdia*, but differs in the fruit not being divisible into 2 parts, and in the stipulas not being cut into many bristles.

FIG. 109.

1 H. marítima (Lin. fil. suppl. p. 126.). ♃. S. Native of Malabar and Coromandel, in the sand by the sea side, Roxb.

corom. 3. p. 30. t. 233. fl. ind. 1. p. 380. Seríssus ánceps. Gærtn. l. c. Flowers of a lilac colour. Habit of *Arenària peploìdes*, but larger (f. 109.).

Sea-side Hydrophilax. Pl. creeping.

† *A species not sufficiently known.*

2 H. Madagascarie'nsis (Willd. herb. ex Rœm. et Schultes, syst. 3. p. 527.) leaves lanceolate, acute, sessile, closely imbricated, sheathed; flowers terminal.—Native of Madagascar, where it was collected by Commerson.

Madagascar Hydrophilax. Pl. creeping.

Cult. This plant should be grown in a pot filled with small gravel, and watered from time to time with salted water. It will be easily increased by separating the rooted stems, or by seeds.

CCIV. SCYPHI'PHORA (from *σκυφος, skyphos*, a bowl or cup, and *φερω, phero*, to bear; application not evident). Gærtn. fil. carp. 3. p. 91. t. 196. Blum. bijdr. p. 955. A. Rich. mem. soc. hist. nat. par. 5. p. 159. t. 14. f. 1. D. C. prod. 4. p. 577.—Hydrophi'lax species, Juss.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an ovate tube, and a short tubular truncate nearly entire limb. Corolla funnel-shaped, having the tube hairy inside, and the limb with 4 lanceolate spreading segments. Stamens 4, exserted; filaments short; anthers incumbent inwardly. Stigma bifid, with approximate lobes. Drupe baccate, crowned, 8-furrowed, containing 2 bony oblong 1-seeded pyrenæ or nuts, which are flat inside, and furrowed on the back. Albumen fleshy. Embryo central, erect, with oblong cotyledons, and a somewhat incurved radicle. —A shrub native of the Moluccas. Leaves opposite, veinless. Flowers subcorymbose, axillary.

1 S. hydrophila'cea (Gærtn. and Blum. l. c.). ♄. S. Native of the Moluccas, by the sea side. Hydrophi'lax, Banks, herb.

Hydrophilax-like Scyphiphora. Shrub.

Cult. For culture and propagation see *Hydrophi'lax* above.

CCV. PLO'CAMA (from *πλοκαμος, plokamos*, bent or twisted hairs; in reference to the numerous slender, pendulous branches). Ait. hort. kew. ed. 1. p. 292. Gærtn. fil. carp. 3. p. 196. Juss. mem. 6. p. 371. A. Rich. mem. soc. hist. nat. Par. 5. p. 161. D. C. prod. 4. p. 577.—Plácoma, Pers. ench. 1. p. 210.—Bartlíngia, Rchb. in flora 1824. p. 241. icon. exot. 1. t. 11. but not of Brongn.—Plócoma and Bartlíngia, Spreng. syst.—Plócoma and Plácoma, Gmel. syst.

Lin. syst. *Penta-Hexándria, Monogýnia.* Calyx with an ovate-globose tube, and a small sinuately toothed limb. Corolla campanulately funnel-shaped, 5-cleft, rarely 6-cleft. Anthers inserted between the lobes of the corolla, sessile at the throat, linear. Stigma thickish, slightly 2-lobed, or undivided. Fruit almost baccate, areolate at the apex, and crowned by the small inflexed calyx, 2-3-celled. Endocarp membranous. Seeds solitary in the cells, erect, with thin albumen. Embryo with a terete radicle, and flat cotyledons.—A small, glabrous, much-branched shrub, with the branches terete, slender, and pendulous. Leaves linear-filiform, opposite. Stipulas combined, with the petioles short, bluntly toothed, membranous. Flowers solitary or by threes in the axils of the upper leaves, and on the tops of the branches, white, on short peduncles.

1 P. pe'ndula (Ait. l. c.). ♄. G. Native of the Canary Islands. Plácoma péndula, Poir. suppl. 4. p. 441. Bartlíngia scopària, Rchb. icon. exot. t. 11. and Plácoma péndula, Rchb. p. 9. with a good description and figure. Habit of *Gàlium*. Leaves 2 inches long.

Pendulous Plocama. Clt. 1772. Shrub 2 feet.

Cult. See *Seríssa*, p. 633. for culture and propagation.

CCVI. PUTO'RIA (from *putor*, rankness; in reference to the smell of the leaves when bruised). Pers. ench. 1. p. 524. A. Rich. mem. soc. hist. nat. Par. 5. p. 160. D. C. prod. 4. p. 577.—Aspérula species, Lin. fil.—Sherárdia species, Cyr.—Pavétta species, Cyr.—Ernòdea species, Smith.

Lin. syst. *Pentándria, Monogy'nia.* Calyx with an ovate tube, and a short tubular, 5-toothed limb. Corolla salver-shaped, with a long terete tube, a glabrous throat, and 4 spreading, acutish lobes. Filaments of stamens short, rising from the top of the tube of the corolla, hardly exserted. Anthers oblong-linear, ex Rich. Stigma bifid. Berry nearly dry, ovate-oblong, umbilicate, 2-celled. Seeds oblong, solitary in the cells.—Shrubs stiff. Leaves opposite, fetid when bruised, oblong-linear, obtuse. Stipulas solitary on both sides. Flowers sessile on the tops of the branches, in fascicles. Habit of Dáphne Gneòrum.

1 P. Cala'brica (Pers. l. c.) stem shrubby, much branched; branches clothed with velvety down; leaves oblong, obtuse, smoothish; stipulas solitary on both sides. ♄. F. Native of Calabria, Candia, Syria, Atlas, Sicily, &c. on calcareous rocks. Aspérula Calábrica, Lin. fil. suppl. p. 120. L'Her. stirp. nov. 1. p. 65. t. 32. Sherárdia fœ'tida, Lam. dict. 4. p. 326. Pavétta fœtidíssima, Cyr. pl. neap. 1. p. 8. t. 1. Ernòdea montàna, Sibth. and Smith, fl. græc. t. 143. Guss. fl. sic. 1. p. 169. Lonicèra Sícula, Ucria, pl. add. p. 249. ex Guss. Sherárdia fœtidíssima, Cyr. char. 69. t. 3. f. 7. Pavétta fœtidíssima, Cyr. neap. fasc. 1. t. 1. Flowers red. Habit of *Aspérula*. Leaves pale beneath, scabrous on the edges and keel.

Calabrian Putoria. Fl. July. Clt. 1820. Shrub ½ to 1 foot.

2 P.? I'ndica (D. C. prod. 4. p. 577.) stem herbaceous, sparingly branched, rather radicant at the base; branches hispid from villi; leaves ovate, acute, villous; stipulas twin on both sides, subulate. ♃. F. Native of the East Indies, on the Nellighery mountains, in humid places, where it was collected by Leschenault, who has called it *Aspérula* from habit, in his herbarium. Style exserted, divided at the apex into 2 thickish, hispid, short stigmas. The flowers are much like those of the first species, but the fruit being unknown, the genus to which it properly belongs is still doubtful.

Indian Putoria. Pl. ½ to 1 foot.

Cult. A mixture of chalk, sand, and peat will be the best soil for the species of *Putòria;* and they may be readily increased by cuttings or seeds.

Tribe XI.

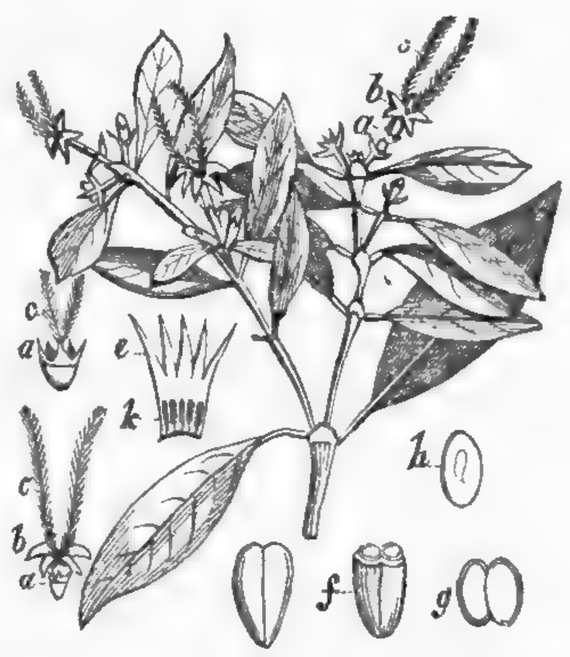
ANTHOSPE'RMEÆ (the plants contained in this tribe agree with the genus *Anthospérmum* in particular characters). Cham. et Schlecht. in Linnæa. 3. p. 309. A. Rich. mem. soc. hist. nat. Par. 5. p. 136. D. C. prod. 4. p. 578. Flowers dioecious, or hermaphrodite. Corolla rotate (f. 110. *b.*). Styles separate to the base, ending in an elongated, hispid, or plumose stigma each (f. 110. *c.*). Fruit constantly of 2 indehiscent, 1-seeded mericarps or nuts (f. 110. *g. f.*), which are easily separated at maturity. Albumen fleshy.—Small shrubs or herbs. Leaves opposite or verticillate. Stipulas small, 1-3-toothed, adnate to both sides of the petioles.

CCVII. CAPRO'SMA (from *καπρος, capros*, a wild boar, and *οσμη, osme*, a smell; in allusion to the species having a fetid smell). Forst. gen. t. 69. Lam. ill. t. 186. and 854. Juss. mem. mus. 6. p. 381. A. Rich. mem. soc. hist. nat. Par. 5. p. 137. D. C. prod. 4. p. 578.

Lin. syst. *Tetra-Heptándria, Digy'nia.* Calyx with an ovate tube, and a 5-7-lobed short limb (f. 110. *a.*). Corolla cam-

panulately turbinate, with a short broad tube, a naked throat, and 4-7 acute lobes (f. 110. *b. e.*). Stamens 4-7 (f. 110. *k.*). Style almost divided to the base into 2 parts; the divisions filiform, very long, pilose (f. 110. *c.*), and exserted. Berry nearly ovate, pulpy, containing 2-3 indehiscent, bony nuts (f. 110. *f.*). Seeds flat on one side, and convex on the other: one in each nut. Albumen hard, fleshy. Embryo with an inferior radicle, and foliaceous cotyledons.—Glabrous shrubs, natives of Australia. Leaves opposite, oval-oblong. Stipulas interpetiolar, solitary on both sides, permanent. Flowers axillary and terminal, solitary or few together on the same peduncle, bibracteolate at the base, sometimes male by abortion. Fruit of *Coffèa*. Stigma of *Anthospérmum*.

FIG. 110.



1 C. hirte'lla (Labill. nov. holl. 1. p. 70. t. 95.) leaves oblong, cuspidate; peduncles simple; flowers 3-5 together, axillary or terminal, hermaphrodite; anthers inclosed; styles very long, hairy. ♄. G. Native at Cape Van Dieman. (F. 110.)

Hairy Caprosma. Sh. 8 feet.

2 C. fœtidíssima (Forst. prod. no. 138.) peduncles simple; flowers solitary; anthers exserted. ♄. G. Native of New Zealand. Leaves opaque. Herb very fetid.

Very-fetid Caprosma. Shrub.

3 C. lu'cida (Forst. prod. no. 138.) leaves ovate, acuminated at both ends; peduncles axillary, compound; flowers sub-capitate; anthers exserted. ♄. G. Native of New Zealand.—C. lùcida, Gærtn. fil. carp. 3. p. 17. t. 182. is probably distinct from Forster's plant, and even appears to belong to a different genus, as the fruit is said to be a unilocular, 8-seeded berry.

Shining-leaved Caprosma. Shrub.

4 C. cuspidifòlia (D. C. prod. 4. p. 578.) leaves oval, attenuated at the base, and ending in a spine-formed point at the apex; flowers axillary, few, fasciculate, almost sessile. ♄. G. Native of Australia, at the Strait d'Entrecasteaux. The flowers are probably dioecious, as in a specimen we examined they were all female. Limb of calyx nearly entire. Lobes of corolla 4-7, linear, striated by 3 parallel nerves. Anthers 1-3 at the top of the tube. Style solitary? very hairy, elongated. Berry ovate, 2-celled, crowned by the calyx. Stipulas triangular, acuminated.

Cusp-leaved Caprosma. Shrub.

Cult. For culture and propagation, see *Phýllis*.

CCVIII. PHY'LLIS (φυλλον, *phyllon*, a leaf; the leaves are the chief beauty of the shrub). Lin. gen. no. 323. Gærtn. fruct. 1. p. 123. t. 25. Juss. mem. mus. 6. p. 370. A. Rich. mem. soc. hist. nat. Par. 5. p. 140. t. 12. f. 3. D. C. prod. p. 578.—Nóbula, Adans. fam. 2. p. 145.—Bupleuroìdes, Boerh. —Valerianélla, spec. Dill.

Lin. syst. *Pentándria, Digy'nia.* Calyx with an obovate, compressed tube, and an obsolete limb. Corolla with a short tube, and a 5-lobed spreading limb. Stamens 5. Anthers sessile at the throat. Style almost wanting. Stigmas 2. Capsule obovate, compressed, narrow at the apex, divisible into two 1-seeded parts, or nuts, ex Gærtn. which hang from the central filiform axis, as in the genus *Knóxia*, or as in umbelliferous plants, ex Rich; but according to others there is no central axis. Seeds erect, conforming to the mericarps. Albumen fleshy. Embryo erect, dorsal, with a filiform radicle, and cordate foliaceous cotyledons.—Glabrous shrubs, with terete branches. Leaves opposite, or 3-4 in a whorl, acuminated. Stipulas membranous, adnate to the petioles, and cleft into many filiform bristles. Panicles terminal, compound. Flowers small, greenish white, but changing to brownish as they fade. According to Cruse, ex Linnæa. 6. p. 20. the fruit is shining, and the nuts are fixed by the base, not hanging from a central filiform axis.

1 P. nóbla (Lin. spec. p. 333.). ♄. G. Native of the Canary Islands.—Dill. elth. p. 405. t. 299. f. 386. Panicles many-flowered. Leaves large.

Var. β, pauciflòra (D. C. prod. 4. p. 579.) peduncles 1-3-flowered, shorter than the leaves. ♄. G. Native of the Canary Islands. P. pauciflòra, A. Rich. mem. soc. hist. nat. par. 5. p. 141.

Noble Bastard Hare's-ear. Fl. June, July. Clt. 1699. Shrub 2 to 3 feet.

Cult. A mixture of loam, peat, and sand is a good soil for this shrub; and cuttings root freely, if planted in a pot of sand, with a hand-glass over them.

CCIX. GALOPI'NA (the meaning of this word is not given by the author). Thunb. diss. nov. gen. 1. p. 3. Juss. mem. mus. 6. p. 371. Cruse, rub. cap. p. 18. A. Rich. mem. soc. hist. nat. par. 5. p. 140. D. C. prod. 4. p. 579.—Asthospérmum, spec. Thunb. prod.—Phýllis, spec. Schlecht. and Cruse.

Lin. syst. *Tetrándria, Digy'nia.* Flowers hermaphrodite. Calyx with an obovate tube, and a very minute, nearly equal limb. Corolla subrotate, 4-parted, almost cleft to the base. Stamens 4, inserted in the bottom of the corolla. Anthers oblong. Styles 2, very short, each ending in a long hairy stigma. Fruit obovate, rather didymous, somewhat compressed from the back, and elegantly and gyrosely warted on the back, composed of two 1-seeded, indehiscent mericarps, joined by a concave commissure, but at length separating from each other.—A glabrous herb, with the habit of *Circæ'a*. Stem rather angular from 2 elevated lines which run from the stipulas, branched. Leaves opposite, 1 to 3 inches long, ovate-lanceolate, acuminated, tapering into the petioles, paler beneath, with serrulately-scabrous margins. Stipulas trifurcate. Peduncles terminal and axillary, the whole forming a large terminal, trichotomous panicle, which is nearly a foot in diameter. Flowers small. Fruit dark brown.

1 G. circæoìdes (Thunb. l. c.). ♃.? ☉.? G. Native of the Cape of Good Hope. Anthospérmum Galopìna, Thunb. prod. p. 32. Phýllis Galopìna, Schlecht. and Cruse, in Linnæa. 6. p. 20.

Enchantress's Nightshade-like Galopina. Pl. 2 feet.

Cult. See *Phýllis* above for culture and propagation.

CCX. ANTHOSPE'RMUM (from ανθος, *anthos*, a flower, and σπερμα, *sperma*, a seed). Lin. gen. no. 1164. Juss. gen. 178. Gærtn. fil. carp. 3. p. 87. t. 195. Crus. rub. cap. p. 1. A. Rich. mem. soc. hist. nat. par. 5. p. 138. D. C. prod. 4. p. 579. Schlecht. and Cruse, in Linnæa. 6. p. 7.—Tournefórtia, Ponted. epist. 11. ex Gærtn.—Ambrària, Heist. but not of Cruse.

Lin. syst. *Tetra-Pentándria, Digy'nia*, or *Diœ'cia Tetra-Pentándria.* Flowers dioecious or hermaphrodite. Calyx with an obovate tube, and a 4-5-toothed deciduous limb (f. 110. *a.*). Corolla funnel-shaped, with a short tube, and a 4-5-parted limb (f. 110. *b.*); lobes linear or ovate-lanceolate, revolute, valvate in æstivation. Stamens 4-5, inserted in the base of the tube of the corolla (f. 110. *c.*). Anthers oblong, sub-tetragonal, exserted. Styles 2, very short, connate? ending each in a long

hairy stigma (f. 110. *f. g.*). Fruit composed of 2 easily-separated, indehiscent, 1-seeded mericarps, which are a little compressed at the raphe, and joined together by a flattish commissure. Albumen sub-cartilaginous. Embryo dorsal, erect.—Small shrubs or herbs, natives of the Cape of Good Hope. Stems branched. Leaves linear or lanceolate, small, opposite or verticillate. Stipulas adhering to the petioles at the base, drawn out into a tooth in the middle. Flowers axillary, sessile, verticillate or opposite, rarely panicled, small, furnished each with 2-3 bracteas at the base, usually dioecious. The male flowers are always smaller than the female ones.

* *Flowers dioecious, sessile in the axils of the leaves.*

1 A. Bergiàìnum (Cruse, rub. cap. p. 8.) leaves linear-lanceolate, 3 in a whorl, imbricated, and connately perfoliate, ciliated; flowers pentandrous, disposed in a verticillate spike. ♄. G. Native of the Cape of Good Hope. Stem branched, terete or obsoletely angular, glabrous at the base, but clothed with long white hairs above. Leaves pale green, having the margins and keel ciliated with long white hairs, half an inch long. Whorles 3-flowered.

Bergius's Amber-tree. Shrub 1 foot.

2 A. Æthiópicum (Lin. spec. 1511.) leaves linear-lanceolate, 3 in a whorl, glabrous; stipulas simple, short, acute; flowers tetrandrous, disposed in verticillate spikes; mericarps elliptic, clothed with white tubercles, crowned by the calycine teeth. ♄. G. Native of the Cape of Good Hope, Crus. rub. cap. p. 10. Gærtn. fruct. 3. p. 195. Lin. hort. cliff. t. 27.—Pluk. alm. t. 183. f. 1.—Ambrària Heistèri, Walth. hort. t. 9. Stem much branched, downy above. Leaves shining above, and whitish beneath, 2-3 lines long. Male flowers brownish, and the female ones green.

Ethiopian Amber-tree. Fl. June, July. Clt. 1692. Shrub 2 to 3 feet.

3 A. spatula'tum (Spreng. neu. entd. 3. p. 45. syst. 1. p. 399.) leaves opposite, linear-spatulate, bluntish; flowers axillary, sub-verticillate; mericarps oblong, warted; branches twiggy, erectly spreading, downy. ♄. G. Native of the Cape of Good Hope, Cruse, rub. cap. p. 9. and p. 13. A. Æthiópicum, var. β, oppositifòlium, Schlecht. and Cruse, in Linnæa. 6. p. 10. It differs from *A. Æthiópicum* in the opposite, linear-spatulate leaves, and in the more loose habit. A. Æthiópicum, var. γ, Eckloniànum, Schlecht. and Cruse, in Linnæa, 6. p. 10. does not appear to differ much from this species.

Spatulate-leaved Anthospermum. Shrub 2 feet.

4 A. cilia're (Lin. spec. 1521.) leaves opposite, lanceolate, acute, ciliated; stipulas short, simple; flowers axillary, tetrandrous; mericarps obovate, glabrous, shining, destitute of the calycine limb. ♄. G. Native of the Cape of Good Hope, Gærtn. fil. carp. 3. p. 195. Cruse, rub. cap. p. 9. and p. 13. A. galioìdes, Rchb. in Spreng. syst. 4. p. 338.—Pluk. mant. t. 344. f. 5. Stem usually decumbent, much branched; branches angular, downy. Leaves glabrous, and green above, but white beneath, connate at the base. Lobes of the corolla hairy outside. Anthers white.—The A. galioìdes, Rchb. differs from this in the leaves being rusty beneath.

Ciliated-leaved Amber-tree. Shrub decumbent.

5 A. lanceola'tum (Thunb. prod. 32. fl. cap. p. 157.) leaves opposite, lanceolate, acute, glabrous, spreading; stipulas profoundly bifid; flowers axillary, sub-verticillate, tetrandrous, and often pentandrous; mericarps ovate-oblong, glabrous. ♄. G. Native of the Cape of Good Hope, Cruse, rub. cap. p. 12. A. herbàceum, Lin. fil. suppl. p. 440. Stem procumbent, glabrous, brownish purple. Branches sub-tetragonal, purplish, downy at the apex. Leaves an inch long, connate at the base, paler beneath, and whitish. Habit of *Gàlium*.

Lanceolate-leaved Amber-tree. Shrub procumbent.

6 A. hírtum (Cruse, rub. cap. p. 11.) leaves opposite, lanceolate, acute, ciliated while young, hairy at the base; stipulas simple, subulate, hairy; flowers axillary, pentandrous; mericarps unknown. ♄. G. Native of the Cape of Good Hope, on mountains. A. rubiàceum, Rchb. in Spreng. syst. 4. p. 338. A. lanceolàtum, Sieb. fl. cap. no. 90. A. hirsùtum, D. C. prod. 4. p. 580. Stem purplish brown, branched, beset with white hairs about the axils of the leaves. Branches purple, hairy. Leaves an inch long, connate at the base. Stipulas hairy, of a shining green colour above, but whitish beneath.

Hairy Amber-tree. Shrub 1 foot.

7 A. sca'brum (Thunb. prod. 32. fl. cap. p. 158.) leaves opposite, linear, somewhat trigonal, acuminated, having the margins and keel scabrous; stipulas simple, very short; flowers axillary, pentandrous. ♄. G. Native of the Cape of Good Hope, on the mountains. Stem decumbent at the base, branched a little. Branches aggregate, twiggy, cinereous at the base, and rather scabrous at the apex, leafy. Leaves ½ to 1 inch long, connate at the base.

Scabrous Amber-tree. Shrub ½ decumbent.

** *Flowers dioecious, panicled.*

8 A. panicula'tum (Cruse, rub. cap. p. 9. and p. 15. t. 1. f. 2.) leaves opposite, linear-subspatulate; stipulas short, simple; flowers panicled, tetrandrous; mericarps glabrous, with 3 ribs. ♄. G. Native of the Cape of Good Hope. Stem fuscescent, branched from the base; branches downy. Leaves glabrous, bluntish, pale on the lower surface, hardly ½ an inch long. Panicle terminal, narrow, elongated. Fruit crowned by the calycine teeth.

Panicled-flowered Amber-tree. Shrub 1 to 1½ foot.

*** *Flowers hermaphrodite.*

9 A. Lichtenstèinii (Crus. rub. cap. p. 15.) leaves opposite, linear, keeled, glabrous, ciliated; stipulas simple, ciliated; flowers axillary, verticillate; mericarps hairy. ♄. G. Native of the Cape of Good Hope. Spermacòce ericæfòlia, Licht. in Rœm. et Schultes, syst. 3. p. 281. Stem branched, glabrous at bottom, and downy at top. Branches naked at the base. Leaves connate at the base, mucronate. Flowers tetrandrous.

Lichtenstein's Amber-tree. Shrub 1 to 2 feet.

10 A. spermacòceum (Rchb. in Spreng. syst. 4. p. 338.) leaves opposite, oblong-lanceolate, with scabrous margins; stipulas entire; flowers axillary, solitary, pedicellate, pentandrous; calyx 5-toothed. ♃. G. Native of the Cape of Good Hope. Stem herbaceous, flexuous, rather angular, branched, glabrous, but downy at the apex. Leaves connate at the base. Stipulas pilose, cleft into bristles.

Spermacoce-like Amber-tree. Pl. 1 foot.

Cult. See *Phýllis*, p. 635. for culture and propagation.

CCXI. AMBRA'RIA (a name formerly applied to the genus *Anthospérmum* by Heister, and is probably derived from Cape Ambra, in Madagascar). Cruse, rub. cap. p. 16. t. 1. f. 3-4. D. C. prod. 4. p. 580. but not of Heister. A. Rich. mem. soc. hist. nat. Par. 5. p. 139. t. 12. f. 2.

Lin. syst. *Diœ'cia, Tetrándria.* Flowers dioecious, of the same structure as those of *Anthospérmum*, but differs from that genus in the capsule being 3-celled, the intermediate cell vacant, and the lateral ones 1-seeded. The rest as in *Anthospérmum*.

1 A. hi'rta (Cruse, rub. cap. p. 17. t. 1. f. 2.) leaves 3 in a whorl, connately perfoliate; fruit tomentosely hairy. ♄. G. Native of the Cape of Good Hope. Shrub much branched from the base, hairy at the top. Leaves linear, subtriquetrous, glabrous, connate at the base, with the margins and keel ciliated,

at length imbricated and deciduous. Stipulas hardly prominent, ciliated. Flowers axillary, verticillate. According to Cham. et Schlecht. Cliffórtia cinérea, Lin. is a synonyme of this.

Hairy Ambraria. Shrub $\frac{1}{2}$ to $\frac{3}{4}$ foot.

2 A. gla'bra (Cruse, rub. cap. p. 17. t. 1. f. 3.) leaves 3 in a whorl, connately perfoliate; fruit obovately subglobose, glabrous. ♄. G. Native of the Cape of Good Hope. Nènax aceròsa, Gærtn. fruct. t. 32. f. 7. Young branches reddish. Leaves linear, subtriquetrous, glabrous, serrulately ciliated on the margin and keel, 3-6 lines long, and $\frac{1}{2}$ to 1 broad. Flowers axillary, subverticillate.

Glabrous Ambraria. Shrub $\frac{1}{2}$ to $\frac{3}{4}$ foot.

Cult. See *Phýllis*, p. 635. for culture and propagation.

Tribe XII.

STELLA'TÆ (from *stellatus*, starry; the leaves and stipulas form whorles, resembling the rays of a star). Ray, syn. p. 223. Cham. et Schlecht. in Linnæa. 3. p. 220. D. C. prod. 4. p. 580.—Aparíneæ, Link, (1809).—Gàleæ, Kunth, nov. gen. amer. (1818) 3. p. 335.—Asperùleæ, A. Rich. mem. soc. hist. nat. Par. (1830) 5. p. 126. Flowers hermaphrodite, rarely of different sexes. Corolla rotate or funnel-shaped; lobes valvate in æstivation. Styles 2, almost distinct from the base, or more or less combined in one. Stigmas capitate. Fruit constantly of 2 indehiscent 1-seeded mericarps. Seeds hardly distinct from the pericarp and calyx. Albumen horny.—Usually herbs, rarely small shrubs. Leaves opposite, bearing each a bud in the axils, furnished with 1-2 or 3 leaf-formed stipulas between the leaves on both sides, which are destitute of buds, and form whorles along with them. Roots usually red, furnishing a red dye, as the madder.—The leaves are only to be distinguished from the stipulas in having buds in their axils.

CCXII. SHERA'RDIA (named by Dillenius after his patron William Sherard, LL.D., consul at Smyrna). Dill. gen. 3. Lin. gen. no. 120. Gærtn. fruct. 1. p. 110. t. 24. A. Rich. mem. soc. hist. nat. Par. 5. p. 129. D. C. prod. 4. p. 581.—Dillènia, Heister.—Aparìnes spec. Tourn.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an ovate tube, and a 4-6-toothed permanent limb. Corolla funnel-shaped, with a terete tube, and a 4-lobed limb. Stamens 4. Style 1, 2-lobed at the apex; stigmas capitellate. Fruit dry, crowned by the calyx, divisible into two mericarps; mericarps 1-seeded, indehiscent, flat on one side, and convex on the other.—An annual herb, native of Europe. Leaves opposite, with 1-2 stipulas on each side, obovate, acute, scabrous, forming whorles. Flowers small, red, capitate, almost sessile, girded or involucrated by the uppermost whorl of leaves.

1 S. arve'nsis (Lin. spec. p. 149.) ⊙. H. Native of Europe and Tauria, very common in fields in sandy soil; plentiful in many parts of Britain in fallow fields and among corn. Fl. dan. t. 439. Curt. lond. 5. t. 13. Smith, engl. bot. t. 891. Schkuhr, handb. t. 22.—Barrel. icon. t. 541. Root with many reddish brown fibres. The whole plant rough and hairy. Leaves rough along the edges and keel, 4-6 in a whorl.

Corn Field-madder. Fl. April, Sept. Britain. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

N. B. *Sherárdia fruticòsa* (Lin. spec. 149.) stem shrubby; leaves 4 in a whorl, equal; flowers axillary. ♄. G. Native of the island of Ascension. Stipulas very short, subulate, interfoliaceous. Corolla white. Fruit unknown. This plant appears to be intermediate between *Diòdia* and *Spermacòce*.

Cult. The seeds only require to be sown in the open ground in a dry situation.

CCXIII. ASPE'RULA (a dim. of *asper*, rough; leaves). Lin. gen. no. 121. Juss. gen. 196. Lam. ill. t. 61. Gærtn. fil. carp. 3. p. 89. t. 195. A. Rich. mem. soc. hist. nat. Par. 5. p. 130. t. 11. f. 1. D. C. prod. 4. p. 581.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with an ovate didymous tube, and a very short 4-toothed deciduous or obsolete limb. Corolla funnel-shaped, rarely campanulate, 4-cleft, rarely 3-cleft. Styles 2, joined together at the base, and nearly to the apex. Fruit didymous, not crowned by the calyx, dry, or hardly fleshy; mericarps easily separated, indehiscent, 1-seeded.—Herbs, rarely small shrubs. Stems and branches usually tetragonal. Leaves opposite, with 1-2-3 stipulas on each side; they are therefore called 4 to 8 in a whorl, but between the uppermost leaves there are no stipulas. Flowers terminal and axillary, in fascicles.

§ 1. *Sherardiàna* (this section only contains plants with the habit of *Sherárdia*). D. C. prod. 4. p. 581. *Annual plants. Corollas tubularly funnel-shaped.*

1 A. arve'nsis (Lin. spec. p. 149.) plant erect, smoothish; leaves 6-10 in a whorl, lanceolate-linear, a little ciliated; lower ones obovate: floral ones ciliated with long hairs; corymbs fascicled, terminal, many flowered; flowers sessile; fruit glabrous. ⊙. H. Native of Europe and Caucasus, in fields and arid stony places. A. cœrùlea, Dod. pempt. p. 355. Lob. icon. t. 801. f. 2. A. ciliàta, Mœnch. meth. p. 484. A. dùbia, Willd. herb. ex Spreng. Roots yellow. Under surface of leaves whitish from adpressed hairs. This differs from all the other species of *Aspérula* in the flowers being blue. It differs from *Sherárdia* in the capsule not being crowned by the calyx, in the blunter leaves, and in the floral leaves being ciliated. Anthers yellow.

Cornfield Woodroof. Fl. July. Clt. 1596. Pl. $\frac{1}{2}$ to 1 foot.

2 A. cilia'ris (D. C. prod. 4. p. 582.) stems ascending, angular, glabrous; leaves 6-9 in a whorl, lanceolate-linear, acute, and are as well as the bracteas, serrated by stiff ciliæ; flowers almost sessile, disposed in a terminal subumbellate corymb, pentandrous; style exserted.—Native of Persia, where it was collected by Gmelin. Corollas glabrous, 5-6 lines long. Stamens 5.

Ciliated-leaved Woodroof. Pl. ascending.

3 A. tricho'des (Gay, in litt. 1829. ex D. C. prod. 4. p. 582.) stems erect, simple at the base, branched at the apex, glabrous; leaves glabrous, subulately filiform, equal in length to the internodes: cauline ones 10-16 in a whorl, and the rameal ones 2-6 in a whorl; pedicels solitary, almost axillary; corollas small, downy outside, trifid; fruit obovate, clothed with very short down. ⊙. H. Native of the north of Persia. Stem very smooth, white, 7-10 inches high. Leaves an inch long, scabrous. Corolla greenish-white, with a slender terete tube, and oblong awnless lobes. Stamens 3.

Hairy Woodroof. Pl. $\frac{1}{2}$ to 1 foot.

§ 2. *Cynánchicæ* (this section agrees with *A. cynánchica* in the corollas being funnel-shaped). D. C. prod. 4. p. 582. *Plants perennial. Corollas tubularly funnel-shaped.*

4 A. Tauri'na (Lin. spec. 150.) plant smoothish, erect; leaves 4 in a whorl, ovate-lanceolate, 3-nerved, with finely ciliated margins; corymbs pedunculate, axillary, fasciculately umbellate, involucrated; bracteas ciliated; fruit glabrous, and rather scabrous. ♃. H. Native of Dauphiny, Piedmont, Switzerland, Carniola, Iberia, &c. on hills in shady places. A. trinérvia, Lam. fl. fr. 3. p. 376. Gàlium Taurìnum, Scop. carn. no. 148.—Lob. icon. t. 800. f. 1.—Moris, hist. sect. 9. t. 21. f. 1.—Hall. helv. no. 732. Leaves broad. Corollas white, elongated. Anthers violaceous, exserted.

Bull Woodroof. Fl. April, July. Clt. 1739. Pl. 1 foot.

5 A. læviga'ta (Lin. mant. p. 38.) plant glabrous, ascending; leaves 4 in a whorl, elliptic, nerved, with finely scabrous margins; cymes corymbose, pedunculate, axillary or nearly terminal; corolla with a short tube; fruit glabrous, scabrous from elevated

dots. ♃. H. Native of the south of Europe, in rugged places and in woods, from Narbonne to Constantinople. Willd. spec. 1. p. 579. exclusive of Barrel. syn. D. C. fl. fr. no. 3344. A. rotundifòlia, Lam. dict. 1. p. 298.—Moris, oxon. 3. sect. 9. t. 21. f. 4.—Bocc. sic. p. 10. t. 11. f. 5. Flowers white.

Smooth Woodroof. Fl. June. Clt. 1775. Pl. ½ to 1 foot ascending.

6 A. hexaphy'lla (All. ped. no. 48. t. 77. f. 3.) plant ascending, glabrous; leaves 6 in a whorl, linear, spreading, acute, with revolute scabrous margins; cymes terminal; flowers aggregate, umbellate; bracteas glabrous, acute, shorter than the flowers. ♃. H. Native of Piedmont, on the lower Alps about Tende and Saorgio. A. Alliòni, Baumg. enum. trans. 1. p. 80. Corolla purple outside, but white within.

Var. β, rigídula (D. C. prod. 4. p. 582.) leaves stiffer and blunter than those of the species, and the floral ones are obovate. ♃. H. Native of Sicily, in the fissures of calcareous rocks by the sea side. A. hexaphýlla, Guss. prod. fl. sic. 1. p. 166. There are glabrous and downy variations of this plant.

Six-leaved Woodroof. Pl. ½ foot.

7 A. gra'cilis (Meyer, verz. pfl. p. 52.) plant perennial, smooth, glabrous; stems filiform, much branched, diffuse; leaves 4 in a whorl, equal, elliptic, bluntish, with rather scabrous margins: upper ones opposite; umbels terminal, few-flowered; corolla 4-5-cleft, almost glabrous, with obtuse segments; style semibifid; mericarps smooth, glabrous. ♃. H. Native of Caucasus, in alpine places at the river Malka.

Slender Woodroof. Pl. diffuse.

8 A. hi'rta (Ramond, bull. phil. no. 41. p. 131. t. 9. f. 1. 2-3.) plant tufted, erectish; leaves 6 in a whorl, linear, acute, hairy, longer than the internodes; flowers aggregately umbellate, terminal, sessile, exceeding the bracteas; fruit glabrous. ♃. H. Native of the central Pyrenees, on the higher ranges on dry banks. A. nov. spec. St. Amans, trav. pyr. 194. Corollas white, purplish outside. In cultivation the plant becomes smooth, and is then referrible to *A. hexaphýlla*.

Hairy Woodroof. Fl. June, July. Clt. 1817. Pl. ½ foot.

9 A. tinctòria (Lin. spec. 150.) plant erectish, glabrous; leaves linear: lower ones 6 in a whorl: middle ones 4, and the uppermost ones opposite; floral leaves ovate; flowers usually trifid. ♃. H. Native of Europe, on hills in arid stony places. A. rubèola β, Lam. fl. fr. 3. p. 375. Gàlium tinctòrium, Scop. carn. no. 149.—Tabern. icon. t. 733. f. 2. Roots large, creeping, reddish, and are used in Gothland instead of madder for dyeing red. Plant procumbent, unless supported. Stem 1-2 feet long, purplish. Flowers usually by threes. Corollas white, reddish on the outside. Very like *A. cynánchica*.

Dyers' Woodroof. Fl. June, July. Clt. 1764. Pl. 1 to 2 feet.

10 A. cyna'nchica (Lin. spec. p. 151.) plant glabrous, erectish; leaves 4 in a whorl, linear: lower ones small, oblong, upper ones opposite; floral ones lanceolate-linear, acuminately awned; flowers terminal, quadrifid; fruit granulated. ♃. H. Native of Europe, in dry gravelly places; abundant in many parts of England on chalky downs. Smith, engl. bot. t. 33. Berg. phyt. t. 81. Rùbia cynánchica, J. Bauh. hist. 3. p. 723. with a figure. Asp. rubèola α, Lam. fl. fr. 3. p. 375. A. tinctòria var. β, Lam. dict. 1. p. 298. Gàlium cynánchicum, Scop. carn. no. 147. Herb variable in habit. Stems prostrate, dichotomously branched. The flowers grow on erect branches, forming a fastigiate corymb, white or blush-coloured, elegantly marked with red lines, and sometimes they are pure white. Dalechamp seems to be the chief authority for the reputation this plant formerly acquired in the cure of quinsies. He says it should be applied externally, as well as taken internally, but it is now entirely out of use.

Var. β, heterophýlla (D. C. prod. 4. p. 583.) decumbent; leaves of the sterile branches ovate, and of the flowering ones linear. ♃. H. Native of the Pyrenees, in sandy places. A. Pyrenàica, Lin. herb. A. cynánchica β and γ, D. C. suppl. fl. fr. p. 493. A. rubèola, Gratel, in bull. soc. hist. nat. bord. 1. p. 311.?

Var. β, saxátilis (D. C. suppl. p. 495. var. δ,) plant tufted, erect; leaves linear, length of internodes. ♃. H. Native of the Pyrenees, among stones and on rocks. A. Pyrenàica, Lin. spec. 151.? A. saxátilis, Lam. ill. no. 139. A. multiflòra, Lapeyr. abr. p. 62. ex Benth.

Var. δ, elongàta (Stev. in litt. ex D. C. prod. 4. p. 583.) plant elongated, erect; leaves linear, shorter than the internodes. ♃. H. Native of Tauria and Caucasus. A. cynánchica, Bieb. fl. taur.

Quinsy Woodroof. Fl. July. England. Pl. ¾ to 1 foot.

11 A. supìna (Bieb. fl. taur. 1. p. 101.) glabrous; stem much branched at the base, procumbent; leaves 4 in a whorl, linear, acute: lower ones imbricately crowded; peduncles 3-flowered, axillary and terminal, rather panicled; corolla with a terete tube, and 4 oblong lobes; fruit glabrous. ♃. H. Native of Tauria and Caucasus, in the fissures of calcareous rocks, and in gravelly places. A. cynánchica β, Meyer, verz. pfl. p. 406. Very nearly allied to *A. cynánchica*, but the flowers are white, not as in it, blush-coloured. Internodes of the stem short.

Supine Woodroof. Fl. June, July. Clt. 1821. Pl. pr.

12 A. longiflòra (Waldst. et Kit. pl. rar. hung. 2. t. 150.) stems numerous from the same neck, erectish, glabrous; leaves 4 in a whorl, linear: lower ones small, obovate: upper ones opposite; fascicles of flowers terminal, pedunculate; bracteas small, subulate; tube of corolla elongated; fruit glabrous, smooth. ♃. H. Native of Croatia, Carniola, and Carinthia, in mountainous places, and on rocks. A. suavèolens, Schrad. in litt. 1815. Corolla whitish, yellowish inside, and reddish outside. Stems weak.

Long-flowered Woodroof. Fl. July, Aug. Clt. 1821. Pl. ½ ft.

13 A. brevifòlia (Vent. hort. cels. p. 63. t. 63.) plant glabrous, decumbent; leaves 4 in a whorl, very short, distant: uppermost ones opposite; flowers axillary, solitary on short pedicels, and in terminal fascicles; corolla 4-cleft; style bipartite to the base. ♃. H. Native of Caramania, near Cylindre on mountains. Stem much branched. Corollas at first yellowish-green, but at length becoming purplish.

Short-leaved Woodroof. Fl. July, Aug. Clt. 1824. Pl. dec.

14 A. lu'tea (Smith, fl. græc. t. 120.) stems erect; leaves 4 in a whorl, linear, glabrous, mucronate; flowers in fascicles, downy, awned. ♃. H. Native of Mount Parnassus. Rubèola Crética saxatilis frutescens flore luteo, Tourn. cor. p. 5. Flowers yellow. Fascicles of flowers spicate.

Yellow-flowered Woodroof. Pl. 1 foot.

15 A. arista'ta (Lin. fil. suppl. 120.) plant erect, glabrous; leaves 4 in a whorl, linear, acute: upper ones opposite: the floral ones like the rest, but smaller; flowers in terminal fascicles; lobes of corolla bluntly awned. ♃. H. Native of the south of Europe, Sicily, &c. Flowers usually by threes, pale yellow.

Var. β, fláccida (D. C. prod. 4. p. 583.) plant diffuse; branches divaricate, pendulous; pedicels usually 2-flowered. ♃. H. Native of the kingdom of Naples, in rocky places. A. fláccida, Tenore, append. 4. prod. p. 8. A. cynánchica α, Tenore, prod. xii. A. longiflòra, Tenore, fl. med. p. 89.

Awned-flowered Woodroof. Fl. July, Aug. Clt. 1823. Pl. ½ to 1 foot.

16 A. monta'na (Willd. enum. p. 151.) glabrous; stem flaccid; leaves linear: lower ones 6 in a whorl: middle ones 4, upper ones opposite; floral leaves linear; flowers in fascicles; corollas 4-cleft, scabrous externally. ♃. H. Native of Hun-

gary, on hills in woods. Link, enum. 1. p. 134. Corolla blush. Perhaps sufficiently distinct from *A. tinctòria*.

Mountain Woodroof. Fl. June, July. Clt. 1801. Pl. $\frac{1}{2}$ to to $\frac{3}{4}$ foot.

17 A. HIRSU'TA (Desf. fl. atl. 1. p. 127.) plant erect or ascending; leaves 6 in a whorl, linear, acute, with revolute margins: lower ones and tops of stems glabrous; flowers in fascicled umbels, rising from the tops of the stem or branches; bracteas hardly exceeding the ovaries; fruit glabrous. ♃. H. Native of Algiers and Algarves, on chalky and sandy hills. Rubèola Lusitánica, &c. Tourn. inst. p. 130. A. rèpens, Brot. phyt. lus. 1. no. 10. t. 10. A. Algérica, Pers. ench. 1. p. 124. Rùbia rèpens, &c. Grisl. vir. no. 1244. Stem hairy at bottom. Leaves glaucous. Flowers subcapitate, red. In cultivation this plant becomes smooth.

Hairy Woodroof. Fl. May, June. Clt. 1819. Pl. 1 to 2 ft.

18 A. TOMENTÒSA (Ten. prod. xii. fl. neap. t. 9.) plant ascending or diffuse, clothed with velvety tomentum; leaves 4 in a whorl, linear, with revolute margins: lower ones obovate; flowers terminal or axillary, 8-10 in a fascicle; bracteas rather shorter than the flowers. ♃. H. Native of Goats' Island, near Naples, in arid places. Herb branched from the base. Stem tetragonal. Stipular leaves the longest. Tube of corolla longish. Corolla red. A crassifòlia, Lin. mant. p. 37. does not seem to differ from the present plant. Perhaps A. scàbra, Link, enum. 1. p. 134. is also the same.

Var. β, semiglàbra (D. C. prod. 4. p. 584.) lower part of herb velvety; upper part and flowers glabrous. ♃. H. Native along with the species, and probably of Sicily at Cafalu. A. commutàta, Presl, fl. sic. prod. p. 62.? Rœm. et Schultes, syst. 3. p. 267.?

Tomentose Woodroof. Fl. June, July. Clt. 1795. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

19 A. INCA'NA (Smith, fl. græc. t. 119.) stems villous at the base, and smoothish at top; leaves 6 in a whorl, linear, hoary; flowers downy, in terminal fascicles. ♃. H. Native of Candia, on the Sphaceotic mountains. Flowers pale red.

Hoary Woodroof. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

20 A. ARCADIE'NSIS (Sims, bot. mag. t. 2146.) plant hoary, decumbent; leaves 6 in a whorl, oblong-ovate, acute, with revolute edges; flowers terminal and axillary, aggregate, sessile; style bifid at top. ♃. F. Native of Arcadia, on Mount Tyria. A small hoary plant, with rose-coloured flowers. Gàlium Græ'cum, Hort.

Arcadian Woodroof. Fl. May. Clt. 1819. Pl. 2 to 3 inches.

21 A. DE'BILIS (Led. hort. dorp. suppl. 1824. p. 2.) plant hispid from pili; leaves 6 in a whorl: upper 4 in a whorl, linear-lanceolate, scabrous above, and keel smooth; umbels lateral, pedunculate, 3-flowered; corolla funnel-shaped; fruit granular. ♃. H. Native of Tauria, near Bachtschisarai.

Weak Woodroof. Pl. $\frac{1}{2}$ foot.

22 A. NÍTIDA (Smith, fl. græc. t. 124.) glabrous; stems diffuse, densely tufted, as well as the leaves; leaves 4 in a whorl, shining, glaucescent: lower ones oval, the rest linear, acute, awned, revolute; fascicles terminal, 3-4-flowered, length of leaves; lobes of corolla awned; tube terete, wide; fruit glabrous, rather rugged. ♃. H. Native of Sicily, on rocky and gravelly mountains, and on Mount Olympus, in Bithynia. Guss. prod. fl. sic. 1. p. 168. Flowers purplish. Very like *A. hexaphýllum*.

Nitid Woodroof. Pl. tufted, $\frac{1}{4}$ foot.

23 A. SCA'BRA (Presl. del. prag. p. 124. but not of Link.) stem scabrous, diffuse, kneed; leaves 4 in a whorl: lower ones oblong downy: upper ones glabrous, linear, unequal, opposite, small, awned; flowers in fascicles; corollas scabrous, with the lobes mucronate; style bipartite to the base. ♃. H. Native of Sicily, on dry mountains; of Spain, in arid places; and of Portugal, on the banks of the Tagus and Douro. Guss. prod. fl. sic. 1. p. 167. A. dígyna, Dufour, ann. gen. sc. phys. 7. p. 295. A. macrorhìza, Link. fl. port. 2. p. 41. t. 84. Stems exactly quadrangular. Flowers purplish white. Habit of *A. longiflòra*, but differs from it in the lower leaves and flowers being downy.

Scabrous Woodroof. Pl. 1 to 2 feet.

24 A. ALPÌNA (Bieb. fl. taur. suppl. p. 103.) the whole plant, as well as the corollas and ovaries are downy; stems procumbent, much branched, tetragonal; leaves 4 in a whorl, linear, acute: upper ones nearly equal, spreading; cymes terminal, crowded, 5-7-flowered; lobes of corolla 4. ♃. H. Native of Eastern Caucasus, on the Alps. A. cynánchica, var. γ, Stev. in mem. soc. mosc. 3. p. 253. Meyer, verz. pfl. p. 406. Flowers white, or tinged with red. Leaves shorter and broader than in *A. cynánchica*, and the lower ones blunter.

Alpine Woodroof. Fl. June, July. Clt. 1820. Pl. $\frac{1}{2}$ foot.

25 A. CRETA'CEA (Willd. in Rœm. et. Schultes, syst. 3. p. 529.) stems tufted, prostrate; leaves 6 in a whorl, lanceolate: the whorles so close as to be imbricated; flowers terminal, aggregate. ♃. H. Native of Siberia, in chalky places.

Cretaceous Woodroof. Pl. prostrate.

26 A. LITTORA'LIS (Smith, fl. græc. t. 122.) stem downy; leaves linear, 4 in a whorl, scabrous on the margins and stem (almost hoary, according to D'Urv.): floral ones opposite; flowers quadrifid, pilose; fruit hispid. ♃. H. Native on the shores of the Euxine Sea, on hills. Flowers pale red. Fascicles of flowers disposed in terminal panicles.

Sea-shore Woodroof. Pl. procumbent.

27 A. NEGLE'CTA (Guss. pl. rar. 69. t. 13. f. 1.) stems numerous, hairy, ascending; leaves 4 in a whorl, hairy, acute, longer than the internodes: lower ones obtuse; flowers in terminal fascicles; mericarps globose, hispid. ♃. H. Native of Abruzzo and Sardinia, in alpine places. Corolla white inside, and reddish outside, and downy. Bracteas ovate. Said to be allied to *A. littoràlis*.

Neglected Woodroof. Pl. decumbent.

28 A. NÍTENS (Guss. pl. rar. 70. t. 13. f. 2.) plant smooth; stems tufted, decumbent; leaves 4 in a whorl, awned, longer than the internodes, shining, quite glabrous: lower ones the broadest; flowers in terminal fascicles; lobes of corolla awned; mericarps tubercularly muricated. ♃. H. Native of Abruzzo, in arid, alpine situations. Flowers white inside, and purplish outside. Very like *A. neglécta*, and probably only a variety of it.

Shining Woodroof. Pl. decumbent.

29 A. RÍGIDA (Sibth. et Smith, fl. græc. t. 121.) stems diffuse, downy; leaves linear, 4 in a whorl, superior ones opposite; flowers scattered; fruit glabrous. ♃. H. Native of Candia, on hills and in fields, Rœm. et Schultes, syst. 3. p. 270. exclusive of the syn. of Lois. Leaves rather scabrous. Flowers pale red, disposed in terminal and lateral few-flowered fascicles.

Stiff Woodroof. Pl. $\frac{1}{2}$ to 1 foot.

30 A. SUBERÒSA (Smith, fl. græc. t. 123.) stems tufted, ascending; root corky; leaves 4 in a whorl, linear, rather hoary; lobes of the corolla awnless. ♃. H. Native of Greece, on high rocks. Stems downy. Flowers rose-coloured, disposed in subspicate fascicles.

Corky-rooted Woodroof. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

§ 3. *Galioídeæ* (the plants contained in this section agree with *Gàlium*, in having campanulate flowers). *D. C. prod. 4. p. 585. Perennial plants. Corollas campanulate.*

31 A. LONGIFÒLIA (Smith, fl. græc. t. 118.) stems smooth;

leaves 8 in a whorl, linear-lanceolate, deflexed, with rather scabrous margins; panicles capillary, many-flowered; fruit smooth. 2. H. Native of Turkey, about Constantinople. Flowers white, campanulately funnel-shaped. Habit of a species of *Gàlium*.

Long-leaved Woodroof. Fl. June, Aug. Clt. 1820. Pl. 3 feet, diffuse.

32 A. odora'ta (Dod. pempt. p. 355.) plant glabrous, erect, or ascending; stems simple; leaves 8 in a whorl, lanceolate, smooth, with serrulately scabrous edges; corymbs terminal, pedunculate; fruit hispid. 2. H. Native of Europe, Siberia, and Caucasus, in shady places and woods; plentiful in Britain. Œd. fl. dan. t. 562. Lam. ill. t. 61. Mill. fig. t. 55. Smith, eng. bot. t. 755. Blackw. t. 60. Gàlium odoràtum, Scop. carn. no. 158. Root creeping a little below the surface of the soil. Stems tetragonal. Corymbs usually trifid, each division bearing about 4 flowers. Flowers snowy white. The plant is without scent when fresh, but when dried diffuses an odour like that of vernal grass. It is said to give a grateful flavour to wine; and when kept among clothes, not only to impart an agreeable perfume to them, but to preserve them from insects. Turner calls the plant *Wood-rose*, or *Wood-rowel*. Gerard, *Woodrowe*, *Woodrowell*, and *Woodrooffe;* and Parkinson, *Woodroofe*. In modern times it is called *Woodroof*, or *Woodruff*. These names are derived from the place of its natural growth, in woods, and from the whorles, ruffs, or rowels of leaves.

Sweet-scented or common Woodroof. Fl. May, June, Britain. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

33 A. aparìne (Bieb. fl. taur. p. 102. and suppl. 105. Bess. fl. gall. 1. p. 114.) branches diffuse, straggling, with scabrous angles; leaves 6-8 in a whorl, oblong or lanceolate, scabrous, having the keel and margins beset with small retrograde prickles; peduncles axillary, branched, disposed in a loose fasciculate panicle; corolla short, tubular; fruit granular. 2. H. Native of Galicia, Tauria, Caucasus, Volhynia, Russia at Moscow, Siberia, and Greece, in boggy, grassy places. Rchb. pl. crit. 1. t. 93. f. 198. Gàlium uliginòsum, Pall. ind. taur. Asp. rivàlis, Sibth. and Smith, fl. græc. t. 117. Angles of stems scabrous from retrograde prickles. Flowers white, campanulately funnel-shaped. Very much the habit of *Gàlium aparìne*, but stronger. Herb scabrous all over.

Cleavers' Woodroof. Fl. July, Aug. Clt. 1818. Pl. straggling.

34 A. paniculà'ta (Bunge in Ledeb. fl. alt. ill. t. 301. fl. alt. 1. p. 140.) stems tetragonal, glabrous; lower leaves 4 in a whorl: the rest 6, oblong-lanceolate, acuminated, with scabrous margins; flowers terminal and axillary, panicled; panicle diffuse; corollas campanulate; fruit smooth. 2. H. Native of Siberia, in grassy parts of mountains at the rivers Tscharysch and Sentelek, and in sandy places at the river Katunja. Leaves rather glaucous beneath. Corollas white, with obtuse segments.

Panicled-flowered Woodroof. Pl. 1 foot.

35 A. subvelutìna (D. C. prod. 4. p. 585.) stems many, branched, erect, velvety from small down; leaves 5-8 in a whorl, broad-linear, obtuse, rather velvety; flowers verticillate, and capitate at the tops of the branches; floral leaves small; corollas campanulate; fruit glabrous. 2. H. Native of Persia, on Mount Elwend, where it was collected by Olivier and Bruguiere. Old stems permanent, white, and glabrous. Leaves 6 lines long, and a line broad.

Rather-velvety Woodroof. Pl. $\frac{1}{2}$ to 1 foot.

36 A. galioìdes (Bieb. fl. taur. 1. p. 101. and suppl. p. 104.) plant glabrous; stems terete, ascending; leaves 6-8 in a whorl, linear, glaucous; peduncles dichotomous, terminal, corymbose; corollas campanulate; fruit glabrous, smooth. 2. H. Native of Middle and South Europe, even to Tauria and Caucasus, in stony places. Gàlium glaúcum, and probably Gàlium montànum, var. Lin. spec. 156. Asp. glaúca, Bess. Gàlium Hallèri, Sut. fl. helv. 1. p. 88. Gàlium campanulàtum, Vill. dauph. 2. p. 326. Gàlium grandiflòrum, Clairv. man. p. 41. Flowers white. Plant glaucous.—This is a very variable plant, and is intermediate between *Gàlium* and *Aspérula*. Stems either terete or bluntly sub-tetragonal, erectish or diffuse, smooth or scabrous at the base. Leaves with revolute or flat margins, obtuse or mucronulate.—See Jacq. fl. austr. t. 84. Vill. dauph. t. 7. Bocc. mus. 2. t. 116.

Var. β, Tyràica (D. C. prod. 4. p. 585.) stems erect, hispid at the base; lower leaves rather hispid. 2. H. Native about Tyra and elsewhere, in stony places. Aspérula Tyràica, Bess. enum. cont. p. 42. Gàlium glaúcum, var. Requien, in. herb. D. C.

Galium-like Woodroof. Fl. Ju. Aug. Clt. 1710. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ ft.

37 A. humifu'sa (Bieb. fl. taur. suppl. p. 105.) stems prostrate, much branched, hispid, tetragonal; leaves 6 in a whorl, linear, spreadingly reflexed, with scabrous edges: lowermost ones 8 in a whorl; pedicels axillary, usually by threes, 1-flowered; corolla sub-campanulate, with a short tube; fruit glabrous. 2. H. Native of Tauria, Caucasus, at the Don, and on Mount Beschtau, Podolia, and about Theodosia, ex D'Urv. enum. p. 15. Gàlium humifûsum, Bieb. fl. taur. 1. p. 104. Ledeb. in Schrad. neu. journ. 4. t. 1. p. 59. Flowers white.

Trailing Woodroof. Fl. Ju. Aug. Clt. 1818. Pl. prostrate.

† *Species not sufficiently known.*

38 A. Tournefórtii (Sieb. ex Spreng. syst. 1. p. 395.) stems suffruticose; leaves obovate-oblong, quite glabrous, glaucous; whorles of flowers approximate; flowers sub-fasciculate, hispid. 2. H. Native of Candia.

Tournefort's Woodroof. Pl. suffruticose.

39 A. umbella'ta (Willd. herb. ex D. C. prod. 4. p. 586.) 2. H. Native of Hungary. This is the same as *A. hexaphylla*, ex Spreng. syst. but according to Stevens, obs. mss. it differs in the flowers being shorter.

Umbellate-flowered Woodroof. Pl.

40 A. involucra'ta (Bergr. et Wahl. in isis. 1828. vol. 21. p. 971.) leaves 4 in a whorl, obovate, elongated, obtuse, glabrous; stems decumbent; peduncles lateral and terminal; flowers umbellate; leaves of involucrum obtuse, glabrous. 2. H. Native of the Levant, among bushes on the sides of hills. Leaves like those of *Gàlium palústre*.

Involucrated Woodroof. Pl. decumbent.

Cult. Most of the species of Woodroof are very pretty when in flower, and are therefore well adapted for decorating flower-borders or rock-work. They will grow in any common garden-soil, and are easily increased by parting at the root. *A. odoràta* will thrive under the shade of trees, where hardly any thing else will grow. The seeds of annual species only require to be sown where the plants are intended to remain.

CCXIV. CRUCIANE'LLA (a dim. of *crux*, a cross: in allusion to the leaves being placed crosswise). Lin. gen. no. 126. Gærtn. fruct. 1. p. 111. t. 24. Lam. ill. t. 61. Juss. mem. mus. 6. p. 370. A. Rich. mem. soc. hist. nat. par. 5. p. 131. D. C. prod. 4. p. 586.

Lin. syst. *Tetra-Pentándria*, *Monogy'nia*. Calyx with an ovate tube, and a hardly distinct limb. Corolla tubular, elongated, funnel-shaped, 4-5-lobed; lobes usually drawn out into a setaceous, inflexed appendage each. Stamens 4-5, inclosed; anthers linear. Style 2-lobed at the apex, shorter than the tube of the corolla. Fruit divisible into 2 parts, but not crowned by

the calyx; mericarps semi-ovate or oblong, indehiscent.—Herbs, sometimes suffrutescent at the base, but usually annual. Leaves truly opposite, furnished with from 1 to 3 stipulas on each side. Flowers furnished with 3 bracteas each, the exterior bractea representing a cauline leaf, and the 2 lateral ones opposite, all longer than the ovarium, and appearing like a calyx. Spikes sometimes elongated and continuous, sometimes capitate, and sometimes interrupted from being formed of pedunculate fascicles of flowers.

§ 1. *Flowers disposed in continuous spikes.*

1 C. latifòlia (Lin. spec. 157.) plant erect, with ascending branches; leaves 4 in a whorl, elliptic-lanceolate, acute: lower ones usually ovate, and mucronated, with scabrous margins; spikes filiform, tetragonal; flowers quadrifid, solitary, imbricated in 4 rows. ⊙. H. Native in the region of the Mediterranean, in sandy places from Spain and Mauritania to Tauria. Guss. prod. fl. sic. 181. Smith, fl. græc. t. 139. C. spicàta, β, Lam. fl. fr. 3. p. 372. Schmied. icon. t. 83. f. 84.—Barrel. icon. t. 520. and 549. Corollas slender, pale yellow: lobes awned.

Var. β, *erectiúscula*, (D. C. prod. 4. p. 586.) stem erectish. C. latifòlia, Bieb. fl. taur. 1. p. 106.

β *Var.* γ, *Monspelìaca*, (D. C. l. c.) lower leaves ovate: upper ones 5-6 in a whorl, linear. ⊙. H. Native of France, Mediterranean, Dalmatia, Greece, Palestine. Benth. cat. no. 73. C. Monspelìaca, Lin. spec. 158. D. C. fl. fr. no. 3347. Smith, fl. græc. t. 140. C. spicàta, γ, Lam. fl. fr. 3. p. 372. C. vulgàris, Gat. fl. mont. 44. Rubèola heterophýlla, Mœnch. meth. p. 526. Lobes of corolla 5, ending in a twisted awn each.

Broad-leaved Crosswort. Fl. June, July. Clt. 1633. Pl. 1 foot, ascending.

2 C. angustifòlia (Lin. spec. p. 157.) erect; leaves 6 in a whorl, linear, acute, scabrous on the margins, and on the angles of the stem; spikes linear, imbricated in 4 rows, somewhat interrupted at the base; flowers tetramerous, twin: one of them bibracteolate. ⊙. H. Native of arid, stony places from Spain and Mauritania to Tauria and Caucasus. Smith, exot. bot. t. 109. Guss. prod. fl. sic. p. 181. C. spicàta, α, Lam. fl. fr. 3. p. 372. Rubèola linearifòlia, Mœnch, meth. p. 525.—Barrel. icon. t. 550.—Sabb. hort. rom. 2. t. 12. Corolla slender, yellowish-green.

Var. β, *monostàchya* (D. C. fl. fr. no. 3345.) stem simple, bearing only one spike at the apex.

Var. γ, *mucronàta*, (Roth, cat. 1. p. 27.) leaves 4 in a whorl, mucronate.

Narrow-leaved Crosswort. Fl. June, July. Clt. 1658. Pl. 1 foot.

3 C. glau'ca (A. Rich. in mem. soc. hist. nat. par. 5. p. 131.) plant suffruticose at the base, erect, glaucous; leaves 6 in a whorl, linear, with revolute edges; spikes slender, pedunculate, somewhat interrupted at the base; bracteas ciliated; flowers pentamerous. ♃. H. Native of Persia.

Var. α, *Bruguièri* (D. C. prod. 4. p. 587.) leaves rough; branchlets and bracteoles rather velvety from fine down. ♃. H. Native of Persia, between Kermancha and Amadan, where it was collected by Olivier and Bruguiere.

Var. β, *Michaúxii* (D. C. l. c.) stem glabrous; leaves smoothish; bracteas a little smaller. ♃. H. Native of Persia, where it was collected by Michaux.

Glaucous Crosswort. Pl. 1 foot.

4 C. cilia'ta (Lam. dict. 2. p. 217.) plant diffuse; leaves 4 in a whorl, or opposite; spikes hardly interrupted at the base; bracteas ciliated, unequal, rather loose; flowers tetramerous; fruit beset with blunt tubercles. ⊙. H. Native of the Levant, about Aleppo, where it was collected by Michaux. C. diffùsa, Roth, in Ust. neu. ann. 4. p. 40. cat. 1. p. 26. C. tuberculòsa, Cav. descript. p. 349. Flowers yellowish. Nearly allied to *C. pàtula*.

Ciliated-bractead Crosswort. Fl. June, July. Clt. 1805. Pl. diffuse ½ foot.

5 C. pa'tula (Lin. spec. p. 602.) erect; branches spreading; leaves 6 in a whorl, linear, rather scabrous; flowers 1-2 in the axils of the bracteas, on short pedicels, pentamerous; fruit smoothish. ⊙. H. Native of Spain, on rocks at Aranjuez, Tudela, and Navarre, and in the kingdom of Valentia. Loefl. itin. p. 68. C. pentándra, Dufour, in Rœm. et Schultes, syst. 3. p. 532. Corolla yellowish.

Spreading Crosswort. Fl. June, July. Clt. 1798. Pl. ½ to ¾ foot.

6 C. suave'olens (Meyer, verz. pfl. p. 406.) plant perennial, glabrous; stem herbaceous, erect, branched; leaves linear, mucronate, with prickly, revolute edges, 8 in a whorl, but the upper ones are 6 in a whorl; flowers opposite, disposed in dense spikes: floral leaves and bracteas lanceolate, ciliated, a little shorter than the corollas, which are glabrous, and 5-cleft; stamens inclosed; mericarps glabrous, smooth. ♃. H. Native of Caucasus, in dry, stony places on the Talusch mountains.

Sweet-scented Crosswort. Pl. 1 foot.

7 C. Ægypti'aca (Lin. mant. p. 38.) plant diffuse; leaves 4 in a whorl, linear, with revolute edges, glabrous above, and on the margins: lower ones ovate; spikes terminal; bracteas lanceolate, with the keel and margins rather scabrous. ⊙. H. Native about Alexandria, in Egypt. C. herbàcea, Forsk. fl. egyp. p. 30. Flowers pentamerous, pale yellow, awned.

Egyptian Crosswort. Fl. June, July. Clt. 1800. Pl. ½ foot.

8 C. Gila'nica (Trin. in mem. act. petersb. 1818. p. 493. t. 12.) stems erectish, branched; leaves 4 in a whorl, linear, mucronate, with prickly revolute edges; flowers remotely spicate; bracteas and floral leaves ovate, ciliated, 4 times shorter than the corolla, which is glabrous. ♃. H. Native of Persia, in the province of Ghilan, on the mountains; and of Caucasus, in dry, stony places on the Talusch mountains. Root slender, creeping. Flowers pentamerous. Lobes of the corolla mucronate. Fruit and stamens glabrous. Style inclosed.

Ghilan Crosswort. Pl. procumbent.

§ 2. *Flowers capitate.*

9 G. marítima (Lin. spec. 158.) plant suffruticose, procumbent, much branched, glaucous, glabrous; leaves 4 in a whorl, lanceolate, stiff, marginated, mucronate; flowers axillary, disposed in interrupted spikes, pentamerous. ♄. F. Native along the Mediterranean, in the sand by the sea side. Desf. fl. atl. 1. p. 132. D. C. fl. fr. no. 3348.—Rubèola marítima, Mœnch. meth. p. 526.—Barrel. icon. t. 355. Flowers cream-coloured. Styles sometimes 3, but usually 2.—Rùbia marítima, Bauh. pin. 334. Rùbia marìna, Clus. hist. 2. p. 176.

Sea-side Crosswort. Fl. July, Aug. Clt. 1640. Pl. proc.

10 C. capita'ta (Labill. pl. syr. dec. 1. p. 12. t. 3.) plant suffruticose, procumbent, branched, glaucous, glabrous; leaves 6 in a whorl, almost linear; spikes capitate, ovate; bracteas membranous, lanceolate, longer than the leaves, trifid, girding 2 flowers each; corollas 5-parted. ♄. F. Native on the top of Mount Lebanon. Corolla blackish in the dried state. Bracteas trifid. Bracteoles linear.

Capitate-flowered Crosswort. Shrub procumbent.

11 C. stylòsa (Trin. mem. act. petersb. 1818. p. 485. no. 3. t. 11. ex Spreng. neu. entd. 1. p. 99.) plant procumbent; leaves 8-9 in a whorl, and are, as well as the stems, hispid; heads terminal, pedunculate; flowers pentamerous; style clavate, much exserted, bifid at the apex.—Native of Persia, in the province of Ghilan, among rocks; and of Caucasus, among bushes in the province of Lenkeran, from the Caspian Sea even to the Talusch

mountains. Laxmánnia fasciculàta, S. G. Gmel. Said to be nearly allied to *C. molluginoìdes*.

Long-styled Crosswort. Pl. procumbent.

12 C. pube'scens (Willd. spec. 1. p. 602.) plant erect; leaves 6 in a whorl, linear, downy; heads of flowers pedunculate, axillary, and terminal; corollas pentamerous. ⊙. H. Native of Candia. Rubèola Crética incana floribus purpurascentibus, Tourn. cor. 5. Stem downy. Corollas purplish, downy.

Downy Crosswort. Fl. July, Aug. Clt. 1799. Pl. 1 foot.

§ 3. *Flowers in fascicles; fascicles opposite, on short peduncles: the whole forming an interrupted raceme.*

13 C. molluginoìdes (Bieb. cent. 2. t. 65. ex fl. taur. 1. p. 106. suppl. 110.) erect; leaves 8-12 in a whorl; linear-lanceolate, with revolute, scabrous edges, and a villous keel; fascicles of flowers opposite, disposed in an interrupted spike; bracteas ovate-lanceolate, acuminated, villous, much shorter than the flowers; fruit glabrous, smoothish; corollas pentamerous. 4. H. Native of Caucasus, in subalpine places, Armenia, and Hungary. C. anómala, Balb. herb. taur. Aspérula tubiflòra, Hortul.—Buxb. cent. 2. t. 30. f. 1. Corollas greenish yellow. Stamens 5. Mericarps nearly globose. Angles of the stem scabrous.

Mollugo-like Crosswort. Fl. July, Aug. Clt. 1800. Pl. 1 foot.

14 C. a'spera (Bieb. fl. taur. 1. p. 107.) plant procumbent or ascending; leaves usually 6 in a whorl, linear, bluntish, with revolute edges, and are, as well as the stem, scabrous; fascicles of flowers opposite, pedunculate, disposed in interrupted spikes; bracteas ovate, acute, ciliated, much shorter than the flowers; flowers pentamerous; fruit glabrous. 4. H. Native of Iberia, about Tiflis. C. prostràta, Adams. in Web. et Mohr. cat. 1. p. 46. Flowers greenish yellow.

Rough Crosswort. Pl. procumbent.

15 C. glomera'ta (Bieb. fl. taur. 1. p. 107.) stems ascending. sterile ones hairy, and floriferous ones smoothish; leaves 6 in a whorl, linear, with revolute margins, scabrous, rather glaucous; heads of flowers opposite, pedunculate, disposed in an interrupted raceme; bracteas ovate, acute, ciliated, much shorter than the flowers; flowers pentamerous. 4. H. Native of Iberia and Caucasus, on stony hills. Rubèola orientàlis foliis Galii, flore multiplici, Tourn. cor. 5. Flowers greenish yellow.

Glomerate-flowered Crosswort. Fl. July, Aug. Clt. 1824. Pl. ¾ foot.

† *Plants referred to the genus which ought to be excluded from it.*

16 C.? America'na (Mill. dict. no. 5.) stem erect, villous; leaves opposite, linear-lanceolate, hairy; flowers solitary, axillary. ♄. S. Native of Vera Cruz. Flowers pale blue. Fruit didymous. Probably a species of *Spermacòce*.

American Crosswort. Fl. July, Aug. Clt. 1780. Shrub 3 feet.

17 C.? híspida (Mill. dict. no. 4.) stem hispid; leaves opposite, lanceolate, hairy; flowers umbellate, terminal. ♄. S. Native of Vera Cruz. Stems quadrangular, rough, prickly. Flowers blue, tetramerous. Fruit didymous.

Hispid Crosswort. Shrub 2 feet.

Cult. The seeds of annual species should be sown in the open ground where the plants are intended to remain. The perennial, herbaceous, and shrubby species being rather tender, should be grown in pots, in a mixture of peat, sand, and a little loam; and they will be easily increased by dividing at the root, or by cuttings.

CCXV. RU'BIA (from *ruber*, red; in allusion to the red colour of the roots). Tourn. inst. 113. t. 38. Lin. gen. no. 127. Lam. ill. t. 60. Gærtn. fil. carp. 3. p. 85. t. 195. D. C. prod. 4. p. 588.

Lin. syst. *Pentándria*, *Digýnia*. Calyx with an ovate-globose tube, and a 4-toothed limb. Corolla 4-5-parted, rotate. Stamens 4, short. Styles 2, short. Fruit didymous, nearly globose, baccate, juicy.—Herbs or sub-shrubs. Stems diffuse, much branched, tetragonal. Leaves opposite, usually furnished with 1-2, rarely with 3-4 stipulas on both sides, which are very like the leaves, constituting 4-10-leaved whorles. Flowers small, greenish white, or pale yellow. Berries black, rarely red or white.

§ 1. *Exinvolucràta* (the flowers of the plants contained in this section are without involucra). D. C. prod. 4. p. 588. *Peduncles axillary, dichotomous or trichotomous; bracteas wanting, or very small, and opposite, but never constituting an involucrum. Flowers usually pentamerous.—Species all natives of the old world.*

* *Cordifòlia* (from *cor*, the heart, and *folium*, a leaf: the leaves are heart-shaped). D. C. prod. 4. p. 588. *Stems herbaceous. Leaves on long petioles, all cordate, or only the lower ones.*

1 R. cordifòlia (Lin. mant. p. 197.) leaves 4 in a whorl, petiolate, oblong, cordate at the base, 3-5-nerved, beset with prickles on the middle nerve, margins, petioles, and angles of stems; flowers tetramerous or pentamerous. 4. H. Native of Siberia, on the banks of the Salenga, &c.—There are varieties of this plant with glabrous, hairy, narrower and broader leaves, which are disposed 8 in a whorl. (Pall. itin. 3. t. L. f. 1. and gall. t. 92.). Flowers whitish. Berries red or black. Perhaps 2 species are confused under this name.

Heart-leaved Madder. Fl. July. Clt. 1783. Pl. straggling.

2 R. Java'na (D. C. prod. 4. p. 588.) leaves 4 in a whorl, petiolate, ovate-lanceolate, not cordate at the base, 5-nerved, scabrous on the middle nerve, petioles, and angles of stems; flowers tetramerous and pentamerous. 4. S. Native of Java, on the mountains. R. cordifòlia, Blum. bijdr. p. 944. An intermediate plant between *R. cordifòlia*, *R. Sibírica*, and *R. Munjista*.

Java Madder. Pl. straggling.

3 R. Munjísta (Roxb. fl. ind. 1. p. 383.) leaves 4 in a whorl, petiolate, cordate, acuminated, 5-nerved, and are, as well as the stems, hispid; flowers all pentamerous. 4. H. Native of Nipaul and Bengal, on the mountains; and of Japan. R. cordàta, Thunb. fl. jap. p. 60. R. Manjith, Roxb. ex Flem. cat. in Desv. journ. bot. 1814. pt. 2. p. 207. There does not appear much difference between this and R. cordifòlia, Lin. This kind of madder is used by the dyers and calico-printers in the same manner as the common madder.

Munjith or Indian Madder. Pl. straggling.

4 R. ala'ta (Wall. in Roxb. fl. ind. 1. p. 384.) leaves 4 in a whorl, petiolate, ovate-lanceolate, and linear, 3-nerved, acuminated at the apex, scabrous; angles of stem winged, scabrous from recurved denticulations; flowers pentamerous, hispid; corymbs trichotomous, elongated. 4. H. Native of Nipaul. Limb of leaf 3 times the length of the petiole. Very like a species of *Gàlium*.

Winged-stemmed Madder. Pl. straggling.

5 R. petiola'ris (D. C. prod. 4. p. 588.) leaves 4 in a whorl, petiolate, oblong-lanceolate, acuminated, 1-nerved, having the nerve, margins, petioles, and angles of the stem scabrous from prickles. 4. G. Native of the Cape of Good Hope. R. cordifòlia, Thunb. fl. cap. p. 151. but not of Lin. Petioles the length of leaves, tetragonal; perhaps the lower leaves are cordate. Flowers not sufficiently known.

Petiolar-leaved Madder. Pl. straggling.

6 R. angustíssima (Wall. cat. no. 6207.) stems quadrangular, almost winged, serrated from retrograde prickles; leaves 4 in a whorl, long, linear, with scabrous edges, sessile; peduncles dichotomously divided. ♃. S. Native of the Burmese Empire, on Mount Taong Dong, near Ava. Root like that of *R. Munjista*.

Very-narrow-leaved Madder. Pl. straggling.

7 R. charæfo`lia (Wall. cat. no. 6210.) stems quadrangular, angles beset with retrograde, prickly denticulations; leaves 8-10 in a whorl, linear, sessile, scabrous on the margins and keel; corymbs terminal. ♃. F. Native of Nipaul.

Chara-leaved Madder. Pl. straggling.

** *Suffruticòsæ. Stems shrubby. Leaves on short petioles, oblong or lanceolate.*

8 R. fruticòsa (Ait. hort. kew. 1. p. 147.) stem shrubby, smooth; leaves 2-6 in a whorl: the uppermost ones opposite, elliptic, on short petioles, having the margins and keel scabrous from prickles; flowers pentamerous; corymbs axillary, short, few-flowered. ♄. G. Native of Teneriffe, among bushes, Jacq. icon. rar. t. 25. R. fruticòsa, and R. Canariénsis, Poir. suppl. 2. p. 707. Leaves varying from oval to oblong-lanceolate, with distant retrograde prickles on the margins. Corollas yellowish. Peduncles usually 3-flowered.

Var. β, *galioìdes* (D. C. prod. 4. p. 589.) stem shrubby, terete, smooth; leaves 6 in a whorl, petiolate, ovate-lanceolate, with rough margins; peduncles axillary, 3-4-flowered, much shorter than the leaves. ♄. G. Native of the Canary Islands. R. galioìdes, Poir. suppl. 2. p. 705.

Shrubby Madder. Fl. Sept. Clt. 1779. Shrub 4 to 5 feet.

9 R. acalycula`ta (Cav. icon. 2. p. 75. t. 195.) stems rather herbaceous, smooth, hexagonal; leaves petiolate, ovate-lanceolate, having the nerve beneath and the margins furnished with retrograde prickles; corymbs axillary, trichotomous, bibracteate; flowers pentamerous. ♃. ♄. G. Native of Madras, where it is called *Tasaygo*. Leaves 7-9 in a whorl, but on the branches only 3 in a whorl. Flowers yellowish. Teeth of calyx not perspicuous, as in many other species of the genus. Very nearly allied to *R. fruticòsa*.

Ecalyculate-flowered Madder. Shrub 2 feet.

10 R. læ`vis (Poir. voy. 2. p. 111. suppl. 2. p. 706. but not of Thunb.) stem shrubby, smooth; leaves 8 in a whorl, linear-lanceolate, mucronate, smooth; peduncles axillary, simple, or bifurcate, diverging. ♄. S. Native of Barbary, on the sea-shore near Lacalle. Perhaps a species of *Gàlium*. Flowers white, tetramerous.

Smooth Madder. Shrub.

*** *Tinctòriæ* (from *tinctorius*, for dying; the roots of most of the species are used for dying). D. C. prod. 4. p. 589. *Stems herbaceous. Leaves sessile, or on short petioles, never cordate.*

11 R. angustifòlia (Lin. mant. p. 39.) plant herbaceous; leaves 4 in a whorl, linear, scabrous above, and also along the margins and nerve; angles of stems prickly; corymbs axillary, 3-flowered; lobes of corolla bluntish, apiculated. ♃. F. Native of Gibraltar, Portugal, and Balearic Islands. Lam. ill. t. 60. f. 2. Leaves evergreen. Flowers pale yellow. Perhaps this and the 6 following are only variations of *R. tinctòria*.

Narrow-leaved Madder. Fl. June, Aug. Clt. 1772. Pl. straggling.

12 R. longifòlia (Poir. suppl. 2. p. 703.?) herbaceous; leaves 4-6 in a whorl, linear-lanceolate, elongated, acuminated, almost sessile, smooth above, but with the margins and nerve scabrous from prickles, as well as the angles of the stem; peduncles trichotomous; lobes of corolla acutish, acuminated, not abruptly cuspidate. ♃. H. Native of Corsica and at Mogodor. R. Requiènii, Duby, bot. gall. 1. p. 247. Flowers yellowish. Berries black.

Long-leaved Madder. Pl. straggling.

13 R. tinctòrum (Lin. spec. p. 158.) herbaceous; leaves 4-6 in a whorl, on short petioles, lanceolate, smooth above, scabrous from prickles on the margins and keel, and along the angles of the stem; peduncles axillary, trichotomous; lobes of corolla gradually acuminated, not cuspidate. ♃. H. Native of the Levant and south of Europe; and also of Caucasus, on Mount Beschbarmak, and plentiful near Dervent, and in the province of Baku; but cultivated in many parts for the sake of its roots. Lam. ill. t. 60. f. 1. Heyne, arzn. gew. xi. t. 5. Schkuhr. handb. t. 28. Mill. fig. t. 1. Woodv. med. bot. t. 68. Smith, fl. græc. t. 141. Sabb. hort. 1. t. 77. Blackw. t. 26. R. peregrìna, Murr. bot. val. p. 91. ex Gaudin. R. sylvéstris and R. tinctòrum, Mill. dict. no. 1-2. Roots long, thick, and red. Leaves and stems fading in autumn. Flowers yellow, pentamerous. Berries dark purple.

The root of the dyer's madder is composed of many long, thick, succulent fibres, almost as large as a man's little finger; these are joined at the top in a head, like the roots of asparagus, and strike very deep into the ground, being sometimes more than three feet in length. From the upper part come out many side-roots, which extend just under the surface of the ground to a great distance, whereby it propagates very fast; for these send up a number of shoots, which, if carefully taken off in spring, soon after they are above ground, become so many plants. It is a native of the south of Europe, flowers in June, and seeds soon afterwards; but by them it is never propagated. Madder is mentioned by the Greeks as a medical plant; but when it was first used in dying is uncertain. It has been cultivated in Holland and Flanders, and other parts of the continent for that purpose, for many years, and has been tried in this country; but unless the importation of the root from the continent were entirely prevented, it will not answer. Its culture has been attempted at different times, when our commerce with the Dutch was interrupted, or when they raised the price of the article exorbitantly high. At present it may be imported not only from Holland, but from France, Italy, and Turkey.

The soils most suited to the cultivation of madder are those of the deep, fertile, sandy loams, that are not retentive of moisture, and which have a considerable portion of vegetable matter in their composition. It may also be grown on the more light description of soils, that have sufficient depth, and which are in a proper state of fertility.

The preparation of the soil may either consist in trench-ploughing, lengthways and across, with pronged stirrings, so as to bring it to a fine tilth; or, what will often be found preferable, by one trenching 2 feet deep by manual labour.

The sets of plants are best obtained from the runners, or surface shoots of the old plants. These being taken up, are to be cut into lengths of from 6 to 12 inches, according to the scarcity or abundance of runners. Sets of one inch will grow, if they have an eye, or bud, and some fibres; but their progress will be slow, for want of maternal nourishment. Sets may also be procured by sowing the seeds in fine light earth, a year before they are wanted, and then transplanting them; or sets an inch long may be planted for one year in a garden, and then removed to the field plantation.

The season of planting is commonly May or June, and the manner is generally in rows, 9 or 10 inches asunder, and 5 or 6 inches apart in the rows. Some plant promiscuously in beds, with intervals between; but this is unnecessary, as it is not the surface, but the descending roots, which are used by the dyer.

The operation of planting is generally done by the dibber, but some plant them by the aid of the plough. By this mode, the

ground is ploughed over with a shallow furrow, and in the course of the operation the sets are deposited in each furrow, leaning on and pressed against the furrow-slice. This, however, is a bad mode, as there is no opportunity of firming the plants at the roots, and as some of the sets are apt to be buried, and others not sufficiently covered.

The after culture consists in hoeing and weeding, with stirring by pronged hoes, either of the horse or hand kind. Some earth up, but this is unnecessary, and even injurious, as tearing the surface roots.

The Madder crop is taken at the end of the third autumn after planting, and generally in the month of October. By far the best mode is that of trenching over the ground, which not only clears it effectually, but fits it at once for another crop. But where madder has been grown on land prepared by the plough, that implement may be used in removing it. Previously to trenching, the haulm may be removed with an old scythe, and carted to the farmery, to be used as litter to spread in the straw-yards.

Drying the roots is the next process, which, in very fine seasons, may sometimes be effected on the soil, by simply laying the plants on it as they are taken up; but in most seasons they require to be dried on a kiln, like that used for malt or hops. They are dried till they become brittle, and then packed up in bags for sale to the dyer.

The produce from the root of this plant is different according to the difference of the soil, but mostly from 10 to 15 or 20 hundred weight, where it is suitable to its cultivation.

In judging of the quality of Madder roots, the best is that which, on being broken in two, has a brightish red or purplish appearance, without any yellow cast being exhibited.

The use of the Madder roots is chiefly in dyeing and calico printing. The haulm which accumulates on the surface of the field in the course of 3 years, may be carted to the farm-yard, and fermented along with horse-dung. It has the singular property of dyeing the horns of the animals who eat it of a red colour.

Madder seed in abundance may be collected from the plants in September of the second and third years, but it is never so propagated.—Madder is sometimes blighted, but in general it has but few diseases.

Madder is cultivated in Holland only on the very best soils, and with plenty of manure. At the end of May or April, according as the young plants are large enough to be transplanted, the land must be ploughed in beds of 2 feet, and $2\frac{1}{2}$ feet wide; the beds are then harrowed and raked, and the young suckers of the roots or plants are to be put down in rows, at intervals of a foot or a foot and a half, and at 6 or 8 inches distant in the row. During the entire summer the land should be frequently stirred, and kept free from weeds. In the month of November, when the leaves are faded, the plants are covered with 2 inches of earth, by a plough, having the point of the coulter a little raised or rounded, so as not to injure the young plants. In the following spring, when the young roots are 4 or 5 inches long, they are gathered or torn off, and planted in new beds, in the same manner as above stated; and then, in the month of September or October, after the faded leaves have been removed, the old roots are taken up. The madder thus taken up should be deposited under cover, to protect it from the rain, and after 10 or 12 days, placed in an oven moderately heated. When dried sufficiently it is gently beaten with a flail, to get rid of the clay that may adhere to the plants; and by means of a small wind-mill, is ground and sifted, to separate it from any remaining earth or dirt. It is then replaced in the oven for a short time, and when taken out, is spread upon a hair cloth to cool; after which it is ground and cleaned once more. It is then carried to a bruising mill, and reduced to fine powder, and then packed in casks or barrels for the market.

Var. β, Ibérica (Fisch. in litt. ex D. C. prod. 4. p. 589.) leaves on longer petioles, downy on the veins and nerves beneath. ♃. H. Native of Iberia. The roots of this variety are said to be better for the purposes of dyeing than those of the species.

Dyer's Madder. Fl. June. Clt. 1596. Pl. straggling.

14 R. peregrìna (Lin. spec. p. 158.) herbaceous; leaves 4-6 in a whorl, sessile, lanceolate, shining above, smooth, but scabrous from hooked prickles on the margins and keel, and along the angles of the stem; peduncles axillary, dichotomous; lobes of corolla ovate, cuspidately awned. ♃. H. Native of south and middle Europe, in rough places; in the west of Britain in thickets, and on stony or sandy ground. D. C. fl. fr. 4. no. 3389. Smith, engl. bot. t. 851. R. A'nglica, Huds. angl. 1. p. 54. R. tinctòrum, With. brit. p. 193. R. tinctòrum α, Lam. fl. fr. 2. p. 605. R. lùcida, D'Urv. cat. p. 17.—Petiv. brit. t. 30. f. 3. —Moris, hist. sect. 9. t. 21. f. 2. Flowers dusky yellow, pentamerous. Root creeping, fleshy, tawny red. Berries black.

Foreign Madder. Fl. July. England. Pl. straggling.

15 R. lu'cida (Lin. syst. veg. xii. p. 732.) herbaceous; leaves 4-6 in a whorl, elliptic, shining, with a smooth keel, but scabrous from prickles along the margins and angles of the stem; peduncles axillary, trichotomous, short; lobes of corolla lanceolate, acuminated, inflexed at the points. ♃. H. Native of south and middle Europe, in rugged places. Smith, fl. græc. 142. D. C. fl. fr. 4. p. 268. R. tenuifòlia, D'Urv. cat. p. 17. R. rotundifòlia, Poir. suppl. 2. p. 106. Leaves permanent. Flowers dusky yellow, pentamerous.

Var. β, angustifòlia (Guss. prod. fl. sic. 1. p. 183.) stem smoothish; leaves elliptic-oblong or lanceolate. ♃. H. Native of Sicily and the south of France.

Shining-leaved Madder. Fl. July. Clt. 1762. Pl. straggling.

16 R. Boccòni (Petagn. inst. bot. 2. p. 255.) herbaceous; leaves 4 in a whorl, ovate, shining above, scabrous on the keel and margins, and angles of the stem; peduncles axillary, trichotomous; lobes of corolla 4-5, acute. ♃. H. Native of Naples and Sicily, among calcareous rocks. Ten. fl. neap. t. 10. Guss. prod. sic. 1. p. 182.—Bocc. mus. t. 75.—Barrel. icon. t. 547. Flowers greenish-white, sweet-scented. Habit of *R. lùcida*. Root yellow. Leaves permanent. Angles of stems prickly. Stamens 4-5.

Bocconi's Madder. Fl. June, Aug. Clt. 1823. Pl. straggling.

17 R. sple'ndens (Hoffms. et Link, fl. port. 2. p. 67. t. 85.) herbaceous; leaves 4-6 in a whorl, obversely oblong, acute, having the nerve on both surfaces and margins scabrous from prickles, as well as the angles of the stems; panicles axillary; lobes of corolla prickly. ♃. H. Native of Portugal, in hedges about Lisbon. R. sylvéstris, Brot. fl. lus. 1. p. 153. but not of Mill. Flowers yellow, pentamerous.

Glittering-leaved Madder. Fl. June, Aug. Clt. 1812. Pl. straggling.

18 R. intrica'ta (Hook. et Arn. in bot. misc. 3. p. 362.) glabrous, smoothish; stems diffuse, herbaceous, divaricately branched, intricate, acutely 4-angled; leaves small, oblong-linear, hardly acute, almost nerveless; branches of panicle divaricate; flowers pedunculate, bractless; berries globose.—Native of Chili, among hedges of Cacti at San Isedro.

Intricate-branched Rubia. Pl. diffuse.

19 R. Olivei'rii (A. Rich. in mem. soc. hist. nat. Par. 5. p. 132.) stems suffruticose, rather hexagonal, scabrous from retrograde prickles or bristles; branches powdery, downy; leaves usually 6 in a whorl, oboval, mucronate at the apex, with hispid margins; peduncles axillary, usually by threes, tripartite, and 3-flowered at the apex; corolla subcampanulate, 5-parted. ♃. H. Native of the island of Scio, where it was collected by Oliveir and Bruguiere.

Oliveir's Madder. Pl. straggling.

20 R. Thunbe'rgii (D. C. prod. 4. p. 590.) plant glabrous in every part; leaves usually 4 in a whorl.—Native of the Cape of Good Hope. R. læ`vis, Thunb. fl. cap. 151. but not of Poir. The rest unknown.

Thunberg's Madder. Pl. straggling.

§ 2. *Involucràtæ* (the flowers of the plants contained in this section are involucrated by bracteas). D. C. prod. 4. p. 590. *Peduncles axillary, bearing each* 4 *bracteas in a whorl, which constitute an involucrum to the flowers. Flowers* 1-3, *rising from each involucrum, sessile, or pedicellate, usually tetramerous.—Diffuse prostrate plants, all natives of America, which probably should be joined with Gàlium according to A. Richard.*

* *Berries glabrous. Leaves* 1-*nerved.*

21 R. Walte`ri (D. C. prod. 4. p. 590.) stems tetragonal, smooth on the angles, and pilose on the sides; leaves ovate, membranous, rather pilose on both surfaces while young, but having the keel and margins scabrous in the adult state; bracteas ovate, acute; flowers solitary from the involucra; fruit glabrous, pedicellate. ♃. H. Native of Carolina and Florida, in shady places. R. peregrìna, Walt. car. p. 86. but not of Lin. R. Brównei, Michx. fl. bor. amer. 1. p. 81. exclusive of the syn. of Browne. R. Techénsis, Rafin. fl. lud. p. 76.? Flowers small, yellow, tetramerous. Fruit blackish.

Walter's Madder. Pl. straggling.

22 R. Guadalupe'nsis (Spreng. syst. 1. p. 397.) stems tetragonal, rough along the angles at the base; leaves oblong, mucronate, attenuated at the base, having the margins and keel prickly; peduncles axillary, shorter than the leaves, 1-flowered; flower sessile among the bracteas, which are oblong; berries scabrous. ♃. S. Native of Guadaloupe, where it was collected by Badier and Bertero.

Guadaloupe Madder. Pl. straggling.

23 R. indeco`ra (Cham. et Schlecht. in Linnæa. 3. p. 229.) stems tetragonal, scabrous from pili; leaves oblong, somewhat cuneated, obtuse, mucronate, membranous, remotely pilose on the nerve beneath and margins; peduncles axillary, solitary, opposite, 1-flowered; bracteas lanceolate; ovarium pilose; berries egg-shaped, glabrous, sessile within the involucra. ♃. F. Native of the south of Brazil.

Indecorous Madder. Pl. straggling.

24 R. Chile'nsis (Mol. chil. 118. ed. gall. p. 330. but not of Willd.) stems smooth, tetragonal while young, but at length becoming terete and erectish; leaves oblong-linear, mucronate, pilose on the nerve and margins; peduncles axillary, opposite, 1-flowered, a little longer than the leaves, hairy at top, as well as the bracteas. ♃. F. Native of Chili, near Rancagua and Valparaiso, where it was collected by Bertero, who asserts that it is the *Relbun* of the natives. Nearly allied to *R. indecòra.*

Chili Madder. Pl. straggling.

25 R. ramosíssima (Pohl, in litt. ex D. C. prod. 4. p. 591.) stems tetragonal, rather hairy along the angles; leaves oblong, obtuse, rather cuneated at the base, 1-nerved, rather pilose beneath and glabrous above, and shining; peduncles axillary, length of leaves, 1-flowered; bracteas oval, glabrous; berry sessile, within the involucrum, glabrous. ♃. G. Native of Brazil, where it was collected by Pohl. Herb becoming black on drying.

Much-branched Madder. Pl. straggling.

26 R. valantioìdes (Cham. et Schlecht. in Linnæa. 3. p. 231.) stems tetragonal, pilose along the angles; leaves sessile, ovate, acute, membranous, 3-nerved, pilose on the margins and nerves; peduncles axillary, verticillate, shorter than the leaves, 1-flowered; bracteas ovate-oblong; flower sessile within the involucrum. ♃. F. Native of Brazil. Stem scabrous from the bases of the hairs remaining. Corolla pilose. Berries glabrous.

Valantia-like Madder. Pl. straggling.

27 R. ni'tida (H. B. et Kunth, nov. gen. 3. p. 339. t. 280.) stems tetragonal, beset with reflexed hairs along the angles; leaves elliptic, bluntish, with revolute edges, glabrous above and shining, and rather hairy beneath; peduncles axillary, 1-flowered, opposite, twice the length of the leaves; flower sessile, within the involucrum; berries glabrous. ♃. F. Native at the foot of the burning mount Pichincha, near Quito. Allied to *R. Waltèri.*

Nitid-leaved Madder. Pl. straggling.

28 R. vìlis (Cham. et Schlecht. in Linnæa. 3. p. 230.) glabrous; stems tetragonal, scabrous from retrograde bristles on the angles, and on the nerves and margins of the leaves; leaves oblong, obtuse, hardly attenuated at the base, rather mucronate, membranous; peduncles axillary, verticillate, 3-flowered, length of leaves: the middle flower sessile; bracteas oblong, acute. ♃. F. Native of the south of Brazil. Berries globose.

Vile Madder. Pl. straggling.

29 R. cilia`ta (D. C. prod. 4. p. 591.) stems procumbent, much branched, tetragonal, glabrous; leaves 4 in a whorl, on short petioles, linear-lanceolate, ciliated, reflexed; peduncles axillary, solitary, filiform, 1-flowered, length of leaves, bearing 4 verticillate leaves at the apex; flower sessile, within the involucrum; fruit glabrous. ♃. F. Native of Peru, on arid hills. Gàlium ciliàtum, Ruiz et Pav. fl. per. 1. p. 59. Gàlium involucràtum, H. B. et Kunth, nov. gen. amer. 3. p. 334. Flowers purple. Fruit nutant. Perhaps a species of *Rùbia.*

Ciliated-leaved Madder. Pl. procumbent.

30 R. mona'ntha (D. C. prod. 4. p. 591.) stems procumbent, much branched, tetragonal, smoothish; leaves oval or ovate-oblong, acutish, ciliated with long hairs, hispid above; peduncles axillary, solitary, 1-flowered, bearing each 4 leaves or bracteas just under the flower; flower sessile, within the involucrum; fruit glabrous, smooth. ♃. F. Native of Peru, where it was collected by Hænke. Gàlium monánthon, Bartl. in herb. Hænke. This species is nearly allied to *R. ciliàta.*

One-flowered Madder. Pl. procumbent.

31 R. ova`lis (D. C. l. c.) stems climbing a little, tetragonal, hairy; leaves 4 in a whorl, oblong-oval, acuminated, equal, at length reflexed; peduncles axillary, 1-flowered, a little shorter than the leaves, bearing 4 oval acute bracteas at top under the flower; fruit glabrous. ♃. F. Native of Peru, among rubbish. Gàlium ovà!e, Ruiz et Pav. fl. per. 1. p. 59.

Oval-leaved Madder. Pl. climbing.

32 R. cro`cea (D. C. l. c.) stems procumbent, branched; branches tetragonal; leaves 4 in a whorl, linear, ciliated, rather scabrous beneath; peduncles axillary, short, 1-flowered, bearing 4 leaves at the apex; fruit glabrous.—Native of Peru, at Tarma and Huanaco, on arid declivities. Gàlium cròceum, Ruiz et Pav. fl. per. p. 126. Flowers 3-4-cleft. Fruit of a reddish copper-colour.

Saffron-coloured-fruited Madder. Pl. procumbent.

33 R. læviga`ta (D. C. l. c.) plant quite glabrous; stems tufted, much branched, diffuse; leaves 4 in a whorl, ovate-oblong or ovate-lanceolate; peduncles axillary, 1-flowered, bearing 4 leaves at the apex; flower sessile, within the involucrum; fruit glabrous, smooth. ⊙.? H. Native of Mexico, where it was collected by Hænke. Gàlium lævigàtum, Bartl. mss.

Smooth Madder. Pl. diffuse.

34 R.? corymbòsa (D. C. prod. 4. p. 591.) stems creeping, filiform; branches alternate, erect, corymbosely dichotomous, tetragonal; leaves 4 in a whorl, sessile, approximate, oblong-lanceolate, rather ciliated, glabrous; peduncles 1-flowered, bearing each 4 bracteas: fruit glabrous.—Native of Peru, on the

high mountains of Tarma, at Bombom. Gàlium corymbòsum, Ruiz et Pav. fl. per. 1. p. 59. The roots dye a red colour.

Corymbose-flowered Madder. Pl. creeping.

* * *Berries hairy or scabrous. Leaves* 1-*nerved.*

35 R. hypoca'rpia (D. C. prod. 4. p. 591.) stems tetragonal, hispid from long villi along the angles; leaves oval-oblong, hairy on both surfaces; peduncles axillary, 1-flowered, hardly shorter than the leaves; bracteas oblong, rather hairy; flower as well as the fruit almost sessile within the involucrum; berries rather hairy.—Native of Jamaica. P. Browne, jam. p. 141. Valántia hypocárpia, Lin. spec. 1491. Swártz, obs. p. 385. R. Brównei, Spreng. syst. 1. p. 397. Berries blackish.

Under-fruited Madder. Pl. straggling.

36 R. Re'lbun (Cham. et Schlecht. in Linnæa. 3. p. 229.) the whole plant is scabrous, and clothed with short pili; stems acutely tetragonal; leaves obovate-elliptic, obtuse, mucronate, rather membranous, with ciliated margins, scabrous from hairs on both surfaces; peduncles axillary, 1-flowered, opposite or verticillate; bracteas broad-lanceolate; flower sessile; berry sessile, globose, rather pilose. ♃. F. Native of Chili, Brazil, and Caraccas. Poep. pl. exsic. chil. no. 705. Feuill. obs. 3. p. 60. t. 45. R. Chilénsis, Willd. spec. 1. p. 604. but not of Mol. The plant is called *Relbun* in Chili, as well as other species; and the roots are red, and used for dyeing like the common madder.

Relbun Madder. Pl. straggling.

37 R. Richardia'na (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 362.) plant glabrous, scabrous, shining; stems erectish, teretely quadrangular; leaves 4 in a whorl, linear-oblong, acute, 1-nerved, one-half shorter than the internodes; peduncles opposite or in whorles, equal in length to the leaves, bearing 4 bracteas and 3 flowers at the apex; fruit tubercular in the immature state.—Andes of Mendoza.

Richardson's Rubia. Pl. straggling.

38 R. Hænkea'na (Gill. mss. ex Hook. bot. misc. 3. p. 363.) plant hairy, hoary; stems procumbent, terete; leaves 4 in a whorl, linear, acute, deflexed, one-nerved, broader at the base; peduncles in whorles much longer than the leaves, bearing 3 flowers and 4 bracteas at the apex; fruit tubercular, scabrous. ♃. F. Native of Chili, about Mendoza.

Hænke's Rubia. Pl. procumbent.

39 R. pusi'lla (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 363.) plant tufted, glabrous, branched, shining; stems smooth, terete, furrowed; leaves 4 in a whorl, oblong-linear, mucronate, with smoothish margins; peduncles equal in length to the leaves, bearing 3 flowers and 3 bracteas at the apex; fruit minutely tubercular when immature. ♃. F. Native of Chili, in the province of San Louis. This has quite the appearance of some states of *Gàlium pùmilum*.

Small Rubia. Pl. straggling.

40 R. Orinoce'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 239.) stems tetragonal, glabrous, scabrous on the angles; branches pilose; leaves on short petioles, oblong, acute, pilose, one-half shorter than the internodes; peduncles axillary, 1-flowered, solitary; flower almost sessile, within the involucrum; berries pilose. ♃. F. Native on the banks of the Orinoco, in hot places, and cf the south of Brazil, ex Cham. et Schlecht. in Linnæa. 4. p. 228. R. Brównei, Spreng. syst. 1. p. 397. Gàlium pauciflòrum, Willd. herb.

Orinoco Madder. Pl. straggling.

41 R. mucrona'ta (Hook. et Arn. in bot. misc. 3. p. 363.) stems prostrate, glabrous, terete, 4-furrowed, branched; leaves 4 in a whorl, linear-oblong, glabrous, shining, with revolute edges, 3 times shorter than the internodes; common peduncles axillary, longer than the leaves; flowers cymose. ♃. F. Native of Chili, about Conception and Tarma; and of Peru, in arid places. Gàlium leucocárpum, D. C. prod. 4. p. 612. Gàlium Tarménse, Spreng. syst. p. 27. G. mucronàtum. Ruiz et Pav. fl. per. 1. p. 66. G. apiculàtum, Rœm. et Schultes, syst. 3. p. 222. Fruit milk coloured.

Mucronate Madder. Pl. prostrate.

42 R. inca'na (H. B. et Kunth, nov. gen. amer. 3. p. 338.) stems tetragonal, hoary from villi; leaves 4 in a whorl, ovate, short-acuminated, mucronate, with revolute margins, which are as well as the middle nerve hispid from pili; peduncles axillary, 1-flowered, length of leaves; flower sessile, within the involucrum; berries rather pilose. ♃. F. Native on the Andes about Quindiu, near El Moral. Corolla rather hairy outside.

Hoary Madder. Pl. straggling.

43 R. hi'rta (H. B. et Kunth, nov. gen. amer. 3. p. 338.) stems tetragonal, hairy; leaves 4 in a whorl, on short petioles, oblong, acute, mucronate, hairy; peduncles axillary, opposite, 1-flowered, hardly shorter than the leaves; flower sessile, within the involucrum; berries scabrous. ♃. F. Native near the town of Quito.

Hairy Madder. Pl. straggling.

* * * *Leaves* 3-*nerved. Berries glabrous.*

44 R. nóxia (St. Hil. pl. rem. bras. p. 229.) stems tetragonal, beset with retrograde bristles along the angles below, and hairy at top; leaves sessile, elliptic, obtuse, ending in a very short point, 3-nerved, membranous, rather pellucid, scabrous from pili above, and on the nerves beneath; peduncles axillary, solitary, 1-flowered, pilose; bracteas 4, ovate; berries glabrous.—Native of Brazil, in woods in the province of Minas Geraes. Corollas greenish, hardly pilose. Flowers either sessile or pedicellate within the involucrum. Berries white.

Hurtful Madder. Pl. straggling.

45 R. a'spera (Pohl, in litt. ex D. C. prod. 4. p. 592.) stems tetragonal, glabrous, scabrous along the angles from retrograde bristles; leaves sessile, ovate, mucronulate, membranous, 3-nerved, rather scabrous along the margins and nerves, especially beneath, glabrous; peduncles axillary, tetragonal, rather longer than the leaves; bracteas oval, glabrous; berries glabrous, sessile, within the involucrum. ♃. F. Native of Brazil, where it was collected by Pohl. Nodi of stems scabrous from short crowded hairs. Bracteas greenish-yellow. Berries blackish.

Rough Madder. Pl. straggling.

46 R. diffu'sa (Pohl, in litt. ex D. C. prod. 4. p. 592.) stems tetragonal, hispid; leaves sessile, oval, acute, membranous, 3-nerved, hispid along the margins and nerves, especially beneath; peduncles axillary, 1-flowered, longer than the leaves; bracteas 4, ovate, acute, rather hispid; berry glabrous, sessile within the involucrum. ♃. F. Native of Brazil, where it was collected by Pohl. Upper leaves smoothish. Peduncles 5-6 lines long. Berries blackish.

Diffuse Madder. Pl. straggling.

§ 3. *Galioìdeæ* (this section contains plants having the habit of species of *Gàlium*). D. C. prod. 4. p. 492. *American species with tetrandrous flowers, which are disposed in dichotomous cymes, never girded by any involucra.*

47 R. equisetoìdes (Cham. et Schlecht. in Linnæa. 3. p. 232.) branches compressedly tetragonal, scabrous from retrograde bristles; leaves small, erectly adpressed, somewhat triangular, acute; cymes divaricate, dichotomous or trichotomous; flowers sessile in the forks; bracteas 4, under the branches; berries glabrous. ♃. F. Native of the south of Brazil.

Horse-tail-like Madder. Pl. straggling.

48 R. ephedroìdes (Cham. et Schlecht. in Linnæa. 3. p. 231.) glabrous; stem nearly terete; branches acutely tetragonal, roughish; leaves narrow-elliptic or linear, acute, smooth; cymes

dichotomous or trichotomous; bracteas *conforming to the leaves* under the branches; flowers pedicellate; berries glabrous. ♃. F. Native of Brazil. Leaves deciduous, smooth.

Ephedra like Madder. Pl. straggling.

49 R. sca'bra (H. B. et Kunth, nov. gen. amer. 3. p. 340.) stems tetragonal, beset with retrograde prickles along the angles; leaves 6 in a whorl, and the upper ones 4 in a whorl, sessile, oblong-lanceolate, acutish, with rather revolute and serrulated edges, 3 times shorter than the internodes; peduncles terminal, usually by threes; bracteas 1-3; berries glabrous. ⊙. H. Native of the Andes about Quindiu, between Carthage and Ibague. Perhaps a species of *Gàlium* nearly allied to *G. Claytòni*.

Scabrous Madder. Pl. straggling.

50 R. de'bilis (H. B. et Kunth, nov. gen. amer. 3. p. 340.) stems tetragonal, beset with retrograde prickles along the angles; leaves oblong, acute, mucronate, flat, having the margins and keel beset with retrograde prickles; peduncles 2-3 together, terminal, 1-flowered, naked; berries glabrous. ♃. F. Native of Quito, in high places near Chillo and Ichubamba. Perhaps a species of *Gàlium* nearly allied to *G. ciliàtum*. Mature fruit unknown.

Weak Madder. Pl. trailing.

Cult. The species will grow in any common soil, and are all easily increased by dividing at the root or by seeds. Those species natives of warm climates require to be placed in the green-house in winter.

CCXVI. GA'LIUM (from γαλα, *gala*, milk; some species are used for curdling milk). Scop. carn. ed. 2. vol. 1. p. 94. D. C. fl. fr. ed. 3. vol. 4. p. 248. Rœm. et Schultes, syst. 3. p. 481. D. C. prod. 4. p. 593.—Gàlium and Valántia species, Lin.—Gàlium, Aparìne, and A'spera, Mœnch. meth.—Gàlium, Eysèlia, Aparìne, Neck. elem. no. 332. 333. and 335.—Gàlium and Aparìne, Tourn. inst. t. 39. Mœnch. meth. 484. and 640.—Gàlium species, A. Rich. mem. soc. hist. nat. Par. 5. p. 133.

Lin. syst. *Tetrándria, Digýnia.* Calyx with an ovate-globose or oblong tube, and hardly any limb. Corolla 4-parted (f. 111. *b.*), rotate, rarely 3-parted. Stamens 4, short (f. 111. *c.*). Styles 2, short. Fruit didymous, roundish, rarely oblong, dry, composed of 2 indehiscent 1-seeded mericarps.—Branched herbs. Leaves forming whorles along with the stipulas. Inflorescence variable.

Sect. I. Euga'lium. Perennial plants.

§ 1. *Leiogàlia* (from λειος, *leios*, smooth, and *galium*; in reference to the smooth fruit of the species). *Perennial plants. Leaves 6 to 10 in a whorl, rarely only 4-5. Flowers disposed in cymose panicles, hermaphrodite, white. Fruit glabrous.*

1 G. sylva'ticum (Lin. spec. p. 155.) stems erect, smooth, terete, much branched; leaves 8 in a whorl, elliptic, obtuse, mucronate, smooth, scabrous beneath, and rather glaucous; floral leaves opposite; peduncles capillary, disposed in a terminal panicle; lobes of corolla obtuse; fruit glabrous. ♃. H. Native throughout Europe (Britain and Sicily excepted), in woods. D. C. fl. fr. no. 3356.—Bauh. hist. 3. pt. 2. p. 716. f. 4. Flowers white.

Var. β, pubéscens (D. C. fl. fr. vol. 4. p. 248.) stem, branches, and nerves on the under side of leaves downy. ♃. H. Native of Moguntia and elsewhere.

Wood Bed-straw. Fl. July, Aug. Clt. 1658. Pl. 1 to 2 ft.

2 G. linifòlium (Lam. dict. 2. p. 578.) stems erect, terete, smooth; leaves 4-8 in a whorl, lanceolate-linear, acuminated, quite glabrous, membranous, glaucous beneath, with smoothish margins; peduncles capillary, panicled; lobes of corolla acute; fruit glabrous, smooth. ♃. H. Native of Dauphiny, Provence, Italy, &c. in shady places as in woods. D. C. fl. fr. 4. p. 252. G. àtro-vírens, Lapeyr. abr. ex Benth. G. lævigàtum, Vill. dauph. 2. p. 229. Leaves rather rough at the tops from a very few bristles or prickles. Flowers white.

Var. β, serrulàtum (D. C. prod. 4. p. 593.) leaves membranous, serrulated by prickles round the margins. ♃. H. Native about Naples, where it was collected by Passy.

Var. γ? rigídulum (D. C. prod. 4. p. 593.) leaves stiffish, subserrated round the margin. ♃. H. Native of the Pyrenees and Corsica, &c. G. aristàtum, Gaud. fl. helv. and perhaps of Lin. G. glaúcum, Sut. fl. helv.? G. intermèdium, Schultes, obs. bot. no. 153.? G. sylváticum, Bess. fl. gal. 1. p. 219. G. glaúcum, Oed. fl. dan. t. 609. G. mutábile, Bess. cont. fl. Volh. no. 1336. is probably referrible to this. Perhaps a proper species.

Flax-leaved Bed-straw. Fl. June, July. Clt. 1759. Pl. 1 to 2 feet, var. γ, 3 to 4 feet.

3 G. Pascha'le (Forsk. descrip. p. 203.) stems weak, glabrous, smooth; leaves 8-9 in a whorl, linear-lanceolate, with scabrous margins, glabrous, mucronate; peduncles axillary, opposite, twice longer than the leaves, trichotomous at the apex; fruit glabrous, minute. ♃. H. Native about Constantinople. G. Hierosolymitànum is probably not distinct from this, ex Vahl, symb. 2. p. 29. but that plant is joined to *G. læ've* by Schrader, and to *G. scàbrum* by Persoon. Flowers white.

Paschale Bed-straw. Pl. 1½ foot.

4 G. incu'rvum (Sibth and Smith, fl. græc. t. 132.) stems panicled; leaves 8 in a whorl, linear, glabrous, awned, incurved; lobes of corolla obtuse, awnless; fruit glabrous. ♃. H. Native of Crete, on the sphaceotic mountains. Flowers yellow.—Perhaps the same as G. incúrvum, D'Urv. enum. p. 15. which was collected on rocky hills in the island of Samos. Stem often pubescent. Peduncles axillary and terminal, trichotomous.

Incurved Bed-straw. Pl.

5 G. subtri'fidum (Reinw. ex Blum. bijdr. p. 944.) stems twiggy, obversely scabrous; leaves usually 6 in a whorl, short, narrow, linear-spatulate, acutish, rather scabrous; peduncles terminal, few-flowered. ♃. F. Native of Java, on the mountains. Said to be nearly allied to *G. spatulàtum* and *G. pùmilum*.

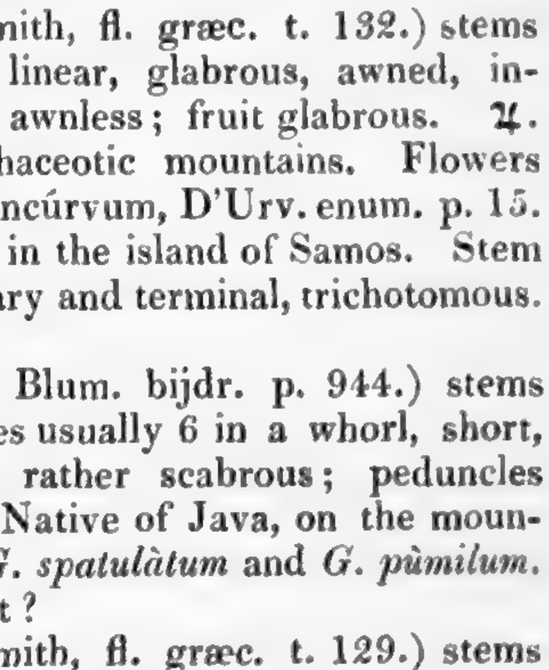
Subtrifid Bed-straw. Pl. 1 foot?

6 G. apicula'tum (Sibth et Smith, fl. græc. t. 129.) stems hoary; leaves 6 in a whorl, lanceolate, rather scabrous; peduncles trichotomous, leafy; lobes of corolla apiculated; fruit glabrous. ♃. H. Native of Mounts Parnassus and Athos. Rœm. et Schultes, syst. p. 229. but not p. 222. Flowers greenish-purple. Peduncles axillary and terminal, forming a leafy panicled raceme.

Apiculated-flowered Bed-straw. Pl. ½ to 1 foot.

7 G. inca'num (Sibth et Smith, fl. græc. t. 130.) leaves 6 in a whorl, linear, and are as well as the stems hoary; peduncles 3-flowered; lobes of corolla awned; fruit glabrous. ♃. H. Native on Mount Parnassus. Flowers white. (f. 111.)

FIG. 111.



Hoary Bed-straw. Pl. tufted, ¼ to ½ foot.

8 G. obli'quum (Vill. dauph. 2. p. 324. t. 8.) stems ascending, tetragonal, villous at the bottom; leaves 8 in a whorl: lower ones obovate, villous: upper ones linear-lanceolate, glabrous; peduncles twice trifid, glabrous; lobes of corolla ending in a setaceous acumen each; fruit glabrous. ♃. H. Native of Dauphiny, Piedmont, Etruria, and Austria, in rugged places, and in hedges among the mountains. G. mucronàtum, Lam. dict. 2. p. 581. D. C. fl. fr. 4. p. 258. Flowers white. Habit of *G. Boccòni*, but differs in the lobes of the corolla ending in a setaceous point.

Oblique Bed-straw. Pl. 1 foot, ascending.

9 G. PUSI'LLUM (Lin. spec. 154. Smith, engl. bot. 74.) stems diffuse, ascending or decumbent, smooth, glabrous; leaves 8 in a whorl, linear-lanceolate, acute, mucronate, glabrous: lower ones almost obovate; umbels terminal, trichotomous; lobes of corolla acute, not awned; fruit glabrous. ♃. H. Native of Europe, in dry pastures and in hedges frequent. In Britain on limestone hills near Kendal; about Matlock bath, Derbyshire; in Scotland; and in Ireland, near the lake of Killarney. D. C. fl. fr. no. 3366. var. a. This is a very variable plant, and to it belong G. Austrìacum, Jacq. fl. austr. t. 80. G. læ've, Thuill. fl. par. ed. 2. vol. 1. p. 77. G. sylvéstre vulgàtum, Gaudin, fl. helv. 1. p. 248. G. glàbrum, Sut. fl. helv. p. 90. G. papillòsum, Lapeyr. abr. p. 66. G. pállens, Thuill. fl. par. G. umbellàtum α, Lam. dict. 2. p. 579. and G. multicaúle oxyphýllum, Wallr. sched. p. 53. Flowers white. Plants forming tufts. Lower leaves and stems sometimes slightly hairy.

Small Bed-straw. Fl. June, Aug. England. Pl. ½ to 1 ft.

10 G. ALPE'STRE (Gaud. in Rœm. et Schultes, syst. 3. p. 225.) plant tufted, glabrous, ascending, erectish, stiff; stems smooth, glabrous; leaves 8 in a whorl, obversely lanceolate, with smoothish margins; umbels trichotomous, fastigiate; lobes of corolla acute, not awned; fruit smooth, glabrous. ♃. H. Native of France, Switzerland, Germany, Carniola, and Upper Italy, among the mountains and alps. G. læ've var. α, β, and γ, D. C. fl. fr. 4. p. 256. G. sylvéstre alpéstre, Gaud. fl. helv. 1. p. 429. G. anisophýllum, pusíllum, montànum, and argénteum, Vill. dauph. 2. p. 318-324. t. 78. G. læ've, Schleich. G. Jussiæ'i, Vill. dauph. 2. p. 323. t. 7. Flowers white. There are varieties of this species with stems from a finger to a hand high, quite glabrous or rather hairy. It is intermediate between *G. læ've*, *G. Boccòni*, and *G. supìnum*, which probably should be all combined under one name.

Alp Bed-straw. Fl. June, July. Clt. 1819. Pl. ½ foot.

11 G. BOCCÒNI (All. ped. no. 24.) stems ascending, tetragonal, downy below; leaves 6-8 in a whorl, obversely lanceolate, smoothish, mucronate: lower ones broadest and downy; umbels trichotomous; lobes of corolla acute, not awned; fruit glabrous, smooth. ♃. H. Native of France, Italy, Germany, in dry sterile places, and in hedges. D. C. fl. fr. no. 3367. G. sylvéstre Boccòni, Gaud. fl. helv. 1. p. 430. G. sylvéstre hirsùtum, Mert. et Koch. deutsch. fl. G. umbellàtum, β, Lam. G. scàbrum, Pers. ench. 1. p. 127. Schleich. exsic. G. sylvéstre, Poll. no. 151. G. nitídulum, Thuill. fl. par. 1. p. 86. G. ásperum, Schreb. spic. p. 5. G. hirsùtum, Sut. fl. helv. G. Marchándi, Lapeyr. abr. p. 25. G. Jussiæ'i, Lapeyr. ex Arnott. G. multicaúle eriophýllum, Wallr. sched. p. 54.—Bocc. mus. t. 101. Barrel. icon. t. 57. Flowers white, tinged with red outside. Probably only a variety of *G. læ've*.

Bocconi's Bed-straw. Fl. May, July. Clt. 1801. Pl. 1 foot, ascending.

12 G. PU'MILUM (Lam. dict. 2. p. 580. ill. no. 1368. t. 60. f. 2.) plant tufted; leaves 6-8 in a whorl, linear, smooth, bisulcate beneath, very acute, tumid at the base; flowers almost terminal, subumbellate; peduncles longer than the leaves; fruit glabrous. ♃. H. Native of the Pyrenees, in rugged places, &c. D. C. fl. fr. no. 3374. Req. diss. mss. G. trichophýllum, All. ped. auct. p. 1. Flowers white. Lobes of the corolla obtuse.

Var. α, hypnoìdes (Vill. dauph. 2. p. 323.) plant tufted, erectish; peduncles 2-3-flowered. ♃. H. Native of Dauphiny, frequent on the mountains.

Var. β, cæspitòsum (Req. diss. mss.) stems decumbent, much branched; pedicels 1-flowered. ♃. H. Native of the Pyrenees, in high pastures. G. cæspitòsum, Ramond, act. acad. sc. par. 1826. p. 155. Lam. ill. no. 1369.? G. Jussiæ'i, Vill. ex Gaud. in litt.

Var. γ, réctum (Req. diss. mss.) stems erectish, branched above; peduncles divided, 2-4-flowered. ♃. H. Native of Provence, &c. among rocks.

Var. δ, pubéscens (D. C. fl. fr. suppl. p. 496.) stems tufted, erectish, and are, as well as the leaves, downy. ♃. H. Native of Provence, in exposed, rocky places. G. pubéscens, Req. in litt. 1813. G. pusíllum, Lin. spec. 154. G. pùmilum hirtéllum, Gaud. fl. helv. 1. p. 433.

Dwarf Bed-straw. Fl. June, July. Clt. 1820. Pl. tufted.

13 G. LITTORA'LE (Guss. fl. sic. prod. 1. p. 172.) stems stiff, tetragonal; branches approximate; leaves usually 8 in a whorl, oblong-lanceolate, dilated at the apex, mucronate, a little serrated on the margin, spreading or reflexed; branches of panicle trichotomous, erect; corolla downy outside, with ovate-lanceolate, awned lobes. ♃. H. Native of Sicily, in sandy, bushy places by the sea side. Flowers white. Nearly allied to *G. Mollùgo* and *G. apiculàtum*.

Var. β, pubéscens (Guss. l. c.) stems and peduncles downy or villous at top.

Sea-shore Bed-straw. Pl. 1 to 2 feet.

14 G. SUPÌNUM (Lam. dict. 2. p. 579.) stems procumbent, filiform, branched, smooth; leaves 5 in a whorl, obovate-linear, with prickly or scabrous edges; umbels trichotomous; lobes of corolla awnless; fruit glabrous. ♃. H. Native of the temperate parts of Europe, in hedges. D. C. fl. fr. no. 3372. Req. diss. mss. G. sylvéstre pùmilum, Mert. et Koch. deutsch. fl. 1. p. 789. Gaud. fl. helv. 1. p. 431. G. Jussiæ'i, Vill. dauph. 2. p. 323.? G. multicaúle polyphýllum, Wallr. sched. p. 59. Juss. act. acad. par. 1714. p. 378. t. 15. f. 2. but the plant, in Jussieu's herbarium, has the margins of the leaves smooth and revolute. Flowers white.

Supine Bed-straw. Fl. June, July. Clt. 1819. Pl. proc.

15 G. TYROLE'NSE (Willd. enum. 1. p. 153.) stems flaccid, tetragonal, equal, smooth; leaves 6-8 in a whorl, obovate-lanceolate, mucronate, with scabrous margins; floriferous branches panicled; peduncles trifid; lobes of corolla awned; fruit smooth, glabrous. ♃. H. Native about Tyrol, on the mountains, &c. Req. diss. mss. G. spléndens, Horn. suppl. 17.? G. Mollùgo, var. Link. Flowers white. Probably a mere variety of *G. Mullùgo*.

Tyrolese Bed-straw. Fl. June, July. Clt. 1801. Pl. 1 to 2 ft.

16 G. CINE'REUM (All. ped. no. 22. t. 77. f. 4.) stems erect, woody at the base, much branched, panicled at top, tetragonal and smooth; leaves 6-8 in a whorl, linear, glaucous beneath, stiff, mucronate, with hardly scabrous margins, usually reflexed; branches of panicle trichotomous; lobes of corolla ending in a setaceous mucrone each; fruit glabrous, smooth. ♃. H. Native of the south of France, in exposed places; and Upper Italy and Vallais. In the lowlands of Scotland, on the banks of the river Leith near Slateford, 3 miles from Edinburgh. D. C. fl. fr. no. 3364. G. diffùsum, Hook. scot. p. 52. Bristles on the edges of the leaves pointing forward. Flowers white.

Var. β, tenuifòlium (D. C. prod. 4. p. 595.) leaves linear, and stiffer than those of the species. ♃. H. Native of Piedmont and Dauphiny. G. tenuifòlium, All. ped. no. 23. D. C. fl. fr. no. 3365. G. corrudæfòlium. Vill. dauph. 2. p. 320. G. pállidum, Presl. fl. sic. pr. 60.

Var. γ, pubéscens (D. C. fl. fr. no. 3364.) lower part of the stems and lower leaves downy. ♃. H. Native of dry, exposed places.

Grey Bed-straw. Fl. June, July. Scotland. Pl. 1 to 2 ft.

17 G. HYRCA'NICUM (Meyer, verz. pfl. p. 53.) plant glaucescent, downy; stems erectish, branched a little, tetragonal, smooth; leaves 6 in a whorl, nearly linear, mucronately acuminated, 1-nerved, smooth; umbels trichotomous, terminal; corolla glabrous, having the lobes terminated by a deciduous, inflexed point; fructiferous pedicels erectly spreading, hardly

twice the length of the fruit. ♃. H. Native of Caucasus, among rocks, and in stony, dry places, on the Talusch mountains.

Hyrcanian Bed-straw. Pl. 1 foot.

18 G. ERE'CTUM (Huds. angl. p. 68. Smith, engl. bot. 2067.) stems erect, branched at the top, tetragonal, smooth, equal; leaves 6-8 in a whorl, linear-lanceolate, mucronate, stiff, having the margins serrulated with prickles; panicles trichotomous, lobes of corolla acuminated; fruit glabrous, smooth. ♃. H. Native of Europe, in hedges and pastures. In England, on the bushy part of Heydon Common; and in dry hedges at Port-Slade. D. C. fl. fr. no. 3362. Req. diss. mss. G. provinciàlis, Lam. dict. 2. p. 581. Stem slightly hairy under each joint. Marginal bristles of leaves pointing forwards. Flowers white. Perhaps a mere variety of *G. Mollùgo*.

Var. β, *lùcidum* (D. C. l. c.) lobes of corolla setaceously acuminated. ♃. H. Native of hills in Piedmont and Dauphiny. G. lùcidum, All. ped. no. 21. t. 77. f. 2. G. rígidum, Vill. dauph. 2. p. 319.

Var. γ, *scábridum* (D. C. prod. 4. p. 596.) lower part of stem and lower leaves clothed with scabrous pubescence. ♃. H. Native of Switzerland and Austria, on dry hills. G. pubéscens, Schleich. exsic. G. scàbrum, Jacq. fl. aust. t. 422. G. lùcidum, β, Gaud. fl. helv. 1. p. 419.

Var. δ, *approximàtum* (D. C. prod. 4. p. 596.) whorles of leaves closer together. ♃. H. G. lùcidum, Hort. par.

Erect Bed-straw. Fl. June, July. Britain. Pl. 1 to 2 feet.

19 G. MOLLU'GO (Lin. spec. p. 155.) stems flaccid, tetragonal, thickened above the nodi, glabrous, spreadingly branched; leaves 6-8 in a whorl, elliptic-obovate, mucronate, spreading, serrated a little; peduncles much branched, disposed in panicles; lobes of corolla acuminated; fruit glabrous, smooth. ♃. H. Native almost throughout Europe and Caucasus, in hedges; plentiful in Britain. Œder. fl. dan. t. 455. Bull. herb. t. 283. Smith, engl. bot. t. 1673. Lob. icon. t. 802. f. 12. G. boreàle, Lapeyr. ex Benth.—Petiv. herb. brit. t. 30. f. 4. Flowers white, and sometimes yellowish. Herb very variable in height and breadth of leaves. Leaves hairy on the margins and keel, but never rough to the touch. The plant is called *Wild Madder*, and *Great Bastard Madder*. The roots are creeping, and yield a red dye like the true Madder, but of a brighter colour: like that also they dye the bones of animals red that feed on them.

Vau. β, *aristàtum* (Dub. bot. gall. p. 249.) lobes of corolla mucronate. ♃. H. G. aristàtum, Lin. spec. 152. D. C. fl. fr. 4. p. 255.

Var. γ, *scàbrum* (D. C. fl. fr. no. 3361. β.) lower parts of stems and lower leaves scabrous from hairs. ♃. H. Native of exposed places. G. scàbrum, With. brit. 190.

Var. δ, *elàtum* (D. C. prod. 4. p. 596.) stems taller and more tumid at the joints. ♃. H. Native of moist places, as bogs. G. elàtum, Thuill. fl. par. ed. 2. vol. 1. p. 76.

Mollugo, or Great-hedge Bed-straw. Fl. July, Aug. Britain. Pl. 2 to 4 feet.

20 G. FRUTICÒSUM (Willd. spec. 1. p. 585.) stems suffrutescent, glabrous, tetragonal; leaves 4 in a whorl, linear, very blunt, glabrous; flowers densely panicled at the tops of the branches; lobes of corolla acuminated; fruit glabrous. ♃. H. Native of Candia. Cruciàta Crética fruticòsa, flore albo, Tourn. cor. p. 4. Very nearly allied to *G. Mollùgo*.

Shrubby Bed-straw. Fl. June, July. Clt. 1819. Sh. 1 ft.

21 G. MEDITERRA'NEUM (D. C. prod. 4. p. 596.) stems ascending, tetragonal, smooth; lower leaves 4 in a whorl, obovate, mucronulate: upper leaves 6 in a whorl, linear-lanceolate, mucronate, with rather scabrous margins; peduncles di-trichotomous; lobes of corolla ending in an awn; fruit glabrous. ♃. H. Native of Corsica, on Mount Reston, where it was collected by M. Thomas; and on the mountains of Liguria, by Badaro. G. campéstre, Dub. bot. gall. 1. p. 248. but not of Willd. Flowers white or yellowish. It differs from *G. campéstre* in the stem being smooth, not scabrous on the angles, in the form of the leaves, and in the awned lobes of the corolla.

Mediterranean Bed-straw. Pl. ascending.

22 G. MA'XIMUM (Moris, elench. sard. 1. p. 55.) plant glabrous; stems smoothish, much branched, erect; leaves 6 in a whorl, oblong-linear, obtuse, with scabrous edges; branches 4 in a whorl; peduncles trichotomous; lobes of corolla acutish; fruit glabrous. ♃. H. Native of Sardinia, among bushes, and in wet pastures by the sea side.

Largest Bed-straw. Pl. 2 to 3 feet.?

23 G. INSU'BRICUM (Gaud. fl. helv. 1. p. 421.) plant glabrous; stems decumbent, much branched; leaves obovate, apiculated, serrated with prickles: cauline ones 6 in a whorl: rameal ones 4 in a whorl; umbels trifid, few-flowered; bracteas oblong, solitary; lobes of corolla drawn out into a thread each; fruit glabrous. ♃. H. Native of Switzerland and Insubria, in rocky, stony places. Flowers very small, white. Allied to *G. Mollùgo*.

Insubrian Bed-straw. Pl. decumbent.

24 G. PYRENA'ICUM (Gouan. ill. p. 5. t. 1. f. 4.) plant tufted, quite glabrous, greenish-glaucous, shining; stems striated, smooth; leaves 6 in a whorl, linear, aristate, erect, approximate, rather tumid at the base; pedicels axillary, solitary, 3 times shorter than the leaves, 1-flowered; fruit glabrous. ♃. H. Native of the Pyrenees, especially on the eastern and central ranges; and on the top of Mount Olympus, in Bithynia. Lin. fil. suppl. p. 121. D. C. fl. fr. no. 3373. exclusive of the syn. of Vill. Sibth. et Smith, fl. græc. t. 131. G. muscoìdes, Lam. dict. 2. p. 580. Flowers pure white. Leaves keeled, with revolute edges.

Pyrenæan Bed-straw. Pl. ¼ foot, tufted.

25 G. VILLA'RSII (Req. in Guer. in vaucl. ed. 2. p. 250.) stems flaccid, filiform, glabrous, much branched; leaves 4-6 in a whorl, oblong-linear, soft, mucronate, with smoothish margins; peduncles by threes, trifid, subumbellate; lobes of corolla awnless; fruit smooth, glabrous. ♃. H. Native of the Alps of Europe and the Pyrenees, on rocks, or in stony pastures. D. C. fl. fr. suppl. p. 497. Gaud. in Rœm. et Schultes, syst. 3. p. 220. Benth. cat. p. 80. G. megalospérma, All. ped. no. 55. t. 79. f. 4.? Vill. dauph. 2. p. 517. t. 7. but not of Lam. G. sylvéstre vírens, Gaud. fl. helv. 1. p. 432. G. megalospérmum, suavèolens, and cometerhìzon, Lapeyr. abrig. and suppl. ex Benth. Herb blackish in the dried state. Fruit larger than in the allies. Flowers small, white.

Villars's Bed-straw. Fl. June, July. Clt. 1823. Pl. dec.

26 G. ULIGINÒSUM (Lin. spec. 153.) stems weak, erectish, scabrous along the angles; leaves 6 in a whorl, obovate-lanceolate, serrulated on the margins and nerve, with retrograde prickles, mucronate, stiff; peduncles almost terminal, trichotomous; lobes of corolla acute; fruit glabrous, dotted. ♃. H. Native of Europe and Siberia, in bogs, wet meadows, and ditches, among reeds; plentiful in Britain. D. C. fl. fr. no. 3371. Req. diss. Smith, engl. bot. t. 1972. Schrad. spic. 17. t. 1. f. 1. Hook. fl. lond. fasc. 1. t. 21. G. spinulòsum, Merat, ex Lejeun. fl. spa. p. 33.? G. supìnum, β, Lam. dict. 2. p. 579. G. spùrium, β, Sut. fl. helv. no. 175. Corollas white; anthers purplish. Root and lateral shoots creeping.

Var. α, *Witheringii* (D. C. prod. 4. p. 597.) leaves lanceolate: lower ones 5-6 in a whorl: upper 4 in a whorl, beset with hooked prickles on the margins: the serratures often tumid towards the apex. ♃. H. Native of Scotland, in bogs. G. montànum, With. arr. p. 187. t. 28. G. Witheringii, Smith, fl. brit. p. 174. engl. bot. t. 2206. The prickles on the edges of the leaves are sometimes retrograde, sometimes straight, and sometimes forward.

Bog Bed-straw. Fl. July, Aug. Britain. Pl. 1 foot.

27 G. helòdes (Hoffm. et Link. fl. port. 2. p. 47.) stems weak, diffuse, scabrous; leaves 5-6 in a whorl, lanceolate-linear, mucronulate, scabrous above and on the margins; panicles capillary. ♃. H. Native of Portugal, in marshes about Torres Vedras. G. uliginòsum, Brot. fl. lus. 1. p. 150. It is very like *G. uliginòsum*, and probably only a variety of it.

Marsh Bed-straw. Fl. July. Clt. 1325. Pl. decumbent.

28 G. palu'stre (Lin. spec. p. 153.) stems diffuse, tetragonal, rather scabrous; leaves 4-6 in a whorl, obovate, obtuse, unequal, glabrous, with scabrous edges: superior ones lanceolate; peduncles nearly terminal, trichotomous; lobes of corolla ovate, awnless; fruit smooth, glabrous. ♃. H. Native of Europe and Siberia, on the banks of rivers and ditches, and in moist meadows; frequent in Britain. Œd. fl. dan. t. 423. Smith, engl. bot. t. 1857. Hook. fl. lond. fasc. 1. t. 20.—Petiv. brit. t. 30. f. 5. Roots creeping. Flowers numerous, white. Plant tall when supported by other herbage.

Var. β, constrictum (Dub. bot. gall. 1. p. 260.) leaves linear. ♃. H. G. constrictum, Chaub. in St. Amans. fl. agr. bouq. t. 2. G. elongàtum, Presl. fl. sic. prod. p. 59.

Var. γ, dèbile (D. C. prod. 4. p. 597.) leaves 5-6 in a whorl; stem roughish. ♃. H. G. dèbile, Desv. obs. fl. par. 134. G. uliginòsum, Mer. fl. par. 2. p. 220.

Fen Bed-straw. Fl. July, Aug. Britain. Pl. 3 to 4 feet.

29 G. suberòsum (Sibth. et Smith, fl. græc. t. 128.) stems diffuse, much branched, smooth; leaves 4 in a whorl, lanceolate, acute, glabrous; flowers terminal and axillary, by threes; fruit glabrous. ♃. H. Native of Candia, on the mountains. Leaves with roughish margins. Flowers greenish-purple, bracteolate. Bracteas ciliated, ovate, acute.

Corky-fruited Bed-straw. Pl. diffuse.

30 G. satureiæfòlium (Trev. mag. nat. amic. berl. 1815. vol. 7. p. 146.) stems flaccid, scabrous along the angles; lower leaves 6 in a whorl, rameal ones 4 in a whorl, linear-elliptic, unequal; branches of panicle dichotomous, panicled; fruit glabrous, spherical, emarginate. ♃. H. Native of Tauria, among reeds about Astrachan; and of Caucasus, in humid places near Lenkeran, mixed with G. palústre, Bieb. suppl. 106. G. palústre, Bieb. fl. taur. 1. p. 103. Corolla white.

Savory-leaved Bed-straw. Fl. June, Aug. Clt. 1817. Pl. 1 ft.

31 G. trífidum (Lin. spec. p. 153.) stems ascending or procumbent, scabrous below; leaves 4-6 in a whorl, linear, obtuse, scabrous on the margins and nerve beneath; peduncles slender, spreading, trifid; lobes of corolla 3-4, obtuse; fruit glabrous, smooth. ♃. H. Native of Sweden, Norway, Lapland, Island of Unalaska, and Falkland Islands, in humid places; and of the Island of Sitka. Œd. fl. dan. t. 48. Cham. et Schlecht. in Linnæa. 3. p. 221. Torr. fl. un. st. 1. p. 165. G. Claytòni, Michx. fl. bor. amer. 1. p. 78. G. trífidum and G. Claytòni, Rœm. et Schultes, syst. G. tinctòrium, Richards. in Frankl. journ. append. 732. Corollas white. This species varies in size from an inch to a foot in length.

Var. β, latifòlium (Torr. fl. un. st. 1. p. 165.) leaves obovate-cuneated. ♃. H. Native of North America.

Trifid-peduncled Bed-straw. Fl. Ju. July. Clt. 1826. Pl. proc.

32 G. tinctòrium (Lin. spec. p. 153.) stems decumbent, smooth; leaves 4-6 in a whorl, linear, obtuse, scabrous on the margins and keel; peduncles axillary and terminal, elongated, subcorymbose, many-flowered; lobes of corolla 4, obtuse; fruit glabrous, smooth. ♃. H. Native of North America, in low marshy places, as in Canada, United States, Newfoundland; Straits of De Fùca, on the North-west Coast. Very nearly allied to the preceding, but differs from it in the stems being smooth, in the peduncles being longer, and in the flowers being always 4-parted. It is said that from the roots of this species the Indians prepare the red dye with which they colour the feathers and other ornaments of their dress. Some states of *G. palústre*, in our country, when they have more numerous leaves than usual, are scarcely distinguishable from the *G. tinctòrium*.

Dyers' Bed-straw. Pl. decumbent.

33 G. obtu'sum (Torr. fl. bost. ed. 2. p. 55.) stems smooth; procumbent, tetragonal; leaves 4 in a whorl, oblanceolate, obtuse, roughish on the margins and nerve; peduncles 3-flowered; lobes of corolla acute; fruit smooth, globose. ♃. H. Native about Boston, on the banks of rivers and rivulets. Corollas white.

Blunt-leaved Bed-straw. Pl. procumbent.

34 G. aspre'llum (Michx. fl. bor. amer. 1. p. 178.) stems diffuse, much branched, tetragonal, rough from retrograde prickles along the angles; cauline leaves 6 in a whorl, rameal ones 4, lanceolate, acuminated, prickly on the nerve and margins; floriferous branches divaricate, many-flowered; pedicels short; lobes of corolla awnless; fruit glabrous. ♃. H. Native of North America, from Canada to Virginia. Pursh. fl. amer. sept. 1. p. 103. Flowers white. Perhaps the same as *G. Claytòni* or *G. trífidum*.

Rough Bed-straw. Pl. decumbent.

35 G. Helve'ticum (Weig. obs. p. 24.) stems weak, tufted, glabrous; leaves 4-6 in a whorl, oblong-linear, mucronate, attenuated at the base, with scabrous margins; peduncles shorter than the leaves, nearly terminal, few-flowered; fruit glabrous, smooth; lobes of corolla obtuse. ♃. H. Native of Dauphiny, Piedmont, Spain, Pyrenees, Switzerland, on rocks. Gaud. fl. helv. 1. p. 434. &c. Lam. dict. 2. p. 584. Req. diss. mss. G. Baldénse, Spreng. pug. 1. p. 10. ex Jan. et Gaud. Plant becoming black on drying. Flowers white.—Juss. mem. de l'acad. de Par. 1714. t. 15. f. 1.

Swiss Bed-straw. Fl. June, July. Clt. 1819. Pl. ¼ foot.

36 G. saxa'tile (Lin. spec. 154. Smith, engl. bot. 1815.) stems procumbent or straggling, glabrous; leaves 6 in a whorl, obovate, obtuse, mucronate, roughish on the edges; flowers in forked lateral and terminal panicles; fruit didymous, granulated. ♃. H. Native of Sweden, Germany, France; plentiful in Britain, on heaths and hilly ground. G. Hercýnicum, Weig. obs. p. 25. D. C. icon. rar. t. 25. G. montànum, Huds. angl. p. 67. G. procúmbens, With. 187.—Petiv. herb. brit. t. 30. f. 8. G. multicaúle, var. Wallr. in litt. Root creeping. Plant becoming blackish on drying. Flowers white, copious.

Hercynian Bed-straw. Fl. Ju. Aug. Britain. Pl. procumb.

37 G. asperifòlium (Wall. in Roxb. fl. ind. 1. p. 381.) stems branched, weak, tetragonal, scabrous from recurved hairs along the angles; leaves 6 in a whorl, oblong-linear, somewhat cuneated, mucronate, rather scabrous above, but beset with recurved hairs on the nerve beneath and margins; peduncles axillary, many-flowered, disposed in a kind of leafy panicle; fruit glabrous.—Native of Nipaul. Req. diss. mss. G. parviflòrum, D. Don, prod. fl. nep. 133. Flowers white, but blackish when dried. Lower leaves 8 in a whorl. The stem and branches are soft, while the leaves are harsh.

Rough-leaved Bed-straw. Pl. diffuse.

38 G. Æ'thnicum (Biv. man. 4. p. 21.) root creeping; stems tetragonal, smooth; leaves 6 in a whorl, mucronate, with prickly serrated margins: lower ones spatulate, upper ones linear; peduncles trichotomous, disposed in a short panicle; lobes of corolla awned. ♃. H. Native of Mount Etna, above the woody region. Guss. prod. 1. p. 174. fl. sic. ined. t. 63. f. 1. G. triná-crium, Rœm. et Schultes, syst. 3. p. 238. G. Æthnénse, Presl. fl. sic. p. 60. Flowers white. Very nearly allied to *G. cinèreum*. Root long, red. Leaves 8-9 in a whorl, ex Rœm. et Schultes.

Etna Bed-straw. Pl. tufted.

39 G. frutice'scens (Cav. icon. 3. p. 3. t. 206. f. 1.) stems suffrutescent at the base, erect; branches tetragonal, glabrous; leaves 6 in a whorl, linear, mucronate, subrevolute; peduncles

usually 2-3-flowered; lobes of corolla acute; fruit glabrous. ♄. F. Native of Spain, in great plenty on the mountains of Valdigna and Enguera, &c. G. Capénse, β, Pers. ench. Flowers white, racemose.

Frutescent Bed-straw. Shrub 1 foot.

40 G. de'bile (Hoffmans. et Link. fl. port. 2. p. 48.) stems weak, tetragonal, branched, rather scabrous; leaves 6 in a whorl, linear, ending in a short mucrone, with roughish margins: the prickles bending forward, not backwards, as in most of the species; panicles erect. ♃. H. Native of Portugal, in humid meadows. Corollas white. Nearly allied to *G. palústre* and *G. helòdes*, and probably only a mere variety of one of them.

Weak Bed-straw. Fl. June, July. Clt. 1824. Pl. dec.

41 G. arista'tum (Lin. spec. 152. Smith, engl. fl. 1. p. 204.) stem erect, much branched, spreading, smooth; leaves 6 in a whorl, petiolate, lanceolate, flat, bristly pointed, with minute marginal prickles, which point forward; lobes of corolla acuminated; seeds smooth, kidney-shaped, separated. ♃. H. Native of many parts of Europe; in Scotland, on hilly ground, in Angusshire, but not common.—Barrel. icon. 1. t. 356.—Bocc. mus. 1. t. 75. Flowers white, in terminal forked compound panicles. The upper leaves are sometimes 4-5 in a whorl.

Awned Bed-straw. Fl. July, Aug. Scotland. Pl. 1 foot.

42 G. ju'nceum (Sibth. et Smith, fl. græc. t. 127.) stems erect, smooth; leaves 4 in a whorl, obovate-linear, obtuse, glabrous; flowers crowded, panicled; fruit glabrous. ♃. H. Native of Candia, in hedges, and on the margins of fields. Flowers cream-coloured. Root creeping.

Rushy Bed-straw. Pl. 1 to 2 feet.

§ 2. *Platygalia* (from πλατυς, *platys*, broad, and *galium*; in reference to the leaves of the species being broad). D. C. prod. 4. p. 598. *Perennial, herbaceous plants. Leaves broad, 4 in a whorl. Flowers disposed in cymose panicles, hermaphrodite, white, very rarely purple or cream-coloured. Fruit glabrous.*

43 Tata'ricum (Trev. mag. am. nat. cur. berl. 1815. p. 146.) stems quadrangular, scabrous from retrograde prickles along the angles; leaves 4 in a whorl, lanceolate, equal, acuminated, 1-nerved, scabrous along the margins above, and on the nerves beneath; peduncles axillary, shorter than the leaves, trichotomous, few-flowered; fruit glabrous. ♃. H. Native of Tartary, on the Ural mountains, ex Fisch; and frequent about Astrachan, ex Trev. Stem purplish at the base. Corollas white, with obtuse lobes.

Tartarian Bed-straw. Pl. 1 foot.

44 G. latifòlium (Michx. fl. bor. amer. 1. p. 70. but not of D. Don.) stems erect, smooth; leaves 4 in a whorl, oval-lanceolate, acuminated, 3-nerved, membranous, having the margins and nerves hispid from very minute bristles; peduncles axillary, opposite, or terminal, divaricate, trichotomous, loosely many-flowered; fruit glabrous. ♃. H. Native of Carolina, on the mountains. Ell. sketch. 1. p. 194. Flowers dark purple. One of the mericarps of the fruit is abortive, and therefore the fruit is 1-seeded. Leaves 1-2 inches long.

Broad-leaved Bed-straw. Pl. 1 foot.?

45 G. rubioìdes (Lin. spec. p. 152.) stems erect, straight, tetragonal, simple, smoothish; leaves 4 in a whorl, lanceolate, 4 or 5 times longer than broad, 3-nerved, often scabrous on the nerves beneath and margins; peduncles axillary, trichotomous, much longer than the leaves, disposed in a terminal panicle; bracteas ovate-oblong; fruit glabrous. ♃. H. Native of Europe, in meadows and woods, especially in the temperate parts; and of Siberia and Caucasus, even to Kamtschatka. G. rubioìdes, var. α, Lam. dict. 2. p. 576. Rœm. et Schultes, syst. 3. p. 214. Buxb. cent. 2. t. 29. G. diffùsum, Schrad. Link, enum. 1. p. 134. ex Cham. et Schlecht. in Linnæa. 4. p. 220. G. hyssopifòlium, Hoffm. germ. 1. p. 71. Root creeping, red. Flowers pale yellow, or cream-coloured. Very like *G. boreàle*, but larger, with broader leaves. There is a variety of this species with hispid fruit, according to Steven, obs. p. 70.

Var. β, *angustifòlium*; leaves narrower and longer; flowers fewer. ♃. H. Native of Kotzebue's Sound; abundant in dry elevated soils, under the shade of solitary pines, in the valley of Columbia, North-west America. The leaves are almost as narrow as those of *G. boreàle*, but the inflorescence and fruit are very different. G. rubioìdes, Hook. et Arn. in Beech. voy. pt. bot. p. 115. and 125. This variety has been received by Dr. Hooker from the United States, under the name of *G. Bermudiànum*.

Madder-like Bed-straw. Fl. July. Clt. 1775. Pl. 1 foot.

46 G. articula'tum (Lam. dict. 1. p. 260.) stems ascending, nodose at the joints, tetragonal, smoothish; leaves ovate-lanceolate, 3 times longer than broad, 3-nerved, with scabrous edges; peduncles trichotomous, disposed in a crowded corymbose panicle: bracteas ovate; fruit glabrous. ♃. H. Native of Tauria, Caucasus, and the Levant, in meadows, and along the margins of paths in woods. Req. diss. mss. ex herb. D. C. Valántia articulàta, Lam. ill. t. 843. f. 3. G. rubioìdes, Bieb. fl. taur. 1. p. 102. ex spec. Stev. G. articulàtum and G. geniculàtum, Rœm. et Schultes, syst. 3. p. 215. and 250. G. rubioìdes, β, Lam. dict. 2. p. 576. Flowers cream-coloured, sometimes small.

Jointed Bed-straw. Fl. July, Aug. Clt. 1752. Pl. 1 foot.

47 valantioìdes (Bieb. fl. taur. 1. p. 102.) stems erectish, branched at the base, glabrous, smooth along the angles; leaves 4 in a whorl, rhomboid-lanceolate, twice longer than broad, obtuse, 3-nerved, rather scabrous on both surfaces; panicle trichotomous, much branched; fruit glabrous, smooth. ♃. H. Native of Caucasus, among subalpine rocks. Req. diss. mss. ex herb. D. C. Rœm. et Schultes, syst. 3. p. 215. Very nearly allied to *G. rubioìdes* and *G. articulàtum*. Flowers cream-coloured.? There is a variety of this with hispid fruit, according to Stev. obs. p. 70.

Valantia-like Bed-straw. Fl. June, July. Clt. 1819. Pl. 1 ft.

§ 3. *Trichogàlia* (from θριξ τριχος, *thrix trichos*, a hair, and *galium*; in reference to the fruit being hispid). D. C. prod. 4. p. 599. *Perennial herbaceous plants. Leaves* 4-10 *in a whorl. Flowers hermaphrodite, usually white, disposed in cymose panicles. Fruit hispid.*

48 G. Ca'spicum (Stev. obs. pl. ross. p. 70.) whole plant villous; stems obsoletely tetragonal; lower leaves 8 in a whorl, lanceolate-oblong, mucronate, upper ones opposite; floriferous branches panicled, and are, as well as the fruit, villous. ♃. H. Native of the north of Persia, in the province of Ghilan. Flowers white. Stature and leaves of *G. sylváticum*, but the panicle is dense, like that of *G. mollùgo*.

Caspian Bed-straw. Pl. 1 to 2 feet.

49 G. rotundifòlium (Lin. spec. p. 156. exclusive of var. β.) stems diffuse, glabrous; leaves 4 in a whorl, roundish-ovate, 3-nerved, ciliated; peduncles axillary and terminal, loose, elongated, naked, trichotomous at the apex; fruit nearly globose, beset with bristles, which are hooked at the apex. ♃. H. Native nearly throughout the whole of Europe, in mountain woods; and on the Talusch mountains in Caucasus. Lam. dict. 2. p. 577. D. C. fl. fr. no. 3386. G. decípiens, Ehrh. herb. p. 63. Aspérula lævigàta, β, Lam. dict. 1. p. 298.—Bocc. sic. t. 6. f. 1.—Moris. hist. 9. t. 21. f. 5.—Barrel. icon. t. 323. Flowers white. Stems procumbent.

Round-leaved Bed-straw. Fl. Ju. Aug. Clt. 1821. Pl. proc.

50 G. ellípticum (Willd. enum. suppl. 1813. Horn. cat. hort. hafn. suppl. 1819. p. 17.) stems erectish, hairy; leaves 4 in a whorl; panicles axillary and terminal, trichotomous, capil-

lary; fruit nearly globose, hispid from bristles, which are hooked at the apex. ♃. H. Native of Corsica, Sardinia, Sicily, on hills and in woods. Guss. prod. 1. p. 176. Presl. del. prag. 1822. p. 122. G. Barrelièri, Salzm. in flora, 1820. p. 107. Duby, bot. gall. 1. p. 251. Lois. fl. gall. ed. 2. p. 114.—Barrel. icon. t. 324.—Bocc. sic. t. 6. f. 1.—G. rotundifòlium, var. β, Rœm. et Schultes, syst. 3. p. 254. G. ovalifòlium, Schott. isis. 1818. p. 821. Flowers white; but there is a variety also with reddish flowers, according to Soleir, in litt.

Elliptic-leaved Bed-straw. Fl. Ju. July. Clt. 1819. Pl. 1 ft.

51 G. obova'tum (H. B. et Kunth, nov. gen. amer. 3. p. 336. t. 278.) stems almost simple, pilose; leaves 4 in a whorl, on short petioles, obovate, acute, flat, smoothish, ciliated, 4 times shorter than the internodes; flowers terminal, by threes, pedunculate; fruit covered with hooked bristles.—Native of South America, in temperate parts of the kingdom of Quito, about Chillo and Guancabamba. Corolla of a whitish violaceous colour. Nearly allied to *G. rotundifòlium*.

Obovate-leaved Bed-straw. Pl. 1½ foot.

52 G. Java'nicum (Blum. bijdr. p. 943.) branches tetragonal, hairy; leaves 4 in a whorl, roundish obovate, 3-nerved, with the margins and veins downy beneath; cymes pedunculate, trichotomous, leafy.—Native of the East of Java, on the mountains. Said to be allied to *G. élegans*.

Java Bed-straw. Pl.

53 G. Neesia'num (Req. diss. mss. ex D. C. prod. 4. p. 600.) stems ascending, erectish, branched, tetragonal, beset with soft hairs; leaves 4 in a whorl, roundish-ovate, ending each in a very short cusp, 3-nerved, hairy; peduncles axillary and terminal, longer than the leaves, trichotomous, hairy; fruit nearly globose, beset with hooked bristles. ♃. F. Native of Teneriffe, in the Chestnut woods. G. hirsùtum, Nees, in Buch. in hor. berl. p. 113. t. 22. but not of Ruiz et Pavon. G. ovalifòlium, Schott, Spix, and Mart. 1. p. 55. ex Link. in Buch. can. p. 151. Flowers white. Said to be nearly allied to *G. rotundifòlium*.

Nees's Bed-straw. Pl. ascending.

54 G. e'legans (Wall. in Roxb. fl. ind. 1. p. 382.) stems diffuse, ascending, tetragonal, hairy; leaves 4 in a whorl, elliptic, obtuse, sessile, 3-nerved, rather hairy above, and villous along the nerves and margins beneath; peduncles axillary and terminal, trichotomous, hardly pilose, disposed in a panicle; fruit roundish, hispid from bristles, which are hooked at the apex. ♃. F. Native of Nipaul. G. Punduànum, Wall. cat. no. 6212. Roots creeping. Fruit small. Flowers white. Habit of *G. cruciàtum*.

Var. β, *glabriúsculum* (Req. diss. mss. ex D. C. l. c.) stems and leaves smoothish. ♃. H. Native of Nipaul.

Elegant Bed-straw. Pl. diffuse, 1½ foot.

55 G. Hamiltònii (Spreng. cur. post. p. 39.) stems erect, branched, pilose; leaves 4 in a whorl, oblong, acute, rather pilose on both surfaces; peduncles terminal, trichotomous, loose-flowered; fruit hispid. ♃. F. Native of Upper Nipaul, at Mereba. G. latifòlium, Ham. in D. Don, prod. fl. nep. 133.

Hamilton's Bed-straw. Pl. 1½ foot.

56 G. hirtiflòrum (Req. diss. mss. ex D. C. prod. 4. p. 600.) stems weak, branched, rather scabrous; leaves 4-6 in a whorl, linear, bluntish, glabrous above, and scabrous from pili on the keel and margins beneath; peduncles axillary and terminal, bifid, disposed in a kind of panicle; pedicels divaricate; corollas bristly outside; fruit roundish, hispid from bristles, which are hooked at the tops. ♃. F. Native of Nipaul, at Narainhetty. G. ciliàtum, D. Don, prod. fl. nep. p. 133. but not of Ruiz et Pav. G. Aparìne, Roxb. fl. ind. 1. p. 382.? Stems rather hispid. Flowers small, milk-coloured.

Hairy-flowered Bed-straw. Pl. ½ to 1 foot.

57 G. uncinula'tum (D. C. prod. 4. p. 600.) stems weak, diffuse, branched, tetragonal, hispid at the base, and glabrous at the apex; leaves 4 in a whorl, oval, acutish, hispid on both surfaces, hardly 3-nerved at the base; peduncles dichotomously corymbose, few-flowered; fruit beset with bristles, which are hooked at the apex, and about equal in length to the diameter of the fruit. ♃. F. Native of Mexico, between Tampico and Real del Monte, where it was collected by Berlàndier.

Small-hooked Bed-straw. Pl. diffuse.

58 G. Chamissònis (Hook. et Arn. in bot. misc. 3. p. 363.) plant quite glabrous, perennial; stems erectish, acutely tetragonal: angles smoothish; leaves deflexed, oblong, acute, with revolute margins; panicles axillary and terminal, trifid, bifid, or trichotomous; pedicels very much divaricate; fruit roundish, hispid from compressed bristles, which are acute at the apex, but not hooked. ♃. F. Native of Chili, about Valparaiso. This approaches somewhat in habit to *Aspérula galioìdes*.

Chamisso's Bed-straw. Pl. 1 foot.

59 G. Gillie'sii (Hook. et Arn. in bot. misc. 3. p. 364.) perennial; stems herbaceous, diffuse, almost simple, acutely 4-angled; leaves 4 in a whorl, oval, obsoletely 1-nerved, with spinulose margins; peduncles axillary and terminal, 3-flowered, equal in length to the leaves; flowers pedicellate; fruit hispid; bristles longer than the friut, not hooked at the apex.

Var. α; stem and leaves glabrous. ♃. F. Native of Chili, in El Valle de Las Caigas, Andes of Mendozo, Cordillera of Chili.

Var. β; stem and leaves hairy. ♃. F. Native of Chili, at El Malpaso and Los Palomares, Andes of Mendozo.

Gillies's Bed-straw. Pl. diffuse.

60 G. suffrutico'sum (Hook. et Arn. in bot. misc. 3. p. 363.) suffruticose, hairy, canescent; stems erectish, simple, terete; leaves oblong-linear, mucronate, hairy: the nerves as well as the recurved margins pilose; peduncles alternate, longer than the leaves, divaricately panicled. ♃. F. Native of Chili, in Vina de La Mar, near Valparaiso. The hairs forming the pubescence point downwards.

Suffruticose Bed-straw. Pl. 1 foot.

61 G. eriocа'rpum (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 600.) plant suffruticose, glabrous, erect; leaves 4 in a whorl, oblong, 1-nerved; flowers trichotomously panicled; fruit beset with bristles, which are as long as it, but are not hooked at the apex. ♃. F. Native of Cordillera of Chili. This is very distinct from all other species.

Woolly-fruited Bed-straw. Pl. 1 foot.?

62 G. trichoca'rpum (D. C. prod. 4. p. 600.) stems dichotomous, much branched, glabrous, tetragonal, having the angles scabrous from retrograde bristles, the rest glabrous; corymbs trichotomous, few-flowered; fruit beset with bristles, which are a little shorter than it, but not hooked at the apex.—Native of Chili, about Rancagua, among bushes. Allied to *G. eriocárpum*, but differs in the bristles of the fruit being shorter and fewer.

Hairy-fruited Bed-straw. Pl. diffuse.

63 G. borea'le (D. C. fl. fr. suppl. p. 498.) stems erect, straight, tetragonal, smoothish; leaves 4 in a whorl, linear-lanceolate, 3-nerved, glabrous; peduncles axillary, trichotomous, much longer than the leaves, disposed in a terminal panicle; bracteas obovately orbicular. ♃. H. Native throughout the whole of Europe, in moist rocky shady places, by rivers and lakes; plentiful in some parts of Britain, as in the north of England and Scotland. Root creeping, brownish. Leaves with scabrous margins. Flowers milk-coloured.

Var. α, *hyssopifòlium* (D. C. prod. 4. p. 600.) fruit quite glabrous. Hoffm. germ. 3. p. 71. G. rubioìdes, Poll. pall. no. 148. G. boreàle α, Lam. dict. 2. p. 576. G. rubioìdes β, Lam. fl. fr. 4. p. 258. Nearly allied to *G. rubioìdes*, but differs in the leaves being narrower, and in the bracteas being roundish.

Var. β, *intermèdium* (D. C. prod. 4. p. 601.) fruit rather scabrous from somewhat adpressed bristles.—G. boreàle, Koch, in litt. D. C. suppl. p. 498.

Var. γ. scàbrum (D. C. prod. 4. p. 601.) fruit hispid from crowded bristles, which are hooked at the apex. G. boreàle β, Lam. G. boreàle, Lin. spec. 156. D. C. fl. no. 3385. but not of Lapeyr. Oed. fl. dan. t. 1024. Smith, eng. bot. t. 105. Svensk. bot. t. 122. G. nervòsum *a*, Lam. fl. fr.

Northern Bed-straw. Fl. July. Britain. Pl. 1 foot.

64 G. septentriona'le (Rœm. et Schultes, syst. 3. p. 253.) stems erect, straight, tetragonal, smoothish, downy at the nodi; leaves 4 in a whorl, oblong-lanceolate, 3-nerved, ciliated at the base; peduncles axillary, much longer than the leaves, trichotomous, disposed into a terminal panicle; bracteas oblong, acute. ♃. H. Native of North America, about lakes in Canada and the State of New York. Bigel. fl. bost. ed. 2. p. 54. G. boreàle, Pursh, fl. amer. sept. 1. p. 104. Torr. fl. un. st. 1. p. 169. Hook. fl. bor. amer. 1. p. 289. G. stríctum, Torr. cat. new York, 23. Flowers milk-coloured, very numerous. Fruit beset with hooked bristles. Like the European *G. boreàle* this is liable to considerable variation, and generally passes into the usual state of *G. boreàle*. The Cree women dye red with the roots of this and *G. Claytònii* indiscriminately, ex Richardson.

Northern Bed-straw. Pl. 1½ foot.

65 G. coria'ceum (Bunge in Ledeb. fl. ross. alt. ill. t. 216.) stems branched, tetragonal, scabrous at the base; leaves coriaceous, shining, with revolute scabrous edges: lower ones 4 in a whorl, obovate-oblong: upper ones opposite, oval, rather scabrous, as well as the stems; peduncles axillary, 2-4-flowered; fruit hispid from hooked pili at the base, much shorter than the pedicels. ♃. H. Native of Siberia, in the fissures of rocks at the river Katunga, at a place called Boom, and at the river Tschuja. Peduncles slender, bifid, trifid, rarely twice trifid, rather hispid. Flowers yellowish-white.

Coriaceous-leaved Bed-straw. Pl. ¼ to 1 foot.

66 G. circæ'zans (Michx. fl. bor. amer. 1. p. 30.) stems erect, smooth; leaves 4 in a whorl, oval, obtuse, smooth, 3-nerved, ciliately scabrous along the nerves and margins; peduncles axillary and terminal, divaricate, few-flowered, longer than the leaves; fruit drooping, beset with hooked bristles. ♃. H. Native of North America, from Carolina to New England and Boston, in rocky mountain woods. Torr. fl. un. st. 1. p. 168. Bigel. fl. bost. ed. 2. p. 55. G. boreàle, Walt. car. p. 87. G. brachiàtum, Muhl. cat. 1. p. 15. G. circæoìdes, Rœm. et Schultes, syst. 3. p. 256. Flowers milk-coloured.

Circæa-like Bed-straw. Pl. 1 to 1½ foot.

67 G. lanceola'tum (Torr. fl. un. st. 1. p. 163.) stems erect, glabrous; leaves 4 in a whorl, ovate-lanceolate, acute, with ciliately scabrous edges, 3-nerved at the base; peduncles terminal, dichotomous, divaricate, longer than the leaves; flowers lateral, sessile, deflexed; corollas very acute; fruit beset with hooked bristles. ♃. H. Native of North America, in the states of New York, Massachusetts, and Boston; and of Canada about Quebec. G. circæ'zans β lanceolàtum, Torr. cat. new york, p. 23. G. Torrèyi, Bigel. fl. bost. ed. 2. p. 56. G. circæ'zans var. Nutt. Flowers milk-coloured.

Lanceolate-leaved Bed-straw. Pl. 1 to 1½ foot.

68 G. brachia'tum (Pursh, fl. amer. sept. 1. p. 103.) stems flaccid, elongated, brachiately branched, hispid; branches short; leaves 6 in a whorl, oblong-lanceolate, acuminated, glabrous, having the margins and keel ciliated by bristles; floriferous branches verticillate, longer than the leaves, divaricately dichotomous; pedicels 2-flowered; fruit beset with hooked bristles. ♃. H. Native of North America, from New England to Virginia, in meadows, and on the margins of woods, frequent. G. longicaúle, Rafin. fl. lud. p. 75.? Flowers white.

Brachiate Bed-straw. Pl. 1 to 1½ foot.

69 G. cuspida'tum (Muhl, cat. ex Ell. sketch. carol. 1. p. 197.) stems prostrate, glabrous; leaves usually 6 in a whorl, lanceolate, acuminated, a little ciliated; peduncles trifid; lobes of corolla acuminated; fruit pilose. ♃. H. Native of Carolina and Georgia. Flowers white. Fruit beset with long white pili.

Cuspidate-flowered Bed-straw. Pl. prostrate.

70 G. hispi'dulum (Michx. fl. bor. amer. 1. p. 79.) stems procumbent, much branched, hispid; leaves 4 in a whorl, oval-lanceolate, acuminated, with revolute edges, wrinkled, hispid on both surfaces; flowers nearly solitary, terminal; fruit hispid. ♃. H. Native of Lower Carolina. Perhaps the same as G. lappàceum, fl. per. 1. p. 59.? ex Pursh, fl. sept. amer. 1. p. 104. Flowers white.

Small-hispid Bed-straw. Pl. procumbent.

71 G. densiflòrum (Led. fl. alt. ill. t. 194. fl. alt. 1. p. 137.) stems many from the same root, erect or ascending, glabrous; leaves 8 in a whorl, oblong-linear, cuspidate, glabrous with scabrous margins; panicles coarctate; segments of corolla mucronulate; ovarium villous. ♃. H. Native of Siberia, near Smejow. Rameal leaves sometimes 6-7 in a whorl, pale green. Panicles from the tops of the stem and branches. Corollas greenish-yellow.

Dense-flowered Bed-straw. Pl. 1 foot.

72 G. puncticulòsum (Michx. fl. bor. amer. 1. p. 80.) stems erect, branched, smoothish; leaves 4 in a whorl, ovate, obtuse, glabrous, but rather downy on the margins and nerves, full of pellucid dots; floriferous branches elongated, trifid at the apex; flowers pedicellate; fruit beset with hooked bristles. ♃. H. Native of South Carolina, in humid places. Req. diss. ined. ex herb. D. C. G. punctàtum, Pers. ench. 1. p. 128. G. Bermudiànum, Pursh, fl. sept. amer. 1. p. 104. and probably of Lin. spec. 153. G. purpùreum, Walt. carol.—Pluk. alm. t. 248. f. 6. Flowers purple. Fruit purple.

Var. β, pilòsum (D. C. prod. 4. p. 601.) stems hispid; leaves villous on both surfaces, and full of pellucid dots. ♃. H. Native of the states of New York and Boston, in dry pastures and woods. G. pilòsum, Ait. hort. kew. p. 145. Torr. fl. un. st. 1. p. 167. The dots on the leaves less pellucid, and villi more conspicuous than in var. *a*, but very like it.

Small-dotted-leaved Bed-straw. Fl. June, July. Clt. 1778. Pl. 1 foot.

73 G. triflòrum (Michx. fl. amer. bor. 1. p. 80.) stems procumbent, tetragonal, hispid or smoothish; leaves 6 in a whorl, oblong, cuspidate, glabrous, scabrous along the nerves and edges, 1-nerved; peduncles axillary and terminal, 3-flowered, longer than the whorles of leaves; flowers pedicellate; fruit beset with bristles, which are hooked at the apex. ♃. H. Native of Carolina, Pennsylvania, New York, Canada, Unalaschka, Sitcha, and Norland, in rather humid shady places. It is common from Quebec to the Rocky Mountains, and as far north as lat. 55°, and from the west side of the Rocky Mountains to the Pacific. Cham. et Schlecht. in Linnæa. 3. p. 222. Torrey, fl. un. stat. 1. p. 167. Willd. hort. berol. t. 66. G. cuspidàtum, Muhl. cat. p. 15. G. suavèolens, Wahl. fl. lapp. p. 48. Req. diss. mss. ex herb. D. C. There are varieties of this with either rough stems, as in *G. aparìne*, or glabrous stems. Flowers small, white. Habit and scent of *Aspérula odoràta*.

Var. β. viridiflòrum (D. C. prod. 4. p. 602.) stems smooth; corollas green. ♃. H. Native about Moscow, in mossy woods. G. hyssopifòlium, Goldb. in litt. 1821. Req. diss. mss. in herb. D. C.

Three-flowered Bed-straw. Fl. June, July. Clt. 1821. Pl. procumbent.

74 G. mari'timum (Lin. mant. p. 38. but not of Thunb. prod. 3.) plant villous all over; stems much branched, tetragonal; leaves 4-6 in a whorl, but the ultimate ones are opposite, all lanceolate-linear, acute; peduncles axillary, 1-flowered; corollas and fruit villous or hispid outside. ♃. H. Native of Nice and

the Levant, in exposed rocky places. Corollas reddish. Stems creeping at the base.

Var. β, villòsum (D. C. prod. 4. p. 602.) plant more crowded; leaves 4-8 in a whorl. ♃. H. Native of the south of Europe, and at the bottom of the Pyrenees. G. villòsum, Lam. dict. 2. p. 582. G. marítimum, Gouan. ill. p. 5. D. C. fl. fr. no. 3384. —Barrel. icon. p. 81.—Bocc. mus. 2. p. 110. t. 86. Fruit clothed with white hairs.

Sea-side Bed-straw. Fl. June, July. Clt. 1826. Pl. ½ to 1 foot.

75 G. brachyphy'llum (Schultes, mant. 3. p. 180.) plant smoothish, much branched, procumbent; leaves 4-6 in a whorl, but the upper ones are opposite, all lanceolate, mucronate, and reflexed; pedicels 2-3-together, axillary, 1-flowered; fruit scabrous from pubescence. ♃. H. Native of Caucasus, about Buduch, in the calcareous range, &c. G. brevifòlium, Stev. mem. mosc. 3. p. 253. but not of Smith et Sibth. G. alpéstre, Stev. cat. hort. gor. 1812. p. 43. G. brachyphýllum, Bieb. fl. taur. suppl. p. 107. Flowers white. This is an intermediate plant between the granular and villous fruited species.

Short-leaved Bed-straw. Pl. procumbent.

76 G. græ'cum (Lin. mant. p. 38.) stems suffruticose, branched at the base; branches erect, hispid; leaves 6 in a whorl, linear, hairy, erect; peduncles axillary and terminal, few-flowered, a little longer than the leaves; fruit beset with long white bristles. ♃. H. Native of Greece, on Mount Parnassus, and the islands of Cois and Candia, on exposed rocks. Sibth et Smith, fl. græc. t. 136. D'Urv. cat. no. 129. Req. diss. mss. Lam. dict. 2. p. 584. Lodd. bot. cab. t. 1373.—P. Alp. exot. t. 166. Peduncles forming a racemose or thyrsoid panicle. Flowers small, yellowish-brown.

Grecian Bed-straw. Fl. June, July. Clt. 1798. Pl. ½ foot.

77 G. ca'num (Req. diss. mss. ex D. C. prod. 4. p. 602.) stems suffruticose, tufted; branches very hairy and hoary; leaves lanceolate, with revolute margins, hairy on both surfaces, hoary beneath; peduncles cymose, few-flowered, 2-3 times longer than the leaves; fruit hispid. ♃. H. Native of Syria, where it was collected by Donati and Labillardiere. Flowers small, purplish. Perhaps only a variety of *G. græ'cum*.

Hoary Bed-straw. Pl. ¼ foot.

78 G. micra'nthum (Pursh, fl. amer. sept. 1. p. 103.) stems much branched, divaricate, beset with retrograde prickles; leaves short, lanceolate, mucronate, glabrous, having the margins and keel prickly; floriferous branches divaricately branched; pedicels usually 2-flowered; fruit hispid. ♃. H. Native of North America, from Canada to New York, in mountain bogs. Said to resemble *G. uliginòsum* very much.

Small-flowered Bed-straw. Pl. divaricate.

§ 4. *Coccogàlia* (from κοκκος, *kokkos*, a grain, and *galium*; in reference to the granular fruit). D. C. prod. 4. p. 602. *Perennial plants. Leaves 4 in a whorl. Flowers on long peduncles, hermaphrodite. Fruit granular.*

79 G. cotinoìdes (Cham. et Schlecht. in Linnæa. 3. p. 227.) stems diffuse, weak, tetragonal, beset with retrograde bristles along the angles; whorles of leaves distant; leaves 4 in a whorl, sessile, lanceolate, acute, with the nerve and margins scabrous; panicles trichotomous, few-flowered, terminal; pedicels capillary, very long; fruit glabrous, minutely tubercular. ♃. F. Native of Chili, in hedges near Talcaguana, and about Conception. This is a very showy species, with the habit of *G. uliginòsum*.

Cotinus-like Bed-straw. Pl. diffuse.

80 G. lanuginòsum (Lam. ill. no. 1360.) stems, branches, and peduncles clothed with long soft dense hairs; leaves 4 in a whorl, lanceolate, acute, glabrous, with scabrous margins; pedicels axillary and terminal, simple and bifid, very long, 1-flowered; corolla glabrous, with acutish lobes; fruit glabrous, minutely tubercular.—Native of the East Indies, ex herb. Lam.

Woolly Bed-straw. Pl. diffuse.

81 G. tomentòsum (Thunb. fl. cap. 151.) stems scandent, glabrous, much branched, tetragonal: with the angles denticulated; branches densely clothed with white hairs; leaves 4 in a whorl, oblong, roughly serrated; peduncles dichotomous, capillary, villous.—Native of the Cape of Good Hope. G. marítimum, Thunb. prod. p. 30. but not of Lin.

Tomentose Bed-straw. Pl. climbing.

§ 5. *Erythrogalia* (from ερυθρος, *erythros*, red, and *galium*; in allusion to the red flowers of the species). D. C. prod. 4. p. 603. *Perennial plants. Leaves 6 in a whorl. Flowers hermaphrodite, cymosely panicled, purple or red. Fruit glabrous.*

82 G. purpu'reum (Lin. spec. p. 156.) stem erect, suffruticose, much branched, glabrous; leaves 5-6 in a whorl, linear-setaceous; peduncles capillary, longer than the leaves; lobes of corolla apiculated; fruit glabrous. ♄. G. Native from Provence to Genoa, on dry hills; and in Greece, Carniola, Croatia. Req. diss. mss. Host. fl. aust. 1. p. 202. Nocc. et Balb. fl. tic. 1. p. 73. t. 3. G. rùbrum, Scop. carn. no. 154. D. C. fl. fr. no. 3354. exclusive of the synonymes. G. purpùreum and G. rùbrum, Wulf. ex Hort. G. sylvéstre, Schleich. pl. exsic.—J. Bauh. hist. 3. p. 721. f. 2. Gàlium rubro flòre, C. Bauh. hist. 335. no. 2. Flowers small, deep purple.

Purple-flowered Bed-straw. Fl. Ju. July. Clt. 1731. Pl. 1 ft.

83 G. ru'brum (Lin. spec. 156.) stems herbaceous, weak, glabrous; leaves 6 in a whorl, linear, spreading, glabrous; peduncles axillary, many flowered; pedicels short; lobes of corolla apiculated; fruit glabrous. ♃. H. Native of the south of Europe, as of Nice and Piedmont. Nocc. et Balb. fl. tic. 1. p. 74. G. purpùreum, Schleich. pl. exsic. D. C. fl. fr. 4. p. 251.—Clus. hist. 2. p. 174. lower figure. Flowers dirty purple, larger than those of *G. purpùreum*.

Var. β, pilòsum (Duby, ench. 1. p. 248.) stem pilose at the base. ♃. H. Native of the meadows of Lozera, about Meldas. G. purpùreum var. β, D. C. fl. fr. 5. p. 446.

Red-flowered Bed-straw. Fl. June, July. Clt. 1597. Pl. procumbent.

§ 6. *Xanthogàlia* (from ξανθος, *xanthos*, yellow, and *galium*; in reference to the yellow flowers of the species). D. C. prod. 4. p. 603. *Plants perennial. Leaves 6-10 in a whorl. Flowers yellow, all hermaphrodite. Inflorescence panicled.*

84 G. rupe'stre (Visiani, ex Biasol. in litt. 1829. ex D. C. prod. 4. p. 603.) stems erect, tetragonal, velvety, glabrous at the apex; leaves 6 in a whorl, upper 4 in a whorl, and the uppermost ones opposite, linear-lanceolate, a little cuneated, mucronate, glabrous, with rather scabrous edges; floriferous branches panicled; lobes of corolla acuminated; fruit glabrous. ♃. H. Native of Dalmatia, on rocks. Flowers small, deep yellow.

Rock Ladies' Bed-straw. Pl. 1 foot.

85 G. ve'rum (Lin. spec. 155.) stems erectish, tetragonal, almost simple; leaves 8 in a whorl, linear, sulcate, with rather revolute edges, smooth; floriferous branches panicled, almost all terminal; pedicels crowded, leafy, about equal in length to the flowers. ♃. H. Native of Europe and Siberia, in meadows, way sides, margins of fields and woods, and among bushes frequent; very common in Britain, in dry soil. G. lùteum, Mœnch, meth. 486. Root creeping, tawny. Flowers yellow. Leaves each tipped by a hair.

Var. α, leiophýllum (Wallr. sched. crit. p. 56.) stem and leaves quite glabrous, smooth; flowers pale yellow. ♃. H. Native in rather humid shady places. G. vèrum β glàbrum, Req. diss. mss.

Var. β, trachyphýllum (Wallr. l. c.) stems and leaves rather scabrous; fruit glabrous; flowers deep yellow. ♃. H. Native of Europe and Caucasus, in open places. Mill. fig. t. 129. Oed. fl. dan. t. 1146. Mart. fl. rust. t. 54. Curt. fl. lond. 6. t. 13. Smith, engl. bot. t. 660. G. vèrum pubéscens, Guss. prod. 171. G. tuberculàtum, Presl, del. prag. p. 120.

Var. β, trachycárpum (D. C. prod. 4. p. 603.) stems and leaves rather scabrous; fruit hairy. ♃. H. Native of Eastern Caucasus, on the Lower Volga, &c. G. vèrum var. Gold. in litt. G. verosímile, Schultes, syst. 3. p. 234.? Perhaps G. Caucásicum, Lag. cat. hort. madr. p. 95.

Var. δ, marítimum (D. C. fl. fr. 4. p. 248.) stems low, much branched, glabrous at the base, villous at the apex; ovaries glabrous. ♃. H. Native of Armoracia, in sand by the sea side.

Var. ε, tomentòsum (Meyer, verz. pfl. p. 54.) stems and fruit densely clothed with tomentum. ♃. H. Native of Caucasus, on the tops of the Talusch mountains near Drych.

The common name Bed-straw given to all the species is from the verb to strew, anciently written straw. Before the invention of feather-beds a variety of herbs were used to strew beds with; among these doubtless this was one. In Johnson's edition of Gerard, it is called our Ladies' Bed-straw (p. 1127.). From the notion of its curdling milk, Dioscorides has named it *γαλιον*; and it is said to have been used in many parts for this purpose, but from later experiments it has not succeeded in coagulating milk. It has probably been put into milk destined to make cheese, not so much for the purpose of curdling it, as of giving it a flavour, or as Matthiolus expresses it, to make it eat the sweeter. The French formerly prescribed the flowers in hysteric and epileptic cases. Boiled in alum-water the flowering stems dye a good yellow colour. The roots dye a very fine red, not inferior to madder.

True Ladies' Bed-straw or Cheese-rennet. Fl. July, Aug. Britain. Pl. 1 to 2 feet.

86 G. RUTHE'NICUM (Willd. spec. 1. p. 596.) leaves 8 in a whorl, linear-filiform, cuspidate, with revolute scabrous margins; stems also scabrous; flowers panicled; peduncles pubescent; fruit hispid from villi. ♃. H. Native of Siberia and Caucasus, growing along with *G. vèrum*. Flowers deep yellow.

Var. β, rosmarinifòlium (Ledeb. fl. alt. 1. p. 138.) leaves 8-10 in a whorl, linear, shining above and pubescent, and clothed with hoary tomentum beneath, with revolute edges; stems tomentose suffruticose at the base; panicle coarctate; fruit villous. ♃. H. Native of Siberia, at the river Tschuja, in the Karaic desert in dry exposed places.

Ruthian Lady's Bed-straw. Pl. 1 foot.

87 G. VE'RO-MOLLU'GO (Wallr. in Schiede, pl. hybr. p. 64.) stems tetragonal, rather downy; leaves sublanceolate-linear, rather scabrous, with revolute scabrous edges, downy beneath; panicles rather divaricate; flowers rather distant; corollas cream coloured, with acutish segments. ♃. H. Native of Germany. This is a hybrid raised from the seed of *G. vèrum*, impregnated by *G. Mollùgo*. G. vèrum *β*, Rœm. et Schultes, syst. 3. p. 233. G. Mollùgo var. ochreoleùca of authors.

Vero-Mollugo or Hybrid Ladies' Bed-straw. Pl. 1 to 2 feet.

88 G. TUNETA'NUM (Lam. dict. 2. p. 583.) stems erect, terete, canescent; leaves 8-10 in a whorl, linear, downy, with rough revolute edges; peduncles many flowered, disposed in a panicle; fruit hispid. ♃. F. Native of Tunis, about Algiers in hedges. Desf. fl. atl. 1. p. 129. Poir. voy. 2. p. 110. Stems villous. Flowers yellow. Resembles *G. vèrum*.

Tunis Bed-straw. Pl. 1 to 2 feet.

89 G. MINU'TUM (Lin. spec. p. 154.) stems decumbent, smooth; leaves 8 in a whorl, lanceolate, mucronate, serrated from prickles, glabrous, incurved; peduncles reflexed; fruit fleshy. ♃. H. Native of Russia. Gmel. sib. 3. p. 169. no. 45. Flowers yellow. The plant resembles *G. vèrum* very much, and is probably only a variety of it.

Minute Bed-straw. Pl. decumbent.

90 G. HUMIFU'SUM (Bieb. fl. taur. 1. p. 104.) stems prostrate, much branched, villous; leaves 6 in a whorl, linear, spreading much, villous; floriferous branches axillary, aggregate; lobes of corolla acutish; fruit downy. ♃. H. Native of Caucasus, Tauria, on the lower Volga, in exposed places, and by way sides common. Corollas cream-coloured; anthers yellow. Habit and inflorescence like that of *G. vèrum*.

Trailing Bed-straw. Pl. trailing.

91 G. ARENA'RIUM (Lois. fl. gall. p. 85.) plant glabrous; stems prostrate, much branched; leaves 6-10 in a whorl, linear-oblong, short-apiculated, thick, with revolute rather scabrous edges; corymbs small, on short peduncles, crowded into a panicle; fruit glabrous, rather fleshy. ♃. H. Native of the west of France, from Bayonne even to Armoracea on the south, in the sand by the sea side. D. C. fl. fr. suppl. p. 495. G. hierosolymitànum, Thor. chl. land. 40. but not of Lin. G. megalospérmum var. *β*, D. C. fl. fr. ed. 3. no. 3350. exclusive of var. *a*. G. minùtum, Aubr. morb. p. 16. Flowers yellow, varying from 3-5-cleft. Distinct from the sea side variety of *G. vèrum*.

Sand Bed-straw. Pl. prostrate.

§ 7. *Ericogalia* (from *erica*, a heath, and *galium*; the habit of the species is that of *E'rica*). D. C. prod. 4. p. 604. *Perennial or suffruticose plants. Leaves 4-6 in a whorl. Inflorescence axillary. Flowers hermaphrodite.*

92 G. ERICOÌDES (Lam. dict. 2. p. 583.) stems suffruticose, much branched, downy; leaves approximate, 4-5 in a whorl, linear-lanceolate, with revolute margins, apiculated, stiff, smoothish; flowers axillary, nearly sessile, solitary, bibracteate; corolla pilose outside; fruit covered with stiff short hairs. ♄. G. Native of Monte-Video and Chili. Cham. et Schlecht. in Linnæa. 3. p. 225. Larger leaves 2-3 lines long, and the smaller ones only half a line. Flowers minute, cream-coloured. Fascicles of leaves sessile, hence the plant has the habit of a heath. Stems decumbent.

Var. β, intermèdium (Cham. et Schlecht. in Linnæa. 3. p. 225.) plant shrubby, clothed with short down; leaves linear, quite glabrous, ending in a long cusp each. ♄ G. Native of Brazil, in Campo d'Utna.

Var. γ, atheròdes (Cham. et Schlecht. in Linnæa. 3. p. 225.) quite glabrous in every part, as also the fruit; leaves linear, with revolute edges. ♄. G. Native of Brazil, in Estrella do Campo Aguda. G. atheròdes, Spreng. cur. post. p. 39.

Heath-like Bed-straw. Pl. decumbent.

93 G. HI'RTUM (Lam. dict. 2. p. 583.) root woody; stems herbaceous, branched, tetragonal, very leafy, hispid; leaves 4-5 in a whorl, sessile, lanceolate, more or less hairy on both surfaces; flowers axillary, verticillate, nearly sessile, bibracteate; lobes of corolla acute; fruit glabrous, tubercular. ♃. G. Native of the south of Brazil and Monte-Video. Cham. et Schlecht. in Linnæa. 3. p. 224. Req. diss. mss. G. refléxum, Pohl, in litt. G. megapotámicum, Spreng. cur. post. p. 39. ex Cham. et Schlecht. in Linnæa. Stems decumbent or erect. Flowers yellow. Inflorescence of *G. verticillàtum*.

Hairy Bed-straw. Pl. decumbent or erect.

94 G. CAMPÒRUM (Pohl, in litt. ex D. C. prod. 4. p. 604.) plant quite glabrous; stems erect, tetragonal; leaves 4 in a whorl, sessile, linear, acutish, spreading, with revolute edges, more or less ciliated; flowers axillary, almost sessile; fruit finely granulated.—Native of Brazil, where it was collected by Pohl. Flowers small. Fruit almost like that of *G. spùrium*, but differs in being almost sessile. Leaves 4 lines long. Allied

to *G. hîrtum*, but differs in the angles of the stem being glabrous.

Field Bed-straw. Pl. 1 foot.

95 G. HU'MILE (Cham. et Schlecht. in Linnæa. 3. p. 226.) stems diffuse, tetragonal, filiform, beset with stiff hairs or glabrous; leaves 4 in a whorl, petiolulate, elliptic, acute at both ends, flat, cuspidate, ciliated; flowers axillary, solitary, opposite, on short pedicels, bibracteate; lobes of corolla acute, rather pilose at the apex; fruit globose, didymous, downy.—Native of the south of Brazil.

Humble Bed-straw. Pl. procumbent.

§ 8. *Maschaligàlia* (from μαχαιρα, *machaira*, sword-grass, and *galium*). D. C. prod. 4. p. 605. *Perennial plants. Leaves 4 in a whorl. Inflorescence axillary. Flowers polygamous, cream-coloured.*

96 G. CORONA'TUM (Sibth et Smith, fl. græc. t. 125.) stems ascending, branched from the base, smooth; leaves 4 in a whorl, elliptic, obtuse, nearly veinless, with the margins and base ciliated; peduncles quinquefid, glabrous, bibracteate; flowers polygamous; fruit glabrous. ♃. H. Native of Bithynia, on Mount Olympus; and of Tauria and Caucasus. Valántia Taúrica, Bieb. fl. taur. 2. p. 437.—Buxb. cent. 5. p. 47. f. 39. There is a variety of this with rather hispid stems. Flowers pale yellow.

Var. β, glabérimum (D. C. prod. 4. p. 605.) stems and lower leaves quite glabrous on the nerve and margins. ♃. H. Native of Armenia and Cappadocia, on the mountains. Valántia humifùsa, Willd. spec. 4. p. 949. Bieb. fl. taur. 2. p. 436. Cruciata orientalis glabra humifusa, Tourn. cor. p. 4.

Crowned Bed-straw. Fl. June, July. Clt. 1816. Pl. procumbent.

97 G. TAU'RICUM (Rœm. et Schultes, syst. 3. p. 250.) stems decumbent, branched, hispid; leaves 4 in a whorl, elliptic, reticulated, hispid; peduncles branched, ciliated, bracteated, deflexed; bracteas oblong; flowers polygamous; fruit hispid from short down. ♃. H. Native of Tauria, in rough places. Valántia Taúrica, Pall. in Willd. spec. 4. p. 951. act. petr. nov. 10. p. 315. Bieb. suppl. p. 640. D'Urv. cat. no. 138. Valántia redevìva, Hoffm. ex Sieb. Flowers yellow.

Taurian Bed-straw. Fl. June, Aug. Clt. 1819. Pl. dec.

98 G. VE'RNUM (Scop. carn. ed. 2. no. 144. t. 2.) stems erect, simple or branched from the base; leaves 4 in a whorl, 3-nerved, ciliated; peduncles dichotomous, bractless, shorter than the leaves; flowers polygamous; fruit glabrous. ♃. H. Native of France and Switzerland, Upper Italy, Germany, Hungary, Gallicia, Siberia, &c. in grassy places. Stems and leaves glabrous or hispid, with the exception of the ciliæ. Flowers yellow or cream-coloured. D. C. fl. fr. ed. 3. no. 3353. Very like *G. cruciàtum*. Valántia vérna, G. Don, in Loud. hort. brit. p. 411.

Var. α, Bauhìnii (D. C. prod. 4. p. 605.) leaves oval or elliptic. ♃. H. Valántia glàbra, Lin. spec. 1491. Valántia glàbra, Waldst. et Kit. hung. t. 32. Valántia crebrifòlia, St. Am. fl. agr. p. 424. G. Bauhìnii, Rœm. et Schultes, syst. 3. p. 218.—J. Bauh. hist. 3. p. 717. Flowers yellow.

Var. β, Hallèri (D. C. prod. 4. p. 605.) leaves oblong; flowers paler and smaller. ♃. H. Valántia glàbra, Vill. dauph. 2. p. 354. G. Scopòlii, Vill. dauph. 1. p. 304. G. rubioìdes, Sut. fl. helv. 1. p. 88. G. Hallèri, Rœm. et Schultes, syst. 3. p. 218. —Hall. nom. no. 720. Flowers cream-coloured.

Spring Bed-straw. Fl. May, June. Clt. 1371. Pl. trailing, 1 foot.

99 G. PE'RSICUM (D. C. prod. 4. p. 605.) plant quite glabrous, smooth, erect, of many stems; leaves 4 in a whorl, oblong, not ciliated; peduncles axillary, many-flowered, 3 times shorter than the leaves, bracteate; fruit glabrous. ♃. H. Native of Persia, near Amadan, where it was collected by Olivier and Bruguiere. Flowers yellow in the dried state. Nearly allied to *G. vérnum*, but differs in the plant being perfectly glabrous.

Persian Bed-straw. Pl. ½ to 1 foot.

100 G. CRUCIA'TUM (Scop. carn. 1. p. 100.) stems erect; branched from the base, simple at the apex, pilose; leaves 4 in a whorl, elliptic-oblong or ovate, hairy, 3-nerved; peduncles hispid, branched; bracteas 2, oblong, ciliated; flowers polygamous; fruit glabrous. ♃. H. Native of Europe, in hedges, road-sides, and shady places frequent; plentiful in Britain; and of Siberia. D. C. fl. fr. no. 3351. Req. diss. mss. G. cruciàtum, Smith, engl. bot. 143. G. Vaillántia, fl. Wett. G. Valántia, Baumg. trans. Valántia cruciàta, Lin. spec. 1491. Lam. ill. t. 843. f. 1. Aparìne latifòlia, Mœnch. meth. 640. Valántia ciliàta, Presl. fl. cech. p. 34. but not of Russ. Root creeping. Flowers yellow, and some are 3-cleft.

Var. β, angustifòlium (D. C. prod. 4. p. 606.) leaves linear-oblong, very scabrous along the edges. ♃. H. Cultivated in gardens, according to Req. diss. mss. ex D. C.

Crosswort Bed-straw. Fl. May, June. Britain. Pl. 1 foot.

101 G. CHERSONE'NSE (Rœm. et Schultes, syst. 3. p. 250.) stems branched, ascending, with hispid angles; leaves 4 in a whorl, oblong, ciliated, somewhat 3-nerved: nerves hispid beneath; peduncles branched, hispid, deflexed, bracteated; bracteas oblong, ciliated; fruit glabrous. ♃. H. Native of Tauria and Caucasus. Valántia Chersonénsis, Willd. spec. 4. p. 951. Bieb. fl. taur. suppl. 1977. G. cruciàtum, β, Chersonénse, D. C. prod. 4. p. 606. Root creeping. Flowers yellow. Very like *G. cruciàtum*.

Cherson Bed-straw. Fl. May, July. Clt. 1817. Pl. 1 ft.

SECT. II. ANNUAL SPECIES.—APARÌNE.

§ 9. *Cruciàtæ* (from *crux*, a cross; in reference to the disposition of the 4 leaves in each whorl). D. C. prod. 4. p. 605. —Cruciàta, Tourn. inst. p. 115.—Valántia species, Lin. *Plants annual. Flowers polygamous; some male, and some hermaphrodite, intermixed, yellow. Leaves 4 in a whorl. Fruit glabrous or pilose.*

102 G. RETRO'RSUM (D. C. prod. 4. p. 605.) stem erect, simple, beset with retrograde prickles along the angles; leaves 4 in a whorl, oblong, villously ciliated; peduncles axillary, pilose, nearly simple, reflexed while in fruit; flowers polygamous, 3-4-cleft; fruit glabrous. ⊙. H. Native of Sicily, Pannonia, and Caucasus, on hills, and in woods on the mountains. G. Pedemontànum, Bieb. fl. taur. 2. p. 436. Guss. prod. 1. p. 170. but not of All. Vaillántia Pedemontàna, Waldst. et Kit. pl. rar. hung. 1. t. 33. but not of Bellardi. Flowers yellow.

Retrograde-prickled Bed-straw. Pl. ½ to 1 foot.

103 G. PEDEMONTA'NA (All. auct. p. 2.) stem erect, simple, slender, loosely villous; leaves 4 in a whorl, oval-oblong, hispid; peduncles bractless, 3-4-flowered, shorter than the leaves, deflexed after flowering; flowers polygamous; fruit glabrous, globose, didymous. ⊙. H. Native of the south of Europe, as of Portugal, Spain, Vallais, Piedmont, &c. in sterile dry places. D. C. fl. fr. ed. 3. no. 3352. Req. diss. mss. Valántia Pedemontàna, Bell. append. 46. t. 5. act. taur. 5. t. 7. but not of Kit. G. chloránthum, Brot. fl. lus. 1. p. 149. Fruit sometimes truly globose, from one of the cells being abortive. Flowers yellow, very like those of *G. cruciàtum*.

Var. β, refléxum (Presl. fl. sic. prod. p. 123.) fruit rough from stiff pili. ⊙. H. Native of Sicily, among grass on the mountains and in groves. Perhaps a proper species.

Piedmont Bed-straw. Fl. July. Clt. 1799. Pl. ½ to 1 foot.

104 G. GIBRALTA'RICUM (Schott, in isis. 1828. p. 821.) stems

pilose, muricated along the angles; lower leaves ovate: cauline ones 8 in a whorl: uppermost ones opposite, all with revolute hispid edges; panicles decompound; lobes of corolla cuspidate; fruit glabrous. ⊙. H. Native of Gibraltar, on the mountains. Flowers yellow.

Gibraltar Bed-straw. Pl. ½ to 1 foot.

105 G. SCHULTE'SII; leaves cordate, glabrous, rather ciliated, with scabrous margins; peduncles dichotomous, leafless. ⊙. H. Native of Caucasus, in dry stony places on the Talusch mountains, near Swant. G. articulàtum, Rœm. et Schultes, syst. 3. p. 250. but not of Lam. nor D. C. ex Meyer, pfl. syst. p. 55.

Schultes's Bed-straw. Pl. ½ foot.

106 G. PYGMÆ'UM (D. C. prod. 4. p. 606.) plant quite glabrous, branched from the base; leaves 4 in a whorl, roundish; peduncles axillary, short, 3-6-flowered, bractless; fruit globose, drooping, glabrous. ⊙. H. Native of Iberia. Valántia murà-lis, Bieb. fl. taur. 2. p. 435. exclusive of the synonyme. Vaillántia pusílla, Stev. in litt. 1825. Herb very minute. Flowers yellow.

Pigmy Bed-straw. Pl. small.

107 G. CORDA'TUM (Rœm. et Schultes, syst. 3. p. 259.) plant glabrous, erectish, branched from the base; leaves 4 in a whorl, obovate, unequal: floral ones sessile, ovate-cordate, deflexed, and covering the flowers and lower parts of the nodi; peduncles branched, short, few-flowered; fruit glabrous. ⊙. H. Native of the Levant, at the foot of Mount Lebanon, where it was collected by Labillardiere, &c. The flowers are probably yellow. This plant is often to be found in gardens under the name of *Callipéltis cucullària*. Nearly allied to *G. articulàtum*.

Cordate-leaved Bed-straw. Pl. ½ foot.

§ 10. *Xanthaparìnes* (from ξανθος, *xanthos*, yellow, and απαρινη, *aparine*, the Greek name of cleavers or goose grass; in reference to the yellow flowers of the species). D. C. prod. 4. p. 600. *Plants annual. Leaves 4-8 in a whorl. Inflorescence cymosely panicled. Flowers yellow, hermaphrodite. Fruit glabrous.*

108 G. CAMPE'STRE (Schousb. ex Willd. enum. 1. p. 152.) stem erect, tetragonal, having the roughness on the angles turned upwards, not retrograde; lower leaves 4 in a whorl, the rest 6, elliptic, mucronate, with scabrous margins; peduncles dichotomous; lobes of corolla lanceolate, bluntish. ⊙. H. Native of Barbary. Rœm. et Schultes, syst. 3. p. 224. Link, enum. 1. p. 135. Corollas cream-coloured. Leaves 4 lines long, and 2 lines broad. Stems decumbent at the base. Leaves on the upper part of the branches sometimes opposite.

Var. β, Vàhlii (D. C. prod. 4. p. 606.) stem smoothish; leaves oblong. ⊙. H. Native of Barbary, where it was collected by Vahl and Lamarck, &c. See Lam. dict. 3. p. 584. observations under G. megalospérmum. The leaves are almost like those of var. α, but the margins are more scabrous. Lobes of corolla not awned. Fruit granular.

Field Bed-straw. Fl. June, July. Clt. 1820. Pl. ½ foot.

109 G. GLOMERA'TUM (Desf. fl. atl. 1. p. 128. t. 40.) stem erect, branched, panicled, tetragonal: angles rough; leaves 6-8 in a whorl, linear-lanceolate, mucronately acute, serrulately scabrous on the margins; panicles trichotomous; lobes of corolla very acute, a little awned; fruit glabrous. ⊙. H. Native of Barbary, in corn-fields. Flowers pale yellow. Said to be allied to *G. campéstre*.

Glomerate-flowered Bed-straw. Pl. ½ to ¾ foot.

110 G. VISCO'SUM (Vahl, symb. 2. p. 29.) stems ascending, tetragonal, smooth, branched; lower leaves 4 in a whorl: upper ones 6, linear-lanceolate, with serrated margins and a smooth keel; the serratures directed upwards; peduncles filiform, by threes; pedicels 2-flowered; fruit clammy. ⊙. H. Native of the kingdom of Tunis, on the mountains. Corolla pale yellow, almost white.

Clammy-fruited Bed-straw. Pl. ¼ foot.

§ 11. *Leiaparìnes* (from λειος, *leios*, smooth, and απαρινη, *aparine*). D. C. prod. 4. p. 607. *Plants annual. Leaves 4-8 in a whorl. Inflorescence cymosely panicled. Flowers white, hermaphrodite. Fruit glabrous.*

111 G. URVI'LLEI (Req. diss. mss. ex D. C. prod. 4. p. 607.) stem erect, branched at the base, glabrous; leaves 6-8 in a whorl, linear, erect, glabrous, with revolute edges; peduncles axillary and terminal, trifid; pedicels 3 times longer than the flowers; fruit glabrous. ⊙. H. Native of the islands in the Grecian Archipelago, in arid places. G. floribúndum, D'Urv. cat. no. 130. but not of Smith. Flowers purplish in the dried state. Habit of *G. setàccum*, but differs in the fruit being quite glabrous.

D'Urville's Bed-straw. Pl. ½ foot.

112 G. DIVARICA'TUM (Lam. dict. 2. p. 580.) stem ascending or erect, branched at top, slender, smoóthish; leaves 6-8 in a whorl, linear, acute, hispid; peduncles axillary and terminal, slender, elongated, divaricate, trifid at the apex; pedicels twice the length of the flowers; fruit glabrous. ⊙. H. Native of the south and middle of France; Liguria and Sicily, in arid sandy places. D. C. fl. fr. no. 3370. icon. rar. t. 24. Req. diss. mss. G. tènue, Vill. dauph. 2. p. 322. t. 7. Flowers greenish.

Divaricate Bed-straw. Fl. June, July. Clt. 1818. Pl. ¼ ft.

113 G. TENUI'SSIMUM (Bieb. fl. taur. 1. p. 104.) stems weak, ascending, much branched, rather scabrous along the angles; leaves 6-8 in a whorl, linear, acute, scabrous, hispid; peduncles axillary and terminal, trichotomous, divaricate; pedicels length of peduncles; fruit glabrous. ⊙. H. Native of Tauria, Caucasus, Iberia, in uncultivated and sterile places. G. purpùreum, Pall. ind. taur. but not of Lin. Flowers small, greenish-white. Very nearly allied to *G. divaricàtum*, and probably only a variety of it according to Steven, but differs in the pedicels being 3 or 4 times longer.

Most-slender Bed-straw. Fl. June, July. Clt. 1818. Pl. ¼ ft.

114 G. A'NGLICUM (Huds. fl. angl. p. 69.) stems decumbent, much branched, rather scabrous; leaves 6 in a whorl, linear-lanceolate, mucronate, with scabrous edges; peduncles 2-3-cleft, a little longer than the leaves, axillary, disposed in a kind of panicle; fruit glabrous, granular. ⊙. H. Native of England, on walls and in sandy places; north and middle of France, palatinate of the Rhine, Vallais, Sicily, and Caucasus. Smith, fl. brit. 1. p. 179. D. C. fl. fr. 3369. Smith, engl. bot. 384. G. Parisiénse, Lam. dict. 2. p. 584. G. Parisiénse β, Bertol. dec. 3. p. 15. G. rùbrum, Poll. pal. no. 156. exclusive of the syn. G. gràcile, Wallr. sched. p. 57. Presl, fl. sic. prod. p. 60. ex Guss. prod. p. 173. Ray. syn. t. 9. f. 1. Corollas of a greenish cream-colour, almost white, small. It differs from *G. litigiòsum* in the fruit being glabrous, and from *G. divaricàtum* in the peduncles being shorter.

Var. β, parvifòlium (Gaud. fl. helv. 1. p. 439.) stems erect, short; floriferous branches short; fruit granular. ⊙. H. Native in fields about Geneva. G. parvifòlium, Rœm. et Schultes, syst. 3. p. 246.

English Bed-straw. Fl. June, July. Wales. Pl. decumbent.

115 G. APRI'CUM (Sibth et Smith, fl. græc. t. 126.) stems pilose, diffuse; leaves 4 in a whorl, obovate, uniform, with scabrous edges; peduncles trifid, leafless; fruit glabrous. ⊙. H. Native of Candia and other islands in the archipelago, frequent. Peduncles 3-flowered; middle flower hermaphrodite and quadrifid; lateral ones male and trifid. Certainly a species of *Vaillántia*.

Sunny Bed-straw. Pl. diffuse.

116 G. GAUDICHAU'DI (D. C. prod. 4. p. 607.) stems weak, decumbent, tetragonal, rather hispid; leaves 4 in a whorl, ob-

long-linear, with hairy revolute edges; floriferous branches short, axillary, few-flowered; lobes of corolla hardly acutish; fruit glabrous.—Native of New Holland, at Port Jackson, where it was collected by Gaudichaud. Stems 8-10 inches long. Leaves 2-3 lines long, shorter than the internodes. Flowers white.

Gaudichaud's Bed-straw. Pl. decumbent.

§ 12. *Euaparines* (from *eu*, well, and *aparine*, cleavers; the section is supposed to contain the true kinds of cleavers). D. C. prod. 4. p. 607. *Plants annual. Stems scabrous. Leaves* 4-8 *in a whorl. Inflorescence axillary. Flowers usually hermaphrodite. Fruit granular or hispid, didymously globose.*

117 G. saccharàtum (All. pedem. no. 39.) stems weak, branched, with retrograde roughness along the angles; leaves 6 in a whorl, linear-lanceolate, scabrous from prickles along the margins; prickles not retrograde; peduncles axillary, 3-4-flowered, recurved when bearing the fruit, and length of leaves; fruit didymosely globose, warted. ⊙. H. Native of Europe, in corn fields; Scotland, in the Carse of Gowrie, and near Forfar; and near Malton, in Yorkshire. D. C. fl. fr. ed. 3. no. 3379. Wallr. ann. bot. 24. Req. diss. mss. G. verrucòsum, Smith, in engl. bot. t. 2173. fl. græc. t. 133. Valántia saccharàta, Gmel. fl. bad. 3. p. 781. Valántia aparìne, Lin. spec. 1491. Schrad. spic. 55. t. 1. f. 3. V. aparìne α, Lam. fl. fr. 3. p. 383. Aparìne verrucòsa, Mœnch. meth. p. 640.—Vaill. bot. t. 4. f. 3. b. Perhaps G. granulàtum, Rœm. et Schultes, syst. 3. p. 249. or Valántia granulàris, Spreng. in Schrad. journ. 1800. 2. p. 200. Peduncles 3-flowered, lateral ones male, and middle one hermaphrodite.

Sugary Cleavers or Goosegrass. Fl. Ju. Aug. Britain. Pl. dif.

118 G. tricò'rne (With. brit. ed. 2. p. 153.) stems weak, simple, rough from retrograde prickles along the angles; leaves 8 in a whorl, lanceolate, scabrous from retrograde prickles along the margins and keel; peduncles axillary, 3-flowered, recurved when in fruit, not exceeding the leaves; fruit didymously globose, granular. ⊙. H. Native throughout the whole of Europe, in corn-fields; also of Caucasus; in many parts of England, in chalky fields, but not common. D. C. fl. fr. ed. 3. no. 3378. Smith, engl. bot. t. 1641. Wallr. ann. bot. t. 23. Req. diss. mss. G. spùrium, Huds. angl. p. 68. G. Valántia, Wigg. prim. p. 12. Valántia triflòra, Lam. fl. fr. 3. p. 384. exclusive of the synonymes. Valántia aparìne, Mart. fl. rust. 1. t. 122. Valántia tricórnis, Roth, neu. beytr. 1. p. 142.—Vaill. bot. t. 4. f. 3. a, a. Flowers greenish-white.

Three-horned Goosegrass. Fl. Ju. Aug. Britain. Pl. ½ to 1 ft.

119 G. spu'rium (Lin. spec. p. 154.) stems decumbent, scabrous from retrograde prickles along the angles, but glabrous at the knees; leaves 6-9 in a whorl, lanceolate, mucronate, keeled, scabrous from retrograde prickles along the keel and edges; peduncles many-flowered, hardly recurved, while in the fruit longer than the leaves; fruit glabrous, smooth. ⊙. H. Native of Europe and Siberia, in fields and all cultivated ground; in Scotland, in corn-fields about Forfar, but rare. D. C. fl. fr. ed. 3. no. 3377. Smith, eng. bot. t. 1871. G. agréste leiospérmum, Wallr. sched. p 59. G. híspidum, Hoffm. germ. 1. p. 74. G. adhæ'rens, Jacq. hort. vind. ex Jan. herb. G. aparìne var. Spreng. Flowers green. Perhaps two species are confused under this name, differing much in the size of the fruit.

Spurious Goosegrass. Fl. June, July. Britain. Pl. decumb.

120 G. scabe'rrimum (Vahl, in Horn. hort. hafn. 1. p. 135.) stem angular, scabrous from retrograde prickles; leaves 8 in a whorl, linear, spreadingly reflexed, longer than the internodes, mucronate, very scabrous above, and scabrous from prickles along the keel and margins; peduncles axillary, few-flowered, subcorymbose; fruit globose, didymous, hispid from bristles, which are hooked at the apex. ⊙. H. Native of Egypt. G. híspidum, Willd. enum. hort. berol. 1. p. 150. Corollas yellowish. Stem simple.

Very-rough Goosegrass. Fl. Ju. July. Clt. 1821. Pl. ½ foot.

121 G. Aparìne (Lin. spec. p. 157.) stems weak, branched, rough from retrograde prickles, villous at the nodi; leaves 8 in a whorl, lanceolate-linear, apiculated, scabrous from retrograde prickles along the margins and keel; peduncles simple and bifid, scabrous; fruit didymously globose, very hispid from bristles, that are hooked at top. ⊙. H. Native throughout the whole of Europe, north of Asia, and North America, in hedges, fields, and in most cultivated places; plentiful in Britain. Oed. fl. dan. t. 495. Smith, engl. bot. t. 816. Bull. herb. fr. t. 215. Heyne, term. bot. t. 13. f. 6. Mart. fl. rust. t. 104. Woodv. med. bot. suppl. 269. Valántia Aparìne β, Lam. fl. fr. 3. p. 383. Aparìne híspida, Mœnch. meth. p. 640. Rùbia tinctòrum, Lapeyr. ex Benth. Aparìne, Dod. pempt. 353. Petiv. brit. t. 30. f. 11. Flowers small, pale buff-coloured. Fruit rather large. Stems climbing. The well known property of this plant of adhering to whatever it comes in contact with, acquired it the names of Cleavers or Clivers, and Catchweed or Scratchweed; and from being a favourite food or medicine of geese, Goosegrass, Gooseshare, and Goslingweed. The stalks, according to Linnæus, are used in Sweden as a filtre to strain milk through. Dioscorides relates that the shepherds made the same use of it in his time. It is reckoned to purify the blood, and for that purpose the tops are an ingredient in spring broth. The expressed juice of the herb taken to the amount of 4 ounces or a quarter of a pint night and morning, during several weeks, is very efficacious in removing many cutaneous disorders. It has been most celebrated in scrofulous and cancerous sores, but the experiments made has not turned out in its favour. The seeds are a good substitute for coffee. The roots, like most of the genus, will dye red, and eaten by birds have tinged their bones of that colour.

Var. β, mìnor (Req. diss. mss. ex D. C. prod. 4. p. 608.) stem dwarf; leaves usually 6 in a whorl, and smaller. ⊙. H. Native of the island of St. Lucia, near Narbonne.

Common *Cleavers* or Goosegrass. Fl. May, Aug. Britain. Pl. climbing.

122 G. Vailla'ntii (D. C. fl. fr. 1805. no. 8381.) stems weak, nearly simple, glabrous at the nodi, but scabrous from retrograde prickles along the angles; leaves 8 in a whorl, linear, having the keel and margins scabrous from retrograde prickles; peduncles simple or bifid; fruit globosely didymous, rather hispid from a few bristles, which are hooked at their tops. ⊙. H. Native of Europe, in cultivated fields; plentiful in some parts of Britain. G. infestum, Waldst. et Kit. pl. rar. hung. 3. p. 202. (1808) Bess. gall. 121. G. agréste echinospérmum, Wallr. sched. p. 59. G. Aparìne β, Lam. Flowers small, yellowish. Fruit about half the size of those of *G. aparìne*, and not so hispid.

Vaillant's Goosegrass. Fl. June, July. Clt. 1817. Pl. 2 to 3 feet.

123 G. aparinoìdes (Forsk. descrip. p. 30.) stems weak, prickly along the angles, but the prickles are not retrograde as in most of the species, but lean forward, and the knees or joints are equal and glabrous; leaves 6 in a whorl, oblong, scabrous from retrograde prickles along the margins and keel; peduncles 3 from the top of each branch, bifid; fruit hispid from bristles, which are hooked at the tops. ⊙. H. Native of Arabia, in shady places. Vahl, symb. 2. p. 30. Flowers white. Fruit like that of *G. aparìne*.

Cleavers'-like Goose-grass. Pl. procumbent.

124 G. pauciflòrum (Bunge, l. c.) annual; stems weak, glabrous, tetragonal, scabrous from retrograde prickles along the angles; leaves 6 in a whorl, spatulately oblong, attenuated at the base, cuspidate by a spine, hispid above, and glabrous be-

neath, with scabrous margins; peduncles axillary, a little longer than the leaves, bracteate, 1-2-flowered; corollas very minute, obtuse; fruit didymous, very hispid from hooked bristles. 4. G. Native of China, in humid places, near Ssi-jui-ssy.

Few-flowered Goose-grass. Pl. decumbent.

125 G. AUSTRA'LE (D. C. prod. 4. p. 608.) stems weak, procumbent, branched, tetragonal, pilose, on one side; leaves 4 in a whorl, oblong, mucronately acute, rather pilose, with subrevolute edges; peduncles axillary, 3-flowered, hardly longer than the leaves; fruit very hispid from bristles.—Native of New Holland, at Bass Straits, where it was collected by D'Urville. Said to be nearly allied to *G. recúrvum*, but differs in the pedicels not being recurved, and in the fruit being twice the size.

Southern Goose-grass. Pl. procumbent.

126 G. GRA'CILE (Bunge, in mem. acad. sc. Petersb. 2. p. 109.) stem simple, erect, quite glabrous, shining, tetragonal; leaves 4 in a whorl: lower ones obovate, middle ones elliptic, superior ones oblong, 1-nerved, scabrous from dots, hispid on the margins; panicles axillary, dichotomous, very slender, exceeding the leaves; corollas very minute, obtuse; fruit hispid from hooked bristles. 4. G. Native of China, on mountains, near Lun-züan-ssy.

Slender Goose-grass. Pl. $\frac{1}{2}$ foot.

127 G. TE'NERUM (Schleich. ex Gaud. fl. helv. 4. p. 442.) stems filiform, glabrous; leaves 6 in a whorl, obovate, setaceously apiculated, scabrous from retrograde prickles on the margins; peduncles by threes, trifid, spreading; fruit hispid. ⊙. H. Native of the Alps of Switzerland. Corollas small, white.

Tender Goose-grass. Pl. procumbent.

128 G. LITIGIÒSUM (D. C. fl. fr. no. 3382. icon. rar. t. 26.) stems decumbent, branched, rather scabrous; leaves 4-6 in a whorl, linear-lanceolate, acute, shorter than the internodes, rather scabrous; peduncles elongated, divaricate, bifid or trifid; fruit nearly globose, hispid at top from somewhat hooked hairs. ⊙. H. Native of the south of France, Italy, Sicily, in rough stony places, and probably about Paris, but very doubtful. G. Parisiénse, Lin. spec. p. 157. exclusive of the synonymes. G. multiflòrum, Brot. fl. lus. 1. p. 251. G. axillàre, Presl. prod. fl. sic. p. 61. ex Guss. Flowers small, reddish. This species differs from *G. An'glicum* and *G. gràcile* in the fruit being hispid.

Var. β, nànum (D. C. prod. 4. p. 609.) stems short, erect. ⊙. H. Native of Europe, in very sterile places. D. C. icon. rar. t. 26. right-hand figure.

Litigious Goose-grass. Fl. June, July. Pl. decumbent.

129 G. MICROSPE'RMUM (Desf. fl. atl. 1. p. 130.) stems erect, tetragonal, glabrous, rough; branches divaricate; leaves 6 in a whorl, linear-acute, denticulated; fruit hispid. ⊙. H. Native of Barbary, near Mascar; and of Sardinia. Aspérula scàbra, Moris, elench. sard. 2. p. 4. and 3. p. 8. Flowers small, white. Very nearly allied to G. divaricàtum, Lam., and is perhaps only a variety of it, with hispid fruit. According to Steven, obs. ined. in herb. Willd. it is only a variety of *G. litigiòsum*.

Small-seeded Goose-grass. Fl. June, July. Clt. 1819. Pl. $\frac{1}{4}$ foot.

130 G. SETA'CEUM (Lam. dict. 2. (1786.) p. 584.) stems filiform, erect, scabrous at bottom; leaves usually 6-8 in a whorl, but from 4 to 8, linear-setaceous, with rather scabrous margins: lower ones oblong; peduncles slender, divaricate, trifid; fruit hispid from bristles, which are hooked at the apex. ⊙. H. Native of Spain, Mauritania, Sicily, Provence, in exposed stony or rocky places. Desf. fl. atl. 1. p. 129. D. C. fl. fr. 5. p. 498. G. microcárpum, Vahl, symb. 2. (1791.) p. 30. G. capillàre, Cav. icon. 2. (1792.) p. 73. t. 191. f. 1. Lag. gen. et spec. no. 127. G. floribúndum, Sibth. et Smith, fl. græc. t. 134.? G. capillàre and G. microcárpum, Spreng. syst. Flowers red. The oldest name is here admitted for this plant, as in all other cases.

Setaceous-leaved Goose-grass. Fl. June, July. Clt. 1819. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

131 G. SIBTHÓRPII (Rœm. et Schultes, syst. 3. p. 244.) stems smooth; leaves 8 in a whorl, linear, revolutely setaceous, scabrous: lower ones obovate; pedicels capillary; fruit rather pilose. ⊙. H. Native of the Grecian Islands, on sterile hills. G. capillàre, Smith, prod. fl. græc. 1. p. 94. but not of Cav. G. Créticum ánnuum tenuifòlium flore albido, Tourn. cor. p. 4. Flowers pale yellow or cream-coloured. Perhaps only a variety of *G. microspérmum* or *G. setàceum*.

Sibthorp's Goose-grass. Pl.

132 G. BREVIFÒLIUM (Sibth. et Smith, fl. græc. t. 135. but not of Stev.) stems villous; leaves 7 in a whorl, obovate, awned, scabrous; peduncles trichotomous, terminal; lobes of corolla awned; fruit hispid. ⊙. H. Native of Caramania, on the seashore. Flowers cream-coloured. The bristles on the stem and leaves are not retrograde, as on most of the species. Perhaps the same as G. álbum, Willd. ex Rœm. et Schultes, syst.

Short-leaved Goose-grass. Pl. 1 foot.

133 G. A'LBUM (Forsk. descrip. const. p. 20.) stems erect, branched, downy, coloured at the nodi; leaves 6-8 in a whorl, oblong, mucronate, with scabrous hardly serrulated margins, glabrous above, and villous beneath, especially on the keel; fruit hispid. ⊙. H. Native about Smyrna. Flowers white.

White-flowered Goose-grass. Pl. $1\frac{1}{2}$ foot.

134 G. RECU'RVUM (Req. diss. mss. ex D. C. prod. 4. p. 609.) stems weak, decumbent, branched, smoothish; leaves 6 in a whorl, but the uppermost ones are only 4, obovate-oblong, narrowed at the base, acutish at the apex, glabrous; peduncles axillary, 3-flowered, equal in length to the leaves, deflexed while in fruit, hairy; fruit small, globose, hispid. ⊙. H. Native of the Grecian Archipelago, among rocks. G. micránthum, D'Urv. cat. no. 133. but not of Pursh. Sherárdia muràlis, Sibth. in herb. L'Her. Sherárdia muràlis, Stev. obs. p. 70?

Recurved-peduncled Goose-grass. Pl. decumbent.

§ 13. *A'speræ* (from *asper*, rough; fruit). D. C. prod. 4. p. 610.—A'spera, Mœnch. meth. 641. *Plants annual. Leaves usually* 4, *rarely* 6 *in a whorl. Inflorescence lateral. Fruit oblong, hispid; mericarps or parts of fruit distinct, narrow, elongated.*

135 G. FILIFÓRME (Rœm. et Schultes, syst. 3. p. 252.) stem simple, hispid, slightly tetragonal; leaves 4 in a whorl, oblong, remotely ciliately denticulated, reticulated, glabrous; male flowers nearly sessile, hermaphrodite ones on short pedicels; fruit oblong, paleaceous, longer than the pedicels. ⊙. H. Native of Teneriffe, on the Walls of Lagunea, but not to be found elsewhere. Valántia filifórmis, Ait. hort. kew. 3. p. 42. Flowers yellowish.

Filiform Goose-grass. Fl. June, July. Clt. 1780. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

136 G. MURA'LE (D. C. fl. fr. no. 3383. All. pedem. no. 34. t. 77. f. 1.) stems branched, decumbent, smoothish; leaves lanceolate, 6 and 4 in a whorl; flowers axillary, twin, on short pedicels; pedicels deflexed after flowering; fruit oblong, hispid. ⊙. H. Native of Occittania, Valentia, Sicily, Siberia, Provence, Italy, Cyprus, Candia, Persia, about Constantinople, in rugged exposed places. Buxb. cent. 2. t. 30. f. 2. G. mínimum, Rœm. et Schultes, syst. 3. p. 262. Aparine mínima, All. nic. p. 4. Sherárdia muràlis, Lin. spec. 149. Sibth. et Smith, fl. græc. 115. G. stenocárpum, Duf. in litt. G. frágile, Pourr. chlor. hisp. 512.—Moris. oxon. t. 21. f. 6. A'spera nùtans, Mœnch. meth. p. 641. Corollas yellowish. Mature fruit of 2 mericarps.

Var. β, leiospérnum (Req. in litt. 1828. ex D. C. prod. 4. p. 610.) stem, leaves, and fruit glabrous. ⊙. H. Native of

Montpelier, at Pont Juvenal, where it was collected by Requien.

Wall Goose-grass. Fl. June, July. Clt. 1818. Pl. decumbent.

137 G. VERTICILLA'TUM (Danth. in Lam. dict. 2. p. 585.) stem branched at the base; branches nearly simple, elongated, smoothish; leaves linear-lanceolate, hispid, 4 in a whorl: uppermost ones opposite, deflexed; flowers 2-4, axillary, and therefore verticillate, almost sessile; fruit erect, hispid. ⊙. H. Native of Sicily, Provence, about Salon Foz; at the foot of Mount Ventosa, Tauria, and Caucasus, in arid places, and at the fountains of the river Salgir. Lois. not. 33. t. 2. D. C. suppl. fl. fr. p. 498. Req. diss. mss. Gàlium muràle, Bieb. fl. taur. 1. p. 105. ex Stev. G. verticillàtum, Pourr. chl. no. 508.

Verticillate-flowered Goose-grass. Fl. June, July. Clt. 1824. Pl. $\frac{1}{4}$ foot.

138 G. SMÍTHII; branches erect, simple, bluntly quadrangular, scabrous; leaves 4 in a whorl, uppermost opposite, all deflexed, elliptic-lanceolate, scabrous; flowers axillary, by threes, therefore 6 in a whorl, erect; fruit hispid, with distinct, elongated mericarps. ⊙. H. Native of the Grecian Islands, among rocks. Sherárdia erécta, Smith, fl. græc. t. 116. Flowers greenish yellow.

Smith's Goose-grass. Pl. $\frac{1}{2}$ foot.

† *Species of Galium not sufficiently known.*

* *Species natives of Europe.*

139 G. SOLEIRÒLII (Lois. nouv. not. 7.) stems weak, angular, downy (Lois.), villous (Spreng.); leaves 5-6 in a whorl, ovate-lanceolate, acute, hairy; peduncles dichotomous (Lois.), divaricate, trifid, few-flowered (Spreng.); fruit wrinkled. ♃. H. Native of Corsica, by the sea-side, where it was collected by Soleirol. G. Córsicum, Spreng. cur. post. p. 39. Flowers unknown.

Soleirol's Bed-straw. Pl. procumbent.

140 G. GOLDLA'CHICUM (Kluk. in Bess. prim. fl. gal. 2. p. 337.) stems procumbent, diffuse, tetragonal; leaves 8 in a whorl, narrow-lanceolate, awned, girded by strong hairs at the apex; flowers umbellate; fruit globose.—Native of Gallicia, in grassy places. Said to be like *G. læ've* and *G. Boccòni*.

Goldlach Bed-straw. Pl. procumbent.

141 G. PENTA'NDRUM (Gileb. ex Kluk. in Bess. prim. fl. gal. 2. p. 338.) stems erect, branched; leaves 8 in a whorl, linear-lanceolate, spotted with white at the apex; racemes few-flowered; flowers pentamerous; fruit didymous—Native of Gallicia. Flowers yellowish. Said to be nearly allied to *G. vèrum*, and is probably merely a pentamerous-flowered variety of that plant.

Pentandrous Bed-straw. Pl. 1 foot.

142 G. OCHROLEU'CUM (Kit. in Schultes, œstr. fl. ed. 2. vol. 1. p. 305.) stems erect, quadrangular, smooth; leaves 8 in a whorl, linear-subulate, with very rough margins, and ending in a long mucrone each; flowers by threes, corymbose, campanulately funnel-shaped. ♃. H. Native of Austria, on mountain rocks. Flowers cream-coloured. Perhaps a species of *Aspérula*.

Cream-coloured-flowered Bed-straw. Pl. 1 foot.

143 G. MONTA'NUM (Lin. spec. p. 155.) stems weak, scabrous; leaves 4 in a whorl, linear, smooth; corymbs trifid. ⊙. H. Native of Germany, France, England. Corolla white, purplish outside before expansion. Anthers brown. This plant is not known at the present day, as the plant under this name in the Linnæan herbarium does not agree with the characters given of it by him.

Mountain Bed-straw. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

** *A species native of the Levant.*

144 G. HIEROSOLYMITA'NUM (Lin. amœn. 4. p. 451.) leaves 10 in a whorl, lanceolate-linear; flowers umbellate, fastigiate.—Native of Palestine. Stature of *G. rùbrum*. The rest unknown.

Jerusalem Bed-straw. Pl. $\frac{1}{2}$ to 1 foot.

*** *Species natives of Asia.*

145 G. TUBERÒSUM (Lour. coch. p. 79.) root oblong, tuberous; stem procumbent, simple; leaves 4-5 in a whorl, lanceolate, glabrous; pedicels axillary, 1-flowered, crowded, longish; fruit rough.—Native of China and Cochin-china, where it is cultivated for the sake of the tubers, which are farinaceous, and are eaten when boiled. Flowers hardly known. Perhaps a true species of *Gàlium*.

Tuberous-rooted Bed-straw. Pl. procumbent.

146 G. STRIGÒSUM (Thunb. nov. act. ups. 7. p. 141. t. 4. f. 1-9.) stems decumbent, tetragonal, scabrous along the angles; leaves 6 in a whorl, elliptic, ending in a spinose point, hispid from pili above, and nearly glabrous beneath, with ciliately scabrous edges; flowers axillary, on short peduncles.—Native of Japan. G. uliginòsum, Thunb. fl. jap. 58.

Strigose Bed-straw. Pl. decumbent.

**** *Species natives of the Cape of Good Hope.*

147 G. MUCRONA'TUM (Thunb. prod. p. 30. fl. cap. 151.) stems downy, weak, tetragonal, rising in numbers from the same root; leaves 6 in a whorl, linear, mucronate, glabrous, with revolute serrated edges; branches few-flowered; fruit glabrous.—Native of the Cape of Good Hope. Perhaps the same as G. mucronàtum, Spreng. pug. 2. no. 49. The G. mucronàtum, Lam. and the G. mucronàtum, Ruiz et Pav. are distinct species. Mucrones of leaves white.

Mucronate-leaved Bed-straw. Pl. $\frac{1}{2}$ foot.

148 G. HÓRRIDUM (Thunb. fl. cap. 1. p. 556. phyt. bl. p. 16.) stem suffruticose, erect, tetragonal, prickly along the angles; leaves usually 8 in a whorl, linear, reflexed, serrated by prickles. ♄. G. Native of the Cape of Good Hope.

Horrid Bed-straw. Shrub 2 feet.

149 G. GLA'BRUM (Thunb. prod. p. 30. fl. cap. 152.) stems flexuous, erect, tetragonal, glabrous, serrated along the angles; leaves 6 in a whorl, obovate-oblong, acute, glabrous, with replicately-serrated edges; peduncles ample, lateral and terminal, panicled. ♄. G. Native of the Cape of Good Hope. Flowers white. Very like *G. ásperum*.

Glabrous Bed-straw. Pl. 1 foot.

150 G. A'SPERUM (Thunb. prod. 30. fl. cap. 554.) stem flexuously erect, beset with white twisted hairs, and scabrous along the angles; leaves 6 in a whorl, oblong, glabrous, with replicately serrated margins; flowers few. ♃. G. Native of the Cape of Good Hope. Angles of stem rough from retrograde denticulations. Fruit glabrous.

Rough Bed-straw. Pl. $1\frac{1}{2}$ foot.

151 G. EXPA'NSUM (Thunb. prod. 30. fl. cap. 152.) stem tetragonal, smooth, with divaricate downy branches; leaves 6 in a whorl, linear, mucronate, glabrous, with revolute margins; panicles trichotomous, spreading, divaricate; fruit smooth. ♃.? G. Native of the Cape of Good Hope. Corollas white.

Expanded Bed-straw. Pl. 1 foot.

152 G. CAPE'NSE (Thunb. prod. p. 30. fl. cap. p. 151.) stems frutescent at the base, erect, branched; branches terete, downy; leaves 6-8 in a whorl, linear-lanceolate, glabrous, with revolute margins; peduncles dichotomous; fruit glabrous, smooth. ♄. G. Native of the Cape of Good Hope. Flowers white.

Cape Bed-straw. Shrub 1 foot.

***** *Species natives of North America.*

153 G. UNIFLÒRUM (Michx. fl. bor. amer. 1. p. 79.) stems flaccid, smooth; leaves 4 in a whorl, linear, acute, glabrous;

peduncles axillary, solitary, 1-flowered, very short; flowers drooping; fruit glabrous. ♃. H. Native of Carolina. Fertile branches ascending. Said to be nearly allied to *G. tinctòrium*. Flowers white. G. uniflòrum, Req. ined. in herb. D. C. is a variety of *G. triflòrum*.

One-flowered Bed-straw. Pl. ascending.

154 G. parviflòrum (Rafin. med. disp. 5. and in Desv. journ. bot. 1. p. 227.) stems diffuse, angular, glabrous; leaves 5-6 in a whorl, linear-lanceolate, very acute, glabrous; flowers very numerous, panicled.—Native of North America, about Newcastle and Delaware. Flowers small, white.

Small-flowered Bed-straw. Pl. diffuse.

155 G. spinulòsum (Rafin. med. serm. p. 40. but not of Merat.) plant diffuse; leaves 4-6 in a whorl, cuneiform, cuspidate, spinulose, scabrous; peduncles lateral, dichotomous, many-flowered; fruit scabrous.—Native of Maryland. Desv. journ. bot. 4. p. 270. Rœm. et Schultes, syst. 3. p. 528.

Spinulose Bed-straw. Pl. diffuse.

156 G.? Mexica'num (H. B. et Kunth, nov. gen. amer. 3. p. 337.) stem beset with retrograde prickles; leaves 8 in a whorl, linear, acuminately pungent, glabrous, with revolute edges, which are, as well as the middle nerve, rough from retrograde prickles, one-half shorter than the internodes; corymbs terminal, sub-trichotomous; fruit hispid. ⊙. H. Native of Mexico, near Guanaxuato. Perhaps a species of *Rùbia*.

Mexican Bed-straw. Pl. 1½ foot.

* * * * * * *Species natives of South America.*

157 G. denticula'tum (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 612.) stems diffuse, branched, rather hispid from bristles; leaves 4 in a whorl, ovate, cuspidate, ciliated by distant bristles, rather hairy on both surfaces, 1-nerved; flowers few, terminal, usually by threes; pedicels capillary; fruit glabrous.—Native of Mexico, at Real del Monte. Perhaps a species of *Rùbia*.

Denticulated-leaved Bed-straw. Pl. diffuse.

158 G. hirsu'tum (Ruiz et Pav. fl. per. 1. p. 59.) stems procumbent, tetragonal, much branched, hairy; leaves 4 in a whorl, lanceolate, reflexed, hairy; peduncles axillary, 1-flowered, solitary, short; fruit scabrous. ⊙. H. Native of Peru, in the province of Canta, in shady places. Perhaps a species of *Rùbia*.

Hairy Bed-straw. Pl. procumbent.

159 G. pilíferum (H. B. et Kunth, nov. gen. amer. 3. p. 337.) stems weak, beset with retrograde prickles; leaves 8 in a whorl, linear-lanceolate, acuminated by hairs, glabrous, with revolute edges, which are, as well as the middle nerve, beset with retrograde prickles, much shorter than the internodes; flowers terminal, on long peduncles; fruit hispid. ⊙. H. Native of New Granada, on the Andes. This plant ought probably to be excluded from the genus, on account of its campanulate corolla. Habit of *G. uliginòsum*.

Piliferous Bed-straw. Pl. procumbent.

160 G. cane'scens (H. B. et Kunth, nov. gen. amer. 3. p. 336.) stems almost glabrous; branches and leaves villous; leaves 4 in a whorl, ovate, acuminated, triple-nerved, canescent beneath, much shorter than the internodes; floriferous branches bifid; flowers lateral and axillary, solitary and terminal, by threes; fruit beset with hooked bristles. ⊙. H. Native about the town of Quito. Habit of *G. marítima*, but is said to be annual. Perhaps a species of *Rùbia*.

Canescent Bed-straw. Pl. procumbent.

161 G. Caripe'nse (H. B. et Kunth, nov. gen. amer. 3. p. 337.) stem glabrous, beset with retrograde prickles; leaves 8 in a whorl, upper ones 6, oblong-lanceolate, mucronate, having the margins beset with retrograde prickles, much shorter than the internodes; flowers terminal, usually by threes, pedunculate; fruit hispid. ⊙. H. Native of Cumana, near Caripe, in shady places. Said to be allied to *G. tinctòrium*, but is annual.

Caripe Bed-straw. Pl. diffuse.

162 G. lappa'ceum (Ruiz et Pav. fl. per. 1. p. 59.) stem rather scandent, much branched, tetragonal; branches villous, dichotomous; leaves oblong or obovate, 4 in a whorl, hispid: upper ones 3 in a whorl, lanceolate; peduncles axillary, 1-flowered; fruit hispid from bristles.—Native of Peru, about Huanaco, at Puelles Collem. The fruit is said to be baccate. Perhaps a species of *Rùbia*.

Burdock-fruited Bed-straw. Pl. climbing.

* * * * * * * *Species the native habitats of which are unknown.*

163 G. dichótomum (Lehm. ind. sem. hort. hamb. 1823. p. 7.) stem dichotomous, frutescent, quadrangular; leaves 4 in a whorl, obovate-lanceolate; fruit glabrous. ♃. H. Native country unknown. Said to be allied to *G. fruticòsum*, but the leaves are much broader and shorter, and the flowers are larger.

Dichotomous-stemmed Bed-straw. Shrub.

164 G. rígidum (Ait. hort. kew. 1. p. 144.) stem erect, terete, pilose, rather scabrous; leaves verticillate, linear, scabrous above; panicles divaricate. ♃. H. Native country unknown.

Stiff Bed-straw. Fl. June, July. Clt. 1778. Pl. 1 foot.

Cult. The species of *Gàlium* are of the most easy culture and propagation. They will all grow in any common soil. The perennial kinds are easily increased by dividing the plants, or by seeds. The seeds of annual species should be sown where the plants are intended to remain. Those species natives of bogs or marshes should be planted in a moist situation; and those natives of warmer climates should be protected during winter, either by covering with mats or haulm of other herbs, or by placing them in a green-house. None of them are worth cultivating, unless in botanical gardens.

CCXVII. CALLIPE'LTIS (from *καλλος*, *kallos*, beauty, and *πελτη*, *pelte*, a buckler; in reference to the large hollow bracteas). Stev. obs. pl. ross. p. 69. D. C. prod. 4. p. 613.—Cucullària, Buxb. cent. 1. p. 13. t. 19. f. 2. but not of Schreb. nor Rafin. Valántia species, Lin.—Gàlium species, Rœm. et Shultes.

Lin. syst. *Tetrándria*, *Digýnia*. Calyx with an oblong tube, and the limb not perspicuous. Corolla 4-parted, campanulate; lobes ovate, very short. Stamens 4, very short. Stigmas 2. Fruit oblong, rather incurved; one of the mericarps being abortive, the fruit is only 1-seeded.—An annual, erect, much-branched, slender, glabrous herb. Leaves 2, oblong, and stipulas 2, very like the leaves, constituting a 4-leaved whorl. Flowers 3 from each axil, on short pedicels, and therefore constituting 6-flowered whorles. Bractea large, membranous, complicate, and as if it were holding the fruit within its hollow. Flowers small, all fertile. Fruit hispid at the apex.

1 C. cuculla'ria (D. C. prod. 4. p. 613.) ⊙. H. Native of Cappadocia, Arabia, Persia, at Aleppo, Iberia; and of Spain, at Aranjuez. Valántia cucullària, Lin. amœn. acad. 4. p. 295. Bieb. fl. taur. 2. p. 438. Lam. ill. t. 843. f. 2.—Buxb. cent. 1. p. 13. t. 19. f. 2.—Gàlium cucullària, Rœm. et Schultes, syst. 3. p. 259. Flowers whitish.

Cucullar-bractead Callipeltis. Fl. May, July. Clt. 1780. Pl. ½ to 1 foot.

Cult. Sow the seeds in a warm dry situation, where the plants are intended to remain for seed.

CCXVIII. VAILLA'NTIA (so named in honour of Sebastien Vaillant, an eminent French botanist, and demonstrator at the botanic garden, Paris, author of Discours sur la Structure des Fleurs, 1718, and Botanicum Parisiense, 1723, 8vo., and 1726, fol. &c.). D. C. fl. fr. 4. p. 266. Rœm. et Schultes, syst. 3. p. 14. and p. 74. A. Rich. mem. soc. hist. nat. Par. 5. p. 134. t. 11. f. 2. D. C. prod. 4. p. 613.—Valántia, Tourn. act. acad. sc. 1705. Mich. gen. 13. t. 17. Mœnch. meth, p. 639.—Valántia species, Lin.—Vaillántia species, Waldst. et Kit.

Lin. syst. *Polygàmia, Monœ'cia.* Flowers by threes; middle one fertile, hermaphrodite, and the two lateral ones male, and combined with the middle one. Tube of calyx ovate; limb denticulated, permanent, the denticulations many, irregular and stiff. Corollas rotate; male ones trifid, and the hermaphrodite one quadrifid. Stamens 3-4. Styles 2 in the hermaphrodite flower; stigmas capitate. Fruit 3-horned, in consequence of the ovaria of the three flowers being combined; the lateral horns sterile, and the middle one biovulate, but usually only 1-seeded at maturity.—Annual branched herbs. Stems tetragonal. Leaves oval, opposite, and stipulas 2, very like the leaves, forming a 4-leaved whorl. Flowers 3 in each axil, sessile, small, yellow, therefore they appear 6 in a whorl. —According to the observation of A. Richard, the seeds are half naked at maturity from the rupturing of the mericarp.

1 V. mura'lis (Lin. spec. p. 1490.) stem, leaves, and calyxes glabrous. ⊙. H. Native of the south of Europe, in dry rocky places, and on old walls; on the whole coast of Tuscany; on the sandy shores of the County of Nice; and in the south of France, about Nemours; also about Montpelier and Leghorn. Sibth. et Smith, fl. græc. 137. V. quadrifòlia, Mœnch. meth. p. 640.—Sabb. hort. 1. t. 83.—Mich. gen. 13. t. 7.—Mor. oxon. 3. sect. 9. t. 21. f. 2.—Col. ecphr. t. 297. Angles of fruit fringed.

Wall Cross-wort. Fl. May, July. Clt. 1739. Pl. ½ foot.

2 V. híspida (Lin. spec. p. 1490.) stem hispid; leaves ciliated; calyxes pilose. ⊙. H. Native of Teneriffe, south of Spain, Italy, Balearic Islands, Candia, Barbary, &c. in hedges and fields. Sibth. et Smith, fl. græc. t. 138. Gàlium híspidum and G. blephárophon, Rœm. et Schultes, syst. 3. p. 249. Fruit prickly. Lateral horns of fruit smaller.

Var. β, aculeàta (D. C. prod. 4. p. 614.) plant larger; fruit glabrous, longer than the denticulations of the calyx. ⊙. H. Native of the kingdom of Naples, among rubbish and on old walls.

Hispid Cross-wort. Fl. May, July. Clt. 1768. Pl. ½ to ¾ foot.

Cult. Sow the seeds on an old wall or on rock-work, or in any dry sandy soil and situation.

Tribe XIII.

OPERCULARIE'Æ (this tribe contains plants whose fruit opens by an operculum). A. Rich. mem. soc. hist. nat. Par. 5. p. 142. D. C. prod. 4. p. 614.—Operculàriæ, Juss. ann. mus. 4. p. 418. and 10. p. 328.—Operculària Gærtn. fruct. 1. p. 111. t. 24. Flowers combined: having the calycine tubes resembling at length a peculiar operculum. Corollas 3-5-cleft. Stamens 1-5; filaments hardly adnate to the tube of the corolla at the base. Style short; stigmas 2, slender, elongated, acute. Fruit 1-celled and 1-seeded by abortion, combined, 2-valved (f. 112. *b.*), at length dehiscing.—Herbs or subshrubs, usually natives of Australia. Leaves opposite. Stipulas twin on both sides, distinct or combined. Flowers combined into a head, girded by a partial, many-toothed involucrum. Heads of flowers sometimes umbellate and pedunculate, and sometimes sessile and capitate, usually girded by a universal involucrum.—This tribe agrees with *Spermacòceæ* in habit and stigmas, but the number of stamens is variable, and therefore it approaches the order *Valeriàneæ*.

CCXIX. PO'MAX (from *πωμα, poma,* an operculum; in reference to the operculum to the fruit). Soland. in Gærtn. fruct. 1. p. 111. t. 24. A. Rich. mem. soc. hist. nat. Par. 5. p. 145. t. 13. f. 1. D. C. prod. 4. p. 615.—Operculàriæ floribus umbellatis, Juss. ann. mus. 4. p. 418.

Lin. syst. *Mono-Tetrándria, Monogýnia.* Limb of calyx wanting. Corolla 3-4-cleft. Stamens 1-4. Seeds wrinkled from tubercles.—Suffrutescent herbs. Leaves opposite, furnished with one leaf-formed stipula on each side. Peduncles 7-10, terminal, umbellate, involucrated by the 2 floral leaves and 4 small stipulas, bearing at their tops a small distinct head of flowers each; heads girded by a blunt 8-10-toothed involucrum. Flowers 3 within each partial involucrum, joined together by the tubes of the calyxes.

1 P. hírta (D. C. prod. 4. p. 615.) branches, leaves, peduncles, and involucra hispid; leaves oblong-linear. ♄. G. Native of New Holland. Pòmax umbellàta, Sol. l. c. Operculària umbellàta, Gærtn. fruct. 1. p. 112. t. 24. Lam. ill. t. 58. f. 1. Juss. mem. mus. 10. p. 426. Sieb. nov. holl. no. 250.

Hairy Pomax. Fl. June, July. Clt. 1826. Pl. ½ to 1 ft.

2 P. gla'bra (D. C. l. c.) plant glabrous in every part; leaves elliptic, attenuated at the base. ♄. G. Native of New Holland, about Port Jackson. Stipulas smaller than in the preceding species.

Glabrous Pomax. Shrub 1 foot.

Cult. The species of this genus grow best in a mixture of loam, peat, and sand; and cuttings root freely under a hand-glass.

CCXX. OPERCULA'RIA (from *operculum,* a lid; in reference to the operculate calyx). A. Rich. mem. soc. hist. nat. Par. 5. p. 144. t. 13. f. 2. D. C. prod. 4. p. 615.—Rubioìdes, Soland. l. c.—Cryptospérmum, Young, in Lin. trans. 3. p. 30. —Operculària and Cryptospérmum, Pers.—Operculàriæ floribus capitatis, Juss.

Lin. syst. *Mono-Pentándria, Monogýnia.* Limb of calyx 3-4-lobed. Corolla 3-5-cleft. Stamens 1-5. Seeds nearly smooth.—Herbs suffruticose at the base. Leaves opposite, furnished with distinct stipulas on both sides. Heads of flowers globose, terminal, or rising from the forks of the branches, pedunculate, or nearly sessile. Universal involucrum wanting, or composed of the 2 upper leaves and 4 small stipulas. Partial involucra acutely 8-10-toothed.

1 O. híspida (Spreng. syst. 1. p. 385.) stems diffuse, furrowed, tetragonal, rough from numerous hairs; leaves small, ovate, pilose; heads pedunculate, rising from the forks of the branches, drooping. ♃. G. Native of New Holland. O. áspera, Juss. ann. mus. 4. p. 427. t. 70. f. 1. Universal involucrum wanting; partial ones 8-10-toothed, each containing 3-5 flowers. Corolla 5-cleft, monandrous or diandrous, white.

FIG. 112.

Hispid Opercularia. Fl. Ju. July. Clt. 1790. Pl. diffuse.

2 O. sessiliflòra (Juss. l. c. p. 427. t. 170. f. 2.) glabrous; stems diffuse, slender, hardly furrowed; leaves linear; heads of flowers small, hemispherical, sessile in the forks of the branches ♃. G. Native of New Holland.

Partial involucra 4-5 in the same head, each containing 2-4 flowers. Corollas 4-5-cleft, monandrous or diandrous, white. Leaves like those of the species of *Linària*.

Sessile-flowered Opercularia. Fl. June, July. Clt. 1824. Pl. diffuse.

3 O. APICIFLÒRA (Labill. nov. holl. 1. p. 35. t. 48.) glabrous; stems diffuse, very slender, furrowed; leaves oblong-linear, short; stipulas joined in one on both sides; heads of flowers terminal, small, hemispherical, involucrated by about 4 verticillate leaves. ♄. G. Native of New Holland, in Van Lewin's Land. Juss. mem. mus. 4. p. 427. Partial involucra 1-3 in each head, each containing 3-4 flowers. Corollas 4-5-cleft; monandrous or diandrous, white. (Fig. 112.).

Top-flowered Opercularia. Shrub 1 foot.

4 O. SPERMACÒCEA (Labill. nov. holl. 1. p. 35. t. 47.) glabrous; stem shrubby, erect; leaves linear, almost triquetrous; stipulas combined in one on both sides, bidentate at the apex; heads spherical, pedunculate, terminal. ♄. G. Native of New Holland, in Lewin's Land. Juss. ann. mus. 4. p. 427. Leaves falsely verticillate. Partial involucra 4-5 in the same head, each bearing 4 flowers. Habit of *Spermacòce verticillàta*.

Spermacoce-like Opercularia. Shrub 1 foot.

5 O. VAGINA'TA (Labill. nov. holl. 1. p. 34. t. 46.) glabrous; stem erect, woody at the base, rather angular; leaves linear; stipulas combined into a long sheath, which is bidentate at top on both sides; heads globose, naked, terminal. ♄. G. Native of New Holland, in Van Lewin's Land. Juss. ann. mus. 4. p. 428. Partial involucra 5-9 in a head, each containing 3-5 flowers. Corolla 4-cleft. Stamens 4, ex Labill.

Sheathed-stipuled Opercularia. Shrub 1 foot.

6 O. HIRTE'LLA (D. C. prod. 4. p. 616.) stem rather angular, and rather pilose at the apex; branches elongated; leaves linear, stipulas lanceolate-subulate; heads of flowers pedunculate, drooping, hairy, rising from the forks of the branches. ♃. G. Native of New Holland. Branches, leaves, and stipulas beset with longish hairs.

Hairy Opercularia. Pl. 1 foot.?

7 O. HYSSOPIFÒLIA (Juss. mem. mus. 4. p. 428. t. 71. f. 1.) stem erect, rather angular, clothed with short down; leaves narrow-lanceolate, with somewhat ciliated margins; stipulas combined entire, acute; heads of flowers rising from the forks of the branches, on short peduncles, drooping a little, globose. ♄. G. Native of New Holland. Partial involucra about 5 in every head, each containing 2-4 flowers.

Hyssop-leaved Opercularia. Shrub 1 foot.

8 O. LIGUSTRIFÒLIA (Juss. mem. mus. 4. p. 428. t. 71. f. 2.) stem erectish, tetragonal, hairy from short down, but glabrous between the nodi; stipulas combined at the base on both sides, acutely 2-lobed; heads of flowers rising from the forks of the branches, on short peduncles, drooping. ♄. G. Native of New Holland, about Port Jackson. The rest as in the preceding species.

Privet-leaved Opercularia. Shrub 1 foot.

9 O. PALEA'TA (Young, in Lin. trans. 3. p. 30. t. 5.) glabrous; stems herbaceous, tetragonal, erect; leaves ovate-lanceolate, acute; stipulas combined on both sides, acutely 2-lobed; heads of flowers pedicellate, drooping when in flower, rising from the forks of the branches, globose, involucrated. ♃. G. Native of New Holland. Juss. ann. mus. 4. p. 428. Cryptospérmum Yoúngii, Pers. ench. 1. p. 122. Partial involucra almost 20 in every head, each containing 5-6 flowers. Corolla 4-cleft, pale green. Stamens 4. Universal involucrum 6-parted, composed of 2 leaves and 4 stipulas. Peduncles sometimes the length of the heads, and sometimes 3 times that length. Anthers whitish.

Chaffy Opercularia. Fl. July, Aug. Clt. 1793. Shrub 4 feet.

10 O. OCYMIFÒLIA (Juss. ann. muss. 4. p. 428. t. 71. f. 3.) glabrous; stems diffuse, tetragonal, furrowed; leaves ovate-oblong, petiolate; stipulas combined in one on both sides; heads of flowers rising from the forks of the branches, on short peduncles, drooping, globose, naked. ♃. G. Native of New Holland. Heads larger than peas, with 7-9 partial involucra in every head, each containing 4-6 flowers. Corolla 3-4-cleft. Stamens 2-3, ex Juss.

Basil-leaved Opercularia. Fl. June, July. Clt. 1824. Pl. 1 foot.

11 O. RUBIOÌDES (Juss. ann. mus. 4. p. 428.) stems tetragonal, ascending, glabrous; leaves lanceolate, with revolute margins; margins and middle nerve scabrous beneath; stipulas combined on both sides, entire or bidentate; heads on short peduncles, rising from the forks of the branches, drooping, globose, naked. ♄. G. Native of New Holland, on the Eastern Coast. Heads of flowers larger than peas. Partial involucra 5-7 in every head, each containing 5-6 flowers. Corolla 3-4-cleft. Stamens 3-4.

Madder-like Opercularia. Pl. 1½ foot.

† *Doubtful species.*

12 O. A'SPERA (Gærtn. fruct. 1. p. 112. t. 24.) leaves oblong, scabrous, veiny; heads of flowers pedunculate, axillary.—Native of New Zealand, ex Solander. O. áspera, Spreng. syst. 1. p. 385. Probably the same as *O. híspida*.

Rough Opercularia. Pl. 1 foot.

13 O. DIPHY'LLA (Gærtn. l. c. p. 113.) stem and leaves unknown; heads of flowers rising from the forks of the branches; partial involucra hispid, many in every head, each containing 3-4 flowers; flowers tetrandrous.—Native of New Zealand. Juss. ann. mus. 4. p. 428. Rubioìdes diphýlla, Soland. mss. The rest unknown.

Two-leaved Opercularia. Pl. 1 foot?

Cult. For culture and propagation see *Pòmax*, p. 662.

CCXXI. LIPO'STOMA (from λειπω, *leipo*, to fall from, and στομα, *stoma*, a mouth; lid from capsule). D. Don, in edinb. new phil. journ. Jan. 1830. Sweet, fl. gard. n. s. with a figure.

LIN. SYST. *Tetrándria, Monogýnia.* Limb of calyx 4-parted. Corolla tubular at the base, and ventricose at the throat, and bearded inside, with a 4-lobed limb; lobes ovate, spreading, valvate in æstivation. Stamens 4, inserted in the throat, exserted; filaments compressed; anthers linear, versatile. Style capillary; stigmas 2, subulate, hispid. Capsule globose, 2-celled, opercular, many seeded, but often 1-celled from the middle dissepiment having vanished. Placentas 2, spherical, stipitate, inserted beneath the middle of the dissepiment. Seed small, angular, scabrous. Embryo slender, with oblong plano-convex cotyledons, and a cylindrical obtuse radicle, which is a little longer than the cotyledons.—Diffuse trailing pilose herbs, natives of Brazil. Leaves opposite, petiolate. Stipulas subulate, interpetiolar. Flowers sessile, capitate, intermixed with bracteas. Heads of flowers pedunculate, solitary, axillary. Corollas blue.

1 L. CAPITA'TA (D. Don, l. c.) plant hairy; leaves roundish, undulated, green, spreading. ♃. S. Native of Brazil. Ægi-nètia capitàta, Graham, in edinb. new phil. journ. April, 1828. p. 389. Hedyòtis campanuliflòra, Hook. bot. mag. t. 2840. Corollas rather large, fine blue, with a yellow throat, pilose outside.

Capitate-flowered Lipostoma. Pl. trailing.

2 L. SERI'CEUM (D. Don, l. c.) plant hairy; hairs adpressed; leaves ovate, acute, when young silky. ♃. S. Native of Brazil, in pastures. The whole plant is clothed with silky adpressed hairs. Heads of flowers smaller than the preceding. Corolla

blue, hairy. Seeds triquetrous, dark brown, beset with elevated dots.

Silky Lipostoma. Pl. trailing.

Cult. For culture and propagation see *Richardsònia*, p. 628.

† *Genera of Rubiàceæ not so sufficiently known as to be placed in any particular situation in the body of the order.*

CCXXII. PSILO'BIUM (from ψιλος, *psilos*, slender, and λοβος, *lobos*, a pod; in reference to the silique-formed fruit). Jack, in mal. misc. vol. 2. ex Roxb. fl. ind. 2. p. 320. D. C. prod. 4. p. 618.

Lin. syst. *Pentándria, Monogýnia.* Limb of calyx spreading, 5-parted. Corolla with a short tube, and a 5-parted limb. Stamens 5, fixed to the base of the corolla. Stigma clavate, 10-winged, exserted. Fruit cylindrical, silique-formed, crowned by the permanent calyx, 2-celled, many-seeded. Seeds disposed in a double series along the axis in each cell.—Indian shrubs. Stems bluntly tetragonal. Leaves opposite, petiolate, lanceolate. Stipulas broad, keeled. Flowers axillary, bracteate. Æstivation valvate. It is not said whether the fruit is dehiscent or indehiscent.

1 P. nu'tans (Jack, l. c.) smooth; peduncles drooping, 3-6-flowered. ♄. S. Native of Sumatra, in the interior of the island.

Drooping-peduncled Psilobium. Shrub.

2 P. tomentòsum (Jack. l. c.) tomentose; flowers almost sessile in the axils of the leaves. ♄. S. Native of the East Indies, at Katoun. Fruit said to be baccate.

Tomentose Psilobium. Shrub.

Cult. See *Psychótria*, p. 599. for culture and propagation.

CCXXIII. PLATYME'RIUM (from πλατυς, *platys*, broad, and μερις, *meris*, a part; probably from the parts of the flowers being broad). Bartl. in herb. Hænke. D. C. prod. 4. p. 619.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx with a short tube, and a rotate 5-parted, rarely 4-parted limb; lobes flat, obtuse. Corolla coriaceous, funnel-shaped, with a short tube, which is woolly inside, and a 5-parted, rarely 4-parted limb; segments of the limb twisted to the right in æstivation. Anthers linear, sessile within the tube of the corolla. Style clavate, spirally 10-ribbed. Ovarium 2-celled, covered by an epigynous disk. Fruit unknown.—A shrub, with slender terete branches. Leaves opposite, coriaceous, lanceolate, acuminated, downy beneath and on the branches, on short petioles. Flowers numerous, glomerate, on short pedicels, axillary. Calyxes tomentose.—This genus is nearly allied to *Psilòbium*, but is distinguished from it in the æstivation of the corolla, and in the fruit not being silique-formed.

1 P. glomera'tum (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 619.) ♄. S. Native of the island of Luzon, one of the Philippines. Leaves 3½ inches long and 1 broad. Flowers small.

Glomerate-flowered Platymerium. Shrub.

Cult. For culture and propagation see *Psychótria*, p. 599.

CCXXIV. STIPULA'RIA (so named on account of the large stipulas). Beauv. fl. d'ow. 2. t. 76. Juss. mem. mus. 6. p. 406. D. C. prod. 4. p. 619.

Lin. syst. *Pentándria, Monogýnia.* Calyx small, tubular, with a 5-toothed border. Corolla tubular, slender. Stamens 5? Style and fruit unknown.—Stems quadrangular. Leaves opposite, petiolate, ovate, acute at the apex, acuminated at the base, yellowish beneath, soft to the touch. Stipulas large, interpetiolar, broadly ovate, acute, glabrous. Heads of flowers almost sessile, surrounded by large 5-toothed calyciform villous involucra. The place which this genus should occupy in the order is very doubtful.

1 S. Africa'na (Beauv. fl. d'ow. 2. p. 26. t. 75.) Native of the west coast of Africa, in deserts about the river Galbar: we have also seen it in the neighbourhood of the Gaboon river. Flowers pale yellow.

African Stipularia. Shrub.

Cult. For culture and propagation see *Psychótria*, p. 599.

CCXXV. BENZO'NIA (named in compliment to the celebrated African traveller Benzoni, who died at Benin, the habitat of the present plant). Schum. pl. guin. p. 113. D. C. prod. 4. p. 620.

Lin. syst. *Tetrándria, Monogýnia.* Calyx with a globose tube, and a small 5-toothed limb; teeth erect. Corolla tubular, coriaceous, 5-cleft; segments concave, cup-shaped. Anthers triquetrous, sessile in the throat. Style filiform; stigma ovate-globose, acutish, marked by 6-7 longitudinal furrows. Fruit unknown.—A shrub, native of Guinea. Branches terete, beset with pili above, and with papillæ below. Leaves opposite, ovate-oblong, acuminated, glabrous, on short hairy petioles. Stipulas interpetiolar, lanceolate, glabrous. Peduncles axillary, dichotomous, corymbose, and are as well as the bifid pedicels hairy.

1 B. corymbòsa (Schum. pl. guin. p. 113.) ♄. S. Native of Guinea, in various parts.

Corymbose-flowered Benzonia. Shrub 5 to 6 feet.

Cult. See *Psychótria*, p. 599. for culture and propagation.

CCXXVI. HIMATA'NTHUS (from ἱματιον, *himation*, a garment, and ανθος, *anthos*, a flower; the flowers are involucrated by a large bractea before expansion). Willd. rel. ex Rœm. et Schultes, syst. 5. p. 13. D. C. prod. 4. p. 621.

Lin. syst. *Pentándria, Monogýnia.* Tube of calyx adnate to the ovarium, turbinate; limb loose, permanent, 5-parted; segments ovate, acuminated, 2 of them one-half smaller than the other three. Corolla funnel-shaped, having the tube much longer than the calyx, dilated a little at the apex; and the limb 5-cleft, with oblong segments. Stamens 5, capillary, very short, inserted in the base of the tube. Anthers linear, erect, shorter than the tube of the corolla. Style truncately clavate; stigma subulate. Ovarium 2-celled, 2-seeded.—A tree. Leaves elliptic-lanceolate, petiolate, quite entire, glabrous. Flowers spicate, sessile, involucrated by a large deciduous bractea each before expansion.—This tree belongs probably to *Rubiàceæ*, but the stipulas and situation of the leaves, seeds, &c. are unknown.

1 H. rí'gida (Hoffm. ex Willd. l. c.). ♄. S. Native of Brazil, in the province of Para, where it is called Sucuba by the natives.

Stiff Himatanthus. Tree.

Cult. For culture and propagation see *Psychótria*, p. 599.

CCXXVII. SICKI'NGIA (evidently named after some person of the name of Sicking, of whom we know nothing). Willd. in nov. act. nat. cur. beroi. 3. p. 445. and in Schrad. bot. journ. 1800. pt. 2. p. 291. D. C. prod. 4. p. 621.

Lin. syst. *Pentándria, Monogýnia.* Calyx permanent, 5-toothed. Corolla campanulate, 5-toothed: teeth oblong. Filaments 5, inserted in the middle of the corolline tube. Anthers linear, exserted. Stigma 1. Capsule woody, 2-valved. Seeds winged.—Trees, natives of Caraccas. Leaves opposite. Flowers terminal, trichotomous, panicled, sweet-scented. This is a very doubtful genus from the description given by Willdenow; but according to Richard it is related to *Cinchonàceæ*, in consequence of the winged seeds; but the stipulas are not mentioned, and the leaves are said to be deeply and remotely toothed; and therefore it ought probably to be excluded from *Rubiàceæ*.

1 S. erythro'xylon (Willd. l. c.) leaves oblong-rhomboid,

toothed at the apex, downy beneath. ♄. S. Native of mountain woods, about Caraccas.

Red-wooded Sickingia. Tree or shrub.

2 S. longifòlia (Willd. l. c.) leaves oblong-ovate, quite entire, glabrous. ♄. S. Native along with the preceding.

Long-leaved Sickingia. Tree.

Cult. See *Psychótria*, p. 599. for culture and propagation.

CCXXVIII. CALYSPHY'RUM (from καλυξ, *kalyx*, a calyx, and σφυρον, *sphyron*, a little hammer; the calyx is like a peduncle). Bunge, in mem. acad. mss. Petersb. 2. p. 107.

Lin. syst. *Tetrándria, Monogýnia.* Tube of calyx linear-pentagonal, adnate to the ovarium, 10-striped; limb subcampanulate, profoundly 5-lobed; segments lanceolate, equal, acute, erect, deciduous. Corolla superior, funnel-shaped, about equal in length to the calycine segments; throat wide, glabrous; limb ample, spreading, 5-parted; segments roundish, imbricate in æstivation: the fifth one a little smaller than the rest. Stamens 5, inserted in the bottom of the tube of the corolla, and alternating with its segments. Anthers linear-oblong, 2-celled, dehiscing at each side by a longitudinal chink. Ovarium inclosed in the tube of the calyx, 2-celled, many-ovulate. Style filiform, exserted; stigma peltate. Capsule 2-celled; cells many-seeded. Seeds disposed in 2 rows in each cell, inserted in the dissepiment, imbricated, compressed.—Perhaps the genus is more nearly allied to *Lobeliàceæ* than to *Rubiàceæ*.

1 C. flo'ridum (Bunge, l. c.) leaves opposite, almost sessile, oblong, acuminated, toothed; flowers 2-4, sessile, terminating the branches; corollas grumose. ♄. G. Native of China, in gardens. Flowers size and form of those of *Rhododéndron Daúricum*.

Flowery Calysphyrum. Shrub.

Cult. See *Pòmax*, p. 662. for culture and propagation.

†† *Genera referred to Rubiàceæ by authors, but do not belong to the order.*

Bellònia, Lin. belongs to *Solàneæ;* and *Gærtnèra*, Lam., *Ustèria*, Willd., *Pagàmia*, Aubl. belongs to *Logàneæ*.

Order CXXXI. VALERIA'NEÆ (this order contains plants agreeing with *Valeriàna* in important characters). D. C. fl. fr. 4. p. 237. propr. med. ed. 2. p. 175. coll. mem. vii. t. 5. Dufres. diss. val. 4to. 1811. Kunth in Desv. journ. 1814. vol. 2. p. 171. et nov. gen. amer. 3. p. 322. Cham. et Schlecht. in Linnæa. 4. p. 129. D. C. prod. 4. p. 423.—Genera of Dipsàceæ, Juss.—Valeriàna, Lin. gen. no. 44.

Tube of calyx adnate to the ovarium; limb variable in the different genera, sometimes toothed or parted, sometimes going away in pappus, which is at first involute, and at length expanded. Corolla tubularly funnel-shaped, usually 5-lobed, rarely 3-4-lobed; lobes obtuse; tube equal or gibbous, or spurred at the base. Stamens adnate to the tube of the corolla, but free at the apex, alternating with its lobes when they are equal in number, but varying in number in the different genera from 1 to 5. Anthers ovate, 2-celled. Style filiform; stigmas 2-3, free, or combined in one. Fruit membranous or subnucumentaceous, indehiscent, crowned by the limb of the calyx in the younger state; sometimes 3-celled, in this case 2 of the cells are vacant; sometimes only 1-celled. Seed in the fertile cell or solitary fruit, pendulous, exalbuminous. Embryo straight, with a superior radicle, and 2 flat cotyledons.—Annual or perennial herbs, very rarely woody at the base. Roots of the perennial species thickish, intensely sweet-scented; of the annual species slender, white, and inodorous. Leaves opposite, exstipulate, different in diverse species, and in the same plant. In the latter case the lower ones are usually entire, and the superior ones are laciniated. Flowers disposed in cymose corymbs, usually hermaphrodite, very rarely dioecious by abortion, usually furnished with from 1-3 bracteas, white, rose-coloured or bluish, but in the genus *Nardóstachys* they are purple, and in *Patrínia* yellow.

The plants contained in this order are more interesting for the sake of their symmetry and neatness than on account of any particular attractions; they may be considered a connecting link between *Rubiàceæ* and *Dipsàceæ*. Most of them are pretty. The *Valerianellas* are useful esculents, known under the name of corn salads; *Centránthus rùber* is also eaten in the same way in Sicily. Their medicinal properties are of a decisive character. The roots of *Valeriàna officinàlis*, *Phu*, *Céltica*, and others are bitter, tonic, aromatic, antispasmodic, and vermifugal; they are occasionally used as febrifuges. The odour of valerian is not generally agreeable, but eastern nations procure from the mountains of Austria the roots of *Valeriàna Céltica*, with which they perfume their baths; and the natives of India at this day employ the *Nardóstachys*, the spikenard of old times, as a perfume, and against hysterics and epilepsy.

Synopsis of the genera.

1 Patri'nia. Limb of calyx slightly 5-toothed. Corolla regular, bluntly 5-lobed. Stamens 4, rarely 5. Stigma capitate, trigonal. Capsule 3-celled.

2 Nardo'stachys. Limb of calyx 5-parted: lobes slightly denticulated. Corolla regular, bluntly 5-lobed, with a bearded throat. Stamens 4. Stigma capitate. Capsule 3-celled.

3 Dufre'snia. Limb of calyx 3-parted; lobes serrated. Corolla obconical, 5-lobed. Stamens 3. Fruit membranous, indehiscent, very villous, 3-celled.

4 Valeriane'lla. Limb of calyx toothed. Corolla regular, 5-lobed. Stamens 3. Stigma almost undivided or trifid. Fruit 3-celled, rather membranous, indehiscent, sometimes with 2 of the cells fertile.

5 Astre'phia. Limb of calyx 5-toothed. Corolla funnel-shaped, 5-lobed, gibbous on one side at the base. Stamens 3. Style trifid at the apex. Fruit 2-celled.

6 Fe'dia. Limb of calyx with 4 unequal subulate lobes (f. 113. *c.*). Corolla filiform, with an unequally 5-lobed subringent limb (f. 113. *f.*). Stamens 2 (f. 113. *h.*). Stigma bifid (f. 113. *g.*). Fruit spongy (f. 113. *b.*), indehiscent, 3-celled.

7 Plectrìtis. Limb of calyx entire. Corolla gibbous at the base in front from a short spur, with a 5-lobed bilabiate limb. Stamens 3. Capsule cartilaginous, 1-celled, 2-winged.

8 Centra'nthus. Limb of calyx involute at the time of flowering (f. 114. *b.*), but afterwards evolute and deciduous, of many-feathered bristles (f. 114. *h.*). Corolla with a narrow tube, which is spurred at the base (f. 114. *c.*), and a regular 5-

lobed limb (f. 114. *d.*). Stamen 1 (f. 114. *e.*). Fruit indehiscent, 1-celled and 1-seeded at maturity.

9 VALERIA'NA. Limb of calyx the same as in *Centránthus*. Corolla with an obconical or cylindrical tube (f. 115. *b.*), which is equal or gibbous at the base, and a bluntly 5-cleft limb (f. 115. *b.*), rarely only 3-cleft. Stamens 3 (f. 115. *b.*). Fruit indehiscent, 1-celled, and 1-seeded at maturity.

10 BE'TCKEA. Limb of calyx 1-toothed, deciduous. Corolla funnel-shaped, 5-lobed. Stamens 3. Fruit 1-celled, triquetrous, naked at the apex.

11 TRIPLOSTE'GIA. Flower having 3 covers, viz. a double involucrum and the calyx. Limb of calyx 4-toothed. Corolla regular funnel-shaped, 5-cleft. Stamens 3. Stigma capitate. Fruit 1-seeded, rostrate, covered by the involucra.

I. PATRI'NIA (so named by Jussieu after M. Patrin, a traveller and collector of plants in Siberia.) Juss. ann. mus. 10. p. 311. Dufr. val. p. 53. Rœm. et Schultes, syst. 3. p. 2. Link, enum. 1. p. 131. D. C. prod. 4. p. 623.—Mouffèta, Neck. elem. no. 210.—Gytonánthus, Rafin. ann. gen. sc. phys. 6. p. 88.—Fèdia, Adans. fam. 2. p. 152. but not of others.—Fèdia species, Vahl.

LIN. SYST. *Tetrándria, Monogy'nia.* Limb of calyx truncate or erect, very short, somewhat 5-toothed. Corolla regular, spurless, bluntly 5-lobed. Stamens 4, adnate to the bottom of the tube of the corolla, rarely 5. Stigma trigonal-capitate. Capsule 3-celled, crowned by the limb of the calyx, usually having chaff-formed bracteas adhering to it at the base, with one of the cells fertile, and 2 usually thick.—Perennial herbs. Leaves for the most part pinnate-lobed. Flowers corymbose, golden-yellow.

1 P. SIBI'RICA (Juss. l. c.) stem beset with 2 rows of hairs; leaves rather fleshy: primordial ones oblong, lanceolate or spatulate, undivided and obtuse, entire, toothed, serrated, or pinnatifid towards the apex; cauline leaves pinnate, with entire, usually obtuse segments; fruit adnate to the paleæ. ♂. H. Native of Siberia, among subalpine rocks. Sims, bot. mag. t. 2325. P. coronàta, Fisch. in litt. Valeriàna Sibírica, Lin. spec. p. 48. but not of Willd. Valeriàna Ruthénica, Willd. spec. 1. p. 181. Fèdia Sibírica, Vahl, enum. 2. p. 122. Gærtn. 3. fr. t. 86. f. 3. Valerianélla lùtea, Mœnch. Valeriàna Sibírica β hùmilis, Gmel. sib. 3. p. 123. no. 3.—Amm. ruth. no. 25. t. 3. Radical leaves spatulate, entire, toothed or serrated, but sometimes pinnatifid at the apex; cauline leaves pinnate. Fruit crowned by the 5-toothed limb of the calyx. Flowers yellow. Root black, strong scented.

Siberian Patrinia. Fl. May, June. Clt. 1751. Pl. 1 foot.

2 P. INTERME'DIA (Rœm. et Schultes, syst. 3. p. 90.) stem glabrous; leaves pinnatifid, with uniform linear acute segments, those of the lower leaves deeply toothed, and those of the superior ones deeply pinnatifid; fruit adnate to the bracteas. ♂. H. Native of Altaia, about Zmeof on hills; and of China. Fèdia intermèdia, Horn. cat. hort. hafn. 1. p. 48. Pat. nudiúscula, Fisch. in litt. Fèdia rupéstris var. Vahl, enum. 2. p. 23. Valeriàna Sibírica, Lin. spec. 1. p. 48. Valeriàna rupéstris, Vahl. itin. 3. p. 318.—Gmel. sib. 3. p. 123. t. 24. Flowers yellow.

Intermediate Patrinia. Fl. May, July. Clt. 1820. Pl. 1 to 2 feet.

3 P. RUPE'STRIS (Juss. l. c. Dufr. l. c.) stem smoothish or rather downy; leaves membranous, pinnatifid, with lanceolate segments: terminal segment large; corymbs subumbellate; fruit adnate to the paleæ. ♂. H. Native of Siberia, Valeriàna rupéstris, Pall. itin. 3. p. 215. Valeriàna Sibírica, Willd. spec. 1. p. 181. Sims, bot. mag. t. 714. but not of Lin. Fèdia rupéstris, Vahl, enum. 2. p. 22.—Gmel. sib. 3. p. 123. t. 24. Flowers yellow, fragrant, smaller than those of *P. Sibírica*.

Rock Patrinia. Fl. May, June. Clt. 1801. Pl. 1 foot.

4 P. HETEROPHY'LLA (Bunge, in mem. acad. imp. petersb. 2. p. 109.) stem leafy, downy; lower leaves pinnatifid, with distant ovate-oblong coarsely toothed lobes: the terminal lobe the largest, sharply toothed or deeply lobed, acuminated; superior leaves quite entire or ternate, with oblong-linear elongated quite entire lobes; flowers corymbose; achenia bracteate. ♃. H. Native of the north of China, on the mountains. Nearly allied to *P. rupéstris*, but differs in the lobes of the leaves being fewer, shorter, broader, and in being variously cut, and in the upper leaves being of a different form.

Variable-leaved Patrinia. Pl. 1 foot.

5 P. SCABIOSÆFÒLIA (Link, enum. 1. p. 131.) stem glabrous; radical leaves ovate or oblong, deeply serrated and lyrate; cauline leaves pinnatifid, with lanceolate-linear acute segments: terminal segment very long; corymbs loose, rather panicled; fruit triquetrous, naked. ♂. H. Native of Dahuria. Sweet. brit. fl. gard. t. 154. Lodd. bot. cab. t. 1340. P. serratulifòlia, Fisch. in litt. Fèdia scabiosæfòlia, Trev. act. bonn. 13. p. 165. Flowers yellow. There is a variety of this plant having the radical leaves rather pilose, and the rest glabrous. Limb of calyx wanting or truncate.

Scabious-leaved Patrinia. Fl. May, July. Clt. 1817. Pl. 1 ft.

6 P. VILLO'SA (Juss. l. c.) stem villous; leaves villous: radical ones petiolate, auriculate; cauline ones sessile, toothed; corymbs panicled. ♂. H. Native of Japan. Valeriàna villòsa, Thunb. fl. jap. p. 32. t. 6. but not of Wall. Fèdia villòsa, Vahl, enum. 2. p. 10. Peduncles axillary and terminal. Bracteas linear. Flowers yellow.

Villous Patrinia. Pl. 1 foot.

7 P. CERATOPHY'LLA (Hook. fl. bor. amer. 1. p. 290.) stem glabrous; leaves all rather fleshy, downy, petiolate: radical ones linear-lanceolate, entire, pinnatifid or bipinnatifid, with divaricate lobes; cauline leaves profoundly pinnatifid, with linear segments; panicles elongated; peduncles ternately verticillate. ♃. H. Native of North-west America, common on low wet soils between the Kettle Falls and Spokan; and in the valleys on the west side of the Rocky Mountains. Root thick, fusiform. Stems simple. Peduncles opposite or 3-4 in a whorl. Pedicels short, and flowers crowded. Flowers white. The roots during the spring months are collected by the Indians, baked on heated stones, and used as an article of winter and spring food. From a bitter and seemingly pernicious substance, it is thus converted into a soft and pulpy mass, which has a sweet taste, resembling that of treacle, and is apparently not unwholesome.

Horn-leaved Patrinia. Pl. 1 to 1½ foot.

Cult. The species of *Patrìnia* grow well in any light soil, and are easily increased by seeds.

II. NARDO'STACHYS (from *ναρδος, nardos*, a shrub, and *σταχυς, stachys*, a spike; but is so named from the plant being called spikenard). D. C. coll. mem. vii. t. 1-2. prod. 4. p. 624. —Patrínia, D. Don, prod. fl. nep. p. 159.

LIN. SYST. *Tetrándria, Monogýnia.* Limb of calyx 5-parted; lobes ovate-oblong, acute, foliaceous, somewhat denticulated, permanent. Corolla regular, spurless, bluntly 5-lobed, with a bearded throat. Stamens 4, adnate to the bottom of the corolla. Stigma capitate. Capsule 3-celled, crowned by the calycine lobes, and shorter than them, but not adnate to the bracteas.—Herbs, with the habit of *Scorzonèra hùmilis*, having very sweet-scented perennial roots, which are beset with erect fibres at the neck. Leaves entire, oblong; radical ones very long; cauline ones

sessile, broadest at the base. Stems simple. Flowers disposed in fascicled corymbs. Corollas purple.

1 N. Jatama'nsi (D. C. coll. mem. vii. t. 1.) stem villous; leaves downy: radical ones lanceolate-long: cauline leaves sublanceolate; fascicles of flowers opposite, pedunculate, and terminal. ♃. F. Native of Nipaul, on the Himalaya mountains and Gosaingsthan; in Mandon and Chitor provinces; in the provinces of Delhi, Bengal, and Decan. Valeriàna Jatamánsi, Jones in asiat. res. 2. p. 405. and 4. p. 109. Roxb. in asiat. res. p. 451. D. Don, in Lamb. cinch. p. 180. with a figure. Valeriàna spìca, Vahl, enum. 2. p. 13. Patrínia Jatamánsi, D. Don, prod. fl. nep. p. 159. Nárdus Garc. ab. hort. arom. p. 133. with a figure of the root. Nárdus I'ndica. J. Bauh. hist. 3. p. 202. Nardostàchyon or Spìca Nárdi or Nárdus Gangìtus or Nárdus Syrìaca of the ancients, and Jatamangsi of the natives of India. It had long been a desideratum among the moderns to know to what order and genus the plant belonged, which produced the spikenard of the ancients. We are indebted to that learned orientalist, the late Sir William Jones, for having first pointed it out satisfactorily, although he confounded it with another species totally distinct, and from which he has taken his botanical description and figure. This mistake arose from his not having received perfect specimens himself; but trusting wholly to the account and drawing given him by a friend, who was entirely unversed in botany, and who therefore could not be supposed to distinguish accurately two plants of the same genus. The Jatamansi or Jatamangsi belongs to the genus *Nardóstachys*, and resembles in several respects the Celtic Nard, *Valeriàna Céltica*. The roots are simple, perpendicular, from 4 to 6 inches long, and the upper half is very thickly covered with the remains of the past leaves, resembling coarse hairs, and the smell resembles those of *Valeriàna officinàlis*. This smell, which to many would not perhaps prove grateful, has led some to doubt its being the spikenard of the ancients. Dr. Francis Hamilton, in his account of Nipaul, has expressed some doubts on the subject, but he says, "As there can be no disputing about taste, I cannot take upon myself to say how far the encomiums bestowed on the spikenard are applicable to this valerian, and the native women no doubt consider the smell very agreeable, because most of such as can afford it use oil impregnated with this root for perfuming their hair. All I can say is, that if this root is the spikenard of the Roman ladies, their lovers must have had a very different taste from the youth of modern Europe. Notwithstanding the objections that might be raised against the Jatamansi, on the ground that the perfume produced by its roots would not prove perhaps so grateful to our modern ladies, yet to the ladies of ancient Rome it might have been highly grateful, as it is to those of Nipaul at the present day. The late Sir William Jones, in two learned dissertations published in the second and fourth volumes of the Transactions of the Asiatic Society, has, indeed, so fully demonstrated by so many proofs that the *Nardóstachys* is identical with the spikenard of the ancients, and this opinion is supported by so many concurring circumstances, that there can, I think, be no doubt now left on the subject. The *Valeriàna Hardwíckii*, with which Sir W. Jones confounded it, has short fleshy roots, sending out numerous cylindrical fibres, the radical leaves cordate, and those of the stem pinnate and ternate. The flowers panicled, and in other respects it differs widely."

Jatamansi or Spikenard. Pl. ½ foot.

2 N. grandiflòra (D. C. coll. mem. vii. t. 2.) stem quite glabrous; leaves oblong, glabrous: cauline ones ovate or cordate; heads of flowers solitary, terminal. ♃. F. Native of Nipaul, at Kamaon. Fèdia grandiflòra, Wall. mss. Bracteas 3-nerved, membranous, oval, longer than the capsule. Capsule downy; lobes of calyx evidently denticulated.

Great-flowered Spikenard. Pl. ½ foot.

Cult. See *Triplostègia*, p. 680. for culture and propagation.

III. DUFRE'SNIA (named after Peter Dufresne, M.D., author of Histoire Naturelle et Medicale de La Famille des Valerianees, 4to, Montpelier, 1811.). D. C. coll. mem. vii. t. 3. prod. 4. p. 624.

Lin. syst. *Tetrándria, Monogýnia.* Limb of calyx 3-parted: lobes ovate, acute, rather unequal, permanent, reticulated, and serrated. Corolla with an obconical tube, and a 5-lobed limb: lobes roundish. Stamens 3. Style unknown. Fruit membranous, indehiscent, very villous outside, crowned by the lobes of the calyx, 3-celled inside, one of the cells fertile and flattened, and the other 2 cylindrical and sterile.—A small glabrous herb. Stem suffruticose at the base, nearly simple. Leaves opposite, oblong, obtuse, quite entire. Cymes crowded, subcapitate. Bracteas oblong, spreading, serrated. Flowers small, rose-coloured in the dry state, and probably monoecious from abortion.

1 D. orienta'lis (D. C. coll. mem. vii. t. 3.) ♃ ? F. Native of the Levant, between Mosul and Bagdad, where it was collected by Olivier and Bruguiere.

Oriental Dufresnia. Pl. ¼ foot.

Cult. This plant should be grown in a pot in a mixture of peat, loam, and sand; and placed among other alpine plants; it can only be increased by seeds.

IV. VALERIANE'LLA (a dim. of *Valeriàna*, which see). Mœnch. meth. p. 486. D. C. fl. fr. 4. p. 240. coll. mem. vii. t. 3. Dufr. val. p. 56. Link, enum. 1. p. 63. Betck. anim. 4to, Rost. 1826. D. C. prod. 4. p. 625.—Valerianélla species, Tourn. —Valeriàna locústa, Lin.—Fèdia species, Gærtn. Vahl. Stev. Bieb. Rchb. but not of Adans. nor Mœnch.—Poliprèmum, Adans. fam. 2. p. 152. but not of Lin.—Odontocárpa, Neck. elem. 1. p. 123.

Lin. syst. *Triándria, Monogýnia.* Limb of calyx toothed, permanent. Corolla spurless, regular, 5-lobed. Stamens 3. Stigma nearly undivided or trifid. Fruit 3-celled, rather membranous, indehiscent, crowned by the toothed or accrete limb of the calyx.—Annual herbs. Stems dichotomous at the tops. Leaves oblong or linear, undivided, or toothed at the base, or the superior ones are pinnatifid. Flowers solitary in the forks, or in fascicled corymbs, bracteate, small, white, rarely rose-coloured.

§ 1. *Locústa* (from *locusta*, a locust; so named from some semblance in the branches). D. C. prod. 4. p. 624. *Mature fruit 2 or 3-celled; one of the cells alone fertile, and gibbous on the back; the two sterile ones equal or broader than the fertile one, sometimes distinct, and sometimes coadunate, from the dissepiment having vanished.*

* *Mature fruit 2-celled.*

1 V. olito'ria (Mœnch. meth. p. 493.) fruit globose, compressed, inflated, glabrous, oblique, 2-lobed; limb of calyx almost wanting, or with 1-3 very short teeth; fruit having the 2 sterile cells combined, from the dissepiment being incomplete; flowers subcapitate; bracteas spreading, oblong-linear, ciliately-serrated; leaves linear-tongue-shaped, almost entire, blunt; angles of stem scabrous. ☉. H. Native of Europe, in corn-fields and light cultivated grounds; plentiful in Britain; and is cultivated in gardens as a salad. D. C. fl. fr. no. 3330. coll. mem. t. 3. f. 2. Dufr. val. 56. t. 3. f. 8. Valeriàna locústa, Willd. spec. 1. p. 182. Fèdia olitòria, Vahl, enum. 2. p. 19. but not of Gærtn. Fèdia locústa, Rchb. pl. cr. 1. t. 60. Fèdia striàta, Stev. mem. mosc. 2. p. 173. Valeriàna olitòria, Willd. spec. 1. p. 182. Lactùca agnìna, Ger. emac. t. 310. f. 1-2.—Riv. irr. t. 6. Valeriàna locústa, Lin. spec. p. 47. a. Smith, eng. bot. 12. t. 811. Curt. lond. fasc. 5. t. 4. Mart.

rust. t. 24. Flowers pale blue. There is a variety of this species having the upper leaves toothed or jagged according to Vahl. Lamb's lettuce is also called *corn-salad; Acker-salat* in German, and *Valerianella* in Italian. It is a diminutive annual plant, common in corn-fields or sandy soils. The leaves are of a pale glaucous hue, and rather succulent. When cultivated it rises almost a foot high, and flowers in March. Gerarde tells us that foreigners using it while in England led to its being cultivated in our gardens. It is used in salads through the winter and early in spring, both as a substitute for common lettuce in those seasons, and to increase the variety of small salads. For these purposes it has long been a favourite plant in France under the denominations of *mache, doucette, salade de chanoine,* and *poule grass.* It is raised from seed, of which a quarter of an ounce is sufficient for a bed 4 feet by 5. To answer the common demand 2 or at most 3 sowings will be sufficient, viz. a principal sowing at the beginning or towards the middle of August, a secondary sowing early in September, to furnish together crops in winter and early spring; and a smaller sowing in spring, at the close of February or in the course of March, if the plants are required in continuation throughout that season, though they are apt to get rank tasted in warm dry weather. If wanted throughout summer, sow once a month, and cut the crop quite young. Sow the seeds in any bed of common mellow earth, broad cast, and rake in the seed. When the plants are up, thin them to 2 or 3 inches asunder, that they may have room to acquire some small stocky growth for gathering. For seed leave some plants in spring.

Var. β, lasiocárpa (Rchb. l. c. f. E.) fruit downy.

Salad Lamb's-lettuce. Fl. April, May. Britain. Pl. $\frac{1}{4}$ to 1 ft.

2 V. RADIA'TA (Dufr. val. p. 57.) fruit oblong, rather tetragonal, glabrous, smooth; limb of calyx obliquely truncate, almost wanting; sterile cells of fruit combined in one, from the dissepiment being incomplete, equal in size to the fertile one; bracteas linear-oblong, spreading, ciliated a little; leaves oblong-spatulate, attenuated at the base, subdentate. ⊙. H. Native from Pennsylvania to Carolina, in corn-fields. Valeriàna radiàta, Willd. spec. 1. p. 185. Fèdia radiàta, Michx. fl. bor. amer. 1. p. 18. Bart. comp. 1. p. 20. Fruit downy, according to Michx. but in the specimen it is obviously glabrous. Flowers pink. Perhaps only a variety of *V. olitòria.* The young leaves are used as a salad.

Rayed Lamb's-lettuce. Fl. April, May. Clt. 1821. Pl. $\frac{1}{2}$ to 1 foot.

3 V.? EXSCA'PA (Stev. mem. soc. mosc. 3. p. 251.) fruit 2-celled, one of which is sterile, obovate, ribbed, glabrous, sessile at the neck, and protruded at the apex, and 5-6-toothed: teeth oblong, straight, thick: leaves ligulate, glabrous; stem none. ⊙. H. Native of Caucasus, near Gandsha. Fèdia exscàpa, Stev. mem. mosc. 5. p. 354. Rœm. et Schultes, syst. 1. p. 366. Fèdia acaúlis, Bieb. suppl. p. 35. Flowers pink. The fruit is said to be 2-celled, with both the cells fertile, but it is probably like the other species, having only one of the cells fertile, and the 2 sterile combined ones.

Scapeless Lamb's-lettuce. Fl. May, June. Clt. 1826. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

** *Mature fruit 3-celled.*

4 V. TU'RGIDA (D. C. prod. 4. p. 626.) fruit nearly globose, compressed on one side and concave-convex, almost awnless, glabrous; fertile cell turgid, convex and cellular on the back, and the 2 sterile cells about equal in size to the fertile one; bracteas oblong, spreading, ciliated; flowers subcapitate; leaves obovate: upper ones oblong-linear, quite entire. ⊙. H. Native of Tauria, in corn-fields. Fèdia túrgida, Stev. mem. mosc. 2. p. 178. but not of others. A very distinct species.

Turgid Lamb's-lettuce. Pl. $\frac{1}{2}$ to 1 foot.

5 V. GIBBÒSA (D. C. coll. mem. t. 3. f. 3.) fruit globose, somewhat compressed, glabrous, crownless, coarctate and flat on one side, and gibbous on the other, and furnished with 2 stripes on both sides; fertile cell turgid, cellular, and furnished with a furrow; and the 2 sterile ones smaller, and furrowed on the back; bracteas linear-oblong, spreading, quite entire; flowers subcapitate; leaves oblong-linear, entire. ⊙. H. Native of Sicily, on the mountains in exposed places. Fèdia gibbòsa, Guss. 1. p. 28. Herb smoothish, 2-3 inches high. Nearly allied to *V. túrgida.*

Gibbous-fruited Lamb's-lettuce. Pl. $\frac{1}{4}$ foot.

6 V. COSTA'TA (D. C. prod. 4. p. 626.) fruit roundish, a little compressed, glabrous, not crowned; fertile cell turgidly cellular and convex on the back, and the two sterile ones profoundly furrowed on the back; bracteas oblong, spreading, with glabrous edges; flowers subcapitate; leaves linear-oblong, quite entire. ⊙. H. Native of the south of Tauria, in vineyards. Fèdia costàta, Stev. mem mosc. 5. p. 344. Bieb. suppl. p. 28. Herb 1-2 inches long, simple, slender, smoothish. Fruit nearly allied to *V. túrgida* and *V. gibbòsa,* but much smaller.

Ribbed-fruited Lamb's-lettuce. Pl. 1 to 2 inches.

§ 2. *Psilocœ'læ* (from ψιλος, *psilos,* slender, and κοιλος, *koilos,* a hollow; in reference to the narrow sterile cells of the fruit). D. C. prod. 4. p. 626. *Fruit 3-celled, flattish in front; fertile cell not cellularly turgid on the back; and the 2 sterile ones filiform, and much narrower than the fertile one, usually close and nerve-formed.*

* *Limb of calyx parted into recurved stiffish teeth.*

7 V. UNCINA'TA (Dufr. val. p. 60.) fruit oblong, pyramidal, rather downy while young, glabrous in the adult state; sterile cells 2, very narrow; limb of calyx tubular, 7-9-toothed; teeth acute, stiff, recurved; bracteas linear, spreading, glabrous; cauline leaves pinnatifid; radical leaves spatulate. ⊙. H. Native of Tauria and Eastern Caucasus, in dry places of mountains; and at the Bosphorus. D'Urv. enum. no. 30. D. C. coll. mem. t. 3. f. 4. Fèdia uncinàta, Stev. mem. mosc. 5. p. 352. Bieb. fl. taur. 1. p. 26. Rchb. pl. crit. t. 69. Valeriàna pubéscens, Hopp. bot. zeit. 1825. p. 359. ex Schultes. Flowers lilac.

Hooked-calyxed Lamb's-lettuce. Fl. May, June. Clt. 1822. Pl. $\frac{1}{2}$ to 1 foot.

8 V. ECHINA'TA (D. C. fl. fr. 4. p. 242.) fruit oblong, somewhat tetragonal, trisulcate, glabrous; sterile cells of fruit very narrow; calyx with 3 conically subulate, stiff and recurved teeth; bracteas oblong, obtuse, glabrous, spreading; leaves entire or toothed, and are as well as the stem glabrous. ⊙. H. Native in the region of the Mediterranean, from Madrid to Tauria, in corn-fields. Dufr. val. 61. t. 30. f. 10. Fèdia echinàta, Vahl, enum. 2. p. 19. Stev. et Bieb. l. c. Rchb. pl. crit. p. 68. Valeriàna echinàta, Lin. spec. p. 47.—C. Bauh. pin. p. 165. Garid. aix. t. 94. Col. ecphr. t. 206.—Moris. ox. sect. 7. t. 16. f. 28. Flowers pink.

Echinated-fruited Lamb's-lettuce. Fl. July, Aug. Clt. 1807. Pl. 1 foot.

9 V. CORNICULA'TA (Meyer. verz. pfl. p. 49.) fruit oblong, with the 2 sterile cells filiform, and the fertile one convex on the back; crown of fruit tubular, tridentate: teeth elongated, linear, usually denticulated, straight or hooked at the apex. ⊙. H. Native of Caucasus, in corn-fields near Baku. Habit of plant nearer to *V. uncinàta* than to *V. echinàta.*

Horned-fruited Lamb's-lettuce. Pl. $\frac{1}{2}$ to 1 foot.

** *Limb of calyx erect, toothed or entire, never recurved.*

10 V. ERIOCA'RPA (Desv. journ. bot. 2. p. 314. t. 11. f. 2.) fruit ovate, obsoletely ribbed, hispid; the 2 sterile cells of fruit

very narrow; limb of calyx obliquely truncate, campanulate, 6-toothed: teeth erect, the 3 front ones the shortest; bracteas adpressed, linear; leaves oblong-linear, quite entire, or toothed at the base. ⊙. H. Native of Europe, in corn-fields, from Andegaveny and Spain to Tauria. Lois. not. p. 49. t. 3. f. 2. Dufr. val. p. 59. t. 3. no. 4. D. C. coll. mem. t. 3. f. 5. Fèdia eriocárpa and Fèdia muricàta, Rœm. et Schultes. Fèdia campanulàta, Presl. sic. p. 11. V. campanulàta, Bir. man. 4. p. 18. Fèdia eriocárpa, Rchb. pl. crit. 1. t. 65. Guss. prod. 1. p. 26. Fèdia rugulòsa, Stev. in litt. Mor. oxon. sect. 7. t. 16. f. 33. Flowers lilac. There is a variety of this, having the fruit pilose on the ribs, and glabrous at the base. Bracteas quite entire or serrated. Sterile cells of capsule very narrow.

Var. β, rugulòsa (D. C. prod. 4. p. 627.) bracteas ovate-lanceolate; habit firmer. ⊙. H. Native along with the species. Fèdia rugulòsa, Spreng. pug. 2. p. 2.

Woolly-fruited Lamb's-lettuce. Fl. April, May. Clt. 1821. Pl. ½ to 1 foot.

11 V. MÍXTA (Dufr. val. p. 59. t. 3. no. 6.) fruit ovate, villous, having the 2 sterile cells very narrow; limb of calyx oblique, with 3 short teeth; bracteas linear, adpressed; leaves oblong, quite entire. ⊙. H. Native of France, Italy, Tauria, in corn-fields. Fèdia míxta, Vahl, enum. 2. p. 21. V. microcárpa, Lois. not. p. 151. Fèdia minùta, Spreng. syst. 1. p. 144.? Flowers pink. Sauvages's plant, cited by Vahl, belongs to *Centránthus Calcitràpa*. Perhaps sufficiently distinct from *V. eriocárpa*.

Mixed Lamb's-lettuce. Fl. May, June. Clt. 1818. Pl. ½ to 1 foot.

12 V. MORISÒNII (D. C. prod. 4. p. 627. Rchb. icon. bot. cent. 1. t. 63.) fruit ovate, rather conical, downy; limb of calyx oblique, tridentate on one side, and furnished with 1-2 nearly obsolete teeth on the other; the 2 sterile cells of fruit filiform, much narrower than the fertile one; bracteas subulate, erect, cartilaginously ciliated; flowers corymbose; leaves linear-tongue-shaped, quite entire or few-toothed at the base. ⊙. H. Native of Europe and Tauria, in corn-fields; and of Caucasus, on the Talusch mountains, near Perimbal; found in corn-fields in Cornwall, Essex, and on Harlton Hill, Cambridgeshire; and in Scotland, about Edinburgh. Fèdia dasycárpa, Stev. mem. soc. mosc. 5. p. 348. Fèdia Morisònii, Spreng. pug. 5. p. 6. Fèdia dentàta, Bieb. fl. taur. no. 70. Valeriàna dentàta, Sow. engl. bot. t. 1370. Fèdia dentàta eriospérma, Wallr. sched. Fèdia dentàta dasycárpa, Rchb. pl. crit. no. 127. t. 63. —Mor. oxon. t. 16. f. 35. Fèdia locústa olitòria, Oed. fl. dan. t. 738. Flowers purple.

Var. β, leiocárpa (D. C. prod. 4. p. 627.) fruit glabrous. ⊙. H. Native along with the species. F. dentàta, Stev. F. Morisònii, Agardh. Fèdia dentàta, var. leiocárpa, Rchb. pl. crit. t. 62. There are varieties of this, having the leaves 3 in a whorl, and pinnatifid.

Morison's Lamb's-lettuce. Fl. April, June. Britain. Pl. 1 ft.

13 V. PUBE'RULA (D. C. prod. 4. p. 627.) fruit ovate, downy, hardish, rather angular, not umbilicated; limb of calyx very short, oblique, 3-5-toothed; the 2 sterile cells of the fruit filiform, and very narrow; bracteas linear, erect, ciliately denticulated, with membranous margins; flowers corymbose; leaves linear-oblong, quite entire, or hardly unidentate at the base. ⊙. H. Native of Sicily and Calabria, in corn-fields. Fèdia pubérula, Bertol. in Guss. pl. rar. p. 14. prod. 1. p. 27. Fèdia microcárpa, Rchb. pl. crit. 2. t. 114.

Downy Lamb's-lettuce. Pl. ½ foot.

14 V. TRUNCA'TA (D. C. prod. 4. p. 627.) fruit ovoid, downy, convex on the back, and bicostate in front; the 2 sterile cells of fruit filiform, much narrower than the fertile one; limb of calyx ear-formed, obliquely truncate, quite entire, equal in length to the fruit; bracteas linear, dilated and concave at the base, ciliately serrated; flowers cymose; leaves oblong, quite entire. ⊙. H. Native of Candia, at Canea or Cydonia, in corn-fields; also of the Island of Melos, and in Cazar and Theodosia. Fèdia truncàta, Rchb. pl. crit. t. 115. Fèdia dentàta, Sieb. ex Rchb. V. aurícula, D'Urv. enum. 5. but not of D. C.

Truncate-calyxed Lamb's-lettuce. Pl. ½ foot.

§ 3. *Platycœ'læ* (from πλατυς, *platus*, broad, and κοιλος, *koilos*, a hollow; in reference to the broad, hollow, sterile cells of the fruit). D. C. prod. 4. p. 627. *Fruit 3-celled, furrowed in front; fertile cell not cellularly gibbose on the back, and the two sterile cells broader than the diameter of the fertile one, or nearly equal to it; the transverse section nearly orbicular.*

* *Limb of calyx entire or toothed, erect; teeth not hooked at the apex.*

15 V. AURÍCULA (D. C. fl. fr. suppl. p. 492. coll. mem. t. 3. f. 6.) fruit ovate, glabrous; limb of calyx obliquely truncate, almost quite entire, acutely auricle-formed; the 2 sterile cells of the fruit broader than the fertile one; bracteas spreading, linear, glabrous; flowers disposed in dichotomous corymbs, rather loose; leaves oblong, quite entire, or toothed at the base. ⊙. H. Native of Europe, in fields, especially in the south. Fèdia auriculàta, Gaud. fl. helv. 1. p. 84. t. 4. Rchb. pl. crit. t. 63. Fèdia olitòria, Gærtn. fr. 2. p. 86. Flowers pink. This species is often confused with *V. dentàta*, and numerous others. There is a variety of it with pinnatifid leaves and villous fruit, according to Rchb.

Var. β, laxiflòra (D. C. prod. 4. p. 626.) dwarf; leaves obovate-oblong. ⊙. H. V. laxiflòra, Dufr. val. p. 58. t. 3. Fèdia laxiflòra, Rœm. et Schultes, syst. 1. p. 360. Flowers pink.

Auricled-calyxed Lamb's-lettuce. Fl. May, June. Clt. 1821. Pl. ½ foot.

16 V. DENTA'TA (D. C. fl. fr. no. 3331.) fruit ovate, glabrous, smoothish, chinky in front; limb of calyx obliquely truncate, auricle-formed, tridentate; the 2 sterile cells of the fruit broader than the fertile one; bracteas spreading, linear-lanceolate, glabrous, hardly ciliated; flowers dichotomously corymbose, rather loose; leaves oblong-linear, quite entire. ⊙. H. Native of Europe, in woods; and of Caucasus, near Baku, in corn-fields. Dufr. val. p. 57. t. 3. no. 5. Fèdia dentàta, Vahl, enum. 2. p. 20. exclusive of the syn. of Moris. Valeriàna dentàta, Willd. spec. 1. p. 183.? V. rimòsa, Bast, journ. bot. 1814. 1. p. 20. Val. olitòria, Sturm, deutsch. fl. with a figure. Flowers blue. This is an intermediate plant between *V. aurícula* and *V. pùmila*, and probably not distinct from the former.

Toothed-calyxed Lamb's-lettuce. Pl. ½ foot.

17 V. PU'MILA (D. C. fl. fr. no. 3335.) fruit nearly globose, inflated, glabrous, engraven in front, retuse at the apex; limb of calyx tridentate, short, unequal; the 2 sterile cells of the fruit broader than the fertile one; bracteas spreading, lanceolate, with membranous villously-ciliated margins; flowers corymbose; leaves oblong-linear, deeply toothed at the base. ⊙. H. Native of the south of Europe and Tauria, in cultivated sandy fields; and of Caucasus, near Baku, in fields and on hills. Valeriàna pùmila, Willd. spec. 1. p. 184. Fèdia pùmila, Vahl, enum. 2. p. 21. Rchb. pl. crit. 2. t. 113. V. membranàcea, Lois. not. p. 130. V. tridentàta, Link. enum. 1. p. 63. Fèdia tridentàta, Stev. mem. soc. mosc. 2. p. 173. Bieb. fl. taur. suppl. p. 29. Rchb. pl. crit. 1. t. 64. Flowers pink. There is a variety of this, having the leaves somewhat pinnatifid.

Var. β, lasiocárpa (Rœm. et Schultes, syst. 5. p. 366.) fruit villous. ⊙. H. Native of Tauria and Caucasus. Fèdia lasiocárpa, Stev. mem. soc. mosc. 5. p. 59.

Dwarf Lamb's-lettuce. Fl. April, May. Clt. 1826. Pl. ¼ to 1 foot.

18 V. sphæroca'rpa (D. C. prod. 4. p. 628.) fruit globose, umbilicate on one side, and convex and bicostate on the other; limb of calyx tridentate, one of the teeth longer than the others; bracteas spreading, lanceolate, acute, with scarious serrately ciliated edges; leaves linear-lanceolate, rather scabrous: uppermost ones pinnatifid at the base; stem smooth. ⊙. H. Native of Sicily, in pastures on the mountains. Fèdia sphærocárpa, Guss. prod. 1. p. 28. pl. rar. p. 14. t. 4. f. 1.

Round-fruited Lamb's-lettuce. Pl. ½ foot.

19 V. cymboca'rpa (Meyer. verz. pfl. p. 49.) fruit nearly linear, with the 2 sterile cells curved, and the fertile cell rounded on the back, and nearly equal; crown of fruit campanulate, 3 and sometimes 4-toothed: the lateral tooth elongated, linear, and straight, the rest usually obsolete. ⊙. H. Native of Caucasus, near Swant, in arid places.

Boat-fruited Lamb's-lettuce. Pl. ½ foot.

20 V. trigonoca'rpa (D. C. prod. 4. p. 628.) fruit trigonal, glabrous, broadly excavated in front, almost without a crown, with callous angles: the 2 sterile cells of the fruit larger than the fertile one; bracteas oblong-linear, glabrous, spreading; flowers capitate: leaves quite entire: lower ones ovate-oblong, upper ones oblong, ciliated at the base. ⊙. H. Native about Constantinople, where it was collected by Castagne.

Trigonal-fruited Lamb's-lettuce. Pl. ½ foot.

** *Teeth of calycine limb hooked at the apex.*

21 V. hama'ta (Bast, in D. C. prod. 4. p. 628.) fruit ovoid, villous outside, somewhat tetragonal, engraven in front: the 2 sterile cells about equal in breadth to the fertile one; limb of calyx spreading, broader than the fruit, quite glabrous inside, and cleft into 6 lobes beyond the middle; lobes awned, hooked at the apex; bracteas adpressed, oblong, ciliated; flowers rather densely capitate; upper leaves linear, entire or tripartite, and are as well as the stem glabrous. ⊙. H. Native in the region of the Mediterranean. D. C. coll. mem. t. 3. f. 7. V. coronàta, Guss. prod. 1. p. 25. V. coronàta integrifòlia, Rchb. pl. crit. 1. p. 54. t. 66. f. 1.—Col. ecphr. t. 209. Fèdia coronàta of many authors. Flowers pink.

Hooked Lamb's-lettuce. Fl. May, June. Clt.? Pl. ½ foot.

22 V. corona'ta (D. C. prod. 4. p. 628.) fruit ovoid, villous, somewhat tetragonal, engraven in front: the 2 sterile cells about equal in breadth to the fertile one; limb of calyx cup-shaped, broader than the fruit, hairy inside, cleft into 6 lobes beyond the middle: lobes awned, hooked at the apex; bracteas adpressed, ciliated; flowers densely capitate; superior leaves pinnatifid, and are as well as the stem downy. ⊙. H. Native of the region of the Mediterranean. V. coronàta, D. C. fl. fr. no. 3333. Dufr. val. 60. t. 3. f. 2. Fèdia Sícula, Guss. prod. 1. p. 25. Fèdia coronàta, Rchb. pl. crit. t. 66. f. β et γ. Vahl, enum. 2. p. 20. Flowers pink.

Var. β, discoídea (D. C. prod. 4. p. 628.) limb of calyx irregularly 7-12-lobed. ⊙. H. Native of the region of the Mediterranean. V. discoídea, var. Dufr. val. p. 59. t. 3. f. 3. D. C. fl. fr. 5. p. 493. Fèdia discoídea, Vahl, enum. 2. p. 21. Rchb. pl. crit. t. 116.

Crowned Lamb's-lettuce. Fl. April, June. Clt. 1731. Pl. ½ ft.

*** *Limb of calyx inflated, closed by the inflexed calycine teeth.*

23 V. vesica'ria (Mœnch. meth. p. 497.) fruit villous, crowned; limb of calyx bladdery, inflated, 6-toothed; teeth conniving, acute; the 2 sterile cells of fruit a little smaller than the fertile one, or nearly equal in size to it; bracteas adpressed, ovate, ciliated, shorter than the fruit; leaves entire or toothed; stem rather villous. ⊙. H. Native in the region of the Mediterranean, in corn-fields. D. C. fl. fr. 4. no. 3332. coll. mem. t. 3. f. 8. Dufr. val. p. 60. t. 3. f. 9. Fèdia vesicària, Vahl, enum. 2. p. 20. Bladdery-calyxed Lamb's-lettuce. Fl. April, June. Clt. 1739. Pl ¼ to ½ foot.

§ 4. *Solenocæ'læ* (from σωλην, *solen*, a tube, and κοιλος, *koilos*, a hollow; in reference to the sterile cells of the fruit). D. C. prod. 4. p. 629. *Fruit 3-celled, broadly furrowed in front; the fertile cell not cellularly gibbose on the back, and the 2 sterile cells broader than the fertile one, and curved, and therefore the transverse section is lunulate.*

* *Lobes of calyx hooked a little.*

24 V. platy'loba (Dufr. val. 59. t. 3. f. 1.) fruit ovoid, villous outside, rather tetragonal, broadly furrowed in front, boat-shaped; limb of calyx spreading, broader than the fruit, rather hairy inside, 6-lobed to the middle; lobes ovate, each furnished with a hooked mucrone; bracteas adpressed, ciliated, oblong; flowers sub-capitate; upper leaves toothed, and are as well as the stem glabrous. ⊙. H. Native in the region of the Mediterranean. D. C. coll. mem. 3. f. 9. Fèdia discoídea, Rchb. pl. crit. 1. p. 54. t. 67. Fèdia rotàta, Rchb. l. c. p. 93. Flowers pink.

Broad-lobed Lamb's-lettuce. Fl. May, June. Clt. 1825. Pl. ½ foot.

** *Limb of calyx erect.*

25 V. carina'ta (Lois. not. p. 149.) fruit oblong, longitudinally boat-shaped, or chinky on one side, and carinated; the 2 sterile cells compressed, curved, about equal in size to the fertile cell; fruit crowned by the unidentate erect limb of the calyx; flowers sub-capitate; bracteas oblong, spreading, serrately ciliated; leaves oblong, almost obovate, quite entire. ⊙. H. Native of France, Germany, Tauria, Sicily, &c. in corn-fields. Dufr. val. p. 56. t. 2. D. C. fl. fr. suppl. 492. coll. mem. t. 3. f. 10. Fèdia carinàta, Stev. mem. soc. mosc. 5. p. 346. Rœm. et Schultes, syst. 1. p. 361. Rchb. pl. crit. t. 61. —Moris. oxon. sect. 7. t. 16. f. 31. Habit of *V. olitòria*. Stem smooth, dichotomous. Flowers blue.

Keeled-fruited Lamb's-lettuce. Fl. April, June. Clt. 1819. Pl. ¼ to ½ foot.

† *Species not sufficiently known.*

26 V. chenopodifòlia (D. C. prod. 4. p. 629.) plant dichotomous; leaves ovate, acute, toothed below; cymes naked, divaricate, dichotomous; filaments long. ⊙. H. Native of Virginia. Fèdia chenopodifòlia, Pursh, fl. amer. sept. 2. p. 727.

Goose-foot-leaved Lamb's-lettuce. Pl.

Cult. The seeds of all the species only require to be sown in the open ground in the early part of spring. All the species answer very well for spring salad.

V. ASTRE'PHIA (from *a*, priv., and στρεφω, *strepho*, to turn; the calyx is not turned back at the time of flowering, as in *Valeriàna*). Dufr. val. p. 50. exclusive of many species. D. C. coll. mem. vii. prod. 4. p. 629.—Hemesòtria, Rafin. ann. gen. sc. phys. 6. p. 88.—Valeriàna species, Ruiz et Pav. Smith.—Fèdia species, Kunth.

Lin. syst. *Triándria, Monogýnia*. Tube of calyx very short, somewhat 5-toothed or subcampanulate. Corolla funnel-shaped, 5-lobed, gibbous on one side at the base, and therefore furnished with a kind of spur. Stamens 3. Style 3-cleft at the apex; stigmas slender. Fruit 2-celled, one of the cells alone fertile; and the other is sterile, and marked by a furrow in the middle, and is therefore probably formed of 2 cells, having the partition between

them obliterated.—Nearly glabrous herbs. Radical leaves rhomboid, cut; cauline ones impari-pinnate, with oval-oblong, deeply toothed segments. Flowers disposed in panicles or corymbs, white.—Habit of *Valeriàna*, and the fruit almost of *Valerianélla*, but is easily distinguished from both these genera in the corolla being gibbosely spurred on one side at the base, and in the style being 3-cleft.

1 A. chærophylloìdes (D. C. prod. 4. p. 629.) stem rather hairy at the nodi; leaves glabrous: radical ones entire: cauline ones pinnate, with sharply jagged segments; corymbs few-flowered; corolla with a short spur; limb of calyx very short, 5-toothed. ⊙. H. Native of Peru, in forests on the hills at Lima and Chancay. Val. chærophylloìdes, Smith, icon. ined. 3. t. 53. Valeriàna laciniàta, Ruiz et Pav. fl. per. 1. p. 49. t. 69. f. a. Val. chærophýlla, Pers. ench. 1. p. 37. Astr. laciniàta, Dufr. l. c. Fèdia chærophylloìdes, Kunth, nov. gen. amer. 3. p. 334. Boerhaàvia chærophylloìdes, Willd. spec. 1. p. 22. Herb hardly a hand high. Flowers white.

Chervil-like Astrephia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

2 A. crìspa (Dufr. val. p. 51.) stem glabrous, as also at the nodi; panicle elongated, with dichotomous branches, floriferous in the axils of the forks; corolla gibbose at the base; limb of calyx sub-campanulate, almost entire. ♃. H. Native of Chili, among bushes, and in meadows and corn-fields. Valeriàna crìspa, Ruiz et Pav. 1. p. 41. Herb 2 feet high. Flowers white.

Curled Astrephia. Pl. 2 feet.

3 A. la'xa (Hook. et Arn. in bot. misc. 3. p. 364.) plant herbaceous, glabrous; radical leaves ovate-cordate, bluntly toothed; cauline leaves lyrately pinnatifid, terminal lobe the largest; panicle loose, divaricate; ultimate pedicels short, crowded; fruit ovate, excavated on one side, 3-ribbed on the back, and crowned by an annular ring.—Native of Chili, about Conception. Fèdia láxa, Hook. et Arn. in Beech. voy. pt. bot. p. 28. This species approaches near to *Fèdia paniculàta*, but that plant is pubescent, and has a pappose fruit.

Loose-flowered Astrephia. Pl. 1 foot.

4 A. loba'ta (Hook. et Arn. in bot. misc. 3. p. 364.) leaves pinnate-lobed; lobes distant, coarsely toothed: terminal lobe broadly ovate, lateral ones oblong, much smaller; lower teeth looking downwards, upper ones upwards; rachis glabrous; corymbs pedunculate, opposite, distant, disposed in a panicle; fruit glabrous.—Native of Chili.

Var. α; stem beset with long hairs. The stem below the last pair of opposite cauline leaves is hairy, above them it is glabrous.

Var. β; stem glabrous.—Native of Chili, about Valparaiso.

Lobed-leaved Astrephia. Pl.

Cult. *A. chærophylloìdes* should be treated like other tender annuals; the rest should be protected in winter by placing them in a frame or green-house. All are only to be increased by seeds.

VI. FE'DIA (derived from *fedus*, an ancient word, synonymous with *hœdus*, a kid). Mœnch. meth. p. 486. D. C. fl. fr. 4. p. 239. Juss. ann. mus. 10. p. 311. Dufr. val. p. 54. D. C. prod. 4. p. 630. but not of Adanson.—Fèdia species, Gærtn. et Vahl. —Polyprèmum species, Adans.—Mitróphora, Neck. elem. 1. p. 123.

Lin. syst. *Diándria*, *Monogýnia*. Limb of calyx short and straight; lobes 4, subulate, unequal (f. 113. *c*.). Corolla with a filiform spurred tube (f. 113. *a*.), and an unequally 5-lobed subringent limb (f. 113. *f*.). Stamens 2 (f. 113. *h*.). Stigma bifid (f. 113. *g*.). Fruit indehiscent (f. 113. *b*.), rather spongy, 3-celled; the 2 sterile cells narrow, and the fertile one broader and 1-seeded.—Glabrous annual herbs. Leaves entire or toothed. Flowers capitately corymbose or cymose, rose-coloured or purple. Bracteas adpressed.

FIG. 113.

1 F. Cornucòpiæ (D. C. fl. fr. 4. p. 240.) leaves ovate-oblong, toothed: lower ones petiolate: upper ones sessile; flowers corymbose, in fascicles; peduncles thickened, fistular. ⊙. H. Native of the south of Europe, Levant, north of Africa, Islands in the Mediterranean &c. in corn-fields and waste places. Gærtn. fruct. 2. p. 36. Valeriàna cornucòpiæ, Lin. spec. 44. Sibth. et Smith, fl. græc. t. 32. Val. locústa, Ucria, hort. pan. p. 46. ex Guss. prod. 1. p. 24.—Sab. hort. rom. 2. t. 17-19. —Mor. oxon. sect. 7. t. 16. f. 27.—Riv. mon. t. 5. Stem purplish. Flowers red. This is a very ornamental annual. The fruit is like a *cornucòpia*.

Cornucopia-fruited Fedia. Fl. June, July. Clt. 1796. Pl. $\frac{1}{2}$ foot, straggling.

2 F. scorpioìdes (Duf. val. p. 55. t. 1.) leaves ovate, petiolate; lower ones quite entire: middle ones irregularly toothed: upper ones ovate-lanceolate, hardly pinnatifid; flowers cymose, unilateral and sessile along the two branches of the cyme. ⊙. H. Native of the north of Africa, about Tangiers. Flowers purple.

Scorpion-like-cymed Fedia. Pl. $\frac{1}{2}$ foot.

† *Species not sufficiently known.*

3 F. panicula'ta (Colla, app. 3. p. 36.) lower leaves spatulate, nearly entire: middle ones lanceolate, obsoletely toothed: upper ones linear-lanceolate, quite entire; stems erect, glabrous; panicles dichotomous. ⊙. H. Native country unknown. Perhaps a species of *Valerianélla*.

Panicled Fedia. Pl. 1 foot.

Cult. The seeds of the species of Fèdia only require to be sown in the open border in spring, like other hardy annuals. A light soil suits them best.

VII. PLECTRI'TIS (from πληκτρον, *plektron*, a cock's spur; in reference to the flower being gibbous in front). D. C. coll. mem. vii. prod. 4. p. 631.—Valerianélla sect. Plectrìtis, Lindl. bot. reg. no. 1095.

Lin. syst. *Triándria*, *Monogýnia*. Margin of calyx straight, quite entire. Tube of corolla furnished with a short spur at the base, and gibbous in front; limb 5-cleft, bilabiate. Stamens 3. Capsule cartilaginous, 1-celled, 2-winged; but the capsule may be truly said to be 3-celled, the 2 empty or abortive cells forming the wings.—A glabrous herb, with a habit between *Centránthus* and *Fèdia*, but the flowers are triandrous, and the fruit is singularly distinct. Flowers monoecious, rose-coloured, crowded, in whorles. Bracteas multifid, with subulate segments.

1 P. conge'sta (D. C. prod. 4. p. 631.) ⊙. H. Native of the north-west coast of America, on the banks of streams and moist rocks, along the shore near the mouth of the Columbia, where it was collected by Douglas. Valerianélla congésta, Lindl. bot. reg. t. 1095.

Var. β, *mìnor* (Hook. fl. bor. amer. 1. p. 291.) leaves narrow. ⊙. H. Native along with the species. Valerianélla parviflòra, Dougl. mss.

Crowded-flowered Plectritis. Fl. July. Clt. 1826. Pl. $\frac{1}{2}$ to 1 foot.

Cult. The seeds of this plant only require to be sown where the plants are intended to remain in the open border.

VIII. CENTRA'NTHUS (from κεντρον, *kentron*, a spur, and ανθος, *anthos*, a flower; in reference to the corolla being furnished with a spur at the base). D. C. fl. fr. 4. p. 238. Dufr. val. p. 38. D. C. prod. 4. p. 631.—Kentránthus, Neck. elem. 1. p. 123.

Lin. syst. *Monándria, Monogýnia.* Limb of calyx involute (f. 114. *b.*) when the flower is in blossom, but afterwards it unfolds into a deciduous pappus, composed of many plumose bristles (f. 114. *h.*). Corolla with an obconical tube, which is spurred at the base (f. 114. *c.*), and a regular 5-lobed limb (f. 114. *d.*). Stamen 1 (f. 114. *e.*). Fruit indehiscent, 1-celled, and 1-seeded at maturity.—Quite glabrous European herbs. Leaves undivided or pinnate. Flowers red or white, unilateral along the branches of the panicle, which is corymbose.

* *Spur of flower elongated. Flowers red, very rarely white.*

1 C. longiflòrus (Stev. obs. pl. ross. p. 76.) leaves lanceolate-linear, quite entire; spur of corolla about equal in length to the tube, and about twice the length of the ovarium; genitals twice the length of the limb of the corolla. ♃. H. Native of Armenia, about Tiflis, among rocks. C. angustifòlius, Bieb. fl. taur. 1. p. 67. but not of D. C. The leaves are intermediate in breadth between the two following, and are probably glaucous like them. Corollas red, an inch long.

Long-flowered Spurred-Valerian. Fl. May, July. Clt. 1817. Pl. 1 to 2 feet.

2 C. angustifòlius (D. C. fl. fr. 4. p. 239.) leaves linear-lanceolate, quite entire; spur one-half shorter than the tube of the corolla, and about equal in length to the ovarium; genitals much exserted. ♃. H. Native of Spain, south of France, Switzerland, Italy, Greece, on the mountains in stony open places. Dufr. val. p. 39. Val. rùbra, β, Lin. spec. p. 44. Valeriàna angustifòlia, Cav. icon. 4. t. 353. Sibth. and Smith, fl. græc. t. 29. but not of Host. Val. monándra, Vill. delph. 2. p. 280. Flowers red, half an inch long. This plant does not change under cultivation.

Narrow-leaved Spurred-Valerian. Fl. May, July. Clt. 1759. Pl. 1 to 2 feet.

3 C. ru'ber (D. C. fl. fr. 4. p. 632.) leaves ovate or lanceolate: upper ones unequal at the base, toothed a little; spur one-half shorter than the tube, and much longer than the ovarium; genitals exceeding the corolla but a very little. ♃. H. Native of the south of Europe, the Levant, north of Africa, and on Mount Vesuvius, and now cultivated in almost every garden. It is to be found in some parts of Britain, on chalk cliffs, on walls, and among rubbish, but is probably an escape from gardens. Stev. obs. pl. ross. p. 67. C. marítimus, Gray, brit. arr. 2. p. 479. C. latifòlius, Dufr. val. p. 38. H. B. et Kunth, nov. 3. p. 323. Valeriàna rùbra, All. ped. 1. p. 1. Valeriàna rùbra, α, Lin. spec. p. 44. engl. bot. t. 1531.—Berg. phyt. t. 141. Dodon, pempt. 351. f. 1.—Riv. mon. t. 3. f. 2. Plant of a glaucous hue. Flowers red.—There is a variety of this with narrow leaves, and another with white flowers. In this and the preceding the root is sweet-scented, and the stem suffruticose at the base.

Red-flowered Spurred-Valerian. Fl. May, July. Britain. Pl. 2 to 3 feet.

** *Spur of flower very short* (f. 114. *c.*). *Flowers white.*

4 C. nervòsum (Moris. elench. sard. 2. p. 4.) leaves all elliptic or oblong-lanceolate, attenuated into the petioles, 3-7-nerved, quite entire; flowers cymosely corymbose; spur very short. ♃. H. Native of Corsica, at a place called Alle Trinita, and of Sardinia, on the mountains. Valeriàna trinérvis, Viv. fl. cors. p. 3. add. fl. ital. p. 67. Flowers white.

Nerved-leaved Spurred-Valerian. Pl. 1 foot.

5 C. calcitra'pa (Dufr. val. p. 39.) radical leaves ovate, entire, or lyrate: upper ones pinnatifid; flowers rather panicled; spur very short. ⊙. H. Native of Europe, in the region of the Mediterranean, and the temperate parts of France. Hoffm. et Link, fl. port. 2. p. 72. Valeriàna calcitràpa, Lin. spec. p. 44. Sibth. et Smith, fl. græc. t. 30. Val. ánnua, Gray, brit. arr. 2. p. 478.—Clus. hist. 2. p. 54. with a figure.—Mor. hist. sect. 7. t. 14. f. 7. Flowers white, tinged with red.

FIG. 114.

Var. β, *orbiculàta* (D. C. prod. 4. p. 632.) lower leaves cordate-orbicular, denticulated: upper ones pinnatifid at the base. ⊙. H. Native of the Island of Cyprus and Balearic Islands, &c. C. orbiculàtus, Dufr.—Valeriàna orbiculàta, Sibth. et Smith, fl. græc. 1. p. 21.

Caltrop-leaved Spurred-Valerian. Fl. May, July. Clt. 1683. Pl. ½ to 1½ foot.

Cult. All the species are elegant border-flowers. They will grow in any common soil, or on walls or rock-work, and are all readily increased by seed.

IX. VALERIA'NA (said by some to be named after one Valerius, who is said to have used this plant first in medicine; and by others to be from *valere*, to be in health, on account of the medicinal qualities of *V. officinàlis*). Neck. elem. 1. p. 123. D. C. fl. fr. 4. p. 238. Rœm. et Schultes, syst. no. 119. D. C. prod. 4. p. 632.—Valeriàna, Phylláctis, and Astrèphia, Dufr.—Valeriàna species and Oligacòce species, Willd.

Lin. syst. *Triándria, Monogýnia.* Limb of calyx involute in the time of blossom, but it unfolds itself at last into a deciduous pappus, which is composed of many plumose bristles (f. 115. *d.*). Corolla with an obconical or cylindrical tube (f. 115. *b.*), which is equal at the base or gibbous, but not spurred, with a bluntly 5-cleft limb (f. 115. *b.*), rarely 3-cleft. Stamens 3 (f. 115. *b.*). Fruit indehiscent, 1-celled and 1-seeded at maturity.—Herbs or subshrubs. Leaves variable even in the same plant. Flowers corymbose, capitate or panicled, nearly all white, rarely blue, rose-coloured, or yellow.

Sect. I. Phylla'ctis (from φυλλον, *phyllon*, a leaf, and ακτιν, *actin*, a ray; in reference to the heads of flowers being involucrated). D. C. prod. 4. p. 632.—Phylláctis, Pers. ench. 1 p. 39. Corolla 3-cleft. Flowers densely aggregate, involucrated. Stems none. Leaves all radical, entire.—Perhaps a proper genus.

1 V. rígida (Ruiz et Pav. fl. per. 1. p. 39. t. 65. f. c.) stemless; leaves crowded in a stellate manner, linear-lanceolate, pungent, quite entire, glabrous, coriaceous; corymbs sessile, crowded, head-formed; corolla 3-cleft; genitals exserted. ♃. F. Native of Quito and Peru, on the tops of the Alps. H. B. et Kunth, nov. gen. amer. 3. p. 324. Phylláctis rígida, Pers. ench. 1. p. 39. Dufr. val. p. 52. Flowers white.

Stiff Valerian. Pl. tufted.

2 V. tenuifòlia (Ruiz et Pav. fl. per. 1. p. 39. t. 65. f. d.) plant stemless; leaves crowded in a stellate manner, linear-subulate, ciliated at the base, very unequal, outer ones very long; corymbs sessile, crowded, head-formed; corollas 3-cleft; genitals exserted. ♃. F. Native of Peru, on the tops of the Alps. Phylláctis tenuifòlia, Pers. ench, 1. p. 39. Dufr. val. p. 53. Flowers white.

Fine-leaved Valerian. Pl. tufted.

3 V. spatula'ta (Ruiz et Pav. fl. per. 1. p. 40. t. 68. f. b.) plant tufted; stems many, simple, 2-edged; leaves linear-spatulate, obtuse, downy, hardly ciliated; corymbs capitate, terminal, involucrated; corollas 3-5-cleft; genitals exserted. ♃. F. Native of the alps of Peru, at Bombom, in the province of Tarma. Phylláctis spatulàta, Pers. ench. 1. p. 39. The corolla is said, in the text of the fl. per., to be 3-cleft, but it is drawn 5-cleft in the figure; however, in the specimen examined it is obviously 3-cleft. Flowers white.

Spatulate-leaved Valerian. Pl. ½ foot.

4 V. obova'ta (Schultes, mant. 1. p. 214.) plant stemless, tufted; root fusiform; leaves disposed in a stellate manner, linear-spatulate, obtuse, hairy; flowers umbellately capitate, involucrated. ♃. H. Native of North America, on dry hills on the banks of the Missouri, about Arikares. Phylláctis obovàta, Nutt. gen. amer. 1. p. 21. Flowers and fruit unknown.

Obovate-leaved Valerian. Pl. tufted.

Sect. II. Aretia'strum (from *Arètia* and *astrum*, an affixed signification, like; the plants contained in the section have the habit of species of *Arètia*). D. C. prod. 4. p. 633. Corolla 4-5-cleft, with a long tube. Flowers yellow, few, hidden among the upper leaves. Leaves imbricate, coriaceous, thick, quite entire. Stems fruticulose. Perhaps a proper genus.

5 V. aretioìdes (H. B. et Kunth, nov. gen. amer. 3. p. 324.) stems suffruticose, tufted, rather procumbent; leaves imbricated, linear-terete, fleshy, glabrous, dilated at the base, and ciliated; flowers 1-3-together, terminal, sessile; corollas 4-5-cleft; stamens exserted. ♃. F. Native of Quito, on the tops of the Andes. Corolla yellow, glabrous, with a very long filiform tube. Style inclosed. Fruit unknown.

Aretia-like Valerian. Pl. procumbent and tufted.

6 V. sedifòlia (D'Urv. fl. mal. p. 44.) stem suffruticose, spreading; branchlets ascending, short; leaves imbricated, thick, coriaceous, retuse at the apex, narrowed at the base, very minutely ciliated; flowers 5-7, terminal, propped by the leaves; corolla 5-cleft; stamens equal in length to the corolla. ♃. F. Native of the Falkland Islands, upon nearly naked rocks on Mount Chatelux. Flowers yellow.

Stone-crop-leaved Valerian. Pl. tufted.

Sect. III. Phu, or Valeria'næ veræ (this section is supposed to contain the true species of *Valeriàna*). D. C. prod. 4. p. 633. Corolla 5-cleft, usually white, rarely red or bluish.

§ 1. *Stems suffruticose, not climbing. Leaves undivided.*

7 V. alypifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 325.) stems shrubby, procumbent; leaves spatulate, fleshy, quite glabrous, approximate; heads of flowers pedunculate; corolla 5-cleft; style exserted; stamens inclosed. ♄. F. Native of the kingdom of Quito, in frigid places at the foot of Mount Antisana, at Chussulongi. Habit of *Globulària cordifòlia*. Flowers white. Allied to *V. spatulàta*.

Alypum-leaved Valerian. Pl. procumbent.

8 V. microphy'lla (H. B. et Kunth, nov. gen. amer. 3. p. 325. t. 275.) stem shrubby, erect; branches terete, clothed with fine down; leaves obovate-oblong, quite entire, 3-nerved, rather coriaceous, downy above; panicles crowded; corolla 5-cleft; genitals inclosed; fruit glabrous. ♄. F. Native on the Andes, about Pasto, in frigid places. Corolla white, with a red throat.

Small-leaved Valerian. Pl. 1 foot.

9 V. conna'ta (Ruiz et Pav. fl. per. 1. p. 39. t. 67. f. c.) stem shrubby, ascending, much branched, with 2 rows of down; leaves lanceolate, connate, quite entire, glabrous, ciliated at the base; corymbs compact, opposite, almost sessile, disposed in an interrupted raceme; stamens equal in length to the corolla, which is 5-cleft. ♄. F. Native of Peru, in the province of Tarma, at Diezmo, among rocks. Flowers small, white.

Connate-leaved Valerian. Shrub 2 feet.

10 V. quadrangula'ris (H. B. et Kunth, nov. gen. amer. 3. p. 326.) stem suffruticose, and is as well as the branches quadrangular, glabrous, pilose at the nodi; leaves ovate-oblong, denticulated at the base, triple-nerved, rather fleshy, glabrous; corymbs dichotomous, divaricate; corolla 5-cleft; stamens inclosed; fruit glabrous. ♄. F. Native of Peru, on the Andes. Corolla red, gibbous at the base. Pappus about 14-rayed.

Quadrangular-branched Valerian. Shrub.

11 V. triphy'lla (H. B. et Kunth, nov. gen. amer. 3. p. 326.) branches woody, terete, glabrous; branchlets angularly furrowed; leaves 3 in a whorl, sessile, lanceolate-oblong, coriaceous, glabrous; heads by threes, axillary and terminal, pedunculate; corolla 5-cleft; stamens exserted. ♄. F. Native of New Granada, near Santa Fe de Bogota, in frigid places on the mountains.

Three-leaved Valerian. Shrub.

12 V. hirte'lla (H. B. et Kunth, nov. gen. amer. 3. p. 327.) stem suffruticose, terete, hairy; branchlets hairy; leaves linear-lanceolate, quite entire, 3-nerved, somewhat coriaceous, rather pilose above, and glabrous beneath; panicles much branched; fruit glabrous. ♄. F. Native of the Andes of Quito, on the top of Mount Assuay. Flowers unknown. Pappus 6-8-rayed.

Hairy Valerian. Shrub 2 to 3 feet.

13 V. chamædrifòlia (Cham. et Schlecht. in Linnæa. 3. p. 129.) stem shrubby, erect, downy at the tops, and densely leafy; leaves ovate-lanceolate, coarsely and bluntly serrated; panicles straight, pyramidal; corolla 5-cleft; genitals about equal in length to the corolla. ♄. F. Native of the interior of Brazil. Flowers small. Fruit unknown.

Germander-leaved Valerian. Shrub.

§ 2. *Stems scandent, shrubby, rarely herbaceous. Leaves undivided.*

14 V. tomentòsa (H. B. et Kunth, nov. gen. amer. 3. p. 327.) shrubby, scandent; branches terete, clothed with hoary tomentum; leaves ovate, cordate, denticulated at the base, membranous, downy above, and clothed with white tomentum beneath; corymbs axillary, pedunculate, dichotomous; corolla 5-cleft; genitals exserted. ♄. G. Native of the temperate parts of Quito, in the valley of Choto. Corolla small, white, gibbous at the base. Fruit unknown.

Tomentose Valerian. Shrub cl.

15 V. clemati'tis (H. B. et Kunth, nov. gen. amer. 3. p. 327.) shrubby, scandent; branches terete, glabrous; leaves ovate, triple-nerved, almost quite entire, membranous, smoothish; panicles much branched, divaricate; corolla 5-cleft; genitals exserted. ♄. G. Native of New Granada and Quito, in alpine situations. Link. jahrb. 1. pt. 3. p. 67. Schultes, mant. 1. p. 262. Corollas downy outside.

Clematis-like Valerian. Shrub cl.

16 V. crassifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 328. t. 274.) shrubby, scandent; branches terete, glabrous; leaves ovate-elliptic, obtuse, quite entire, rather fleshy, glabrous; corymbs trichotomous, divaricate; corolla 5-cleft, pilose outside; stamens inclosed; style exserted. ♄. G. Native of New Granada, in frigid places, near La Erre and Sebondoi. Fruit unknown.

Thick-leaved Valerian. Shrub cl.

17 V. laurifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 328.) shrubby; branches terete, glabrous, tetragonal while young; leaves ovate-oblong, acuminated, quite entire, rather coriaceous, quite glabrous and shining; panicles branched, with the branchlets and bracteas downy. ♄. G. Native of New

Granada, in alpine situations. Flowers monoecious, ex Mutis. Nearly allied to *V. crassifòlia*.

Laurel-leaved Valerian. Shrub cl.

18 V. sca'ndens (Lin. spec. p. 47. but not of Forsk.) plant glabrous, herbaceous, scandent; branches terete; leaves trifoliate; leaflets quite entire: the terminal broad-ovate, acuminated, large: lateral ones lanceolate, smaller; panicles axillary, loose; stamens exserted; fruit rather pilose. ♃. S. Native of New Andalusia, near Caripe, and about Cumana; also of Brazil and St. Domingo, and probably of Mexico. H. B. et Kunth, nov. gen. amer. 3. p. 333. Rœm. et Schultes, 1. p. 353. mant. 1. p. 257. V. volùbilis, Moc. et Sesse. fl. mex. with a figure. Lœfl. itin. p. 235. no. 64.

Climbing Valerian. Pl. cl.

§ 3. *Stems herbaceous, never scandent. Leaves all undivided.*

* *Species natives of America.*

19 V. pilòsa (Ruiz et Pav. fl. per. 1. p. 39. t. 66. f. a.) stem herbaceous, erect, pilose; leaves linear-lanceolate, pilose, with revolute margins: radical leaves obtuse: cauline ones few, distant, acutish; corymbs racemose; stamens exserted. ♃. G. Native of Peru, in frigid places. The whole herb has the habit of *Plantàgo álbicans*. Corollas white.

Pilose Valerian. Pl. 1 foot.

20 V. longifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 330.) stems herbaceous, terete, rather hairy; leaves quite entire, coriaceous, glabrous: radical ones linear-lanceolate, petiolate: cauline ones linear, sessile; panicle branched; corolla 5-cleft, glabrous; stamens exserted. ♃. G. Native of New Granada, in alpine places. There is a variety of this with the stem 1-3 feet high, and the radical leaves 3-12 inches long. Corollas white. Nearly allied to *V. pilòsa* and *V. plantagínea*.

Long-leaved Valerian. Pl. 1 to 3 feet.

21 V. salicariæfòlia (Vahl, enum. 2. p. 16.) plant glabrous, herbaceous; stem simple, striated, rooting at the bottom; leaves lanceolate, quite entire, sessile: upper ones cordate at the base; corymbs terminal, decomposed.—Native of Buenos Ayres.

Salicaria-leaved Valerian. Pl. 1½ foot.

22 V. plantagínea (H. B. et Kunth, nov. gen. amer. 3. p. 329.) stem herbaceous, erect, tetragonal, furrowed, glabrous, pilose at the nodi; leaves quite entire, coriaceous, glabrous: radical leaves oblong-spatulate, petiolate: cauline ones lanceolate, sessile, connate at the base; panicles branched; stamens exserted; fruit glabrous. ♃. G. Native of Quito, in arid places, on the plains of Antisana, and on the declivities of Mount Pichincha. Flowers white. Pappus of fruit few-rayed.

Plantain-like Valerian. Pl. 4 to 6 feet.

23 V. lapathifòlia (Vahl, enum. 2. p. 11.) stem herbaceous, striated, glabrous; leaves ovate-cordate, almost quite entire, undivided, villous above on the nerves, the rest of the leaf glabrous: superior leaves sessile; corymbs trichotomous.—Native of the Straits of Magellan.

Dock-leaved Valerian. Pl. 1½ foot.

24 V. urticæfòlia (H. B. et Kunth, nov. gen. amer. 3. p. 330. t. 275.) stem herbaceous, erect, terete, hairy; leaves roundish-ovate, subcordate, acute, sinuately toothed, rather pilose above: lower leaves petiolate: upper ones sessile; panicles branched; corymbs downy; corolla gibbous at the base; genitals exserted; fruit glabrous. ♃. G. Native of New Granada and Peru. Flowers white. Root a round tuber.

Nettle-leaved Valerian. Pl. 1 foot.

25 V. scorpioìdes (D. C. prod. 4. p. 635.) stem rather herbaceous, erect, terete, downy; leaves ovate or roundish, dentately crenated, pilose above and on the margins; panicle corymbose, trichotomous; branches of panicle elongated, bearing unilateral flowers; fruit small, ovate, glabrous. ♃. H. Native of Mexico, in the valley of Tolucca, where it was collected by Berlandier. Habit almost of *Fèdia scorpioìdes*.

Scorpion-like Valerian. Pl. 1 foot?

26 V. prócera (H. B. et Kunth, nov. gen. amer. 3. p. 329.) stem herbaceous, furrowed, glabrous: cauline leaves sessile, ovate-cordate, long-acuminated, sharply toothed, stiff, glabrous; panicles much branched; fruit villous. ♃. F. Native of Mexico, near Pascuaro. Flowers unknown. Pappus of calyx 11-12-rayed.

Tall Valerian. Pl. 3 to 4 feet.

27 V. macrorhìza (Poepp. pl. exsic. no. 918.) glabrous; radical leaves spatulate, obtuse, tapering into the petiole, which is twice the length of the limb; scapes a little higher than the leaves; panicles racemosely spicate, terminal, having the racemules opposite: the lower ones pedunculate; floral leaves linear. ♃. F. Native of Chili, near the baths of Villa Vicenzio and La Quebrada de San Isedro, and on the Andes of Mendosa. Root thick. Flowers white. Stamens exserted. Habit almost of *V. coarctàta*.

Long-rooted Valerian. Pl. 1 foot.

28 V. coarcta'ta (Ruiz et Pav. fl. per. 1. p. 40. t. 68. f. a.) stems herbaceous, erect, simple, striated, downy; leaves narrow-lanceolate, attenuated, denticulated, ciliated: cauline leaves few; flowers crowded in whorles, disposed in a somewhat interrupted spike. ♃. G. Native of Peru, at Huassa-Huassi, in frigid places in the province of Tarma. Flowers white. Fruit said to be oblong, and crowned by 5 scales. Astrèphia coarctàta, Dufr. val. p. 50.

Coarctate Valerian. Pl. 1 foot.

29 V. serra'ta (Ruiz et Pav. fl. per. 1. p. 40. t. 68. f. c.) plant tufted, glabrous; stems striated; leaves cuneate-lanceolate, serrated from the middle to the apex; flowers in crowded whorles, disposed in an interrupted elongated spike. ♃. F. Native of Peru, in cold places. Astrèphia serràta, Dufr. val. p. 51. Flowers white. Fruit as in *V. coarctàta*, to which it comes very near.

Serrated-leaved Valerian. Pl. ½ foot.

30 V. carnòsa (Smith, icon. ined. 3. p. 52.) stems herbaceous, ascending, glabrous; leaves oval, toothed, fleshy, quite glabrous; corymbs dichotomous. ♃. H. Native at the Straits of Magellan. Astrèphia carnòsa, Dufr. val. p. 51. Val. Magellánica, Lam. ill. 1. p. 93. Plant glaucous.

Fleshy Valerian. Pl.

31 V. oblongifòlia (Ruiz et Pav. fl. per. 1. p. 40. t. 65. f. a.) plant herbaceous, pilose; stems many, striated, almost leafless; radical leaves oblong, dentate, obtuse: cauline ones linear, serrately-cut; corymbs contracted. ♃. F. Native of Peru, on the alps in the province of Tarma, towards Pasco. Flowers white.

Oblong-leaved Valerian. Pl. 1 foot.

32 V. obtusifòlia (D. C. prod. 4. p. 635.) plant herbaceous, erect, glabrous; root tuberous; leaves obtuse: lower ones obovate or oval, petiolate: upper ones sessile, oval-oblong, toothed at the base; corymbs coarctate. ♃. F. Native of Chili. Valeriàna, no. 630. Poepp. pl. exsic. Fruit unknown. Herb 3-7 inches high. Flowers white, crowded. Stamens not exserted. Allied to *V. oblongifòlia*, and with it is intermediate between the present and following division of the genus.

Blunt-leaved Valerian. Pl. ½ foot.

** *Species natives of Europe and the Levant.*

33 V. alliariæfòlia (Vahl, enum. 2. p. 11.) plant glabrous, erect; stem striated; leaves all cordate, undivided, equally toothed, acuminated: lower ones petiolate, upper ones almost sessile; corymbs rather contracted; fruit glabrous. ♃. H. Native of Cappadocia, Iberia, and throughout Caucasus, in alpine

places. Valeriàna macrophýlla, Bieb. fl. taur. 1. p. 25. Flowers white, tinged with red.

Alliaria-leaved Valerian. Fl. June, July. Clt. 1826. Pl. 1 to 2 feet.

34 V. MONTA'NA (Lin. spec. p. 45.) plant glabrous or a little hairy, erect; lower leaves oblong or obovate, obtuse, a little toothed, on long petioles: upper ones lanceolate, acute; corymbs at length panicled; fruit smoothish. ♃. H. Native of Europe, on the mountains. Jacq. austr. 3. t. 269. vind. 202. D. C. fl. fr. no. 3319. Dufr. val. p. 46. V. montàna, *a*, V. saxátilis, and V. Phù, Lapeyr. abr. p. 18.—Scheuch. itin. 1. p. 51. Roots horizontal. Stems simple. Flowers white, tinged with red.

Var. β, rotundifòlia, (D. C. fl. fr. l. c.) stems more humble; lower leaves roundish. ♃. H. Native of Europe, on high mountains. Sims, bot. mag. t. 1825. Lodd. bot. cab. 317. V. rotundifòlia, Vill. dauph. 2. p. 283. V. intermèdia, Sternb. et Hoppe. bot. ges. 2. p. 89.

Var. γ, cuspidàta, (D. C. prod. 4. p. 636.) stems humble, nearly naked: lower cauline leaves ovate, acuminated, undivided or subtrifid. ♃. H. Native of Abruzzo, on the Appenines. Val. cuspidàta, Bert. ined.

Mountain Valerian. Fl. June, July. Clt. 1748. Pl. 1 to $1\frac{1}{2}$ foot.

35 V. ALPE'STRIS (Stev. in mem. soc. nat. mosc. 5. p. 342.) radical leaves ovate, almost quite entire, obtuse: cauline leaves tripartite or ternate, acute: upper ones linear, entire; flowers capitately corymbose; pappus of calyx equal to the achenia in length. ♃. H. Native of Siberia, about the fountains of the rivers Sentelek, Uba, and Ina; and of Caucasus, in alpine meadows. V. montàna, Bieb. fl. taur. 1. p. 25. no. 67. 3. p. 28. Schultes, mant. 1. p. 258.—Gmel. sib. 3. p. 121. no. 2. The whole plant is glabrous. Corymbs coarctate when in flower, but rather loose while in fruit.

Alp Valerian. Pl. 1 foot.

FIG. 115.

36 V. SAXA'TILIS (Lin. spec. p. 45.) radical leaves on long petioles, elliptic, 3-5-nerved, undivided, or a little toothed, ciliated: cauline leaves few, small, linear; stems erect; corymbs racemose; fruit glabrous. ♃. H. Native of the Alps of France, Austria, Italy, &c. Jacq. austr. 3. t. 267. vind. 204. D. C. fl. fr. 4. no. 3324. Bert. amœn. ital. p. 326. Krok. sil. no. 52. t. 6.—Pluk. phyt. t. 232. f. 2. Root blackish, very sweet-scented, and when chewed leaving a bitterness on the tongue. The whole plant shining, and about half a foot high, with the stems subdivided at top. Flowers white, often dioeco-polygamous.

Rock Valerian. Fl. July. Clt. 1740. Pl. $\frac{1}{2}$ foot.

37 V. SUPÌNA (Lin. mant. p. 27.) leaves undivided, ciliated, on short petioles: radical ones obovate: cauline ones lanceolate; corymbs coarctate; bracteas ciliated; fruit glabrous. ♃. H. Native of Carinthia and Tyrol, on the alps. Jacq. misc. austr. 2. t. 17. f. 2. Rœm. fl. cur. f. 3. Sturm, fl. germ. with a figure. Dufr. val. p. 47. V. supìna, Willd. exclusive of the synonymes of All.—Ard. spec. 2. t. 13. Root scentless. Stems 1-2 inches high. Peduncles of corymbs opposite. Flowers white, tinged with red.

Supine Valerian. Fl. May, June. Clt. 1822. Pl. $\frac{1}{8}$ foot.

38 V. SALIU'NCA (All. ped. 1. p. 3. t. 70. f. 1.) plant glabrous; leaves spatulate or obovate, obtuse, entire, on short petioles: cauline leaves sometimes tridentate at the base; stems short; flowers disposed in capitate corymbs; fruit oblong, glabrous. ♃. H. Native of Savoy, Vallais, Piedmont, Dauphiny, Italy, on the higher alps. Dufr. val. p. 47. V. supìna, D. C. fl. fr. 4. no. 3323. but not of Jacq. V. Céltica, Vill. dauph. 2. p. 285. but not of Lin. Root acrid, sweet-scented. Flowers sweet-scented, white, tinged with red.

Lavender Valerian. Fl. May, June. Clt. 1824. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

39 V. CE'LTICA (Lin. spec. p. 46.) plant glabrous; leaves quite entire, obtuse: radical ones obovate: cauline ones linear; stems simple; flowers disposed in interrupted racemose spikes; fruit hairy. ♃. H. Native of France, Italy, Illyria, Carinthia, Switzerland, &c. on the alps. Jacq. coll. 1. t. 24. f. 1. vind. 203. D. C. fl. fr. no. 3322. Dufr. val. p. 47. Val. saxátilis, Vill. ex Poir.—J. Bauh. hist. 3. p. 203. with a figure. Roots sweet-scented, black. Stems 1-2 inches high. Flowers white inside, and reddish outside. Eastern nations procure the roots of this plant from the mountains of Austria to aromatize their baths.

Celtic Valerian. Fl. June. Clt. 1748. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

§ 4. *Stems herbaceous. Radical leaves undivided; cauline ones tripartite or pinnatifid.*

* *Species natives of Europe.*

40 V. GLOBULARIÆFO'LIA (Ram. in D. C. fl. fr. 4. p. 236.) plant glabrous, glaucescent; radical leaves petiolate, ovate, quite entire, obtuse; cauline ones pinnate: lobes or leaflets of the lower leaves obovate, of the superior ones linear; corymbs short, coarctate, subracemose; fruit oblong, glabrous. ♃. H. Native of the Pyrenees, on rocks; and of Spain, on Mount Pinnafurado. Dufr. val. p. 41. no. 4. and no. 5. V. heterophýlla, Lois. fl. gall. 1. p. 21. t. 2. but not of Baumg. V. glaúca, Lapeyr. abr. V. rupícola, Lag. var. 2. p. 212. gen. et spec. 2. no. 16.

Globularia-leaved Valerian. Pl. 1 foot.

41 V. INTERME'DIA (Vahl, enum. 2. p. 9.) plant glabrous, erect; lower leaves on short petioles, cordate, quite entire: cauline ones tripartite, with lanceolate quite entire lobes; corymbs at length panicled. ♃. H. Native of the Pyrenees. V. montàna γ appendiculàta, Lapeyr. abr. p. 19. V. trípteris β, integrifòlia, Arn. in litt. Perhaps a variety of *V. montàna* or *V. trípteris*, or a hybrid between these two species. Flowers white.

Intermediate Valerian. Fl. May, June. Clt. 1818. Pl. 1 foot.

42 V. TRI'PTERIS (Lin. spec. p. 45.) plant glabrous, erect; radical leaves petiolate, cordate or ovate, toothed; cauline ones sessile, tripartite, with ovate-oblong or lanceolate lobes, which are toothed a little; corymbs panicled at length; fruit glabrous. ♃. H. Native of Europe, in rocky places on the mountains, as of Austria, Carniola, Dauphiny, and Piedmont. Jacq. austr. 3. t. 268. Baumg. fl. trans. 1. p. 36. var. *a* and *β*.—Pluk. phyt. t. 231. f. 7-8.—Barrel. icon. t. 742. Root brownish, strong smelling. Flowers white, in loose corymbs. There are varieties of this plant having the radical leaves cordate or ovate, and the stem ones more or less divided, toothed or cut; lobes or leaflets of the upper leaves linear, undivided.

Three-winged-leaved Valerian. Fl. March, May. Clt. 1752. Pl. 1 foot.

43 V. SAXI'COLA (Meyer, verz. pfl. p. 49.) root creeping; stems nearly terete; radical leaves oblong or ovate, quite entire; lower cauline leaves petiolate, trifid or tripartite: lobes linear or oblong: uppermost leaves linear, sessile, entire; flowers hermaphrodite, corymbose, crowded. ♃. H. Native of Western Caucasus, among alpine rocks.

Rock Valerian. Pl. 1 foot?

44 V. PYRENA'ICA (Lin. spec. p. 46.) plant downy, erect; stems striated; lower leaves large, petiolate, cordate, unequally-toothed; superior ones pinnate, having the 1-2 lower pairs of

lobes or leaflets oblong or acuminated, and the terminal one broad-ovate or roundish, cordate, serrated; corymbs ample; fruit glabrous. ♃. H. Native of the Pyrenees, in woods; and of Scotland, in woods, particularly about Edinburgh and Glasgow. D. C. fl. fr. no. 3317. Sowerb. engl. bot. t. 1591.—Pluk. phyt. t. 232. f. 1. V. Canadénsis, Riv. mon. t. 6.—Buxb. cent. 2. p. 19. t. 11. A showy pale green herb, with large leaves. Flowers pale red, disposed in ample corymbs. There is also a white flowered variety of this plant.

Pyrenean Valerian. Fl. May, June. Scotland. Pl. 2 to 4 ft.

45 V. Ita'lica (Lam. ill. 1. p. 92.) plant glabrous, erect; stems terete, nearly smooth; radical leaves petiolate, undivided, ovate-oblong, remotely toothed, the rest pinnate; leaflets or lobes ovate or ovate-oblong, toothed; corymbs subpanicled; fruit glabrous. ♃. H. Native of Liguria and Candia, on the mountains. Vahl, enum. 2. p. 6. Dufr. val. p. 45. V. tuberòsa, Imp. hist. nat. ed. 2. p. 656. with a figure. Flowers truly triandrous, not tetrandrous, as said by Lam. and Vahl.

Italian Valerian. Pl. 1 to 2 feet?

46 V. elonga'ta (Lin. spec. p. 1664.) plant glabrous, erect; stems striated; radical leaves petiolate, oval; cauline leaves sessile, subcordate or hastate; upper leaves deeply 3-5-cleft, acute; panicle elongated, with the lateral branches short and subcorymbose; corolla very short, tubularly campanulate; fruit glabrous. ♃. H. Native of Austria, Carniola, &c. on the alps. Jacq. fl. austr. 3. t. 219. vind. t. 1. Morr. ox. sect. 7. t. 15. f. 20. Root whitish, with little taste or smell. Flowers dusky. Stems 6-10 inches high.

Var. β, polygama (D. C. prod. 4. p. 637.) plant larger; upper leaves trifid. ♃. H. Native of Galicia, in humid meadows. V. dioíca, Bess. prim. 1. p. 48. enum. p. 40. V. polýgama, Bess. in litt. Flowers corymbose, a little larger than in *V. elongàta;* but very similar in form.

Elongated-panicled Valerian. Fl. June, July. Clt. 1812. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

47 V. asarifo'lia (Dufr. val. p. 44.) plant glabrous, erect; radical leaves petiolate, cordate-reniform, a little toothed; cauline leaves few, pinnate; lobes or leaflets of the upper leaves linear; corymbs rather contracted. ♃. H. Native of Crete, on the Spaceotic mountains. Sieb. herb. cret. Schultes, syst. 1. p. 356. mant. 1. p. 259.—Alp. exot. p. 132. with a figure. Flowers red. Root tuberous, black.

Asarabacca-leaved Valerian. Fl. June, July. Clt. 1824. Pl. 1 foot.

48 V. tuberòsa (Lin. spec. p. 46.) plant glabrous; radical leaves ovate, lanceolate-oblong or oblong, undivided, quite entire; cauline leaves pinnatifid, with 2-3 pairs of linear segments or lobes, the terminal segment the largest; corymbs at first coarctate; fruit ovate, hairy. ♃. H. Native of the south of Europe, from Spain to Caucasus; of Siberia, near Sogra and Wydricha, and from Buchtorminsk to Lake Noor Saisan. Vahl, enum. 2. p. 12. Dufr. val. p. 45. D. C. fl. fr. no. 3320. Lob. icon. t. 717. f. 2. Cam. epit. p. 16. Root tuberous, blackish, simple or double, ovate or oblong. There are varieties of this species with the cauline leaves all pinnatifid, or the lower ones are quite entire, oblong-lanceolate and elongated, and the upper leaves more or less pinnatifid. Flowers pale red.

Var. β, monorhìza (D. C. prod. 4. p. 637.) root simple, nearly globose; radical leaves ovate-cordate. ♃. H. Native of Liguria. V. bulbòsa, Imp. hist. nat. ed. 12. p. 659. with a figure. Barrel. icon. t. 867. V. monorhìza, Dufr. val. p. 44.

Tuberous-rooted Valerian. Fl. May, June. Clt. 1629. Pl. $1\frac{1}{2}$ foot.

49 V. Phu' (Lin. spec. p. 45.) plant glabrous, erect; stems terete, smooth; radical leaves oblong or elliptic, undivided; cauline ones pinnatifid, with oblong lobes; corymbs panicled; lobes of stigma 3, slender; fruit glabrous, but exhibiting 2 hairy lines. ♃. H. Native of Alsatia, Switzerland, Silesia, Caucasus, &c. in subalpine places, but not of the Pyrenees. Dufr. val. p. 40. but not of Lapeyr, nor Ruiz et Pav.?—Fusch, hist. p. 155. with a figure. Heyn. arz. gew. 3. t. 33. good.—Blackw. t. 256.—Plench. t. 28. Moris, hist. sect. 7. t. 14. f. 1. Riv. mon. t. 3. Lob. icon. t. 714. Root oblique, thick, and matted, pale green. Plant glaucous. Flowers white, with a pleasant smell.

Phu or Garden Valerian. Fl. May, July. Clt. 1597. Pl. 2 to 4 feet.

50 V. du'bia (Bunge, in Led. fl. alt. 1. p. 52.) primary radical leaves quite entire or auricled; the rest lyrately pinnatifid, and the cauline leaves pinnate; leaflets oblong, obtuse, almost entire: superior ones decurrent; corymbs compound; flowers hermaphrodite. ♃. H. Native of Siberia. V. officinàlis, Falk. topogr. beytr. 2. no. 50.?—Gmel. fl. sib. 3. p. 120. no. 1. exclusive of the synonymes. This species is very nearly allied to *V. officinàlis*, but differs from it in the lower leaves being undivided or auricled. Stem and margins of leaves beset with minute adpressed hardly conspicuous pili.

Var. α, latifòlia (Bunge, l. c.) segments of leaves 7-11, more remote and broader than in var. β. ♃. H. Native of Siberia, frequent on schistous mountains in exposed places.

Var. β, angustifòlia (Bunge, l. c.) segments of leaves 21-27, more crowded and narrower, and more elongated than in var. α. ♃. H. Native of Siberia, near Salair and Barnaul.

Doubtful Valerian. Pl. 2 to 3 feet.

51 V. dioi'ca (Lin. spec. p. 44.) plant glabrous, erect; stems striated; radical leaves petiolate, ovate or subspatulate, undivided; cauline leaves pinnatifid, with linear-oblong lobes; flowers dioecious; corymbs of the male flowers loose; of the female ones contracted; lobes of stigma almost combined; fruit glabrous. ♃. H. Native of Europe and the Levant, in wet meadows and marshes, and by the sides of streams and ditches; in Britain in moist boggy meadows frequent. Dufr. val. p. 29. Oed. fl. dan. t. 687. Sturm, deutsch. fl. with a figure. Heyne, arzn. gew. 3. p. 478. Smith, engl. bot. 628. Curt. lond. 4. t. 3. Poit. et Turp. fl. par. t. 41. V. sylvéstris, Gray. brit. arr. 2. p. 478. V. montàna, gen. el. no. 31. ex Wahl. Roots horizontal, creeping, white, but sometimes tinged with red, slender. Flowers white, tinged with red or flesh coloured.

Var. β, integrifòlia (D. C. prod. 4. p. 637.) all the leaves both radical and cauline are quite entire. ♃. H. Native of Silesia. V. dioíca simplicifòlia, Reich. icon. 1. p. 48. t. 59.—Loes. pruss. no. 724. t. 84.

Dioecious Valerian. Fl. May, July. Britain. Pl. $\frac{1}{2}$ to 1 foot.

* * *Species natives of America.*

52 V. capita'ta (Pall. in Willd. herb. no. 789. exclusive of Cham. et Schlecht. which is Gentiàna frígida,) plant glabrous, erect; stems downy at the nodi; radical leaves petiolate, roundish, simple; cauline ones almost sessile, simple or ternate; leaflets sinuately serrated, middle one the largest; panicles terminal, capitate, girded by long linear bracteas; tube of corolla elongated; fruit ovate, compressed, glabrous. ♃. H. Native of the higher ranges of the Sagan Alps, at the bay of St. Laurence; Kotzebue's Sound; on the Arctic shores of America beyond Behring's Straits; and between the Coppermine and Mackenzie rivers. Link, jahrb. 1. pt. 3. p. 66. Cham. et Schlecht. in Linnæa. 3. p. 130. Perhaps distinct from V. trípteris, ex Stev. obs. in herb. Willd.

Capitate-flowered Valerian. Pl. 1 foot.

53 V. sylva'tica (Banks, mss. Richards, in Frankl. 1st journ. ed. 2. append. p. 2.) plant glabrous, erect; stem striated; radical leaves petiolate, ovate or subspatulate, undivided; cauline leaves pinnate-parted, with ovate-lanceolate nearly entire

segments; flowers hermaphrodite; lobes of stigmas 2-3, minute; fruit ovate, compressed, glabrous. ♃. H. Native of Newfoundland, ex Banks, Clear-water River, ex Richards, Prairies of the Rocky Mountains abundant, ex Drummond. In every respect this agrees with the European *V. dioíca*. It differs from *V. Phù* by the smaller and shorter fruit, and entire absence of the two hairy lines.

Wood Valerian. Pl. 1 foot.

54 V. laxiflòra (D. C. prod. 4. p. 638.) plant glabrous, ascending, suffruticose at the base; leaves petiolate, ovate or oval, with a few coarse irregularly dentately cut teeth; floriferous branches elongated, almost naked; superior leaves pinnate-parted, with 1-2 linear quite entire lobes on each side; floral leaves linear; panicle loose, with opposite branches, which are trifid and few-flowered at the apex. ♃. F. Native of Chili. Valeriàna, no. 825. Poepp. pl. exsic. Fruit oblong, glabrous.

Lax-flowered Valerian. Pl. ascending.

55 V. hyalinorhìza (Ruiz et Pav. fl. per. 1. p. 41. t. 67. f. b. Hook. et Arn. in Beech. voy. pt. bot. p. 28.) plant herbaceous, rather downy; stems terete; radical leaves roundish-obovate, crenated, entire, and auricled; cauline ones pinnatifid; flowers corymbose; genitals exserted; fruit glabrous. ♃. F. Native of Chili and Peru, in sandy arid places. Astrèphia hyalinorhìza, Dufr. val. p. 52. Oligacòce hyalinorhìza, Willd. herb. Root obovate, shining, white, insipid. Corollas yellow, ex Ruiz et Pav.

Shining-rooted Valerian. Pl. ½ foot.

56 V. Humbo'ldtii (Hook. et Arn. in bot. misc. vol. 3.) stem herbaceous, erect, terete, and is as well as the leaves smoothish; radical leaves entire, roundish-elliptic, crenated; cauline leaves sessile, pinnatifidly lyrate; panicles much branched; corollas quinquefid; stamens exserted; fruit glabrous, crowned by feathered pappus. ♃. F. Native of Peru, in rocky places. V. hyalinorhìza, H. B. et Kunth, nov. gen. amer. 3. p. 331. but not of Ruiz et Pav.

Humboldt's Valerian. Pl. ¾ to 1½ foot.

57 V. pinnati'fida (Ruiz et Pav. fl. per. 1. p. 40. t. 69. f. b.) plant herbaceous, glabrous; stems erect, simple, striated; two lower leaves lanceolate, quite entire: the rest pinnatifid, with oblong serrate-toothed lobes; panicle loose; lateral corymbs ditrichotomous; stamens exserted. ♃. F. Native of Peru, at Chancay and Lima on hills. Val. brachiàta, Pers. ench. 1. p. 37. Root tuberous, sweet scented, as in *V. Phù*. Flowers white. A variety of the present plant, or a distinct species, was gathered by Bertero in the grassy pastures on Mont La Leona at Rancagua, in Chili.

Pinnatifid-leaved Valerian. Pl. 1 foot?

58 V. leucoca'rpa (D. C. prod. 4. p. 638.) plant herbaceous, erect, glabrous; lower leaves on long petioles, oboval-oblong, obtuse, attenuated at the base, membranous; cauline leaves very few, small, pinnate-parted at the base, with linear lobes; panicle loose, with opposite trichotomous branches; fruit pale, glabrous, compressed. ♃. F. Native of Chili. Valeriàna, no. 847. Poepp. pl. exsic. Stem 2 feet high. Radical leaves with the petioles 10-12 inches long. Stamens not exserted. Pappus of calyx plumose.

White-fruited Valerian. Pl. 2 feet.

59 V. vagina'ta (H. B. et Kunth, nov. gen. amer. 3. p. 331.) plant glabrous; stems tufted, simple, tetragonal; radical leaves oblong-elliptic, petiolate, toothed a little; cauline leaves sinuately pinnatifid, sheathed at the base, with linear pilose segments; corymbs crowded; stamens inclosed; style much exserted. ♃. F. Native of New Spain, in humid places near Real del Monte. Corolla glabrous, gibbous at the base, white.

Sheathed-leaved Valerian. Pl. ½ foot.

60 V. panicula'ta (Ruiz et Pav. fl. per. 1. p. 41. t. 70. f. a.) plant herbaceous, villous; stems many, erect, striately furrowed, terete, rather 2-edged; radical leaves undivided, cordate, acute; cauline leaves pinnate, with 3-5 ovate acute, denticulated leaflets; panicle diffuse; stamens length of corolla. ♃. H. Native of Peru, in moist rocky places. Corollas small, gibbous at the base, white. Pappus of calyx 10-rayed.

Panicled-flowered Valerian. Pl. 2 to 3 feet.

61 V. pauciflòra (Michx. fl. bor. amer. 1. p. 18. Hook. fl. bor. amer. 1. p. 291. t. 101.) plant herbaceous, glabrous; stems erect, simple, furrowed; radical leaves simple, cordate, sinuately crenated, petiolate; cauline ones lyrately pinnatifid, with 5-7 segments or leaflets, those at the top of the stem trifoliate or simple; leaflets broad-ovate, acute, sinuately toothed; panicle scattered; corymbs few-flowered; corollas tubular; stamens exserted; fruit ovate, compressed, glabrous. ♃. H. Native of North America, on the Alleghany mountains in shady places; and in woods on the Rocky Mountains north of the Smoking river, and on Wolf's plain. Nutt. gen. amer. p. 20. Pursh, fl. amer. sept. 1. p. 28. Root thick, creeping, emitting fibres. Stems hairy at the nodi. Flowers white, ex Nutt., pale blue, ex Torrey, rose-coloured, ex Hook. Panicle terminal, cymose.

Var. β; leaflets almost entire. ♃. H. On moist rocks and islands of the Columbia river. Hook. fl. bor. amer. 1. p. 292.

Few-flowered Valerian. Pl. 2 feet.

62 V. hebeca'rpa (D. C. prod. 4. p. 638.) plant herbaceous, erect, glabrous; lower leaves petiolate, obovate-oblong, coarsely toothed: superior ones sessile, pinnate-parted, with lanceolate-toothed lobes; branches of panicle opposite, trichotomous; bracteas linear, obtuse; fruit small, ovate, velvety from short crowded down. ♃. F. Native of Chili. Valeriàna, no. 942. Poepp. pl. exsic. Herb 1½ foot high. From the fruit being canescent, it agrees with *V. Papílla*, but the fruit is 3 or 4 times smaller.

Hairy-fruited Valerian. Pl. 1½ foot.

§ 5. *Stems herbaceous. Leaves all pinnate-lobed.*

* *Species natives of America.*

63 V. Papi'lla (Bert. in litt. ex D. C. prod. 4. p. 638.) stems erect, glabrous; leaves glabrous, lyrately pinnatifid: having the lateral lobes linear and entire, and the terminal one large, obovate-oblong, and somewhat sinuated; panicle trichotomous; fruit oblong, very hispid. ♃. F. Native of Chili, in sandy pastures along the Cachapual, at a place called St. George, where it is called by the natives *Papilla*, and about the banks of Collina. Herb 1½ foot high. Pedicels pilose. Fruit large. Flowers unknown. Pappus blackish.

Papilla Valerian. Pl. 1½ foot.

64 V. pyramida'lis (H. B. et Kunth, nov. gen. amer. 3. p. 331.) plant glabrous; stem herbaceous, terete, furrowed; leaves pinnate, with sessile ovate-cordate quite entire segments or leaflets; panicle much branched, pyramidal; genitals almost inclosed; fruit oblong, glabrous. ♃. G. Native on the walls of the city of Quito. Corolla with a very short tube, white.

Pyramidal-panicled Valerian. Pl. 3 feet.

65 V. Bridge'sii (Hook. et Arn. in bot. misc. 3. p. 365.) glabrous; leaves lyrately pinnatifid: lobes erose, curled: lateral ones small, terminal one much larger; radical leaves obovate, and more entire than the rest; panicle elongated, with opposite dichotomous distant branches; fruit ovate, glabrous.—Native of Chili, on the mountains and plains near Valparaiso. Very closely allied to *V. crispa*, with a totally distinct fruit, which, in this species, is not flat on one side, with a tubercle on the other, but presents a tubercle which is internally spongy on both sides, nor is it half so large as in *V. crispa*.

Bridges's Valerian. Pl. 1 to 2 feet?

66 V. polemonoìdes (H. B. et Kunth, nov. gen. amer. 3. p. 332.) plant downy; stems herbaceous, erect, terete; leaves pinnate: leaflets oblong, on short petioles, quite entire, rather fleshy, smoothish above; panicle much branched; genitals inclosed. ♃. F. Native of the kingdom of Quito, between Hambato and Llactacunga. Corolla glabrous, gibbous at the base, white.

Polemonium-like Valerian. Pl. 2 to 3 feet.

67 V. decussa'ta (Ruiz et Pav. fl. per. 1. p. 42. t. 70. f. b.) plant herbaceous, downy; stems erect, striated; leaves pinnate; leaflets lanceolate, acuminated, a little denticulated: the terminal one rather the largest; panicle loose, divaricate, downy; stamens nearly inclosed. ♃. F. Native of Peru, among rocks, and in hedges. Peduncles decussate. Corolla small, white.

Decussate-peduncled Valerian. Pl. 3 feet.

68 V. polysta'chya (Smith, icon. ined. 3. t. 51.) plant glabrous, erect; stems a little striated; leaves pinnatifid, with linear quite entire acute segments; racemes compound, elongated, composed of opposite spikes.—Native of Buenos Ayres, in moist places, where it was collected by Commerson. Vahl, enum. 2. p. 5. Astrèphia polystàchya, Dufr. val. p. 51. Oligacòce polystàchya, Willd. herb. Corolla hardly gibbous at the base.

Many-spiked Valerian. Pl. 2 feet.

69 V. sorbifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 332.) stems herbaceous, erect, terete, rather pilose below; leaves pinnate; leaflets sessile, ovate-oblong, cuneated at the base, coarsely serrated, glabrous; panicle much branched; stamens inclosed; style exserted. ♃. F. Native of Mexico, on the western declivities of mountains between Valladolid and Pazcuaro. Corolla glabrous, gibbous at the base, white.

Mountain-Ash-leaved Valerian. Pl. 2 to 3 feet.

70 V. sanguisorbifòlia (Cav. icon. 5. p. 456.) plant herbaceous, glabrous; stems prostrate at the base, and erect at the apex; leaves pinnate; petioles naked almost to the middle; leaflets sessile, ovate, few-toothed, equal; panicle racemose, oblong, rather loose. ♃. F. Native of the Cordillera of Chili. V. sanguisórbæ, Pers. ench. 1. p. 37. Flowers white.

Burnet-leaved Valerian. Pl. 1 foot.

71 V. glau'ca (Poepp. pl. exsic. no. 127.) plant herbaceous, erect, glabrous; stems terete, naked at the apex; leaves glaucous; pinnate: leaflets obovate-oblong, toothed, those at the base of the petiole small, and those at the top of the leaf larger and confluent; branches of panicle opposite, trichotomous; bracteas linear. ♃. F. Native of Chili, where it was collected by Poeppig. Allied to *V. sanguisorbæfòlia*, but the petioles are almost leafy to the base. Leaflets narrowed into the petioles.

Glaucous Valerian. Pl. 1 to 2 feet.

72 V. virga'ta (Ruiz et Pav. fl. per. 1. p. 42. t. 66. f. b.) plant suffruticose, almost glabrous; stem much branched, striated, rather downy; leaves pinnate; leaflets entire or bifid, with linear bluntish entire lobes; corymbs panicled, with dichotomous branches, bearing a sessile flower in each fork; stamens exserted. ♄. F. Native of Peru, in the province of Canta, among broken rocks. Flowers white.

Twiggy Valerian. Pl. 3 feet.

73 V. globiflòra (Ruiz et Pav. fl. per. 1. p. 43. t. 65. f. b.) plant herbaceous, humble, hispid on one side; stems striated, hardly longer than the leaves, almost naked; leaves pinnate: leaflets sinuately toothed; flowers capitate; bracteas spatulate, membranous. ♃. F. Native of Peru, on the alps in the provinces of Tarma and Canta. Corollas white.

Globe-flowered Valerian. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

74 V. lyra'ta (Vahl, enum. 2. p. 4.) plant herbaceous, glabrous; stem bearing 2 leaves; radical leaves lyrate; leaflets oblong, dentately serrated: the terminal one rather pinnatifid: those of the cauline leaves linear-lanceolate; peduncles trichotomous. ♃. F. Native of Peru.

Lyrate-leaved Valerian. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

75 V. interru'pta (Ruiz et Pav. fl. per. 1. p. 42. t. 67. f. a.) plant herbaceous, glabrous; stems many, erect, bearing 2 opposite bipinnatifid leaves under the corymb, which is trichotomous; radical leaves pinnate-parted, and appendiculately toothed between the lobes; segments linear or oblong, unequally bluntly and coarsely toothed; stamens exserted. ♃. F. Native of Peru, on the alps in the province of Tarma at Diezmo. Astrèphia interrúpta, Dufr. val. p. 51. Flowers capitate, sessile. Bracteas linear.

Interrupted-leaved Valerian. Pl. $\frac{1}{2}$ foot.

76 V. cri'spa (Hook. et Arn. in Beech. voy. pt. bot. p. 27. but not of Ruiz et Pav.) leaves fleshy: inferior ones laciniately pinnatifid, with acutely toothed curled segments; fructiferous panicle coarctate; fruit cordately ovate, plano-convex, broadly marginated, with a longitudinal elevated line in front, and 3 lines on the back; pappus plumose, united by a membrane at the base.—Native of Chili, about Conception. V. pterocárpa, Hook. et Arn. l. c.

Curled-leaved Valerian. Pl. 1 to 2 feet?

77 V. ceratophy'lla (H. B. et Kunth, nov. gen. amer. 3. p. 333. t. 276.) plant glabrous; stems herbaceous, terete, striated; leaves pinnate; leaflets hastately trifid, sessile, with linear acuminated segments; corymbs dichotomous; genitals exserted; fruit downy. ♃. F. Native of Mexico, in high plains near Chapoltepec. Val. dichótoma, Moc. et Sesse, fl. mex. icon. ined. Corolla downy outside, gibbous at the base, white.

Horn-leaved Valerian. Pl. 1 to 2 feet.

78 V. Tolucca'na (D. C. coll. mem. vii. prod. 4. p. 640.) plant glabrous, herbaceous, erect; stem nearly terete; leaves pinnate, with 3-4 pairs of membranous repandly toothed leaves, with an odd one: those of the upper leaves very narrow; panicle loose, elongated; lateral corymbs dichotomous; flowers sessile in the forks; fruit oblong, downy. ♃. F. Native of Mexico, in the valley of Tolucco. Very like *V. Hardwickii*, but differs in the stem and leaves being quite smooth, in the segments of the leaves being more ovate, in the corymbs being dichotomous, and in the fruit being oblong.

Tolucca Valerian. Pl. $\frac{1}{2}$ to 2 feet?

79 V. Mexica'na (D. C. coll. mem. vii. prod. 4. p. 640.) plant herbaceous, glabrous, erect; stems rather angular; leaves pinnate, with 2 pairs of oblong leaflets, and an odd one: the latter is larger and ovate, and usually auricled at the base, but all are repandly toothed; panicle loose, elongated, having the lateral branches elongated and trichotomous; stamens exserted; fruit ovate, scabrous. ♃. F. Native of Mexico, about the city, where it was collected by Berlandier. Very nearly allied to *V. Hardwickii* and *V. Toluccàna*, but is distinguished from both by its angular stem.

Mexican Valerian. Pl. $\frac{1}{2}$ to 2 feet?

* * *Species natives of Asia.*

80 V. Leschenau'ltii (D. C. mem. vii. prod. 4. p. 640.) radical leaves petiolate, ovate, obtuse, crenated, hairy on both surfaces; stems erect, simple, glabrous between the joints, but the joints are pilose; cauline leaves remote, small, sessile: upper ones pinnately divided into 3-5 linear glabrous lobes, the terminal lobe the longest; corymbs contracted; fruit villous. ♃. F. Native of the East Indies, on the mountains of Anigueda, where it was collected by Leschenault. Stem 2 feet high. Radical leaves with the petioles, hardly 2 inches long. Habit of *V. dioìca*.

Leschenault's Valerian. Pl. 2 feet.

81 V. re'pens (Wall. cat. no. 434.) the whole plant is

roughish from short hairs; stems striated, with the lower joints or knees radicant; lower leaves undivided, toothed, acuminated, on long petioles, heart-shaped; upper ones on short petioles, ternate; lateral leaflets small, terminal one larger, ovate or oblong, acuminated; panicle terminal, with short opposite branches, which are corymbose at the apex. ♃. F. Native of Nipaul, at Gosaingsthan. Trunk of root slender, creeping, and throwing out fibres.

Creeping Valerian. Pl. creeping, 1 foot.

82 V. Wallíchii (D. C. coll. mem. vii. t. 4. prod. 4. p. 640.) radical leaves petiolate, heart-shaped, a little crenated, villous, but most so on the petioles; stems erect, striated, simple, smoothish; cauline leaves distant, small, cut a little at the base; upper leaves linear, entire; corymbs subumbellate; fruit villous. ♃. F. Native of Nipaul, at Kamaon. V. villòsa, Wall. herb. but not of Thunb. Stems villous at the knees. Herb 8-10 inches high. Petioles beset with retrograde villi.

Wallich's Valerian. Pl. ½ to 1 foot.

83 V. ela'ta (D. Don, prod. fl. nep. p. 159.) stem branched, terete, smooth; leaves pinnate; leaflets lanceolate, quite entire, downy; flowers corymbosely panicled; fruit with villous furrows. ♃. F. Native of Nipaul. Root fibrous. Stem erect, branched, 3-4 feet in length. Flowers small, rose-coloured, triandrous.

Tall Valerian. Pl. 3 to 4 feet.

84 V. Hardwíckii (Wall. in Roxb. fl. ind. 1. p. 166.) plant erect, downy; stems striated, villous; radical leaves numerous, undivided, cordate, toothed, acute, unequally sinuated, on long petioles; cauline leaves sessile, remote, pinnate; leaflets lanceolate, crenated, villous; corymbs at length elongated and panicled; peduncles dichotomous; stamens inclosed; fruit tetragonal, hairy; stigma 3-lobed. ♃. F. Native of Nipaul, and near the town of Sirinagur, where it is called by the Nawarre people chamaha-swa. Hardw. in asiat. res. 4. p. 350. with a figure. D. Don, prod. fl. nep. p. 159. Wall. pl. rar. asiat. 3. t. 263. Val. Hardwickiàna, Rœm. et Schultes, mant. 1. p. 259. Root thick, short, furnished with long thickish fibres. Stem fistular, branched, very variable in height, from a hand to 2-3 feet. Hairs on the leaves very short. Flowers white. Spikenard, Jones, asiat. res. 2. p. 405. with a figure. The root is strong scented like the common valerian, and is used medicinally by the natives of Nipaul.

Hardwick's Valerian. Pl. ½ to 3 feet.

85 V. te'nera (Wall. cat. no. 435.) plant smoothish, erect; stem striated, villous at the knees, the rest glabrous; radical leaves small, reniform, on long petioles: cauline leaves pinnate; leaflets lanceolate, almost entire, acuminated; corymbs contracted. ♃. F. Native of Nipaul, at Kamaon. Herb 5-6 inches high. Leaves downy on the margins and petioles. This is probably only a dwarf variety of *V. Hardwickii*.

Tender Valerian. Pl. 1 foot.

86 V. sisymbriifòlia (Desf. choix. Tourn. p. 53. t. 41. ann. mus. 11. p. 273. t. 28.) plant glabrous, erect; stem finely striated; leaves all pinnate; leaflets ovate-roundish, quite entire; corymbs densely contracted. ♃. ◡. H. Native of Armenia, Caucasus, Iberia, and the Levant; and on the mountains in the island of Cois. Dufr. val. p. 42. V. cardámines, Bieb. fl. taur. 1. p. 24. ex Stev. obs. p. 67. Flowers red.

Sisymbrium-leaved Valerian. Fl. June, July. Clt. 1824. Pl. 1 foot.

87 V. petróphila (Bunge, Led. fl. ross. ill. t. 19. fl. alt. 1. p. 54.) leaves all lyrately pinnate-parted: the terminal segment the largest, oblong, all quite entire and obtuse; stems simple; flowers verticillately subracemose. ♃. H. Native of Siberia, in rough stony places on the tops of Alps at the river Tschuja, against the mouth of the river Tschegan. Root with long thick yellowish white fibres, emitting sarmenta. Leaves glabrous, rather fleshy, the primary ones simple or auricled. Flowers disposed in whorles of threes. Pappus of fruit greyish violet.

Rock-loving Valerian. Pl. ¼ to ⅓ foot.

88 V. alternifòlia (Led. fl. alt. 1. p. 52.) cauline leaves alternate, pinnate; leaflets lanceolate-linear, downy beneath as well as on the stem; flowers corymbose. ♃. H. Native of Siberia, near the city of Irkutzk. Stem erect, simple. Radical leaves wanting in the specimen examined. Upper cauline leaves sessile, but the petioles become gradually elongated to the base. Genitals exserted. Corolla 5-parted, cleft longitudinally.

Alternate-leaved Valerian. Pl. 1 to 1½ foot.

89 V. Dioscóridis (Sibth. et Smith, fl. græc. t. 33.) plant glabrous, erect; lower leaves lyrately pinnate, with ovate toothed leaflets: the terminal one large; upper leaves with equal lanceolate toothed leaflets; cymes crowded, panicled; peduncles dichotomous. ♃. H. Native of Lycia. Roots tuberous. Flowers pale red.

Dioscorides' Valerian. Pl. 2 feet.

*** *Species natives of Europe.*

90 V. sambucifòlia (Mikan, in Rœm. et Schultes, syst. 1. p. 351.) stems erect, striated, glabrous, pilose at the joints; leaves all pinnate; leaflets 4-5 pairs and an odd one: those of the lower leaves ovate, and coarsely toothed, of the superior ones oblong-lanceolate, toothed, and rather decurrent; panicles thyrsoid. ♃. H. Native of Germany. Link, enum. hort. berol. 1. p. 63. V. altíssima, Horn.? This is a larger plant in all its parts than *V. officinàlis*, and does not change by culture. Flowers pink.

Elder-leaved Valerian. Fl. May, June. Clt. 1819. Pl. 2 to 4 feet.

91 V. officina'lis (Lin. spec. p. 45.) plant smoothish, erect; stems furrowed; leaves all or nearly all pinnate, with 7-8 pairs of lanceolate serrated leaflets, and an odd one; corymbs at length panicled; fruit glabrous. ♃. H. Native of Europe and Caucasus, in humid places, and about the banks of pools and rivers; plentiful in Britain. Dufr. val. p. 40. D. C. fl. fr. no. 3315. Blackw. herb. t. 171. Woodv. med. bot. t. 96. Heyne, arz. gew. 3. t. 32. Curt. lond. 6. t. 3. Sowerb. engl. bot. 698. Oed. fl. dan. t. 570. V. sylvéstris, Dodon. pempt. 349. f. 2. Phù, Column. phyt. 114. Phù Germánicum, Fusch. hist. p. 857. This is a very common and a very variable plant, having the stem from 2 to 4 feet high, glabrous or pilose: the lower leaves almost undivided, or all pinnate, with the leaflets broader or narrower, and more or less decurrent, most often toothed, very rarely quite entire, shining or opaque; corymbs contracted or loose; but all these variations are hardly considered varieties. V. lùcida, Hort. par. V. excélsa, Poir. dict. 7. p. 301. V. altíssima, Mikan in Bess. enum. p. 4. V. rèpens, Host, austr. 1. p. 35. are only varieties of *V. officinàlis*. Root composed of long slender fleshy fibres, uniting into a head, and sending out long fleshy creeping shoots from the crown. Leaves bearded at the base on the under side. Flowers pale red, having a singular odour. Pappus of seeds 12-rayed, purplish. In high dry pasture heaths and woods, the plant becomes smaller and more hairy, with the leaves narrower, and the roots more highly aromatic and less nauseous.

The roots have a strong, and to most people a disagreeable smell; its taste is warm, bitterish, and subacrid, communicating its properties to wine, water, and spirit; but it is best in substance, and may be taken from half a drachm to 2 drachms to a dose. There is no doubt of its possessing antispasmodic virtues in an eminent degree. It is often prescribed with advantage in

hysterical cases; and instances are not wanting where it appears to have removed some obstinate epilepsies. In habitual costiveness it is an excellent medicine. The unpleasant flavour of valerian is best concealed by a small addition of mace. A tincture of the root in proof spirit, and in volatile spirit, is ordered in the London Pharmacopæia. Dr. Cullen says, that if it has sometimes failed, it is from the disease depending upon different causes, or the root being frequently employed in an improper condition, or in doses not large enough.—It is well known that cats are much delighted with the roots. Dr. Stokes informs us, that rats are equally fond of them, and that rat-catchers employ them to draw the rats together.

Officinal Valerian. Fl. June, July. Britain. Pl. 1 to 4 ft.

92 V. Sitche'nsis (Bongard, in mem. acad. imp. Petersb. 2. p. 145.) stem erect, glabrous, but pilose at the nodi; lower leaves ternate: superior ones pinnate, with 2 pairs of ovate, acuminated, coarsely toothed segments or leaflets; corymbs dense, contracted. ♃. H. Native of the island of Sitcha, where the roots are used by the natives as a precious medicine. Very nearly allied to *V. sambucifòlia* and *V. officinàlis*.

Sitcha Valerian. Pl. 2 to 3 feet.

93 V. angustifòlia (Tausch. ex Host, fl. austr. 1. p. 36. but not of Cav.) plant downy, erect; stems furrowed; leaves pinnate; leaflets linear-lanceolate, obtuse, ciliated, quite entire, the 3 terminal ones confluent. ♃. H. Native of Bohemia, on hills and mountains. Flowers rose-coloured. Root like that of *V. officinàlis*.

Narrow-leaved Valerian. Pl. 1 to 2 feet.

**** *A species native of the Cape of Good Hope.*

94 V. Cape'nsis (Thunb. prod. p. 7. fl. cap. p. 33.) plant glabrous, erect; stem striated; leaves pinnate; segments or lobes alternate? ovate-toothed, acute, the odd one the largest; corymbs panicled. ♃. G. Native of the Cape of Good Hope, in valleys on the mountains. Habit of *V. officinàlis*, but differs from it in the shorter lobes of the leaves. The roots are used in the same way as *V. officinàlis*. Stem pilose at the joints.

Cape Valerian. Pl. 1 foot.

† *Species not sufficiently known.*

95 V. leucophæ'a (D. C. prod. 4. p. 641.) V. orientàlis mínima flore leucophæa, Tourn. cor. p. 6. Allied to V. tuberòsa, ex Stev. obs. p. 67. but the bracteas are long and distant. Flowers dusky.

Dusky-flowered Valerian. Pl. 1 foot.

96 V. angustíloba (D. C. prod. 4. p. 641.) V. orientàlis angustifòlia, floribus et radice Valerianæ hortensis, Tour. cor. p. 6. This plant is nearly allied to *V. officinàlis*, but differs in the narrower leaves.

Narrow-lobed-leaved Valerian. Pl. 2 to 3 feet.

Cult. All the hardy species thrive well in any common garden soil, and are easily increased by dividing at the root. Many of them are very ornamental border-flowers. The tender kinds, or those from warmer climates, should be grown in pots, in a mixture of peat, sand, and loam, so that they may be protected in winter by placing them in a frame or green-house.

X. BE'TCKEA (named after M. Betcke, who has described many species of *Valerianélla*). D. C. coll. mem. vii. prod. 4. p. 642.

Lin. syst. *Triándria, Monogýnia.* Limb of calyx 1-toothed, deciduous. Corolla funnel-shaped, 5-lobed. Stamens 3. Fruit 1-celled, triquetrous, naked at the apex. Seed 1, conforming to the fruit, and filling the cell.—Glabrous, annual, simple, erect herbs. Leaves undivided. Flowers small, white. Habit of a species of *Valerianélla*.

1 B. samolifòlia (D. C. prod. 4. p. 642.) lower leaves obovate-oblong: upper ones ovate-roundish, sessile, stem-clasping; cymes small, on short peduncles in the axils of the leaves; bracteas oblong. ⊙. H. Native of Chili, in mountain pastures near La Punta de Cortes, and about Valparaiso and Conception. Valeriàna seu Fèdia samolifòlia, Bert. in litt. 1829. and in bull. sc. 1830. p. 111. Habit of *Samòlus* or *Claytònia*.

Samolus-leaved Betckea. Pl. ¼ foot.?

2 B.? Gillie'sii (Hook. et Arn. in bot. misc. 3. p. 366.) plant quite glabrous; root tufted, woody; radical leaves roundish-elliptic, almost 3 times shorter than the petioles, quite entire; scapes about equal in length to the leaves; flowers in crowded heads; fruit glabrous, lanceolate, angular; limb of calyx short, urceolate.—Native of Chili, in clefts of rocks near La Casa de Piedro, and the Andes of Mendosa, forming dense masses. B. samolifòlia, Gill. but not of D. C. There is on the scape usually one pair of floral leaves: from the axil of each arises a head of flowers, in addition to the terminal one; and these three heads are often so close as to appear like one. This is probably not a species of *Bétckea;* its fruit is not triquetrous, nor is the limb of the calyx 1-toothed and deciduous; but the fruit is still 1-seeded.

Gillies's Betckea. Pl. ¼ foot.

Cult. The seeds will only require to be sown in the open ground in May, in a sheltered situation.

XI. TRIPLOSTE'GIA (*τριπλοος, triploos,* triple, and *στεγος, stegos,* a covering; the flowers are clothed by 3 coverings, a double involucrum and the calyx). Wall. cat. no. 436. D. C. coll. mem. vii. prod. 4. p. 642.

Lin. syst. *Triándria, Monogýnia.* Flowers covered by a triple tegument, a double involucrum, and the calyx. Outer involucrum 4-parted and 4-keeled: inner one tubular, 8-toothed, and 8-ribbed. Calyx adhering to the ovarium, with a small 4-toothed limb. Corolla funnel-shaped, 5-cleft, not gibbous at the base, nor spurred. Stamens 3, rising from the base of the tube; anthers a little exserted. Stigma capitate. Utriculus 1-seeded, beaked, covered by the double involucrum, and crowned by the teeth of the calyx, downy.—An Indian herb. Root long, fibry, scentless. Stems obsoletely 4-furrowed, simple or sparingly branched, bearing longish articulated hairs towards the top, which are tipped with glands. Leaves approximate at the base of the stem, oval-lanceolate, toothed, pinnatifid, downy above, and rather villous beneath, petiolate; cauline leaves few, pinnatifid, small. Corymbs or panicles clothed with glandular down. Flowers small, by threes, downy.

1 T. glandulífera (Wall. l. c.) ♃. H. Native of Nipaul, on mountains about Gosaingsthan, growing along with *Nardóstachys*.

Gland-bearing Triplostegia. Pl. ½ to 2 feet.

Cult. This plant should be grown in a pot, in a mixture of loam, peat, and sand, and placed among other alpine plants. It may be propagated by dividing at the root, or by seed.

Order CXXXII. DIPSA'CEÆ (the plants contained in this order agree with the genus *Dípsacus* in several important characters). Vaill. mem. acad. par. 1722. D. C. fl. fr. 4. p. 221. Coult. dips. diss. 4to. geneva, 1823. et emend. ined. in litt. 1824. D. C. prod. 4. p. 643.—Dipsacearum genera, Juss. and Adans.

Tube of calyx closely girding the ovarium (f. 118. *d.*). Limb of calyx variable, short or elongated, entire (f. 117. *g.*), toothed, or ending in numerous variable bristles (f. 118. *d.*) which are usually plumose, and pappus-formed. Corolla gamo-

petalous (f. 117. *f.* f. 118. *e.*), inserted in the top of the tube, rarely ringent, but usually unequal (f. 117. *f.* f. 118. *e.*), 4-5-cleft. Stamens 4 (f. 118. *f.*), inserted in the tube of the corolla, and alternating with its lobes, nearly always distinct and free; anthers 2-celled. Style filiform (f. 118. *g.*); stigma simple, longitudinal or subcapitate. Fruit indehiscent, membranous or subnucumentaceous (f. 118. *h.* f. 117. *c.*), crowned by the limb of the calyx (f. 117. *i.* f. 118. *i.*), 1-celled, 1-seeded, usually covered by the involucel (f. 117. *g.*) Seed pendulous in the fruit; albumen fleshy. Embryo straight, with a superior radicle.—Herbs or subshrubs. Leaves opposite, rarely verticillate, very variable in form, and even so in the same individual, the radical and cauline ones being very different. Flowers in dense heads, girded by involucra, very rarely in whorles. Involucel calyciform, girding the flower.

This order was formerly joined with *Valerianeæ*, but is readily distinguished from it, by the whole habit, by the flowers being in involucrated heads, and the single flowers being involucellate; by the fruit being constantly 1-celled and 1-seeded, in the stamens being always 4 in number, by the stigmas being simple, and by the seeds being albuminous. In this latter respect it agrees with the order *Calycereæ*, but is distinguished from it in the embryo being erect, not inverted, and in the anthers being free, not combined into a tube. It agrees also with *Compositæ*, from which it differs in its distinct stamens, and its pendulous albuminous seeds. What is called the involucel is a curious organ, resembling an external calyx, and is to each particular flower in the head of *Dipsaceæ*, what the partial involucrum of *Compositæ* is to each umbellule. In several species of *Scabiosa* the ovarium is entirely united with the tube of the calyx. Mr. Brown remarks, that the base of the style coheres with the narrow apex of the tube of the calyx, even in those plants of the order in which the dilated part of the tube is entirely distinct from the ovarium. This kind of partial cohesion between pistillum and calyx is directly opposite to what usually takes place, namely, the base of the ovarium being coherent, while its upper is distinct. It equally, however, determines the apparent origin or insertion of the corolla and stamina, producing the unexpected combination of flos superus with ovarium liberum. The order also agrees in many respects with *Nyctagineæ* and *Globularineæ*.

The plants contained in this order have almost the habit of *Compositæ*; all have the flowers growing in heads. Many of them are elegant border-flowers, and are cultivated with great facility. Some of the species of *Scabiosa* have been employed as diaphoretic and anti-syphilitic, but are now neglected.

Synopsis of the genera.

Tribe I.

Morineæ. *Corolla ringent. Stamens 4, combined by twos, or didynamous. Flowers verticillate, bracteated.*

1 Morina. Involucrum 1-leaved, campanulate, with spiny-toothed edges. Calyx with an ovate tube, and a foliaceous bifid limb. Corolla long, tubular.

Tribe II.

Scabioseæ. Corolla 4-5-cleft (f. 118. *e.*), not ringent. Stamens 4-5 (f. 118. *f.*), free, nearly equal. Flowers aggregate upon a receptacle (f. 118. *c.*), the heads involucrated by a general involucrum, and each flower girded by a calyciform involucel (f. 117. *g.*).

2 Dipsacus. Involucrum of many leaves, much longer than the paleæ among the flowers, which are foliaceous. Corolla 4-cleft. Stamens 4. Fruit crowned by the subtetragonal limb of the calyx, inclosed within the involucel.

3 Cephalaria. Involucrum of many imbricated leaves, which are shorter than the paleæ (*f.* 116. *a*). Involucel terminated by a 4-8-toothed crown. Corolla 4-cleft (f. 116. *c.*). Stamens 4. Fruit tetragonal, crowned by the limb of the calyx, and inclosed within the involucel.

4 Knautia. Involucrum of many leaves. Paleæ none. Receptacles hairy. Involucel girding the fruit, denticulated at the apex. Limb of calyx cup-shaped. Corolla 4-5-cleft. Stamens 4.

5 Pterocephalus. Involucrum double, each series of 4-6 leaves. Receptacle villous or chaffy. Involucel toothed (f. 117. *h.*) or awned. Limb of calyx ending in feathery bristles (f. 117. *i.* f. 118. *i.*). Corolla 5-cleft. Stamens 4, rarely 2-3.

6 Scabiosa. Involucrum of many leaves. Receptacle chaffy. Involucels usually subcylindrical. Limb of calyx attenuated into a neck at the base, and ending in 5 awned bristles. Corolla 4-5-cleft. Stamens 4.

Tribe I.

MORI'NEÆ (this tribe only contains the genus *Morina*). D. C. prod. 4. p. 644. Corolla ringent. Stamens 4, didynamous, or combined by twos. Flowers verticillate, bracteate.

I. MORI'NA (so named by Tournefort after Louis Morin, M. D. member of the Academy of Sciences at Paris, who first raised it from seed in his garden at the Abbey of St. Victor. He gave lectures on botany in the Jardin du Roi, Paris, in place of Tournefort, while he was in the Levant). Tourn. cor. p. 48. Lin. gen. no. 41. Lam. ill. 21. Coult. dips p. 21. D. C. prod. 4. p. 644.—Diotothèca, Vaill. mem. acad. par. 1722. but not of Rafin.

Lin. syst. *Tetrándria, Monogýnia.* Involucel 1-leaved, tubularly campanulate, destitute of foveolæ, with spinosely-toothed margins. Tube of calyx ovate: limb foliaceous, bifid: lobes oblong, entire or bifid. Corolla long, tubular, ringent. Stamens 4, sometimes free, didynamous, and sometimes joined together by pairs, diadelphous. Stigma peltately capitate. Fruit crowned by the lobes of the calyx, and girded by the involucel.—Perennial, simple, erect herbs, with the habit of *Carduus*. Leaves oblong, sinuated, dentately spinose, rarely quite entire. Flowers crowded in whorles in the axils of the superior leaves. Floral leaves shorter, almost palmately spiny-toothed.

Sect. I. Diotoca'lyx (from δις, *dis*, twice, and ους ωτος, *ous otos*, an ear, and καλυξ, *kalyx*, a calyx; in reference to the limb of the calyx being of 2 lobes). D. C. prod. 4. p. 644. Leaves sinuated and spinosely toothed. Lobes of calyx 2, oblong, more or less emarginate at the apex, unarmed. Stamens combined by twos, perhaps in all the species.

1 M. Pe'rsica (Lin. spec. p. 39.) leaves pinnate-parted: lobes ending in long hard spines; floral leaves and corollas villous: lobes of calyx retuse, slightly emarginate. ♃. F. Native of Persia about Ispahan, Syria, Asia Minor, and on Mount Parnassus, Sibth. et Smith, fl. græc. t. 28. Coult. dips. 21. t. 1. f. 1. M. orientàlis carlinæfòlia, Tourn. voy. 2. p. 282. with a

figure. M. orientàlis, Mill. M. verticillàta, Mœnch. suppl. Flowers white and reddish on the same plant. Stamens joined from the base to the anthers by twos.

Persian Morina. Fl. July, Aug. Clt. 1740. Pl. 2 to 3 ft.

2 M. longifòlia (Wall. cat. no. 426. D. C. prod. 4. p. 644.) leaves sinuately pinnatifid, and somewhat spiny-ciliated; floral leaves rather villous; lobes of calyx emarginate. ♃. F. Native of Nipaul, at Gosaingsthan. Stem terete, not furrowed. Leaves of the consistence and form of those of *Cirsium oleràceum*, almost a foot long, and hardly an inch broad. Spikes of flowers interrupted at the base. Floral leaves ovate-lanceolate. Lobes of calyx as in *M. Pérsica*, but more emarginate. Corolla and genitals unknown.

Long-leaved Morina. Pl. 2 to 3 feet.

3 M. polyphy'lla (Wall. cat. no. 425. D. C. prod. 4. p. 644.) leaves pinnatifid: lobes spinosely toothed; floral leaves rather villous, elongated, stiffly spinose; lobes of calyx deeply divided. ♃. F. Native of Nipaul, at Gosaingsthan. Intermediate between *M. Pérsica* and *M. longifòlia*, but is distinguished from them in the leaves being more elongated and acuminated, and in the lobes of the calyx being bifid beyond the middle. Corolla and genitals unknown.

Many-leaved Morina. Pl. 2 to 3 feet.

Sect. II. Acanthoca'lyx (from *ακανθος, acanthos*, a spine, and *καλυξ, kalyx*, a calyx; in reference to the limb of the calyx being spiny-toothed). D. C. prod. 4. p. 645. Leaves quite entire, except the floral ones, which are a little spiny-toothed. Limb of calyx oblique, irregularly spiny-toothed. Stamens 4, distinct, didynamous.

4 M. na'na (Wall. cat. no. 424. D. C. prod. 4. p. 645.) cauline leaves quite entire: floral ones bearing spines at the base; involucel 1-leaved, ciliated by spines; limb of calyx oblique, irregularly spiny-toothed. ♃. F. Native of Nipaul, at Gosaingsthan. M. Nipaulénsis, D. Don, prod. fl. nep. prod. 161. Stem villous at top, as well as the young leaves. Flowers red. Corollas villous outside, 3 times longer than the calyx.

Dwarf Morina. Pl. ½ to 1 foot.

Cult. The species of *Morìna* thrive best in a light rich soil; and may be increased by dividing at the root, or by seed.

Tribe II.

SCABIO'SEÆ (this tribe contains plants agreeing with *Scabiòsa* in having capitate flowers). D. C. prod. 4. p. 645.—*Dipsàceæ*, Wallr. sched. crit. p. 41. Corolla 4-5-cleft (f. 117. *f.* f. 118. *f.*), not ringent. Stamens 4-5, free (f. 118. *f.*), nearly equal. Flowers crowded in heads upon receptacles, each head girded by a general involucrum (f. 117. *a.*), with usually distinct paleæ on the lower side, and each flower girded by a calyciform involucel (f. 117. *e.* f. 118. *d.*).

II. DI'PSACUS (said to be from *διψαω, dipsao*, to thirst; probably in consequence of the connate leaves holding water: *διψακος, dipsakos*, is also the Greek name for the disease called diabetes, which is always accompanied by great thirst). Tourn. inst. t. 265. Lin. gen. 114. Gærtn. fruct. 2. t. 86. Coult. dips. p. 21. f. 2-4. Wallr. sched. crit. p. 49.

Lin. syst. *Tetrándria, Monogýnia.* Involucrum of the head of flowers of many leaves, longer than the paleæ. Paleæ on the receptacle acuminated, rather foliaceous. Involucel tetrandrous, 8-furrowed. Limb of calyx somewhat cyathiform or discoid. Corolla 4-cleft. Stamens 4. Stigma longitudinal. Fruit crowned by the subtetragonal limb of the calyx, and inclosed within the involucel.—Erect, pilose, or prickly biennial herbs. Leaves opposite, usually connate at the base, toothed or jagged. Heads of flowers terminal, oblong-ovate or roundish. Corolla lilac-coloured, yellow, or white.

1 D. sylve'stris (Mill. dict. no. 2.) stem prickly; leaves connate at the base, ovate-lanceolate, acuminated, toothed; leaves of involucrum inflexed, weak, longer than the heads of flowers; paleæ of heads straight, linear-lanceolate, setaceous, bent; involucel not drawn out beyond the furrows. ♂. H. Native of Europe and Siberia, frequent; plentiful in some parts of Britain, about hedges and by road sides. Jacq. fl. austr. t. 402. Oed. fl. dan. t. 965. Smith, engl. bot. t. 1032. Curt. lond. 3. t. 9. D. sylvéstris *α*, Coult. dips. p. 22. D. vulgàris, Gmel. fl. bad. 1. p. 312. D. fullònum, Thor. chlor. land. p. 36. Poll. pal. no. 137. D. purpùreus, Fuschs. hist. 225. Flowers bluish-purple, first breaking forth about the middle of the head. Heads of flowers ovate-oblong. The water contained in the basin formed by the leaves is said to cure warts on the hands, and to serve as a beauty-wash for the face; hence Ray conjectures it had its name, *Labrum Veneris*.

Var. β, pállidus (Bess. in Rœm. et Schultes, syst. 3. p. 41.) leaves of involucrum shorter, hardly ascending. ♂. H. Native of Galicia, &c.

Wild Teazle. Fl. July. Britain. Pl. 6 feet.

2 D. lacinia'tus (Lin. spec. p. 141.) stem prickly; leaves connate at the base, sinuately jagged, and the lobes sinuately toothed; leaves of involucrum erectish, stiffish, usually shorter than the head, which is ovate; paleæ straight, linear-subulate; involucel not drawn out beyond the furrows. ♂. H. Native of Europe and Siberia, in hedges and ditches, as of Germany, France, Alsace, Austria, Caucasus, &c. Jacq. fl. austr. 5. t. 403. D. sylvéstris, var. *γ*, Coult. dips. p. 22. Leaves downy beneath. Corollas whitish; anthers reddish.

Var. β, comòsus (D. C. prod. 4. p. 645.) leaves of involucra very narrow, longer than the heads. ♂. H. Native of the south of Europe. D. comòsus, Hoffm. et Link. fl. port. 2. p. 81. D. laciniàtus, Brot. fl. lus. 1. p. 147. D. sylvéstris *δ*, Coult. l. c.

Jagged-leaved Teazle. Fl. July, Aug. Clt. 1683. Pl. 3 to 5 ft.

3 D. divarica'tus (Presl. fl. sic. p. 57. del. prag. 117.) stem prickly; radical leaves oblong, rather lyrate, ciliated: cauline ones interruptedly pinnatifid: lobes divaricate, pinnatifid at the base; leaves of involucrum shorter than the head, which is ovate,; paleæ spinescent, arched; involucels unknown. ♂. H. Native of Sicily, on the edges of fields. Guss. prod. 1. p. 157. D. laciniàtus, Ucria, hort. pan. p. 66.?

Divaricate Teazle. Pl. 3 to 5 feet.

4 D. fullònum (Mill. dict. no. 1.) stem prickly; leaves connate at the base, oblong-lanceolate, serrated: upper ones entire; leaves of involucra spreadingly reflexed, shorter than the heads, which are cylindrical; paleæ stiff, recurved; involucel not drawn out beyond the furrows. ♂. H. Native of the south of Europe, where it is said to grow spontaneously in fields. It is said to be a native of England; but scarcely wild. Plenck. off. t. 50. Sowerb. engl. bot. 2080. Hayn. term. bot. t. 41. f. 8. Coult. dips. p. 22. D. satìvus, Gmel. fl. bad. 1. p. 314. D. fullònum *β*, Lin. spec. p. 140. D. sylvéstris *ε*, Coult. in litt. 1824. —Lob. icon. 2. p. 17. with a figure. Flowers whitish, with pale purple anthers. This and the three preceding have been combined by Coulter.

Fullers' Thistle or Teazle is called *Chardon a foullon* in French, *Kardendistel* in German, and *Cardencha* in Spanish; *Dipsaco* in Italian: is a biennial plant from 4 to 6 feet high, prickly and rough in the stem and leaves, and terminated by rough bur-like heads of flowers. It is cultivated in Essex and the West of England, for raising the nap upon woollen cloths, by means of the crooked paleæ upon the heads. For this purpose they are fixed round the circumference of a cylinder, which is made to turn round, and the cloth is held against them. There are no varieties of the cultivated Teazle, but the wild species is not

materially different, and may be used in its stead, though its chaff is not quite so rigid.

The soils on which the Teazle grows the strongest are deep loamy clays, not over rich. The situation should be rather elevated, airy, and exposed to the south. In the rotation, it may occupy the place of a green and corn-crop, as the first year the plants are treated like turnips, and the second the crop is ripened. The soil should be ploughed deep, and well comminuted by cross ploughings or stirrings with pronged implements.

The sowing season is the beginning of April; the quantity of seed is from 1 to 2 pecks per acre, and in quality it should be fresh and plump. The mode of sowing is almost always broad-cast, but no crop is better adapted for being grown in drills, as the plants require hoeing and thinning. The drills may be either sown on ridgelets or a flat surface, in the manner of turnips, or by ribbing. The distance between the rows may be from 18 inches to 2 feet. In Essex, carraway is commonly sown with the teazle crop, but this is reckoned a bad plan.

The after culture of this crop consists the first year in hoeing and stirring the soil, and in thinning out the plants to the distance of 1 foot every way, if sown broad-cast, or to the distance of 6 inches, if sown in rows. Vacancies may be filled up by transplanting; and a separate plantation may be made with the thinnings, but these never attain the same vigour as seedlings. The culture the second year consists also of hoeing, stirring, and weeding, till the plants begin to root. When the teazle is grown broad-cast, the intervals between the plants are dug by means of spades which have long narrow blades, about the length of 16 or 17 inches, and not more than about 4 inches in breadth. With these the land is usually worked over in the intervals of the plants, three or four times during the summer months; and in the course of the following winter, as about the latter end of February, the land between the plants is to be again worked over by the narrow spades, care being taken that none of the mould falls into the hearts of the plants; and again, about the middle of May, when they begin to spindle, another digging over is given, the earth being raised round the root-stems of the plants, in order to support and prevent them from being blown down by the wind. Some cultivators perform more frequent diggings, that the ground may be rendered cleaner and more mellow; consequently the growth of the plants will be more effectually promoted. The business in Essex has usually the name of spaddling, and is executed with great despatch by labourers that are accustomed to perform it.

The taking of the Teazle crop, when no regard is had for seed, commences about the middle of July, when the blossoms begin to fall from the heads. It is the best method to have the heads cut as they become ripe; but the work is usually executed at three different times, at the distance of ten days or a fortnight from each other. It is performed by means of a knife, contrived for the purpose, and a string attached to the haft. This last is done in order that it may be hung over the hand. A pair of strong gloves are also necessary. Thus prepared, the labourer cuts off the ripe heads along the rows or lines, with about 9 inches of stem, and ties them up in handsfull, with the stem of one that is more perfectly ripened. And on the evening of the day on which they are cut, they should be put into a dry shed; and when the weather is fine, and the air clear, they should be taken out and exposed to the sun daily, till they become perfectly dry. Much care must, however, be taken that no rain falls upon them. In doing this, some make use of long small stakes or poles, on which these handsfull are hung during the time of their preparation.

As soon as they are completely dried, they should be laid up in a dry room, in a close manner, till they are become tough, and of a bright colour, and ready for use. They should then be sorted or separated into three different kinds, by opening each of the small bundles. These are distinguished into kings, middlings, and scrubs, according to their different qualities. They are afterwards, the author of "The Somerset Report" says, made into packs, which, of the first sort, contain 9000 heads, but of the second, 20,000; the third is a sort of very inferior value. By some, before forming them into packs, they are done up into what are termed staves, by means of split sticks, when they are ready for sale.

The produce of Teazle varies from 10 to 15 packs per acre; nine packs of kings, nineteen of middlings, and two of scrubs, are reckoned a large crop, with a great bulk of haulm. Often, however, the crop fails.

The use of the heads of the Teazle has been already mentioned. The haulm is of no use but for burning as manure. Parkinson observes, that this is a sort of crop that may be grown to advantage on many lands; in rotation, as a fallow to prepare for wheat; and by burning the straw and refuse stuff after the crop is reaped, it will be found not to impoverish, but rather to improve the land. In their young state, the teazle plants stand the winter without danger, and are a good crop for clearing land of all weeds, from their lateness in the process of hoeing, there being few weeds at so advanced a season; on all these accounts they become an advantageous crop for the farmer.

To save seed, leave a few of the very best plants uncropped, and then, when the seed is ripe, cut off only the largest and terminating heads, from which the seed is easily separated by beating with flails, and cleaned by a winnowing machine or a sieve.

The chief injuries to which the Teazle is liable are those effected by the fly and slug in its infant state.

Fullers' Teazle. Fl. July. Britain. Pl. 6 feet.

5 D. sinua`tus (Willd. mss. in Rœm. et Schultes, syst. 3. p. 519.) leaves pinnatifidly sinuated: segments laciniately toothed. ♂. H. Native of Persia, on the alps in the province of Ghilan. Coult. dips. no. 22.

Sinuated-leaved Teazle. Pl. 3 to 4 feet.

6 D. fe`rox (Lois. fl. gall. p. 719. t. 3.) stem and leaves echinated from prickles; leaves connate at the base: radical ones sinuated: middle ones pinnatifid: upper ones entire; leaves of involucra spreading, a little longer than the heads, which are ovate; paleæ subulate, straight, stiff; involucel drawn out beyond the furrows into a short membrane. ♂. H. Native of Corsica and Sardinia, on the edges of fields. Said to grow in plenty in Austria, Bohemia, and Moravia. Tratt. tab. t. 235. D. C. fl. fr. suppl. p. 486. Coult. dips. p. 23. Flowers white or pale red. The central head of flowers is usually cylindrical, and the lateral ones roundish.

Fierce Teazle. Fl. July, Aug. Clt. 1818. Pl. 3 to 4 ft.

7 D. Gmelìni (Bieb. fl. taur. 1. p. 92.) stem prickly; leaves sessile: lower ones undivided or cut: superior ones pinnate-parted, with oblong acute segments; leaves of involucra deflexed, incurved, weak, shorter than the heads, which are ovate, or nearly globose; paleæ membranous, acuminately awned, straight; involucel drawn out beyond the furrows into a membranous crown. ♂. H. Native of Tauria, at Kuma, about the ruins of Maschar, but rare, ex Steven; at the river Don, ex Golb.; and of Siberia, about the Irtish, ex Gmel. sib. 2. p. 209.; and of the Kirghisean Steppe, between Bucktorminsk and Lake Noor Saisan, ex Led. fl. alt. 1. p. 127. Coult. dips. p. 23. D. laciniàtus, Falck. top. beytr. 2. no. 140. Corollas blue.

Gmelin's Teazle. Fl. July, Aug. Clt. 1820. Pl. 3 feet.

8 D. strigòsus (Willd. mss. ex Rœm. et Schultes, syst. 3. p. 520.) leaves toothed and entire, appendiculated: upper ones jagged at the base, ciliated; involucra twice the length of the paleæ; paleæ setaceous, twice the length of the flowers. ♂.

H. Native of Persia, in the province of Ghilan. Coult. dips. p. 23. Said to be allied to the following.

Strigose Teazle. Pl. 3 to 4 feet.

9 D. pilòsus (Lin. hort. ups. p. 25.) stem prickly, glabrous; prickles hair-formed under the head; leaves glabrous, petiolate, ovate, toothed, auricled at the top of the petioles; leaves of involucra deflexed, shorter than the heads, which are globose, but hardly exceeding the paleæ, which are linear-subulate and pilose; involucel not drawn out beyond the furrows. ♂. H. Native nearly throughout the whole of Europe, in woods and hedges; Caucasus, in Alpine places. In England, in moist shady places on a chalky or lime-stone soil. Oed. fl. dan. t. 1448. Jacq. fl. austr. t. 248. Smith, engl. bot. t. 877. Coult. dips. 23. Curt. lond. t. 10. Cephalària appendiculàta, Schrad. cat. sem. gœtt. 1814. Paleæ ciliated. Corollas white. Anthers dark purple or brown.

Pilose Teazle. Fl. Aug. Britain. Pl. 2 to 4 feet.

10 D. strictus (D. Don, prod. fl. nep. 160.) stem unarmed, but beset with short retrograde hairs; leaves petiolate, lanceolate, acute, dentately serrated, beset with villi on both surfaces; leaves of involucra spreadingly deflexed, shorter than the heads, but hardly exceeding the paleæ, which are oblong-cuneated, straight at the apex, ciliated, canescent; involucels hardly furrowed, crowned. ♂. H. Native of Nipaul. D. inérmis, var. *a*, Wall. in fl. ind. 1. p. 367. Stem erect, branched, hexagonal. Flowers cream-coloured. According to D. Don, in fl. nep. the leaves are connate at the base. Heads of flowers spherical.

Straight Teazle. Fl. July. Clt. 1823. Pl. 4 to 5 feet.

11 D. ine'rmis (Coult. dips. p. 23.) stem unarmed, downy, but having the branches hispid under the heads; leaves petiolate, ternate or somewhat pinnatifid, clothed with adpressed pili on both surfaces: lobes lanceolate, acuminated, serrated; leaves of involucra deflexed, shorter than the heads, which are globose, but exceeding the paleæ a little; paleæ ovate, mucronate, ciliated at the apex; involucels hardly furrowed, crowned. ♂. H. Native of Nipaul, in alpine places. D. inérmis, var. *β*, Wall. in fl. ind. 1. p. 367. D. mìtis, D. Don, prod. fl. nep. p. 161. Stem hexagonal, pilose, unarmed. Paleæ about equal in length to the flowers. Corollas yellow.

Unarmed Teazle. Fl. July. Pl. 2 to 3 feet.

12 D. a'sper (Wall. cat. no. 428. D. C. prod. 4. p. 646.) stem prickly; leaves undivided or pinnatifid, oblong-lanceolate, acuminated, serrated, scabrous on both surfaces from bristly hairs; leaves of involucra deflexed, shorter than the heads, which are globose, but exceeding the paleæ, which are ovate, ciliated, and mucronate; involucels hardly furrowed. ♂. H. Native of the East Indies, on the Pundua Mountains. Stem and branches angular; angles beset with stiff prickles.

Rough Teazle. Pl. 2 to 3 feet.

13 D. Leschenau'ltii (Coult. in litt. ex D. C. prod. 4. p. 647.) stem smooth, rather hairy; leaves lyrately pinnatifid, very villous on both surfaces, acuminated, coarsely serrated at the apex: lower ones petiolate: lobes of leaves 3-nerved at the base; leaves of involucra spreading, shorter than the heads, which are globose, and hardly exceeding the paleæ, which are oblong, acuminated and pilose; involucel drawn out a little into a membranous crown beyond the furrows. ♂. H. Native of the East Indies, on the Nellighery Mountains, where it was collected by Leschenault and Noton. Scabiòsa Brunoniàna, Wall. cat. no. 429. The plant is called *Donde Gueda* by the natives. Stem 3 feet high, rather hairy, not prickly. Habit of *Cephalària alpìna*.

Leschenault's Teazle. Pl. 3 feet.

Cult. None of the species are worth growing, except in botanic gardens. They will grow in any soil in which the seeds may be sown.

III. CEPHALA'RIA (from κεφαλη, *kephale*, a head; the flowers are disposed in round heads). Schrad. cat. sem. hort. gœtt. 1814. Rœm. et Schultes, syst. 3. p. 406. Coult. dips. p. 24. et emend. mss. 1824. D. C. prod. 4. p. 647.—Lepicéphalus, Lag. gen. et spec. 1816. p. 7.—Cerionánthus, Schott, mss. ex Rœm. et Schultes, syst.—Succìsa, Vaill. Wallr. l. l. c. c. Spreng. syst. no. 376. exclusive of some species.—Picnócomon, Wallr. mss.—Scabiòsa species, Lin. and others.

Lin. syst. *Tetrándria, Monogy'nia.* Involucra surrounding the heads of many imbricated leaves (f. 116. *a.*), shorter than the paleæ. Involucel tetrandrous, rarely compressed, 8-furrowed, terminated by a 4-8-toothed crown. Limb of calyx rather cup-shaped or discoid. Corolla 4-cleft. Stamens 4 (f. 116. *d.*). Stigma longitudinal. Fruit tetragonal, crowned by the limb of the calyx, inclosed within the involucel.—Perennial herbs. Leaves toothed or pinnatifid. Heads of flowers terminal, globose (f. 116. *e.*); paleæ imbricated: outer ones sterile. Corollas white, cream-coloured, or lilac.—This genus is hardly distinct from *Dipsacus*, unless in the involucra being very short.

* *Perennial plants. Paleæ acuminated, downy.*

1 C. alpìna (Schrad. l. c.) stem striated, rather velvety; leaves pinnate; leaflets lanceolate, decurrent, unequally serrated; paleæ acuminated, downy; teeth of involucel 8, awned, nearly equal in length to the corolla; anthers green and striated at the time of dehiscence. ♃. H. Native of Europe, on the alps; and of Greece, on Mount Athos. Rœm. et Schultes, syst. 3. p. 43. Coult. dips. 24. Scabiòsa alpìna, Lin. spec. 141. D. C. fl. fr. no. 3296. Succìsa alpìna, Spreng. syst. 1. p. 378. Besl. syst. œst. 9. t. 98. f. 1. Corollas yellow. Heads of flowers drooping a little before expansion. Leaves large, downy.

Alpine Cephalaria. Fl. June, July. Clt. 1570. Pl. 3 to 4 feet.

2 C. Tata'rica (Schrad. l. c.) stems striated, clothed with retrograde villi at the base and on the petioles; leaves pinnate; leaflets decurrent, oval-lanceolate, serrated; bracteas acuminated, downy; teeth of involucel 8, awned, nearly equal; outer corollas radiant; anthers green, and striated at the time of bursting. ♃. H. Native of Siberia and Caucasus, in alpine meadows. Rœm. et Schultes, syst. 3. p. 51. Coult. dips. p. 24. Scabiòsa Tatárica, Gmel. sib. 1. p. 159. Bieb. fl. taur. 1. p. 92. but not of Lin. Scabiòsa elàta, Horn. hort. hafn. 1. p. 126. Rchb. pl. crit. 4. t. 301. but not of Lin. Cephalària elàta, Schrad. l. c. Scabiòsa atràta, hort. mad. 1805. Lepicéphalus atràtus, Lag. l. c. Succìsa Tatárica, Spreng. l. c. Plant glabrous. Peduncles angular, downy. Heads large. Paleæ deep green, white inside, ciliated. Corollas yellow.

Var. β, gigantèa (Coult. l. c.) plant 12 feet high. ♃. H. Scabiòsa altíssima, Mill. dict. no. 6. Scabiòsa gigantèa, Ledeb. cat. hort. dorp. 1811. Plant glabrous.

Tartarian Cephalaria. Fl. June, Aug. Clt. 1759. Pl. 5 to 6 feet.

** *Annual plants. Paleæ membranous, awned at the apex.*

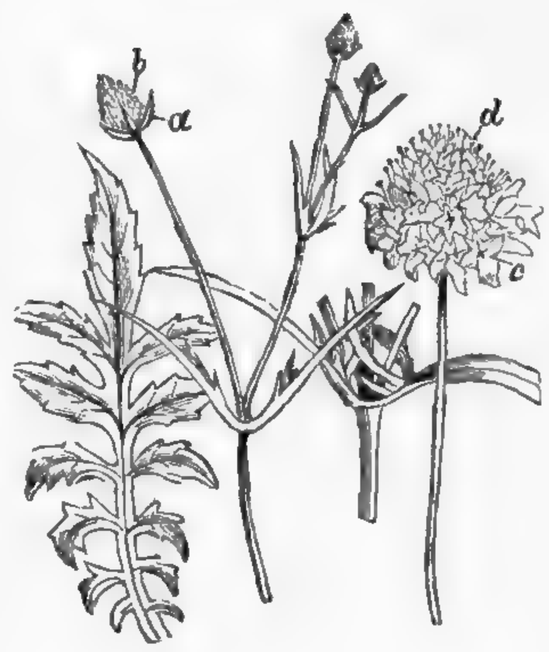
3 C. Transylva'nica (Schrad. l. c.) stems terete, rather pilose at the base; leaves pinnatifid: lower ones lyrate; lobes of the cauline leaves linear-oblong toothed: terminal lobes lanceolate, serrated a little; paleæ glabrous, membranous, oblong, ending in a dark purple awn each; teeth of involucel 8, short, equal. ⊙. H. Native of the south of Europe, from Vascony to Constantinople, in fields; and of Caucasus, on mountains near Grosnaja. Coult. dips. p. 24. t. 1.

f. 6. Scabiòsa Transylvánica, Lin. spec. p. 141. Jacq. hort. vind. t. 111. Rchb. pl. crit. 2. p. 121. Succìsa pentaphýlla, Mœnch. meth. p. 488. Scabiòsa Transylvánica, Spreng. l. c. Lepicéphalus Transylvánicus, Lag. Corollas white in the disk, and pale deep blue or lilac in the rays.

Var. β, semiaristàta (Coult. in litt. 1824. ex D. C. prod. 4. p. 648.) alternate teeth of involucels awned, the rest as in the species.

Transylvanian Cephalaria. Fl. July. Clt. 1699. Pl. 1 to 3 feet.

FIG. 116.



4 C. JOPPE'NSIS (Coult. in litt. ex D. C. prod. 4. p. 648.) stems terete, branched; leaves pinnatifid: lobes serrated; heads ovate; scales of involucra roundish; paleæ silky, short-acuminated; teeth of involucels 8, short, equal; corollas nearly equal. ⊙. H. Native of Joppa, in hedges. Succìsa Jóppica. Spreng. syst. 1. p. 1378. Scabiòsa Joppénsis, Rchb. hort. bot. 1. t. 17. Scabiòsa Transylvánica, Sieb. in herb. Kunth. Leaves, habit, and fruit of *C. Transylvánica*.

Joppa Cephalaria. Pl. 1 to 3 feet.

5 C. SYRÌACA (Schrad. l. c.) stems more or less hispid; leaves oblong-lanceolate, serrated; heads ovate; paleæ broad at the base, membranous, ending each in a long awn; teeth of involucels 8, 4 of which are awned, and the other 4 very short; corollas equal. ⊙. H. Native from Spain to Persia, in fields and woods. Coult. dips. p. 23. tr. f. 7. Scabiòsa Syrìaca, Spreng. l. c. There are hispid and glabrous varieties of this plant, with either serrated or nearly entire leaves. Flowers blue.

Var. α, pedunculàta (D. C. prod. 4. p. 648.) heads of flowers on long peduncles. ⊙. H. Scabiòsa Syrìaca β, Lin. spec. 141. Scabiòsa Syrìaca, Sibth. et Smith, fl. græc. t. 105. Var. β, sessilis (D. C. l. c.) heads of flowers almost sessile, rising from the forks of the branches. ⊙. H. Scabiòsa Syrìaca *a*, Lin. spec. 141. Scabiòsa dichótoma, Lam. ill. no. 1303. but not of Willd. Lepicéphalus Syrìacus, Lag. Flowers blue.

Syrian Cephalaria. Fl. July. Clt. 1633. Pl. 2 to 3 feet.

* * * *Perennial plants. Outer paleæ alone blunt or bluntish.*

6 C. DECU'RRENS (Rœm. et Schultes, syst. 3. p. 50.) stems furrowed; leaves pinnatifid: lobes decurrent, diverging; bracteas bluntly acuminated, purplish at the apex, villous; teeth of involucels 4, purplish at the apex; limb of calyx small, hidden within the involucel; corollas unequal. ♃. G. Native of the Cape of Good Hope. Scabiòsa decúrrens, Lag. gen. et spec. p. 8. Cephalària decúrrens, Coult. dips. p. 27. and in litt. 1824. Peduncles elongated. Heads about the size of walnuts. Corollas white.

Decurrent Cephalaria. Pl. 1 foot.

7 C. CENTAURIOÌDES (Coult. dips. p. 25. t. 1. f. 8.) stems terete; leaves pinnatifid; lobes oblong, quite entire, decurrent; heads nearly globose; paleæ awnless, whitish-yellow: outer ones obtuse: inner ones acuminated; teeth of involucel 4-8, or obsolete. ♃. H. Native of the south of Europe, south of Siberia, and the Levant. The following are varieties of this plant, according to Coulter and Treveranus, in mag. nat. am. ber. 1815. Leaves glabrous, ciliated or villous: radical ones entire or variously pinnatifid; lobes narrow or ovate, straight or divaricate. Corollas equal or radiant, always yellow.

Var. α, commùnis (D. C. prod. 4. p. 648.) teeth of involucels 4-8, erect. ♃. H. Coult. l. c. Scabiòsa centaurioìdes, Lam. ill. no. 1312. D. C. fl. fr. no. 3297. Succìsa centaurioìdes, S. lævigàta, and S. ambrosioìdes, Spreng. l. c. Scabiòsa Transylvánica, All. ped. no. 504. t. 48. Scab. ambrosioìdes, Smith and Sibth. fl. græc. t. 103. Radical leaves simple; cauline ones bipinnatifid; all ciliated. In *C. ambrosioìdes* the leaves are downy, and the cauline ones bipinnatifid.

Var. β, corniculàta (D. C. prod. 4. p. 648.) teeth of involucels distorted. ♃. H. Coult. l. c. Scabiòsa corniculàta, Waldst. et Kit. 1. t. 13. Rchb. pl. crit. 4. t. 315. Cephalària corniculàta, Rœm. et Schultes, syst. Lepicéphalus corniculàtus, Lag. Stems tetragonal. Leaves pilose. Flowers pale yellow.

Var. γ, Uralénsis (D. C. prod. 4. p. 648.) paleæ at length squarrose. ♃. H. Native of Siberia, on the Ural Mountains, and of Caucasus. Scabiòsa Uralénsis, Murr. comm. gœtt. 1782. p. 13. t. 4. Rchb. pl. crit. 4. t. 314. Stem hexangular, hairy. Corollas pale yellow.

Var. δ, cretàcea (D. C. prod. 4. p. 648.) teeth of involucels abortive. ♃. H. Coult. l. c. Scabiòsa cretàcea, Bieb. fl. taur. 1. p. 93. Scabiòsa coriàcea, Willd. enum. 1. p. 145. Cephalària cretàcea, Rœm. et Schultes. Leaves glabrous, usually all entire.

Centauria-like Cephalaria. Fl. June, July. Clt. 1801. Pl. 2 to 4 feet.

8 C. LEUCA'NTHA (Schrad. l. c. Coult. dips. p. 26. t. 1. f. 9.) stem nearly terete; leaves pinnatifid: lobes linear or oblong; heads nearly globose; outer paleæ adpressed, silky, obtuse: inner ones hardly acuminated; crown of involucel membranous. ♃. H. Native of the south of Europe, the Levant, Siberia, &c. Scabiòsa leucántha, Lin. spec. p. 142. D. C. fl. fr. no. 3298. Rchb. pl. crit. 4. t. 356. Succìsa leucántha, Spreng. l. c. Flowers of all white.

Var. α, angustiloba (D. C. prod. 4. p. 649.) glabrous; lobes of leaves linear, almost quite entire. ♃. H. Cephalària leucántha, Rœm. et Schultes, syst. 3. p. 47. Lepicéphalus leucánthus, Lag. gen. et spec. p. 7.—Clus. hist. 2. p. 4. f. 1. Flowers white.

Var. β, incìsa (D. C. prod. 4. p. 649.) glabrous; lobes of leaves oblong or oval, deeply serrated. ♃. H. Cephalària leucánthema, Rœm. et Schultes, syst. 3. p. 48. Lepicéphalus leucánthemus, Lag. l. c. Corollas white.

Var. γ, albéscens (D. C. prod. 4. p. 649.) lobes of leaves lanceolate, deeply toothed, ciliated. ♃. H. Native of Siberia. Scabiòsa albéscens, Willd. enum. p. 144. Cephalària albéscens, Rœm. et Schultes, syst. 3. p. 48. Cauline leaves ternate or simple. Corollas cream-coloured.

Var. δ, Scopòlii (Vis. pl. dalm. p. 3.) hairy; leaves lyrately pinnatifid; lobes of lower leaves ovate, toothed: of the superior ones linear. ♃. H. Native of Dalmatia, in the fissures of rocks. Scabiòsa leucántha, Scop. carn. ed. 2. vol. 1. p. 95. Flowers white. Fruit 3-4-angled. Foveolæ of the receptacles villous. Perhaps a proper species.

White-flowered Cephalaria. Fl. Sept. Oct. Clt. 1739. Pl. 2 feet.

9 C. RÍGIDA (Schrad. l. c.) stems terete; leaves oval-oblong, serrated; heads nearly globose; paleæ obtuse; crown of involucel membranous. ♃. G. Native of the Cape of Good Hope. Rœm. et Schultes, syst. 3. p. 44. Coult. dips. p. 26. Scabiòsa rígida, Lin. mant. p. 328. Sieb. fl. cap. no. 252. Lepicéphalus

rígidus, Lag. Succìsa rígida, Spreng. l. c.—Comn. hort. amst. t. 93. Shrubby. Flowers white. Said to be allied to *C. leucántha*. There are varieties of this with either glabrous or scabrous leaves. The upper leaves are cut, with revolute edges.

Stiff Cephalaria. Fl. July. Clt. 1731. Shrub 2 feet.

10 C. attenua'ta (Rœm. et Schultes, syst. 3. p. 44.) stem terete, rather villous; leaves linear, glabrous, entire and trifid; heads of flowers nearly globose; paleæ obtuse; teeth of involucel 5, scabrous; corollas equal. ♄. G. Native of the Cape of Good Hope. Coult. dips. p. 27. and in litt. 1824. Scabiòsa attenuàta, Lin. fil. suppl. 118. Succìsa trífida, Spreng. l. c. Succìsa trífida, Spreng. Scabiòsa trífida, Thunb. fl. cap. 1. p. 520. Lepicéphalus attenuàta, Lag. Flowers white.

Var. β, verbenàcea (Rœm. et Schultes, l. c. Coult. l. c.) leaves oblong, toothed, and somewhat pinnatifid at the base. ♃. G. Scabiòsa verbenàcea, Lam. ill. no. 1314.

Attenuated-leaved Cephalaria. Fl. July, Sept. Clt. 1774. Shrub 1 foot.

† *Species not sufficiently known.*

11 C. Græ'ca (Rœm. et Schultes, syst. 3. p. 43.) leaves pinnate; leaflets decurrent, deeply serrated, glabrous; paleæ of the heads imbricated, equal to the corollas. ♃. H. Native of Greece, on Mount Athos. Coult. dips. p. 26. Scabiòsa decúrrens, Sibth. et Smith, prod. 1. p. 80. but not of Thunb. Scabiòsa flàva, Sibth. et Smith, prod. 2. p. 356. Scabiòsa orientalis foliis teucrii, &c. Tourn. cor. p. 34. Flowers yellow. Perhaps sufficiently distinct from *C. centaurioìdes*.

Grecian Cephalaria. Pl. 2 feet.

12 C. hu'milis (Rœm. et Schultes, syst. 3. p. 50.) glabrous; leaves linear, dentately pinnatifid; paleæ obtuse, downy; corollas unequal. ♃. G. Native of the Cape of Good Hope. Coult. dips. p. 27. Scabiòsa hùmilis, Thunb. fl. cap. 1. p. 526. but not of Host. Lepicéphalus hùmilis, Lag. gen. et spec. p. 8. Succìsa hùmilis, Spreng. l. c. Flowers white. Stem nearly leafless, filiform. Scales of calyx ovate, purplish at the apex.

Humble Cephalaria. Pl. ½ to 1 foot.

13 C. ustula'ta (Rœm. et Schultes, syst. 3. p. 43.) glabrous; leaves lyrate: lobes ovate, toothed; paleæ imbricated, ovate, acute, villous, purplish at the apex; corollas equal.—Native of the Cape of Good Hope, in rock lands. Coult. dips. p. 27. Succìsa ustulàta, Spreng. l. c. Scabiòsa ustulàta, Thunb. fl. cap. 1. p. 528. Lepicéphalus ustulàtus, Lag. l. c. Stems striately angular. Paleæ and flowers white.

Ustulate-bractead Cephalaria. Pl. 1 to 2 feet.

14 C. sca'bra (Rœm. et Schultes, syst. 3. p. 44.) plant scabrous from hairs; leaves stiff, pinnatifid; lobes dentately cut; paleæ ovate, obtuse, purplish at the apex; corollas equal. ♄. G. Native of the Cape of Good Hope, on hills. Coult. dips. p. 28. Scabiòsa scàbra, Thunb. fl. cap. 1. p. 529. Lepicéphalus scàber, Lag. Succìsa scàbra, Spreng. l. c. Heads about the size of filberts. Flowers white.

Scabrous Cephalaria. Fl. June, July. Clt. 1825. Shrub 1½ foot.

N. B. Scabiòsa marìna, Lin. mant. p. 329. is distinct from Scabiòsa marítima, Lin., and are probably referrible to the present genus, but are hardly known.

Cult. The hardy herbaceous kinds of *Cephalària* are of the most easy culture, and will grow in any kind of soil, and are readily increased by dividing at the root, or by seed. The seeds of the annual species only require to be sown in the open border. The green-house shrubby kinds should be grown in a mixture of loam, peat, and sand, and may be increased either by young cuttings under a hand-glass, or by seed.

IV. KNAU'TIA (in honour of C. Knaut, physician at Halle, in Saxony, who died in 1694; author of a catalogue of plants growing in the neighbourhood of Halle). Coult. dips. p. 28. D. C. prod. 4. p. 650.—Trichèra, Schrad. cat. sem. gœtt. 1814.—Scabiòsa, Vaill. l. c. Lag. gen. et spec. p. 8.—Knaútia and Scabiòsa species, Lin.—Scabiòsa and Knaútia, Spreng. Wallr. l. l. c. c.

Lin. syst. *Tetrándria, Monogýnia.* Involucra of heads of many leaves. Paleæ none. Receptacle hairy. Involucel compressed, with 4 hollows closely girding the fruit, denticulated at the apex, having 2 of the teeth larger than the other 2, furnished with a short stipe. Limb of calyx cup-shaped, neither pappose nor awned at the apex. Corolla 4-5-cleft. Stamens 4.—Erect branched, usually villous herbs.

Sect. I. Lychnoìdes (this section contains plants resembling species of *Lýchnis*). D. C. prod. 4. p. 650. Lýchni-scabiòsa, Boerh.—Knaútia, Lin. gen. no. 116. Involucrum erect, cylindrical, of 6-10 leaves. Flowers few within the involucrum, 5-10. Receptacle narrow. Corollas very irregular.—Annual herbs. Flowers pale red.

1 K. orienta'lis (Lin. spec. p. 146.) leaves oblong, cut or entire; involucrum cylindrical, of 5-10 erect leaves; corollas 5-10 in each head: outer ones radiating, longer than the involucrum; teeth of involucel 12-15, very short; ciliæ of calyx obsolete. ⊙. H. Native of the Levant. Lam. ill. t. 58. Schkuhr, handb. 1. t. 22. Coult. dips. p. 28. t. 1. f. 9.—Houtt. pfl. syst. v. p. 250. t. 39. Scabiòsa orientàlis, Lag. gen. et spec. p. 9. Kn. trichótoma, Mœnch. meth. p. 487.—Till. pis. 153. t. 48. Plant villous. Seeds pilose, hairy at the apex. Flowers pale red. Lobes of stigma acute.

Eastern Knautia. Fl. June, Sept. Clt. 1713. Pl. 1 to 1½ ft.

2 K. propóntica (Lin. spec. ed. 2. p. 1666. exclusive of Till. syn.) leaves serrated: superior ones lanceolate, quite entire; corollas 10, equal to the involucrum; ciliæ of calyx 15 in number. ⊙. H. Native of the Levant. Willd. spec. 1. p. 561. exclusive of the syn. of Tourn. Rœm. et Schultes, syst. 3. p. 87. exclusive of the Lam. syst. Coult. dips. p. 28. Scabiòsa propóntica, Lag. gen. et spec. p. 9. Plant villous. Corollas purple. Pistilla white; the corolla is said to be 4-cleft by Linnæus. This is a doubtful plant, and is perfectly unknown at the present day, as the plant known in our gardens under this name is *K. orientàlis*.

Propontic Knautia. Fl. Ju. Sept. Clt. 1768. Pl. 1 to 2 feet.

Sect. II. Tricheroìdes (this section contains plants having the habit of those of the next section). D. C. prod. 4. p. 650. Involucrum spreading, 10-12-leaved. Flowers few or many. Involucel bidentate at the apex. Corollas rather irregular. Limb of calyx ciliated.—Annual herbs. Flowers bluish or rose-coloured.

3 K. Urvillæ'i (Coult. dips. p. 29. t. 1. f. 10.) lower leaves pinnatifid: superior ones linear, quite entire; corollas 10-12 in each head, nearly equal, hardly longer than the involucrum, which is spreading; teeth of crown of the involucel 8, a little awned. ⊙. H. Native of the island of Leri, in arid fields, where it was collected by D'Urville; and also of Bulgaria. K. orientàlis, D'Urv. enum. p. 14. Plant villous? Stems branched, divaricate. Heads of flowers small. Corollas pale blue.

D'Urville's Knautia. Pl. 1 to 2 feet.

4 K. hy'brida (Coult. dips. p. 30. and in litt. 1824.) lower leaves petiolate, lyrate: lobes obovate, toothed: terminal lobe the largest, ovate or roundish; cauline leaves oblong, simple, serrated; heads many-flowered; the 2 teeth of the involucel of many bristles; ciliæ of calyx 20-24, obsolete. ⊙. H. Native of the south of Europe. Scabiòsa hýbrida, All. auct. p. 9.

Trichèra hýbrida, Rœm. et Schultes, syst. 5. p. 58. Scabiòsa lyràta, Lam. ill. no. 1310. Trichèra mutábilis, Schrad. l. c. Scabiòsa bìdens, Sibth. et Smith, fl. græc. t. 104. Cephalària bidens, Rœm. et Schultes, syst. et Coult. l. c. Scabiòsa integrifòlia var. D. C. fl. fr. 4. p. 227. Scabiòsa ánnua integrifòlia, Tourn. herb. Scabiòsa integrifòlia and S. Moldávica, Hortul. Stem villous. Leaves rather scabrous. Stigmas blunt. Corollas pale purple.

Hybrid Knautia. Fl. June, July. Clt. 1819. Pl. 2 to 3 ft.

SECT. III. TRICHE'RA (from τριχες, *triches*, hairs; in reference to the limb of the calyx). Schrad. l. c. D. C. prod. 4. p. 651.—Scabiòsa species, Lin. Involucrum spreading, of many leaves. Flowers numerous. Receptacle dilated. Involucels rather truncate at the top. Limb of calyx divided into 8-10 awns. Corollas almost regular.—Perennial herbs. Flowers purplish-blue. According to Coulter all the species contained in this section might be with propriety combined.

5 K. ARVE'NSIS (Coult. dips. p. 29. var. *a*, *β*, *γ*, t. 1. f. 13.) stems hispid; leaves sessile, villous; radical ones unequally pinnatifid, with lanceolate lobes: cauline leaves pinnatifid, with linear lobes; uppermost leaves linear-lanceolate; leaves of involucra bluntish. ♃. H. Native of Europe, in meadows, pastures, and cultivated fields; plentiful in Britain. Duby, bot. gal. 1. p. 257. Scabiòsa arvénsis, Lin. spec. p. 142. Gaud. fl. helv. 1. p. 389. Scabiòsa polymórpha, Schmidt, boh. 3. p. 77. Trichèra arvénsis, Schrad. Flowers bluish purple, and verging to white or purple. Perhaps Scabiòsa dùbia, Mœnch. hass. no. 116. t. 3. which is said to have a 5-cleft corolla, is only a variety of this species. This plant may rather be considered a troublesome weed in corn-fields, but in grass-fields it may be considered rather useful, as it produces a large quantity of foliage, which is not refused by kine, sheep, or horses. The plant varies much in the divisions of the leaves, and in its hairiness. It sometimes occurs with white flowers. The flowers held over the smoke of tobacco in a few minutes become a beautiful green. The plant is slightly astringent, bitter, and saponaceous. The root creeps deep in the ground.

Var. α, vulgàris (D. C. prod. 4. p. 651.) leaves downy: radical ones pinnatifid or entire; cauline ones always pinnatifid. ♃. H. Native of Europe, in corn-fields and meadows. Sowerby, engl. bot. t. 659. Curt. lond. 4. t. 13. Fl. dan. t. 447.—Blackw. t. 185. Flowers bluish, and varying from purple to white, outer ones more or less radiant.

Var. β, collìna (Duby, bot. gall. 1. p. 257.) leaves nearly all radical and pinnatifid; stems nearly naked. ♃. H. Native of Europe, on dry hills. Scabiòsa collìna, Req. in Guer. vaucl. ed. 2. p. 248. D. C. fl. fr. 5. p. 487. Scabiòsa hirsùta, Lapeyr. Plant canescent. Flowers bluish.

Var. γ, canéscens (Coult. l. c. var. *β*.) leaves canescent from hairs; lower ones ovate, acuminated, toothed: upper ones pinnatifid; outer flowers of the heads hardly radiant. ♃. H. Native country unknown. Scabiòsa canéscens, Hort. taur.

Corn-field Knautia. Fl. July, Oct. Britain. Pl. 2 to 4 feet.

6 K. SYLVA'TICA (Duby, bot. gall. 1. p. 257.) stems hispid; leaves tapering into the dilated winged connate bases of the petioles, all undivided, oblong or lanceolate; radical ones entire, cauline ones crenated or toothed; leaves of involucrum acutish. ♃. H. Native of Europe, in mountain woods, and sometimes in fields. Kn. arvénsis *γ*, Coulter, dips. p. 29. Scabiòsa sylvática, Lin. spec. p. 142. Jacq. obs. 1. p. 28. 3. p. 20. t. 72. fl. austr. t. 362. Gaud. fl. helv. 1. p. 387. Scabiòsa Pannónica, Jacq. vind. p. 22. Trichèra sylvática, Schrad. Scabiòsa integrifòlia, Savi, fl. pis. 1. p. 162. t. 2. f. 1. Scabiòsa ovatifòlia, Lag. gen. et spec. p. 9. Flowers red: outer flowers radiant. There is a variety of this with smooth stems, and another with white flowers.

Var. β, longifòlia (Duby, bot. gall. l. c.) leaves oblong, entire, quite glabrous; heads of flowers nearly equal, lilac-coloured. ♃. H. Native of Hungary and the alps of Jura. Scabiòsa longifòlia, Waldst. et Kit. hung. 1. p. 4. t. 5. Scabiòsa integrifòlia, Sut. fl. helv. 1. p. 387.—Scabiòsa sylvática *β*, Gaud. fl. helv. 1. p. 387. Scabiòsa Carpática, Wahl. Stem glabrous below, and hairy above.

Var. γ, integrifòlia (Coult. under K. arvénsis, l. c. var. *γ*,) leaves undivided, toothed or quite entire. ♃. H. Native of Europe. Scabiòsa integrifòlia, Lin. spec. 142. Scabiòsa dipsacifòlia, Schott. Host, fl. austr. 1. p. 191. Scabiòsa pubéscens, Willd. enum. 1. p. 146. Trichèra pubéscens, Schrad. Corollas cream-coloured. Anthers fulvous. Perhaps Scabiòsa hýbrida, Bouch. fl. abb. Perhaps Scabiòsa Uralénsis, Rchb. pl. crit. 4. t. 332. The plant is more or less downy, and the upper leaves are sometimes jagged at the base.

Wood Knautia. Fl. June, July. Clt. 1633. Pl. 1 to 3 feet.

7 K. MONTA'NA (D. C. prod. 4. p. 651.) stems hispid, brachiate; leaves oblong, serrated: lower ones entire and jagged; heads of flowers radiant; leaves of involucrum acute, narrow. ♃. H. Native of Caucasus, in mountain meadows. Scabiòsa montàna, Bieb. fl. taur. 1. p. 95. Jacq. fil. eclog. 1. t. 60. Kn. arvénsis var. Coult. dips. p. 29. and in litt. 1824. Leaves hairy. Flowers white.

Mountain Knautia. Fl. July. Clt. 1820. Pl. 3 to 6 feet.

8 K. CILIA'TA (Coult. dips. p. 30.) stems very hispid; leaves ovate, hispid, lower ones petiolate, entire, auricled or pinnatifid: cauline ones deeply toothed, cordately stem-clasping or perfoliate; leaves of involucrum ciliated. ♃. H. Native of Moravia, in meadows. Trichèra ciliàta, Rœm. et Schultes, syst. 3. p. 37. Scabiòsa ciliàta, Spreng. in Schrad. journ. 1800. 2. p. 199. Rchb. pl. crit. 3. t. 273. Scabiòsa Kitaibèlii, Schultes, obs. p. 18. Scabiòsa pubéscens, Wahl. fl. carp. p. 38. Trichèra leucántha, Schrad. S. híspida, Porter's mss. Perhaps Scabiòsa ciliàta, Horn. hort. hafn. 1. p. 125. is the same, although said to be annual. Flowers dirty white; outer ones radiant. Anthers violaceous.

Ciliated Knautia. Fl. July, Aug. Clt. 1802. Pl. 2 feet.

9 K. DIVERSIFÒLIA (D. C. prod. 4. p. 652.) stems branched, hispid; radical leaves pinnatifid: lobes rather falcate, quite entire; lower cauline leaves petiolate, ovate-lanceolate, bluntly toothed; superior leaves lyrate; uppermost leaves stem-clasping, quite entire; leaves of involucra ovate-cordate. ♃. H. Native of Transylvania, in mountain meadows. Scabiòsa diversifòlia, Spreng. neu. entd. 1. p. 279. Corolla 4-cleft, radiant, of a lilac-colour, ex Spreng., violaceous and blue, ex Baumg.

Divers-leaved Knautia. Fl. June, July. Clt. 1826. Pl. 2 ft.

10 K. LEGIONE'NSIS (D. C. prod. 4. p. 652.) stems hispid from retrograde hairs; leaves lanceolate, long-acuminated, remotely toothed: lower ones entire; leaves of involucrum 18, exceeding the flowers. ♃.? H. Native of Spain, on the mountains of Leone. Scabiòsa Legionénsis, Lag. nov. gen. et spec. p. 9. Asterocéphalus Legionénsis, Spreng. syst. 1. p. 379. Flowers red. There is a variety of this with pinnatifid leaves and white flowers. Said to be nearly allied to *K. sylvática*.

Leone Knautia. Fl. June, July. Pl. 2 feet.

11 K. SALCE'DI; stem scabrous from hairs; leaves all undivided, lanceolate: lower ones entire: upper ones sharply toothed in the middle. ♃. H. Native of Spain, on the mountains of Leone. Scabiòsa Salcèdi, Lagasca. Leaves downy on both surfaces, hoary beneath. Peduncles long, beset with rufous villi under the head of flowers. Involucrum of many lanceolate pilose leaves, the length of the flowers, which are of a lilac colour.

Salcedi's Knautia. Fl. June, July. Clt. 1823. Pl. 1 to 2 ft.

12 K. OVATIFÒLIA; superior leaves broad, ovate, acuminated, serrated, sessile. ♃. H. Native of Spain? K. ovatifòlia, Lagasca, gen. et spec. nov. diagn. p. 9. no. 116. Very like *K. Legionénsis*, but more slender in every part. Said to be nearly allied to *K. sylvática*.

Ovate-leaved Knautia. Pl. 1 to 2 feet.

Cult. The species of this genus are of the most easy culture and propagation. They will grow in any soil and situation.

V. PTEROCE'PHALUS (from πτερον, *pteron*, a wing, and κεφαλη, *kephale*, a head; in reference to the receptacle of the flowers being villous or chaffy). Vaill. act. acad. Par. 1722. p. 184. t. 13. f. 23. f. 24. Coult. dips. p. 31. Wallr. sched. p. 47. Spreng. syst. no. 378. D. C. prod. 4. p. 652.—Scabiòsa and Knaútia species, Lin.—Pterocéphalus and Knaútia, Lag. gen. et spec. 9.

LIN. SYST. *Tetrándria, Monogýnia.* Involucrum double, each series of 4-6 leaves. Heads many-flowered (f. 118. *a.*). Receptacles villous (f. 117. *b.*) or chaffy. Involucels toothed or awned (f. 117. *a.*). Limb of calyx ending a in many-rayed pappus (f. 117. *c.* f. 118. *d.*), which at length become feathery (f. 117. *i.* f. 118. *i.*). Corollas 5-cleft (f. 117. *f.* f. 118. *e.*). Stamens 4 (f. 118. *f.*), rarely 2-3.—Herbs or subshrubs.

§ 1. *Annual plants. Leaves pinnatifid, particularly the superior ones.*

1 P. PAPPÒSUS (Coult. dips. p. 32. t. 1. f. 17.) stem herbaceous, erect; leaves bipinnatifid, with lanceolate lobes; receptacle paleaceous; involucels drawn out into 1-3 long awns; bristles of calyx 20-24, plumose, about equal in length to the awns of the involucel. ⊙. H. Native of Portugal, Spain, Greece, and Candia. Pter. ánnuus, Vaill. act. par. 1722. p. 183. Pter. Vaillánti, Lag. gen. et spec. p. 9. Scabiòsa pappòsa, Lin. spec. p. 146. Scabiòsa involucràta, Sibth. et Smith, fl. græc. t. 112. Scabiòsa divaricàta, Spreng. neue entd. 3. p. 163. Corollas red. Leaves of involucrum pinnatifid. Plant villous.

Var. β, diándrus (D. C. prod. 4. p. 652.) smaller; flowers di-triandrous. ⊙. H. Native of Spain, at Aranjuez, and of Portugal. Scabiòsa diándra, Lag. var. 2. p. 39. Pterocéphalus diándrus, Lag. nov. gen. p. 9. Cephalària diándra, Rœm. et Schultes, syst. 3. p. 52. Flowers blue.

Pappose-seeded Pterocephalus. Fl. July. Clt. 1597. Pl. 1 to 2 feet.

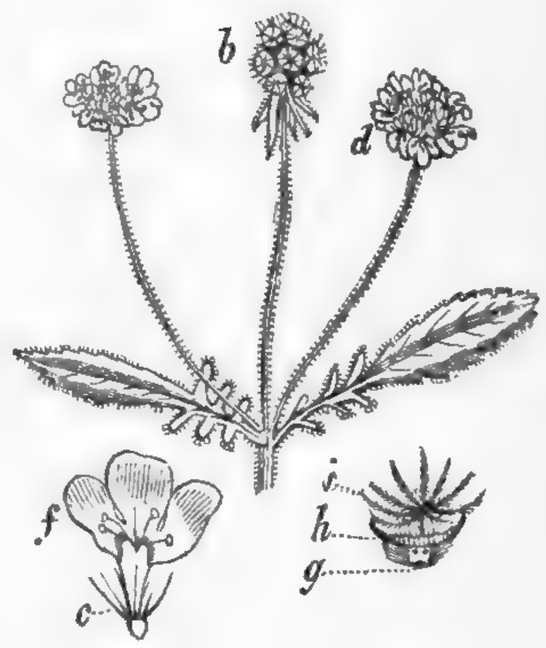
2 P. BRE'VIS (Coult. dips. p. 32. t. 1. f. 16.) plant clothed with soft villi; stems herbaceous, erect; leaves pinnatifid; corollas hardly exceeding the involucrum; crown of involucels membranous, hardly denticulated, very short, spreading; bristles of calyx 14-16, feathery, a little longer than the involucel. ⊙. H. Native country unknown. Very nearly allied to the following.

Short-involucelled Pterocephalus. Pl. 1 foot.

3 P. PLUMÒSUS (Coult. dips. p. 31. t. 1. f. 15.) plant downy; stem herbaceous, erect; lower leaves broad-lanceolate, serrated: middle ones lyrate: upper ones pinnatifid; corollas longer than the involucrum; crown of involucel obsolete; bristles of calyx 11-13, plumose, hardly twice the length of the involucel. ⊙. H. Native of the Levant, Iberia, Candia, Samos, and Caucasus, in arid places of mountains, &c. Knaútia plumòsa, Lin. mant. p. 197. Scabiòsa plumòsa, Sibth. et Smith, fl. græc. t. 111. Scabiòsa pappòsa, Gærtn. fruct. t. 86. Willich. in Rchb. op. 1. p. 160. Scabiòsa Willíchii, Link, in Rœm. coll. 2. Cephalària Willíchii and Scabiòsa plumòsa, Rœm. et Schultes, syst. 3. p. 53. and p. 70. Pter. marcéscens, Mœnch. meth. p. 491. exclusive of the synonymes. Flowers rose-coloured or purplish.

Feathered-calyxed Pterocephalus. Fl. June, July. Clt. 1819. Pl. 1 to 2 feet.

FIG. 117.



4 P. PALÆSTÌNUS (Coult. dips. p. 31. t. 1. f. 14.) plant clothed with silky villi; lower leaves obovate-oblong, quite entire, the rest lyrately pinnatifid: lower lobes small, decurrent: terminal lobe large, obovate-oblong; involucel having 8 foveola at the base; crown of involucel membranous; bristles of calyx 8-10, subulate, spreading, irregularly pilose at the sides. ⊙. H. Native of the islands of Cyprus and Scio; and of Palestine. Knaútia Palæstìna, Lin. mant. 117.—Jacq. hort. vind. 1. t. 96. Scabiòsa brachiàta and Scabiòsa Sibthorpiàna, Sibth. et Smith, fl. græc. t. 109. Flowers white or pale purple. The rays of the corollas in *S. Sibthorpiàna* are entire, while in those of *P. Palæstìnus*, they are jagged; they are, therefore, probably distinct species.

Var. β, Calábricus (D. C. prod. 4. p. 653.) leaves all entire or lyrate. ⊙. H. Native of Calabria, on arid hills. Scabiòsa brachiàta, Guss. pl. rar. p. 66. Flowers purplish.

Var. β, Dalmáticus (D. C. l. c.) plant hairy; lower leaves lyrate; upper ones pinnate, with oblong-linear acute lobes. ⊙. H. Native of Dalmatia. Scabiòsa multisèta, Vis. pl. dalm. p. 1. t. 1. Perhaps Scabiòsa silenifòlia, Waldst. et Kit. pl. hung. 2. p. 157. and therefore Asterocéphalus silenifòlius, Spreng.

Palestine Pterocephalus. Fl. July, Aug. Clt. 1771. Pl. 1 to 2 feet.

§ 2. *Perennial or frutescent species. Leaves jagged or toothed.*

5 P. LUSITA'NICUS (D. C. prod. 4. p. 653.) stems ascending, sparingly pilose; lower leaves bipinnatifid; superior ones pinnatifid; segments of all linear; paleæ of the receptacle and leaves of involucrum scarious and hairy; involucels many-toothed; awns of calyx 6-9, feathery. ⊙. ♃. H. Native of Portugal, between Abrantes and Casabranca. Scabiòsa plumòsa, Hoffm. et Link, fl. port. 2. p. 91. Cephalària plumòsa, Rœm. et Schultes, syst. 3. p. 70. Scabiòsa Gramúntia, Brot. fl. lus. 1. p. 145. Flowers pale red. Perhaps Asterocéphalus intermèdius, Lag. gen. et spec. p. 8. which is the Scabiòsa intermèdia, Rœm. et Schultes, 3. p. 76. is referrible to this species, as also Scabiòsa marítima and Sc. tenuifòlia, Lag. elench. hort. madr. 1803. and 1805.

Portugal Pterocephalus. Fl. June, July. Clt. 1824. Pl. 1 to 2 feet.

6 P. BROUSSONE'TII (Coult. in litt. 1824. ex D. C. prod. 4. p. 653.) leaves bipinnate; corollas equal; awns of calyx 6-7, linear, feathery, hardly twice the length of the involucel. ♃. H. Native of Gibraltar, about San Roque, where it was collected by Broussonet.

Broussonet's Pterocephalus. Pl. 1 foot.

7 P. TOMENTO'SUS (Coult. in litt. 1824. ex D. C. prod. 4. p. 653.) stems procumbent, shrubby; leaves dentately pinnatifid, hoary from tomentum; leaves of involucrum bluntish; bristles of calyx 6, short, scabrous. ♃. H. Native of Candia, on the Spaciotic mountains. Scabiòsa tomentòsa, Sibth. et Smith, prod. fl. græc. 1. p. 85. but not of Cav. Scabiòsa Spaciótica, Rœm. et Schultes, syst. 3. p. 86. Asterocéphalus Spacióticus, Spreng. syst. 1. p. 382. Herb tufted. Flowers blue.

Tomentose Pterocephalus. Pl. ½ foot.

8 P. PERE'NNIS (Vaill. act. acad. par. 1722. p. 184.) stems procumbent, suffruticose; leaves lyrate, cut, tomentose; involucels downy; corollas 5-cleft; stigmas longitudinal; pappus plumose. ♃. H. Native of Mount Parnassus, on rocks. Scabiòsa pterocéphala, Lin. spec. p. 146. Sibth. et Smith, fl. græc. t. 113. Pterocéphalus Parnássii, Spreng. syst. 1. p. 384. Flowers pale purple. Perhaps belonging to a different section.

Perennial Pterocephalus. Pl. procumbent.

FIG. 118.

§ 3. *Perennial or frutescent species, with entire leaves.*

9 P. NI'VEUS (Coult. dips. p. 32.) lower leaves orbicular: cauline ones obovate-spatulate, all quite entire, and are as well as the stems clothed with white tomentum; bristles of calyx 10-12, plumose, 3 times longer than the seed. ♃. H. Native of Spain, on the top of Sierra Toxada. Scabiòsa nívea, Agardh, in Rœm. et Schultes, syst. 3. p. 81. A very small plant.—According to Sprengel, it is the same as the following.

Snowy Pterocephalus. Pl. 1 to 2 inches.

10 P. SPATULA'TUS (Coult. dips. p. 32.) leaves quite entire, roundish-spatulate, tomentose; corollas 5-cleft, radiant; pappus coloured, of 14 rays. ♃. H. Native of Spain, in Granada, and near Ellin in Murcia. Knaútia spatulàta, Lag. gen. et spec. p. 9. Rœm. et Schultes, syst. 3. p. 88. Stems tomentose. Involucra 8-12-leaved. Heads containing about 16 flowers.

Spatulate-leaved Pterocephalus. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

11 P. CA'NUS (Coult. in litt. 1824. ex D. C. prod. 4. p. 653.) leaves quite entire, obovate-oblong, hoary; peduncles scape-formed, bearing each one head of flowers; corollas 5-cleft; involucel lagenæform, downy, without furrows; rays of calyx 20-25, plumose, linear, twice longer than the involucel; stigma emarginate. ♃. H. Native of the Levant, between Amadan and Kermancha, where it was collected by Olivier and Bruguiere. Scabiòsa dumetòrum var. from the Levant, Coult. dips. p. 32.

Hoary Pterocephalus. Pl. $\frac{1}{2}$ foot.

12 P. LASIOSPE'RMUS (Link, in Buch. can. p. 150.) stem suffruticose, with many branches; leaves on very short petioles, oblong-lanceolate, quite entire, crowded, white from short dense tomentum; involucels densely plumose. ♄. G. Native of the Grand Canary island, near Trente, and among rocks on the top of Pico Tedi. Pter. dumetòrum var. pusílla, Coult. dips. p. 32. Scabiòsa fruticòsa, Smith, mss.

Woolly-seeded Pterocephalus. Shrub small.

13 P. DUMETO'RUM (Coult. dips. p. 32. var. α,) stem suffruticose, erect, bearing many heads of flowers; leaves petiolate, quite entire, oval, acuminated, attenuated at the base, smoothish on both surfaces; peduncles and involucels downy; rays of calyx 20-24, plumose, linear, hardly twice the length of the involucel. ♄. G. Native of Teneriffe. Scabiòsa dumetòrum, Brouss. in Willd. enum. 1. p. 146. Trichèra dumetòrum, Rœm. et Schultes, syst. 3. p. 56. Leaves crowded at the tops of the branches.

Thicket Pterocephalus. Shrub small.

Cult. For culture and propagation see *Cephalaria*, p. 686.

VI. SCABIO'SA (from *scabies*, the itch; which disorder the common sort is said to cure). Rœm. et Schultes, syst. 3. p. 2. Coult. dips. p. 33. D. C. prod. 4. p. 654.—Asterocéphalus, Vaill. act. acad. par. 1722. Lag. gen. et spec. p. 8. Wallr. sched. crit. p. 46. Spreng. syst. 1. p. 379. exclusive of some species.—Scabiòsa spec. Lin. &c.—Sclerostémma, Schott.

LIN. SYST. *Tetrándria, Monogy'nia.* Involucra of heads many-leaved. Receptacle chaffy. Involucels with 8 foveolæ, usually somewhat cylindrical. Limb of calyx tapering into a neck at the base, and ending in 5 awned bristles, rarely only 1-4 from abortion. Corollas 4-5 cleft. Stamens 4.—Perennial or suffruticose herbs. Leaves variable. Heads of flowers depressed. Outer flowers of heads usually radiant.

SECT. I. ASTEROCE'PHALUS (from *αστηρ, aster*, a star, and *κεφαλη, kephale*, a head; in reference to the star-like crown on the top of the seeds). Coult. dips. p. 33. D. C. prod. 4. p. 654. Base of the involucels terete, not plicate, furnished with 5-8 foveolæ. Crown of seed large, membranous, spreading or erect, Calyx sessile or stipitate, ending in 5 exserted bristles. Corollas 5-cleft.

1 S. CAUCA'SICA (Bieb. fl. taur. 1. p. 98.) herbaceous; radical leaves lanceolate, acuminated, quite entire, glaucous; involucrum very villous; corollas 5-cleft, radiant; base of involucels elongated, longer than the ovate foveolæ; crown of seeds short, 25-nerved; limb of calyx sessile, with exserted bristles. ♃. H. Native of Caucasus and Armenia, in arid places. Coult. dips. p. 33. t. 2. f. 1. Asterocéphalus Caucásicus, Spreng. syst. 1. p. 381. Leaves like those of a species of *Scorzonèra*. Heads of flowers large, radiant, pale blue. This is an elegant plant while in flower.

Var. α, heterophýlla (D. C. prod. 4. p. 654.) leaves green; cauline ones pinnatifid. ♃. H. Scabiòsa Caucásica, Rœm. et Schultes, syst. 3. p. 84. Willd. enum. p. 148. Sims, bot. mag. 886.

Var. β, élegans (D. C. prod. 4. p. 654.) leaves whitish; cauline ones undivided, quite entire or nearly so. ♃. H. Scabiòsa élegans, Spreng. pug. 2. p. 24. Sclerostémma connàtum, Schott. Asterocéphalus élegans, Lag. gen. et spec. p. 8. Scabiòsa connàta, Horn. hort. hafn. 1. p. 128. Scabiòsa Caucàsea, Sims, bot. mag. t. 886.

Caucasian Scabious. Fl. June, Aug. Clt. 1803. Pl. 1 foot.

2 S. CRE'TICA (Lin. spec. p. 145.) stem shrubby; leaves lanceolate, quite entire, and are as well as the involucra clothed with hoary down; corollas 5-cleft, radiant; base of involucels elongated, equal in length to the foveolæ, which are linear; crown of seed spreading, obliquely truncate, 20-28-nerved, hardly twice longer than the base; limb of calyx sessile, with 4-6 inclosed bristles. ♃. H. Native of Sicily and Candia, among calcareous rocks. Coult. dips. p. 33. t. 2. f. 2. Guss. prod. 1. p. 165. Asterocéphalus Créticus, Spreng. Scabiòsa arbòrea, P. Alp. exot. t. 34.—Morr. oxon. sect. 6. t. 15. f. 31. Stem white from down. Flowers pale blue, rarely white. There is a variety of this having the involucrum longer than the flowers.

Cretan Scabious. Fl. June, Oct. Clt. 1596. Shrub 1 foot.

3 S. CANDOLLIA'NA (Wall. cat. no. 430.) stem suffruticose at the base, branched; leaves linear, quite entire, nearly glabrous; corollas 5-cleft, radiant; involucels clothed with short villi at the base, the foveolæ hidden by the villi; crown of seed 20-nerved? toothed a little; bristles of calyx 5, black, rather scabrous, 3 times longer than the crown. ♄. G. Native of Nipaul, at Kamaon. Stems sparingly leafy, tufted at the apex; peduncles elongated, naked. Heads small, purplish. Perhaps referrible to sect. iii. *Succìsa.*

De Candolle's Scabious. Shrub 1 foot.

4 S. GRAMINIFO'LIA (Lin. spec. 145.) stems herbaceous, suffruticose at the base; leaves linear, lanceolate, quite entire, of a silvery white colour; corollas 5-cleft, radiant; base of involu-

cels elongated, equal in length to the linear foveolæ; crown of seed spreading, 24-nerved; limb of calyx pedunculate; bristles of calyx 5, equal in length to the crown. ♃. H. Native of Provence, north of Italy, Carniola, Pannonia, Barbary, Switzerland, on the mountains. Coult. diss. p. 34. t. 2. f. 3. Waldst. et Kit. pl. rar. hung. 188. Lindl. bot. reg. t. 835. Asterocéphalus graminifòlius, Spreng. Flowers pale blue, very like those of *S. Caucásica*. The Swiss variety of this plant is much more tufted than those from other countries, and seems different altogether.

Grass-leaved Scabious. Fl. June, Oct. Clt. 1683. Pl. 1 ft.

5 S. prolífera (Lin. spec. p. 144.) stem herbaceous, dichotomous; leaves oblong-lanceolate, almost entire, downy; heads almost sessile in the forks of the stem; corollas 5-cleft, radiant; involucels obconical, elongated at the base, equal to the foveolæ, which are obovate; crown of seed spreading, exceeding the base, 32-36-nerved; limb of calyx pedunculate, hardly equal in length to the bristles of the crown. ⊙. H. Native of Cyprus, Egypt, and Barbary. Coult. dips. p. 34. t. 2. f. 4. Sibth. et Smith, fl. græc. t. 107. Asterocéphalus prólifer, Spreng.—Herm. par. t. 125. Flowers pale yellow.

Proliferous-stemmed Scabious. Fl. July, Aug. Clt. 1686. Pl. 1 foot.

6 S. stellàta (Lin. spec. p. 144.) stem branched; leaves cut or sublyrate: the terminal lobe obovate, toothed, large; heads on long peduncles; corollas radiant; base of involucels elongated, about equal in length to the foveolæ, which are also elongated; crown spreading, 40-nerved, twice the length of the base; limb of calyx pedunculate, having the bristles thickened at the disk, not exceeding the crown. ⊙. H. Native in the region of the Mediterranean, in fields and arid places. Coult. dips. p. 34. t. 2. f. 5. D. C. fl. fr. no. 3312. Succìsa stellàta, Mœnch. meth. p. 490. Scabiòsa rotàta, Bieb. suppl. p. 102. ex Coult. Asterocéphalus rotàtus, Spreng. Bristles of calyx black. Flowers very pale blue, almost white.

Var. β, pinnatífida (D. C. prod. 4. p. 655.) leaves pinnatifid, with linear lobes. ⊙. H. Native about Montpelier, in fields. S. stellàta β et γ, Coult. dips. p. 34. S. símplex, Desf. fl. atl. 1. p. 125. t. 39. f. 1. ex Coult. Gærtn. fruct. 2. p. 39. t. 86. There are varieties of this with branched stems, bearing many heads of flowers; and single stems, bearing only one head of flowers.

Starry-crowned Scabious. Fl. July, Aug. Clt. 1596. Pl. 1½ foot.

7 S. Monspelie'nsis (Jacq. misc. 2. p. 320. icon. rar. 1. t. 24.) hairy; stem a little branched; leaves pinnate-parted: with toothed or cut oblong-linear lobes; heads on long peduncles; corollas nearly equal; base of involucels hardly elongated, equal to the linear open foveolæ; crown twice the length of the base, 32-35-nerved; limb of calyx pedunculate, with much exserted bristles. ⊙ or ♂. Native of Spain, Barbary, and the south of France, in exposed places. Coult. dips. p. 34. t. 2. f. 7. Asterocéphalus stellàtus, Spreng. Scabiòsa símplex, D. C. fl. fr. no. 3313. Desf. fl. atl. 1. p. 125. t. 39. f. 1. Flowers purple.

Montpelier Scabious. Fl. July, Aug. Clt. 1820. Pl. 1 to 2 ft.

8 S. Palæstìna (Lin. mant. p. 37.) stem divaricately branched; leaves obovate-oblong, coarsely toothed, tapering into the petioles, pinnatifid at the base; heads on long peduncles; corollas radiant; base of involucels hardly elongated, equal to the foveolæ, which are linear and elongated; crown spreading, twice longer than the base or more, 32-35-nerved; limb of calyx on a long peduncle; bristles shorter than the crown. ⊙. H. Native about Aleppo, and in Palestine. Jacq. hort. vind. 1. t. 96. S. Váhlii, Coult. dips. p. 35. t. 2. f. 6. exclusive of the country. Asterocéphalus Palæstìnus, Spreng. Flowers white or pale red; segments jagged.

Palestine Scabious. Fl. July, Aug. Clt. 1771. Pl. 1 foot.

9 S. Ale'ppica (Coult. dips. p. 35. t. 2. f. 8.) stem branched; leaves pinnate-lobed: lobes oblong-linear, quite entire; heads of flowers pedunculate; corollas radiant; base of involucels hardly elongated, equal in length to the linear foveolæ; crown spreading, 3 times longer than its base, 20-24-nerved; limb of calyx on a long peduncle; bristles shorter than the crown. ⊙. H. Native of the Levant, between Bagdad and Aleppo, where it was collected by Olivier and Bruguiere. Stems humble, silvery, villous. Peduncles smoothish.

Aleppo Scabious. Pl. humble.

10 S. Ukra'nica (Lin. spec. p. 144.) stem branched; leaves ciliated at the base: lower ones pinnatifid, with linear distant lobes: superior ones linear, quite entire; heads pedunculate; corollas radiant; base of involucels hemispherical, equal in length to the foveolæ, which are ovate-linear; crown 20-24-nerved, acutely toothed, shorter than the bristles. ♃. H. Native of the south of Europe, from Spain to Tauria; also of the temperate parts of France. Coult. dips. p. 63. var. α, ε, ζ, γ, t. 2. f. 9. D. C. fl. fr. no. 3310. Mor. bibl. ital. p. 9. Rchb. pl. crit. 4. t. 316. but the fruit is erroneous in the figure. Scabiòsa álba, Scop. del. 3. p. 33. t. 16. S. argéntea, Lin. spec. p. 145. Sibth. et Smith, fl. græc. t. 168. Desf. ann. mus. 11. t. 24. S. Gmelìni, St. Hil. bull. phil. 661. p. 149. t. 3. Asterocéphalus pilòsus, Lag. gen. et spec. p. 8. Aster. argénteus, Spreng. Sclerostémma Scopòlii and S. argénteum, Schott.—Gmel. sib. 2. p. 213. t. 87. Cauline leaves ciliated at the base. Flowers from blue to white, and greenish yellow. Segments of corolla entire, ciliated.

Var. β, umbellàta (Coult. l. c. var. β.) flowers pedicellate, within the involucrum. ♃. H. Native about Venice. Moricand, fl. ven. 1. p. 84.

Var. γ, Sícula (Coult. l. c. var. γ.) leaves of involucrum elongated, exceeding the flowers. ♃. H. Native of Sicily, &c. S. Sícula, Lin. mant. p. 196. S. divaricàta, Jacq. hort. vind. 1. t. 15. Succìsa macrocalycìna, Mœnch. meth. p. 489. S. marítima, Wulf. in Rœm. arch. 3. p. 317. Sclerostémma Sículum, Schott. S. ebúrnea, Sibth. et Smith, fl. græc. t. 106. ex Coult. Flowers white or rose-coloured. Segments of corolla toothed.

Ukraine Scabious. Fl. Sept. Clt. 1795. Pl. 1 foot.

11 S. micra'ntha (Desf. ann. mus. 11. t. 25. choix. t. 40.) stem branched; leaves hairy; lower ones lyrately pinnate, with oblong or linear lobes; lower leaves oblong or lanceolate-toothed; heads of flowers on long peduncles, ovate; corollas equal; base of involucel hemispherical, equal in length to the linear ovate foveolæ; crown 20-24-nerved, acutely toothed, shorter than the bristles. ⊙. H. Native of Tauria, Caucasus, Armenia, and Iberia, in sterile stony places. S. micrántha and S. Biebersteìnii, Rœm. et Schultes, syst. 3. p. 80. and 75. S. Sícula, Bieb. fl. taur. p. 98. S. Ukránica δ, Coult. dips. p. 35. and diss. mss. 1824. Asterocéphalus micránthus, Spreng. S. orientàlis villòsa, flore suavi rubente, fructu pulchro oblongo, Tourn. cor. inst. p. 35. Flowers red. Plant villous. According to Desfontaines the radical and upper cauline leaves are entire.

Small-flowered Scabious. Fl. June, July. Clt. 1825. Pl. 1 to 2 feet.

12 S. Olivie'ri (Coult. dips. p. 36. t. 2. f. 10.) stem much branched, dichotomous; leaves linear-oblong, villous, entire or auricled; heads small, pedunculate, few-flowered; base of involucel hemispherical, equal to the obovate foveolæ; crown entire, spreading, 20-24-nerved, hardly exceeding its base; limb of calyx almost sessile, with much exserted bristles.—Native of the Levant, between Bagdad and Kermancha, where it was collected by Olivier and Bruguiere. Stem glabrous, white. Herb very slender. Flowers white.

Olivier's Scabious. Pl. 1 to 2 feet.

13 S. Isete'nsis (Lin. mant. p. 37.) stem much branched; leaves pubescent: lower ones bipinnate-parted; superior ones pinnate-parted; segments of all oblong-linear; heads and peduncles clothed with white tomentum; corollas radiant; base of involucels elongated, villous; crown erect, 16-20-nerved, one-half shorter than the bristles. ♃. H. Native of Siberia, in stony dry places, about Isetsk, and at Cape Caucasus; in the Kirghisean steppe, between the mountains Ku and Karkaraly, and at the Don. Coult. dips. 1. p. 34. Bieb. suppl. p. 100. S. rupéstris, Bieb. fl. taur. 1. p. 95. S. rupéstris and Iseténsis, Rœm. et Schultes, syst. 3. p. 64. 83. Asterocéphalus Iseténsis, Spreng. Sclerostémma Iseténse, Schott. mss.—Gmel. sib. 2. p. 214. no. 7. t. 88. Flowers white.

Isetsk Scabious. Fl. July, Aug. Clt. 1801. Pl. 1 foot.

14 S. crena'ta (Cyr. pl. rar. neap. 1. p. 11. t. 3.) stems suffruticose at the base, ascending; leaves smoothish, bipinnatifid: lobes entire or tridentate; heads on long peduncles; corollas radiant, crenated; base of involucel equal to the oblong foveolæ; crown subdentate, 16-20-nerved; limb of calyx sessile; bristles twice longer than the crown. ♃. ♄. H. Native of Calabria, on calcareous mountains; and of Greece. Coult. dips. p. 36. Asterocéphalus crenàtus, Spreng. S. coronopifòlia, Sibth. et Smith, fl. græc. t. 114. S. crenàta and S. coronopifòlia, Rœm. et Schultes, syst. 3. p. 71. and 86.—Col. phyt. 2. f. 31. There are elongated and dwarf varieties of this plant.—Corollas flesh-coloured or pale-red.

Var. β, hirsùta (Guss. prod. 1. p. 162.) leaves hairy; bristles of calyx 3 times longer than the crown. ♃. or ♂. Native of Sicily, on the mountains. Columbària crenàta, Presl. S. coronopifòlia hirsùta, Biv. mant. 3. p. 6.

Crenate-flowered Scabious. Fl. June, July. Clt. 1825. Pl. 1 to 2 feet.

15 S. pectina'ta (Lag. elench. madr. 1803. p. 33.) stems spreading; leaves fleshy, pinnatifidly pectinated, channelled; corollas radiant. ⊙. H. Native of Arabia. Coult. dips. p. 36. Asterocéphalus pectinàtus, Lag. gen. et spec. p. 8. Said to be allied to *S. Ukránica*. Flowers violaceous?

Pectinated-leaved Scabious. Fl. July, Aug. Clt. 1824. Pl. 1½ foot.

16 S. lyra'ta (Forsk. descrip. p. 203. but not of Lam.) stem simple; lower leaves oblong, coarsely and bluntly serrated: superior ones pinnate at the base; corollas radiant, with entire lobes. ♂. H. Native at the Dardanelles. Vahl. symb. 2. p. 92. Coult. dips. p. 37. Asterocéphalus lyràtus, Spreng. Stem rather tomentose. Corollas purple.

Lyrate-leaved Scabious. Pl. 1 foot.

17 S. acutiflo'ra (Rchb. pl. crit. 4. p. 24. t. 326.) stem branched: lower leaves spatulate, and linearly pinnatifid, serrated: superior ones pinnate-parted, with oblong-linear entire lobes; heads of fruit ovate; corollas 5-cleft, radiant, with the outer lobes acuminated; crown a little longer than the tube; bristles of calyx 5, exserted. ♃. H. Native of the south of Europe. Involucels spongy at the edges. Flowers pale, peach-coloured. Allied to *S. Ukránica*.

Acute-flowered Scabious. Pl. 1 foot.

Sect. II. Vidu'a (meaning not explained by the author). Coult. dips. p. 37. D. C. prod. 4. p. 657. Involucels rounded at the base, plicate; tube with the foveolæ usually obliterated. Crown small, inflexed. Limb of calyx pedicellate, with 5 exserted bristles.

18 S. atropurpu'rea (Lin. spec. p. 144.) stem branched; radical leaves lanceolate-ovate, lyrate, coarsely toothed; cauline leaves pinnate-parted, with oblong, toothed or cut lobes; heads ovate while bearing the fruit; corollas radiant, a little longer than the involucra. ⊙. H. Cultivated in gardens. Said to be spontaneous in India, but Roxburgh contradicts that assertion. Said also to be a native of Sicily, but according to Schouw it has been introduced there. S. atropurpùrea α, and β, Coult. dips. p. 37. t. 2. f. 11. Curt. bot. mag. t. 247. Succìsa atropurpùrea, Mœnch. Sclerostémma, Schott. Asterocéphalus atropurpùreus, Spreng. Sc. calyptocárpa, St. Am. fl. agen. p. 61.—There is a proliferous headed variety of this species (Mor. oxon. sect. 6. t. 14. f. 27.). The flowers are very sweet-scented. There is a great variety in their colour, some being of a purple, approaching to black, others of a pale purple, some red, some white, and others variegated. It varies also in the leaves, some being more finely cut than others.

Dark-purple-flowered or Sweet-scented Scabious. Fl. July, Aug. Clt. 1629. Pl. 2 to 3 feet.

19 S. seti'fera (Lam. ill. no. 1321.) stem branched, downy; lower leaves ovate-spatulate, crenated or cut, rather villous; superior ones pinnate, with linear-lanceolate obtuse segments, the terminal segment the largest; corollas radiant, much longer than the involucrum. ♃. H. Native of the south of France, about Marseilles. S. atropurpùrea β sétifera, D. C. prod. 4. p. 657. Asterocéphalus sétifer, Spreng. Corollas lilac. Bristles of calyx 5, black.

Bristle-bearing Scabious. Pl. 2 feet.

20 S. grandiflo'ra (Scop. del. ins. 3. p. 29. t. 14.) stem branched, downy; leaves rather villous; radical ones oblong, crenated; cauline ones pinnatifid, with lanceolate linear spreading segments; corollas amply radiant. ♃. H. Native of Barbary, Italy, and Sicily, in fields. Desf. atl. 1. p. 123. S. arvénsis, Ucria, but not of Lin. Columbària vulgàris, Presl. S. atropurpùrea γ grandiflòra, D. C. prod. 4. p. 657. Corollas cream-coloured or white, with reddish tubes. Bristles of calyx 5, reddish brown.

Great-flowered Scabious. Fl. June, Sept. Clt. 1804. Pl. 2 to 3 feet.

21 S. mari'tima (Lin. amœn. 4. p. 304.) stem branched; radical leaves pinnatifid, with toothed lobes; middle cauline ones pinnatifid, with linear entire lobes; uppermost ones linear and quite entire; fructiferous heads globose; involucrum twice shorter than the radiant flowers. ⊙. or ♂. H. Native of the south of France, Corsica, Italy, and Sicily, in arid places by the sea side. D. C. fl. fr. suppl. no. 3309 α. S. Cupàni, Guss. prod. 1. p. 160.? S. angulàta, Rafin. car. p. 81.? S. atropurpùrea var. Coult. Stem villous. Flowers lilac, rose-coloured or white.

Sea-side Scabious. Fl. June, July. Clt. 1683. Pl. 2 feet.

22 S. daucoìdes (Desf. fl. atl. 1. p. 123. t. 38.) stem almost simple; lower leaves lyrate: cauline ones pinnate-parted, with linear acute cut segments; leaves of involucrum pinnatifid; bracteas exceeding the fruit. ♂. H. Native of Algiers, on hills. Coult. dips. mss. 1824. Asterocéphalus daucoìdes, Spreng. syst. 1. p. 388. Very like *S. atropurpùrea*. Plant downy. Corollas bluish or violaceous.

Carrot-like Scabious. Pl. 1 to 2 feet.

23 S. ambi'gua (Ten. fl. neap. append. 5. 1826. p. 7.) plant glabrous; leaves fleshy, shining, crenated; radical leaves obovate: cauline leaves lyrate or pinnatifid, with oblong remote entire lobes; heads few-flowered, radiant; tube of corolla very long; corolla spongy, involute. ♃. H. Native of the kingdom of Naples, at Paneta del Fusaro, in corn-fields by the sea side. Flowers purple or blue.

Ambiguous Scabious. Pl. 1 to 2 feet.

24 S. cornucòpiæ (Vivian. add. fl. itin. in fl. lyb. p. 67.) plant hairy; radical leaves elliptic, toothed; cauline ones pinnate: flowers 5-cleft, pedicellate within the involucrum; involucels trifid; seed triaristate.—Native of Liguria, in the valley of

Andora, and Sicily. Perhaps a proliferous variety of S. grandiflòra, Guss. or S. atropurpùrea.

Horn-of-Plenty Scabious. Pl. 2 feet?

25 S. integra'ta (Hoffm. et Link, fl. port. 2. p. 88.) lower leaves oblong, entire: inferior ones lyrate: upper ones pinnatifid or wanting; corollas 5-cleft, radiant. ♃. H. Native of Portugal. Said to be allied to *S. Columbària* and *S. grandiflòra*.

Entire-leaved Scabious. Pl. 2 feet.

* *Species belonging to the present tribe of the genus, but are not sufficiently known.*

26 S. limonifo'lia (Vahl, symb. 2. p. 27.) stem shrubby; radical leaves coriaceous, obovate, quite entire, glabrous, and green above, but reticulated and clothed with hoary tomentum beneath; cauline leaves connate at the base; corollas equal, 6-cleft; crown scarious, plicate, denticulated at the apex, broad, extended; limb of calyx sessile; bristles of calyx 4-5, exserted. ♄. H. Native of Sicily, among the mountains on calcareous rocks. Guss. prod. p. 164. Coult. dips. p. 42. Asterocéphalus limonifòlius, Spreng.—Cup. panph. 2. t. 247. Lower leaves like those of *Státice Limònium*. Corollas blue.

Limonium-leaved Scabious. Shrub.

27 S. saxa'tilis (Cav. icon. 2. p. 68. t. 184.) stem herbaceous, glabrous; leaves lanceolate, quite entire, green above, tomentose beneath; cauline leaves very few, connate at the base; corollas equal, 4-5-cleft; crown white, ciliated; bristles of calyx 5, purple. ♃. H. Native of Spain, in the fissures of rocks, in Valentia. Coult. dips. p. 42. Asterocéphalus saxátilis, Spreng. Corollas white; anthers violaceous. Very like *S. succìsa*.

Rock Scabious. Fl. July, Aug. Clt. 1827. Pl. 1 foot.

28 S. ni'tens (Rœm. et Schultes, syst. 3. p. 82.) stem herbaceous; leaves undivided, elliptic, serrated, shining, petiolate; corollas radiant, 5-cleft. ♃. H. Native of the Azores. S. lùcida, Ait. hort. kew. ed. 1. vol. 2. p. 229. but not of Vill. Asterocéphalus lùcidus, Spreng.

Glittering-leaved Scabious. Fl. June, Aug. Clt. 1779. Pl.

Sect. III. Succi'sa (from *succido*, to cut down; on account of the præmorse root of the first species). Coult. dips. p. 37. D. C. prod. 4. p. 657. but not of others. Base of involucels not distinguishable from the tube; having the foveolæ engraven from the base to the crown. Crown spreading, short, membranous. Limb of calyx sessile, with 5 bristles, of which some are sometimes abortive and sometimes all.

* *Corollas 5-cleft.*

29 S. Africa'na (Lin. spec. p. 145.) stem shrubby; leaves lyrate, coarsely toothed, rather hairy; heads of flowers pedunculate; corollas hardly radiant; tube of involucel obconical; crown one-half shorter than the tube, 24-28-nerved; bristles of calyx 5, exserted. ♄. G. Native of the Cape of Good Hope. Coult. dips. p. 37. t. 2. f. 12. Shrub evergreen, with the leaves variable in form, sometimes they are obovate-oblong, toothed at the base (Herm. par. t. 219.), sometimes cut at the base (Breyn. icon. 33. t. 26. S. altíssima, Jacq. hort. vind. t. 185.), sometimes lyrately pinnatifid (Herm. par. t. 221.). S. induràta, Lin. mant. p. 196. ex Rœm. et Schultes, syst. S. incìsa, Mill. dict. no. 18. Young stems and leaves villous. Heads about the size of walnuts. Corollas white, but in the variety altíssima pale purple or blue.

African Scabious. Fl. July, Oct. Clt. 1690. Shrub 4 to 6 feet.

30 S. Fische'ri (D. C. prod. 4. p. 658.) stem branched, smoothish; leaves all pinnate, almost glabrous, with linear acute entire lobes; leaves of involucrum equal in length to the corollas, which are 5-cleft and radiant; crown of the involucel, which is somewhat cylindrical, membranous, and 3 times shorter than the tube; bristles of sessile calyx pale, twice the length of the crown. ♃. H. Native of Dahuria. It was sent to Gay from Fischer under the name of *S. Dahùrica*. Perhaps the same as S. comòsa, Rœm. et Schultes, syst. 3. p. 84.? in which the corollas are said to be large, showy, and violaceous, and in this bluish-purple.

Fischer's Scabious. Pl. 2 feet.

31 S. semipappòsa (Salzm. pl. exsic. 1825. ex D. C. prod. 4 p. 658.) plant hairy, rather canescent; stem herbaceous, branched; lower leaves oval, coarsely toothed, petiolate: superior ones pinnatifid, with oblong-linear, acute, subdentate lobes; heads of flowers pedunculate; leaves of involucrum linear-subulate, ciliated, at length reflexed; corollas radiant; heads ovate; lower fruit of the heads without bristles: the rest furnished each with 5 long exserted bristles.—Native about Tangiers and Mogodor. S. atropurpùrea γ, coronâ erectâ, Coult. dips. p. 37.

Semi-pappose Scabious. Pl. 1 to 2 feet.

32 S. lu'cida (Vill. dauph. 2. p. 293.) plant glabrous; stems usually 1-flowered; leaves shining: radical ones ovate-lanceolate, obtuse, crenated: cauline ones pinnatifid, with linear acute lobes; involucrum usually exceeding the radiant flowers; crown 20-24-nerved, 3 times shorter than the tube; bristles of calyx 5, black, equal in length to the flowers, but 5 times longer than the crown. ♃. H. Native of France, in alpine places, Savoy, Switzerland, Austria, Syria, and Croatia, D. C. fl. fr. 4. p. 228. Rchb. pl. crit. 4. t. 381. S. stricta, Waldst. et Kit. pl. rar. hung. 2. t. 138. S. Nórica, Vest. bot. zeit. 1805. no. 3. Wahl. fl. carp. p. 39. S. Columbària α, Coult. dips. p. 38. exclusive of the two synonymes. Asterocéphalus stríctus, Spreng. Corollas pale blue, or of a pale violaceous colour. In the wild plant the stems usually bear only one head of flowers. This plant, with several of the following, are combined under the name of *S. polymórpha*, by Wibel, and by Coulter under that of *S. Columbària*.

Shining-leaved Scabious. Fl. June, Sept. Clt. 1800. Pl. 1 to 2 feet.

33 S. amœ'na (Jacq. fil. eclog. 1. p. 86. t. 59.) stem branched, rather hairy at the base; radical leaves obovate, toothed or lyrate, rather hairy: cauline leaves pinnatifid, with lanceolate acute nearly entire lobes; peduncles elongated, beset with retrograde villi under the heads; corollas radiant; crown 20-nerved, 3 times shorter than the tube; bristles of calyx 5, of a rufous brown colour, 4 times longer than the crown. ♃. H. Native of Russia. S. nítida, Bernh. ex Rœm. ex Schultes, syst. 3. p. 68. S. longipedunculàta, Fisch. et Jacq. S. Columbària α, Coult. dips. p. 38. Asterocéphalus amœ'nus, Spreng. Flowers lilac or rose-coloured. There are varieties of this having the involucrum either longer or shorter than the flowers.

Pleasing Scabious. Fl. June, July. Clt. 1820. Pl. 2 to 3 feet.

34 S. angustifòlia (Hoffm. verz. 1826. p. 206.) stem quite glabrous; leaves downy: radical ones petiolate, oblong, toothed: lower ones lyrately pinnatifid, serrately cut: superior ones ovate, somewhat lyrately twice bipinnate, with linear lobes; peduncles scabrous from retrograde hairs at the apex; leaves of involucrum linear, terminated each by a hair. ♃. H. Native country unknown. Said to be allied to *S. amœ'na*.

Narrow-leaved Scabious. Pl. 1 to 2 feet.

35 S. ochroleu'ca (Lin. spec. p. 146.) stem branched, rather hairy; radical leaves lyrately pinnatifid, downy on both surfaces: cauline ones pinnate-parted, with flat linear lobes; peduncles elongated, rather hairy; crown 20-nerved, one-half shorter than the tube; bristles of calyx fucescent, 3 times longer than the crown. ♃. H. Native of Europe, Caucasus, and Si-

beria, in dry warm places. Jacq. obs. 3. t. 73. 74. fl. austr. t. 439. S. heterophýllos, Gmel. itin. 1. t. 28. S. tenuifòlia, Roth. germ. 1. p. 59. S. polymórpha δ, Weig. obs. p. 24. Asterocéphalus ochroleùcus, Wallr. sched. crit. 50. S. Columbària ochroleùca, Coult. Rchb. pl. crit. 4. t. 355.—Gerard. herb. 584. f. 7. Barrel. icon. t. 770. f. 2. Stem purplish at the joints. It differs from all the European species of *Scabiòsa* in the flowers being cream-coloured.

Cream-coloured-flowered Scabious. Fl. July, Aug. Clt. 1597. Pl. 1 to 2 feet.

36 S. Scopòlii (Link, enum. hort. berol. 1. p. 128. but not of Vis.) stem clothed with retrograde hairs above; leaves hairy: radical ones oblong, crenate: lower cauline leaves pinnatifid; superior ones bipinnatifid; lobes linear, cut; leaves of involucrum linear, clothed with adpressed hairs. ♃. H. Native of the south of Europe. Corollas cream-coloured. According to Link, this species comes nearest to *S. ochroleùca*, but according to Coulter, to *S. Banática*.

Scopoli's Scabious. Fl. June, July. Clt. 1818. Pl. 1 to 2 feet.

37 S. reve'rsa (Ledeb. ined. sem. hort. dorp. suppl. 1824. p. 6.) radical leaves obovate, obtuse, crenated, clothed with spreading down: cauline leaves pinnate, with deeply cut segments; peduncles beset with retrograde hairs; involucrum exceeding the corollas, which are rather radiant and 5-cleft. ♃. H. Native country unknown. Said to be nearly allied to *S. grandiflòra* and *S. Scopòlii*.

Reverse-haired Scabious. Pl. 1 to 2 feet.

38 S. paucise'ta (D. C. prod. 4. p. 658.) stem branched, hairy at the base; radical leaves lyrately-pinnatifid, hairy, having the terminal lobe ovate and coarsely toothed: cauline leaves pinnate-parted, with narrow lobes; flowers radiant; heads of fruit globose; crown 20-nerved, 3 times shorter than the fruit; bristles of calyx usually only one, rarely 2-3, black, 3 times longer than the crown. ♃. H. Native of Italy, in fields about Pisa, Carrara, Sarzana, &c. S. unisèta, Savi, fl. pis. p. 167. t. 2. f. 6. S. Gramúntia, var. Seb. et Maur. fl. rom. p. 76. S. tenuifòlia, var. Savi, bot. etrus. 122. S. Columbària, var. Poll. Coult. Flowers violaceous. Perhaps the same as S. Saviàna, Rchb. hort. bot. 1. t. 53. but in that plant the bristles of the calyx are 5, and the heads ovate.

Few-bristled Scabious. Pl. 1 to 2 feet.

39 S. Columba'ria (Lin. spec. 143.) stem branched, smoothish; radical leaves ovate, obtuse, petiolate, crenated, membranous, clothed with canescent down on both surfaces: cauline leaves smoothish, pinnate-parted, with flat linear segments; peduncles elongated, usually trifid, downy; corollas radiant; heads of fruit ovate-globose; crown 20-nerved, one-half shorter than the tube; bristles of calyx 5, twice longer than the crown. ♃. H. Native of Europe, Caucasus, and Siberia, very common; in England plentiful on chalky soils. Coult. dips. p. 39. var. δ, Smith, engl. bot. 1311. Rchb. pl. crit. 4. t. 353. Savi, fl. pis. 1. p. 165. t. 2. f. g. Fl. dan. t. 314. Asterocéphalus Columbària, Wallr. sched. crit. 48. Flowers purple or violaceous. This is a very polymorphous plant.

Var. β, *Colúmnæ* (D. C. prod. 4. p. 659.) leaves villous; lobes of cauline leaves wedge-shaped, cut; bristles of fruit 3-5, deciduous. ♃. H. Native about Naples, in fields. S. Colúmnæ, Ten. fl. nep. 1. p. 29. t. 7.

Var. γ, *commutàta* (D. C. l. c.) stem glabrous; leaves smoothish: radical ones on long petioles, deeply serrated or pinnatifid: cauline leaves pinnate, with linear lobes. ♃. H. Native of Siberia. S. commutàta, Rœm. et Schultes, syst. 3. p. 65. Corollas deep blue, radiant.

Pigeon Scabious. Fl. July, Aug. Britain. Pl. 1 foot.

40 S. Bana'tica (Waldst. et Kit. hung. 1. t. 12) stem branched, beset with reflexed white hairs at the base and at the joints; radical leaves lyrate, hairy: cauline ones somewhat bipinnate, with linear ciliated segments, which are each terminated by a white hair; involucrum equal in length to the corollas; seeds furnished with 8 pilose ribs; bristles of calyx 5, long, black. ♃. H. Native of Hungary, on rocks. S. diversifòlia, Baumg. enum. hisp. trans. 1. p. 75. S. Columbària γ? Banática, D. C. prod. 4. p. 659. Asterocéphalus Banáticus, Spreng. Receptacles of heads columnar. Corollas pale red or cream-coloured, with red rays. Anthers pale red.

Banatic Scabious. Fl. July, Aug. Clt. 1800. Pl. 2 to 3 feet.

41 S. agre'stis (Waldst. et Kit. pl. rar. hung. 3. t. 204.) stem terete, purplish at the joints, glaucous, hairy at the base; radical leaves entire and somewhat lyrate: cauline ones tripinnate and pinnate, with linear segments; peduncles hairy at top; corollas radiant; leaves of involucrum linear, downy; seeds crowned by a membrane, which at length ends in 5 teeth; angles of seeds downy. ♃. H. Native of Hungary and Croatia, in dry fields. S. columbària, var. Bieb. fl. taur. 1. p. 96. S. Colúmnæ, Tenor. prod. fl. neap. p. 12. fl. neap. 1. p. 29. t. 7. S. columbària δ? agréstis, D. C. prod. 4. p. 659. Asterocéphalus agréstis, Spreng. Corollas pale lilac. Heads on long peduncles; hence the plant is sometimes to be found in gardens under the name of *S. longipedunculàta*.

Field Scabious. Fl. June, July. Clt. 1818. Pl. 1½ to 3 ft.

42 S. Gramu'ntia (Lin. spec. 145.) stem rather hairy; peduncles beset with retrograde hairs under the heads; radical leaves pinnatifid, with obtuse distant segments; cauline ones bipinnate, with linear segments; leaves of involucrum linear, acute, short; bristles of calyx 5, dark brown; corollas radiant, sometimes 4-cleft. ♃. H. Native of the middle and west of France, the north of Africa, and the Pyrenees. S. triándra, Lin spec. p. 99. S. columbària ε, Gramúntia, D. C. fl. fr. no. 3305. Asterocéphalus Gramúntius, Spreng. S. grácilis, Rœm. et Schultes, syst. 3. p. 104.—Gerard. herb. 584. f. 2. Leaves cinereous from villi. Corollas lilac or red.

Gramont Scabious. Fl. July, Aug. Clt. 1597. Pl. 1 to 2 feet.

43 S. ceratophy'lla (Tenor. prod. fl. neap. p. 12. fl. neap. 1. p. 31. t. 8.) stem fistular, villous; radical leaves lyrate, crenated: cauline ones bipinnatifid, with linear falcate segments; leaves of involucrum equal in length to the flowers; bristles of calyx 5. ♃. H. Native of Abruzzo, in forests. S. pilòsa, Lag. Flowers red or lilac.

Horn-leaved Scabious. Fl. July, Aug. Clt. 1820. Pl. 2 ft.

44 S. Hispa'nica (Willd. in Rœm. et Schultes, syst. 3. p. 521.) leaves pinnate-parted: the terminal lobe lanceolate, and a little toothed; corollas 5-cleft, radiant, longer than the involucrum. ♃. H. Native of Spain. According to Coulter, this is hardly distinct from *S. columbària*.

Spanish Scabious. Pl. 1 to 2 feet.

45 S. coronopifòlia (Willd. herb. but not of fl. græc.) radical leaves lanceolate-spatulate, sharply toothed, or pinnately jagged: cauline ones pinnate-parted, with divaricate linear lobes; corollas 5-cleft, radiant. ♃. H. Native of Siberia. S. ceratophýlla, Rœm. et Schultes, syst. 3. p. 521. but not of Tenore. The rest unknown.

Coronopus-leaved Scabious. Pl. 1 to 2 feet.

46 S. Hercle'a (Willd. in Rœm. et Schultes, syst. 3. p. 521.) lower leaves bipinnatifid: superior ones pinnate-lobed; corollas 5-cleft, radiant.—Native at the Straits of Gaudilava. The rest unknown.

Hercules' Scabious. Pl. 1 to 2 feet.

47 S. inca'na (Rœm. et Schultes, syst. 3. p. 521. and 67.) stem villous; leaves hoary, pinnate-parted, with linear ciliated

lobes; corollas 5-cleft, radiant.—Native of Tauria. S. Ucránica, Bieb. fl. taur. 1. p. 97.? S. incàna, Schultes, obs. 19. Hardly distinct from *S. columbària*, or *S. suavèolens*. Radical leaves quite entire and lyrate, ciliated; leaves of involucrum obtuse. Corollas radiant, violaceous. Pappus 5-awned.

Hoary Scabious. Pl. 8 to 2 feet.

48 S. rhiza'ntha (Viv. fl. lib. spec. p. 6. t. 3. f. a. b.) radical leaves elliptic: cauline ones pinnate-lobed: lobes all linear; central peduncle rising from the root, bearing one head: the rest rising from the tops of the branches; leaves of involucrum 5, linear; corollas 5-cleft, radiant; bristles of calyx 5. ♃. H. Native of Cyrenaica, on the mountains.

Root-flowered Scabious. Pl. 1 to 2 feet.

49 S. Hladnikia'na (Host, fl. austr. 1. p. 195.) stem straight, branched, downy; leaves hispid: lower ones obovate, crenated: upper ones pinnate-parted: lobes jagged; leaves of involucrum linear; corollas 5-cleft, radiant; bristles of calyx 5, dark purple. ♃. H. Native of Carniola, on the mountains. Rchb. pl. crit. 5. p. 30. Corollas purplish.

Hladniki's Scabious. Pl. 1 to 2 feet.

50 S. hu'milis (Host, fl. austr. 1. p. 195. but not of Thunb.) stem branched, glabrous, ascending; lower leaves oblong, crenated or jagged: superior ones pinnate-parted: lobes jagged; peduncles beset with reflexed hairs; leaves of involucrum linear-subulate; corollas 5-cleft, radiant; bristles of calyx 5. ♃. H. Native of the alps of Austria, about Gemona. Corollas white, suffused with purple. Rchb. pl. crit. 5. p. 30.

Humble Scabious. Pl. ½ foot.

51 S. negle'cta (Horn. hort. hafn. 1. p. 127.) leaves all lyrate or pinnatifid; peduncles very long; leaves of involucrum exceeding the corollas, which are 5-cleft and radiant. ♃. H. Native of Italy. Flowers red or lilac. The plant we have in the gardens under this name appears to be nothing but *S. Graméntia*.

Neglected Scabious. Fl. June, July. Clt. 1825. Pl. 1 to 2 feet.

52 S. lacinia'ta (Licht. in Rœm. et Schultes, syst. 3. p. 87.) plant downy; stem dichotomous; lower leaves obovate-oblong, unequally and bluntly serrated: superior ones pinnatifid; lobes cut, acute; corollas 5-cleft, radiant.—Native of the Cape of Good Hope. Leaves of involucrum downy, linear, acute, and sometimes bifid, one-half shorter than the corollas, which are pale violet.

Jagged-leaved Scabious. Pl. 1 to 2 feet.

53 S. Pyrena'ica (All. ped. 1. p. 140. t. 25. f. 2. and 26. f. 1.) the whole plant clothed with cinereous tomentum; stem a little branched, few-flowered; radical leaves oblong, crenated: upper cauline ones bipinnatifid: lobes linear, quite entire; corollas radiant; leaves of involucrum lanceolate; crown 3 times shorter than the tube, 20-nerved; bristles of calyx 5, 4 times longer than the crown. ♃. H. Native of the south of Europe, on the lower mountains and hills; and of Caucasus, on the Talusch Mountains, in dry fields. Dub. bot. gall. p. 256. S. columbària, var. Coult. dips. p. 38. exclusive of the synonymes. Corollas frequently reddish purple, but most often of a bluish purple.

Var. α, *cinèrea* (D. C. prod. 4. p. 659.) plant clothed with hairy down. ♃. H. Native of the Pyrenees. S. cinèrea, Lam. ill. no. 2319. S. marítima, Vill. dauph. 2. p. 225. S. Pyrenàica, D. C. fl. f. 4. p. 229.

Var. β, *mollíssima* (D. C. l. c.) plant clothed with hoary tomentose velvety down. ♃. H. Native from Nice to Sarzana. S. mollíssima, Visiani, ann. 2. p. 161. Asterocéphalus mollíssimus, Spreng. S. laxiflòra, Link. enum. 1. p. 128. The plant in the gardens, under the name of *S. mollíssima*, has white flowers.

Var. γ, *tomentòsa* (D. C. l. c.) lower leaves lyrately pinnatifid, obtuse: superior ones divided into linear acute lobes. ♃. H. Native of Spain, in the kingdom of Valentia. S. tomentòsa, Cav. icon. 2. t. 183. Asterocéphalus tomentòsus, Spreng. Corollas pale violaceous.

Pyrenean Scabious. Fl. June, July. Clt. 1819. Pl. 1 ft.

54 S. holoserícea (Bertol. dec. 3. p. 49.) plant clothed with soft hoary tomentose velvety down; lower leaves lanceolate, obtuse, crenated: superior ones pinnatifid, with lanceolate acute entire lobes; leaves of involucrum linear; corollas radiant; crown 20-nerved, 3 times shorter than the tube, which is hairy; bristles of calyx 5, black, twice longer than the crown. ♃. H. Native of the Appenines, Abruzzo, Dalmatia, and the Pyrenees. D. C. fl. fr. 5. p. 480. Dub. ench. 1. p. 256. S. columbària holoserícea, Coult. dips. p. 39. Asterocéphalus seríceus, Spreng. Leaves sometimes all simple. Corollas bluish purple.

Whole-silky Scabious. Fl. July. Clt. 1818. Pl. 1 to 2 ft.

55 S. Webbia'na (D. Don, in bot. reg. t. 717.) plant clothed with soft silky hoary tomentum; lower leaves petiolate, obovate, crenated: superior ones pinnatifid, with ovate or oblong entire lobes; heads on long peduncles; corollas nearly equal; crown 4 times longer than the tube; bristles of calyx 5, black. ♃. H. Native of Phrygia, on the top of Mount Ida. Asterocéphalus Webbiànus, Spreng. Flowers cream-coloured.

Webb's Scabious. Fl. July. Clt. 1818. Pl. ½ foot.

56 S. móllis (Willd. enum. suppl. p. 7.) lower leaves supradecompound: superior ones bipinnate-parted; lobes of all very slender and filiform, smoothish, except the margins, which are rather pilose; peduncles very long, scabrous; involucrum equal to the corollas, which are 5-cleft and radiant; crown spreading; bristles of calyx 3-5, short. ♃. H. Native country unknown. Rchb. pl. crit. 4. t. 353. S. capillàta, Rœm. et Schultes, syst. 3. p. 64. Lower leaves lyrate, soft, tomentose, ex Link. enum. 1. p. 128. Flowers pale violaceous, ex Willd. Perhaps only a variety of *S. columbària* or *S. Pyrenàica*.

Soft Scabious. Fl. June, July. Clt. 1820. Pl. 2 to 3 ft.

57 S. pu'mila (Poir. dict. 6. p. 723.) plant hispid from grey pili; stem short, almost simple; radical leaves lyrate or pinnatifid, with obtuse toothed lobes: cauline leaves pinnate-parted, with linear acute lobes, which are sometimes trifid at the apex; leaves of involucrum lanceolate, villous, shorter than the corollas, which are 5-cleft and radiant; bristles of calyx 5, black, nearly equal in length to the corollas. ♃. G. Native of the Cape of Good Hope. Asterocéphalus pùmilus, Spreng. S. acaúlis, Lin. mant. 196. Thunb. fl. cap. p. 145. S. nudicaúlis, Lam. ill. no. 1331. Corollas cream-coloured or nearly white. Plant very hairy.

Dwarf Scabious. Pl. ½ foot.

58 S. suave'olens (Desf. cat. hort. par. p. 110.) plant rather canescent from short down; stems straight; radical leaves oblong, attenuated at the base, quite entire: cauline ones pinnate-parted, with linear-thickish quite entire lobes, smoothish; heads of fruit ovate; flowers radiant; tube of involucel cylindrical; crown very short, 16-nerved; bristles 5, spreading, hardly exserted. ♃. H. Native of France, Germany, Sweden, Hungary, &c. on the higher hills. D. C. fl. fr. no. 3307. Coult. dips. p. 39. t. 2. f. 14. S. asterocéphala, Thuill. herb. S. columbària odoràta, Thuill. fl. fr. 1. p. 72. S. canéscens, Waldst. et Kit. pl. rar. hung. 1. t. 53. Asterocéphalus canéscens, Lag. Spreng. Asterocéphalus suavèolens, Wallr. sched. crit. p. 51. S. média, Ger. hist. p. 720. Corollas of a bluish lilac colour, having a scent like *O'rchis nìgra*.

Sweet-scented-flowered Scabious. Fl. July, Aug. Clt. 1802. Pl. 1 to 1½ foot.

59 S. dichótoma (Ucria. pl. lin. add. 249. Willd. enum. 1. p. 144.) smoothish; stem dichotomous; heads almost sessile at the sides, globose; leaves oblong, entire: radical ones petiolate

and toothed: cauline ones almost sessile, quite entire; corollas equal; tube of involucel nearly cylindrical; crown 20-24-nerved, one-half shorter than the tube; bristles of calyx spreading, very short, inclosed. ⊙. H. Native of Mauritania, Sicily, &c. Coult. dips. 9. t. 2. f. 15. Guss. prod. 1. p. 163. Asterocéphalus dichótomus, Lag. gen. et spec. 8. S. parviflòra, Desf. fl. atl. 1. p. 119. Lower leaves sometimes lyrate or jagged. Corollas 5-cleft, and flesh-coloured; but by some authors they are said to be 4-cleft.

Dichotomous-stemmed Scabious. Fl. June, July. Clt. 1804. Pl. 1 to 1½ foot.

60 S. urceola'ta (Desf. fl. atl. 1. p. 122.) glabrous; leaves rather fleshy: radical ones oblong, bluntly and sinuately pinnatifid: cauline ones pinnate-parted, with linear lobes; leaves of involucrum 5-7, combined at the base; heads on long peduncles; corollas nearly equal. ♃. H. Native of Corsica, Sicily, Etruria, Portugal, Mauritania at Tangiers, Tunis, and Mogodor, in sand by the sea side. Coult. dips. p. 39. t. 2. f. 16. S. rutæfòlia, Vahl. symb. 2. p. 26. S. divaricàta, Lam. ill. no. 1311. S. marítima rutæfòlia, Bocc. sic. t. 40. f. 3. Asterocéphalus urceolàtus, Spreng. Pycnócomon rutæfòlium, Hoffm. et Link. fl. port. l. c. Corollas pale yellow.

Urceolate-involucred Scabious. Fl. July, Aug. Clt. 1804. Pl. 1 to 3 feet.

* * *Corollas 4-cleft.*

61 S. Succìsa (Lin. spec. 142.) root præmorse, or appearing as if it was bitten off at the end; radical leaves ovate-lanceolate, acuminated at both ends: cauline leaves connate, almost entire; heads of flowers pedunculate; leaves of involucrum disposed in 2-3 series; corollas equal; tube of involucel 4-sided; crown very short, undulated; bristles of calyx short, a little exserted, connivent. ♃. H. Native of Europe even to Caucasus, very common in bogs and moist meadows and pastures; plentiful in Britain. Fl. dan. t. 279. Smith, engl. bot. t. 878. Curt. lond. 3. t. 10. Coult. dips. p. 39. t. 2. f. 17. D. C. fl. fr. 4. p. 226. Blackw. t. 142. Asterocéphalus Succìsa, Wallr. sched. 1. p. 52. Succìsa praténsis, Mœnch. meth. p. 489. The lower stem leaves are toothed, but the upper ones are entire. Involucrum hairy. Flowers violet or dark purplish blue, varying to flesh-coloured and milk-white. The leaves are sometimes gashed according to Haller, and the heads of flowers are sometimes proliferous. In cultivation the plant becomes more branched than in the wild state. In days of superstition it was fabled that the Devil, envying the good this herb might do to mankind, bit away a part of the root; hence the plant is commonly called *Devil's-bit*. This appearance of a stumped root is not peculiar to *S. succìsa*, but is observed in some species of *Plantàgo*, and many other herbs. According to Bergen the root is astringent, and the infusion of it bitterish, but not unpleasant. A strong decoction of it, kept a good while, was formerly an empirical secret for gonorrhœas. Linnæus says that the dried leaves are used to dye wool yellow or green.

Var. α, hirsùta (Wallr. sched. l. c.) stem, peduncles, and both sides of leaves hairy. ♃. H. This is the British variety. Succìsa hirsùta, C. Bauh. pin. p. 269.

Var. β, glabràta (Wallr. sched. l. c.) stem and both sides of leaves glabrous. ♃. H. Succìsa glàbra, C. Bauh. pin. 269. S. glabràta, Schott. in Rœm. et Schultes, syst. 3. p. 61.

Common *Devil's-bit*. Fl. Aug. Oct. Britain. Pl. 1 foot.

62 S. Austra'lis (Wulf. in Rœm. arch. 3. p. 216.) plant smoothish; leaves ovate, elongated, acuminated, almost quite entire: lowermost ones somewhat auriculated at the petioles; heads ovate; leaves of involucrum disposed in two series; corollas equal; tube of involucel lagenæform; crown obsolete; bristles of calyx abortive. ♃. H. Native of Upper Italy, Syria, and Pannonia, in marshy parts of woods, and by the sides of rivulets. Coult. dips. p. 40. t. 2. f. 18. Rchb. pl. crit. 4. t. 325. S. rèpens, Brign. for Jul. 19. Nocc. et Balb. fl. ticin. 68. t. 2. S. pseudaustràlis, Rœm. et Schultes, syst. 3. p. 60. Roots creeping, tufted. Corollas of a bluish violet or purple colour, but Wulfen says they are yellow; there are, therefore, 2 plants probably confused under this name, or only mere variations in the colour of the flowers.

Southern Devil's-bit. Fl. June, Aug. Clt. 1820. Pl. 1. ft.

63 S. tenuifòlia (Linnæa. vol. 8.) bristles of pappus twice longer than the denticulated calyx; corollas downy, equal, shorter than the involucrum; heads ovate; stem erect, branched; cauline leaves pinnate, with linear, acute, quite entire, elongated segments. ♃. H. Native country unknown. Said to be nearly allied to *S. Austràlis*.

Fine-leaved Devil's-bit. Pl. 1 foot.

† *Species not sufficiently known.*

§ 1. *Leaves entire or serrated.*

64 S.? amplexicau'lis (Lin. mant. p. 195.) stem herbaceous, brachiate; leaves stem-clasping, lanceolate, quite entire: radical ones trifid; corollas radiant, 4-cleft.—Native country unknown. Succìsa amplexicaúlis, Spreng. Said to be nearly allied to S. integrifòlia, Lin. Corollas bluish. According to Coulter, it is probably a species of *Knaútia*.

Var. β, lyràta (Rœm. et Schultes, syst. 3. p. 62.) lower leaves lyrate, obtuse, crenated; superior ones lanceolate, sessile. ♃. H. Native of France. S. lyràta, Lam. ill. no. 1310. Flowers pale red.

Stem-clasping-leaved Scabious. Pl. 1 foot.

65 S.? Cochinchine'nsis (Lour. coch. p. 68.) stem quite simple, nearly naked; leaves lanceolate, undivided, undulated: radical leaves quite entire; involucrum 3-leaved; corollas 5-cleft; pappus pilose.—Native of China and Cochin-china. Asterocéphalus Cochinchinénsis, Spreng. Flowers purple. Corollas 5-cleft, nearly equal. Bristles of calyx 5.

Cochin-china Scabious. Pl. 1 foot.

§ 2. *Leaves lyrate or pinnate-lobed.*

* *Corollas 4-cleft.*

66 S.? Dahu'rica (Willd. in Rœm. et Schultes, syst. 3. p. 521.) leaves pinnate-parted, tomentose; lobes pinnatifidly jagged; stem tomentose; corollas 4-cleft, radiant.—Native of Dahuria. Coult. dips. p. 41. There is another plant under this name by Fischer, cultivated in the gardens.

Dahurian Scabious. Pl. 1 foot.

67 S. hírta (Willd. in Rœm. et Schultes, syst. 3. p. 251.) leaves all pinnate, and are as well as the stem hairy; lobes or segments linear-lanceolate, acute; corollas 4-cleft, radiant.—Native of Siberia. Coult. dips. p. 41. The rest unknown.

Hairy Scabious. Pl. 1 to 2 feet.

* * *Corollas 5-cleft.*

68 S. Styrìaca (Vest, in flora. 1821. p. 146.) plant clothed with fine hairs; stem much branched, many-flowered; leaves all pinnate-parted; lobes lanceolate, few, each furnished with a tooth; leaves of involucrum linear, spreading; corollas 5-cleft, radiant, outer lobes acute; crown quite entire; bristles of calyx wanting.—Native of Styria.

Styrian Scabious. Pl. 1 to 2 feet.

Cult. Many of the species of this genus are very ornamental, and are well fitted for decorating flower-borders. The perennial herbaceous kinds are easily increased by seed, or dividing at the root. The seeds of annual kinds only require to be sown

in the open ground. The shrubby species are increased by cuttings under a hand-glass, or by seed. The species most worthy of cultivation are *S. Caucásica*, *S. gramnifòlia*, *S. atropurpùrea*, *S. grandiflòra*, and many others.

Order CXXXIII. CALYCE'REÆ (this order contains plants agreeing with *Calycèra* in important characters). R. Br. in Lin. trans. 12. p. 132. (1816). Rich. in mem. mus. 6. p. 76. (1820). Lindl. introd. bot. p. 201.—Bhoodpídeæ, Cassini in dict. des. sc. 5. p. 26. suppl. 1817.

Calyx of 5 unequal segments. Corolla regular, funnel-shaped, with a long slender tube, and 5-3-nerved segments; glandular spaces or areolæ below the stamens, and alternate with them. Stamens 5, monadelphous; anthers combined by their lower half. Ovarium inferior, 1-celled. Style smooth, clavate in the upper part; stigma capitate, undivided. Fruit or acheniæ indehiscent, crowned by the rigid spiny segments of the calyx. Seed solitary, inverted, sessile. Embryo in the axis of fleshy albumen, slender.—Herbaceous plants, with alternate leaves without stipulas. Flowers collected into heads, which are either terminal or opposite the leaves, surrounded by an involucrum, and bearing bracteas among the flowers. Flowers sessile, hermaphrodite or neuter. This is a very small tribe of plants, differing from *Compósitæ* in their albuminous pendulous ovulum, and half distinct anthers; and from *Dipsàceæ* in their filaments being monadelphous, and their combined anthers.

Synopsis of the genera.

1 Calyce'ra. Crown of fruit in some long horned, and in others short and scaly.

2 Boòpis. Limb of corolla not contracted, campanulate. Fruit crowned by the segments of the calyx, which are stiff and membranous, but acute and spinescent at the apex.

3 Acica'rpha. Lower flowers of the heads fertile: superior ones numerous and sterile. Tube of anthers undivided. Fruit combined into a globose echinated head.

I. CALYCE'RA (from *καλυξ*, *a calyx*, and *κερας*, *keras*, a horn; the crown of the fruit is a long horn). Cav. icon. 4. p. 34. t. 358. Juss. ann. mus. 2. p. 350. Pers. ench. 2. p. 500. Cassini, dict. 5. suppl. p. 28.

Lin. syst. *Syngenèsia*, *Necessària*. Involucrum 5-parted. Flowers fertile, dissimilar, and promiscuous. Segments of the calyx in some long and horn-formed, and in others short and scale-formed. Limb of calyx contracted a little below the lobes. Tube of stamens inserted a little below the contraction of the corolla, divided at the top.—Herbaceous plants with sub-pinnatifid leaves and terminal heads of flowers.

1 C. Cavanille'sii (Richard, in ann. mus. 6. p. 77.) glabrous; leaves semi-pinnatifid; fructiferous heads almost 2 inches long, globose; bracteoles narrow and subulate at the apex. ♃. F. Native of Chili. C. herbàcea, Cav. icon. 4. p. 34. t. 358. Pers. ench. 2. p. 500. Flowers green.

Cavanilles's Calycera. Pl. 1 foot.

2 C. balsamitæfòlia (Rich. ann. mus. 6. p. 86. t. 10.) stem pilose; leaves deeply toothed or subpinnatifid, downy on the margins; bracteoles linear, subulate at the apex. ♄. F. Native of Chili, where it was collected by Dombey. Boòpis balsamitæfòlia, Juss. ann. mus. 2. p. 350. Pers. 2. p. 500. Scabiòsa sympaganthèra, Ruiz et Pav. fl. per. 1. p. 49. t. 76. f. a. Flowers green? Root woody.

Cosmary-leaved Calycera. Shrub 2 feet.

Cult. The species of *Calycèra* should be grown in pots, in a mixture of loam, sand, and peat; and they will be readily increased by seed.

II. BOO'PIS (from *βους*, *bous*, an ox, and *ωψ*, *ops*, an appearance; the flowers have some resemblance to the eye of an ox). Juss. ann. mus. 2. p. 350. t. 58. f. 2. Pers. syn. 2. p. 500. C. Cassini, dict. 5. suppl. p. 28. Richard, mem. mus. 6. p. 87.

Lin. syst. *Syngenesia*, *Necessaria*. Involucrum 7-8-cleft. Flowers fertile, nearly alike. Segments of calyx shorter than the ovaria, membranous, some entire, and some deeply toothed. Limb of corolla without any contraction, campanulate, half divided. Column of stamens inserted at the base of the limb of the corolla; tops of filaments distinct.—Many stemmed branched herbs, with pectinately pinnatifid leaves, and terminal heads of flowers.

1 B. anthemoìdes (Juss. l. c.) leaves pectinately pinnatifid; segments of leaves linear. ⊙. H. Native of Buenos Ayres, where it was first detected by Commerson. Pers. ench. 2. p. 500. Rich. l. c. p. 87. pl. ii.

Anthemis-like Boopis. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

2 B. alpi'na (Poepp. mss. coll. 2. no. 823. ex Cham. et Schlecht. in Linnæa. 6. p. 258.) leaves oblong-obovate, fleshy, entire, or furnished with a tooth on one or on both sides, quite glabrous. ♃. G. Native of Chili. Root woody. Stem erect, simple, only leafy at the base. Corolla yellowish. Involucrum 12-toothed.

Alpine Boopis. Pl. 2 to 3 inches.

3 B. leuca'nthema (Poepp. mss. l. c.) leaves petiolate, fleshy, glabrous, profoundly pinnatifid, with linear acute segments. ⊙. H. Native of Chili. Involucrum many parted. Root slender, branched. Corolla white.

Leucanthema-leaved Boopis. Pl. 1 to 2 inches.

Cult. The seeds only require to be sown in a warm sheltered situation in the open ground.

III. ACICA'RPHA (from *ακις*, *akis*, a point, and *καρφος*, *carphos*, chaff; in reference to the segments of the calyx being spiny). Juss. ann. mus. 2. p. 347. t. 58. f. 1. Pers. ench. 2 p. 488. Cassini, dict. 1. supp. 32. Rich. ann. mus. 6. p. 77. pl. 11-12.—Cryptocárpha, Cassini, dict. 12. p. 85.

Lin. syst. *Syngenèsia*, *Necessària*. Involucrum 4-5-parted: outer ones adnate to the ovaria. Lower flowers of heads fertile, superior ones much more numerous and sterile, with the ovaria of all combined. Segments of the calyx for the most part ending in acicular spines. Limb of corolla funnel-shaped. Column of stamens inserted beneath the attenuated part of the limb of the corolla, undivided to the top of the anthers. Bases of connectives knot-formed.—Herbaceous plants, with toothed or entire leaves, and terminal and lateral heads of flowers.

1 A. tribuloìdes (Juss. l. c.) plant erect, glabrous; leaves oblong, cuneate-oboval, obtuse, with broad teeth; style much exserted. ⊙. H. Native of Buenos Ayres, where it was collected by Commerson. Cryptocárpha tribuloìdes, Cassini, dict. 12. p. 85.

Caltrop-like Acicarpha. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

2 A. spatula'ta (R. Br. comp. p. 29. Richard. mem. mus. 6. p. 78. pl. 12.) procumbent, glabrous; leaves spatulate, tapering a long way at the base, denticulated and entire at the apex, and mucronate; style a little exserted. ⊙. H. Native of Brazil, where it was collected by Sello. Cryptocárpha spatulàta, Cassini, dict. 12. p. 85.

Spatulate-leaved Acicarpha. Clt. 1824. Pl. proc.

3 A.? lana'ta (Lag. in Pers. ench. 2. p. 488.) stem woolly; leaves linear, glabrous, having a tooth on one side, and some-

times on both; uppermost leaves entire.—Native of New Spain. Cassini, dict. 12. p. 36. Rich. l. c. p. 79.

Woolly-stemmed Acicarpha. Pl. prostrate.

Cult. Being annual plants, the seeds only require to be sown in the open ground in a warm sheltered situation.

N. B. Ceva'llia sinua'ta (Lag. gen. et spec. p. 11. with a figure,) appears to be allied to the present order, but the characters of the plant are not sufficiently known.

Order CXXXIV. LOBELIA'CEÆ (this order contains plants agreeing with the genus *Lobèlia* in many characters). Juss. ann. mus. 18. p. 1. (1811.). D. C. et Duby, bot. gall. p. 310. (1828.). Lindl. introd. nat. syst. p. 107.—Campanulàceæ, § 2. R. Br. prod. p. 562.

Calyx superior, 5-toothed, or 5-parted, seldom entire, with the tube adnate to the ovarium at the base. Corolla monopetalous, irregular, inserted in the calyx, 5-lobed, or deeply 5-cleft. Stamens 5, inserted into the calyx alternately with the lobes of the corollas; anthers cohering; pollen oval. Ovarium inferior, with from 1 to 3 cells, but usually of 2 cells. Ovula very numerous, attached to the axis or parietes of the fruit. Style simple; stigma usually 2-lobed, surrounded by a cup-like fringe. Fruit capsular or baccate, 1-2-celled, rarely 3-celled, many seeded, dehiscing at the apex. Seeds attached to the axis or parietes of the fruit. Embryo straight, in the axis of fleshy albumen, with the radicle pointing to the hylum.—Herbaceous plants or shrubs. Leaves alternate, exstipulate. Flowers axillary or terminal, of various colours.

This order appears more nearly related to *Compósitæ* than to *Campanulàceæ*, in their cohering anthers, and in the irregularity of the corolla; the stigma is surrounded by hairs, which are probably analogous to the indusium of *Goodenòviæ*, to which order *Lobeliàceæ* approaches very closely. It participates in all the affinities of *Campanulàceæ*.

The plants contained in this order are all dangerous or suspicious, in consequence of the acridity of their milk. *Tùpa Feuillei* yields a dangerous poison in Chili. The most active article of the Materia Medica of North America is said to be *Lobèlia inflàta;* it is possessed of an emetic, sudorific, and powerful expectorant effect, especially the first. When given with a view to empty the stomach, it operates vehemently and speedily, producing, however, great relaxation, debility, and perspiration, and even death, if given in over-doses. Barton, 1. p. 189. The antisyphilitic virtues ascribed to *Lobèlia syphilitica* are supposed to have resided in its diuretic properties; they are, however, generally discredited altogether. Barton, 2. p. 211. *Hippobròma longiflòra*, a native of some of the West India Islands, is one of the most venomous of plants. The Spanish Americans call it *Rebentia Cavallos*, because it proves fatal to horses that eat it; it acts as a violent cathartic, the effects of which no remedy can assuage, and which ends in death. The leaves are an active vesicatory. *Lobèlia cardinàlis* is an acrid plant, which is reckoned anthelmintic. Barton, 2. p. 180. All the plants contained in this order are very ornamental, and therefore well deserving the care of the gardener. The flowers are very showy blue, white, red, scarlet, but seldom yellow.

Synopsis of the genera.

1 Clermóntea. Calyx tubular, 5-cleft. Corolla arched, 5-cleft, almost regular. Stamens with combined filaments and cohering anthers; the two lower anthers bearded. Stigma 2-lobed, girded by hairs. Capsule baccate, naked at the apex, indehiscent, 2-celled, many-seeded.

2 Rolla'ndia. Calyx 5-parted. Corolla compressed at the sides, with an undivided tube, and a 5-parted, somewhat bilabiate limb. Stamineous column adnate to the superior part of the corolla. Anthers cohering, two lower ones bearded. Stigma pilose. Capsule baccate, crowned by the calyx, 2-celled, many-seeded, indehiscent.

3 Cya'nea. Calyx 10-furrowed, with oblong, foliaceous, curled segments. Corolla tubular, arched, with a 5-parted, somewhat bilabiate limb. Stamens, combined filaments, and cohering bearded anthers. Stigma capitate ciliated. Capsule baccate, 10-furrowed, indehiscent, crowned by the limb of the calyx, 2-celled, many-seeded.

4 Delíssea. Limb of calyx 5-toothed. Corolla with an arched undivided tube, and a 5-parted somewhat bilabiate limb. Anthers cohering; 2 lower ones bearded. Stigma 2-lobed, girded by hairs. Capsule baccate, crowned by the limb of the calyx, indehiscent, 2-celled, many-seeded.

5 Pra'tia. Limb of calyx 5-toothed (f. 119. *a.*). Corolla cleft on the back, even to the base, and therefore the limb is 5-parted, unilabiate, or all on the lower side (f. 119. *b.*). Stamens combined above and the anthers cohering; the two lower anthers mucronate (f. 119. *d.*). Stigma 2-lobed. Capsule baccate, crowned.

6 Tu'pa. Calyx spherical, 5-parted. Corolla cleft on the back almost to the base, having the limb divided into 5 segments, which are all united at their tips. Stamens combined almost to the base; anthers cohering, bearded. Stigma 2-lobed, protruding. Capsule 2-celled, many-seeded.

7 Siphoca'mpylus. Limb of calyx 5-parted (f. 120. *d.*). Corolla with a curved undivided tube, which is ventricose in the middle, and a 5-parted bilabiate limb (f. 120. *b.*). Stamens and anthers combined; anthers bearded. Capsule 2-celled, 2-valved, dehiscent.

8 Lobe'lia. Limb of calyx 5-parted (f. 121. *a.*). Corolla with the tube cleft on the upper side, and thickened at the base, and a bilabiate limb (f. 121. *g.*). Anthers cohering; 2 lower ones usually bearded. Capsule 2-celled, 2-valved, dehiscent at the apex.

9 Dortma'nna. Limb of calyx 5-parted. Corolla with the tube cleft on the upper side, a bilabiate limb, and a bearded throat. Stamens with free filaments, and cohering bearded anthers. Stigma capitate, hairy. Capsule half superior, 3-celled, 3-valved, dehiscent, many-seeded, surrounded by the calycine segments below the apex.

10 Parastra'nthus. Limb of calyx 5-cleft. Corolla

with hardly any tube, and a bilabiate, 5-parted, reversed limb. Column of stamens under the lower lip. Filaments and anthers combined; the latter bearded. Stigma bifid or trifid. Capsule crowned by the segments of the calyx, 2-celled, many-seeded.

11 Isótoma. Limb of calyx 5-parted (f. 122. *a*.). Corolla salver-shaped (f. 122. *d*.), or funnel-shaped, with an entire or cleft tube, and a 5-parted, nearly regular limb (f. 122. *d*.). Filaments combined; anthers cohering, beardless; the two lower ones mucronate. Stigma capitate, protruding. Capsule 2-celled, many-seeded, dehiscent.

12 Holostígma. Flowers dioecious. Limb of calyx 5-parted. Corolla with the tube cleft above, and a nearly regular 5-cleft limb. Anthers cohering, bearded. Stigma undivided. Capsule 2-celled, many-seeded, dehiscent.

13 Lysipòmia. Limb of calyx 5-parted. Corolla with an entire tube, and a 5-parted sub-bilabiate limb. Anthers cohering; the 2 lower ones bearded, or terminating in a membranous process. Stigma 2-lobed, ciliated. Capsule 1-celled, opening by an operculum at the apex, many-seeded.

14 Monópsis. Calyx tubular, 5-cleft. Corolla salver-shaped, with a terete tube, which is cleft on one side, allowing the stamens to escape, and a regular rotate limb. Anthers cohering. Capsule 2-celled, many-seeded, dehiscent.

15 Hippobròma. Limb of calyx 5-parted. Corolla with a very long undivided tube, and a 5-parted nearly regular limb. Stamineous tube exserted beyond the throat of the corolla. Anthers cohering, bearded. Stigma 2-lobed. Capsule 2-celled, 2-valved, many-seeded, dehiscent.

16 Clintònia. Limb of calyx 5-cleft. Corolla bilabiate, with hardly any tube. Anthers cohering; the 2 superior ones bearded. Capsule silique-formed, triangular, dehiscing by 3 loriform valves, many seeded. Seeds attached to two parietal placentas.

17 Cy'phia. Limb of calyx 5-cleft. Corolla bilabiate, 5-parted; the segments easily separated to the base. Stamens with combined hairy filaments, and free anthers. Stigma hollow, gibbous, bearded. Capsule 2-celled, many-seeded, dehiscent.

18 Canona'nthus. Calyx hemispherical, with a 5-parted limb. Corolla tomentose outside, campanulate, regular, 5-parted at the apex. Stamens with free filaments, and combined anthers. ? Capsule unknown.

I. CLERMO'NTEA (named in compliment to the Marquis de Clermont-Tonnerre, minister of the marine of France). Gaud. in Freyc. voy. pt. bot. 459.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular, arched, 5-cleft, coloured, length of corolla, caducous. Corolla tubular, arched, 5-cleft, almost regular. Stamens 5, one of which falls off along with the corolla, with combined filaments and cohering anthers; the 2 lower anthers bearded. Stigma 2-lobed, girded by pili. Capsule baccate, 2-celled, naked at the apex, indehiscent; cells many-seeded.—Shrubby or arboreous lactescent plants. Leaves alternate, entire. Flowers racemose, axillary, bracteate, showy, white, or of a rose-violet colour, blue. ?

1 C. oblongifòlia (Gaud. l. c. t. 71.) leaves on very long petioles, oblong, acutish, crenated; calyx 5-parted. ♄. G. Native of the Sandwich Islands.

Oblong-leaved Clermontea. Shrub.

2 C. persicifòlia (Gaud. l. c. t. 72.) leaves oblong-lanceolate, acute, crenated; calyx 5-cleft. ♄. G. Native of the Sandwich Islands. Lobèlia Clermontiàna, Gaud. mss.

Peach-leaved Clermontea. Shrub.

3 C. grandiflòra (Gaud. l. c. t. 73.) leaves obovate-oblong, rather acuminated, dentately crenated; flowers large; calyx 5-parted. ♄. G. Native of the Sandwich Islands. Lobèlia grandiflòra, Gaud. mss.

Great-flowered Clermontea. Shrub.

Cult. All the species of this genus bear ornamental blossoms, and are therefore worth cultivating in every collection of greenhouse plants. A mixture of loam, sand, and peat is the best soil for them; and they will be easily increased by cuttings planted in the same kind of soil, under a hand-glass, in a little bottom heat.

II. ROLLA'NDIA (named after R. M. Rolland, gunner of the expedition under Freycenet, who rendered great services to ornithology). Gaud. in Freyc. voy. pt. bot. p. 458.

Lin. syst. *Pentándria, Monogýnia.* Calyx closely adhering to the ovarium; limb free, 5-parted, with short obtuse segments. Corolla tubular, with the sides compressed; tube curved, undivided; limb 5-parted, somewhat bilabiate: segments narrow, Stamens 5. Stamineous tube adnate at the bottom to the superior part of the tube of the corolla. Anthers cohering, two lower ones bearded. Stigma 2-lobed, girded by hairs. Capsule baccate, indehiscent, 2-celled, crowned by the permanent calyx; cells many-seeded.—Lactescent shrubs. Leaves alternate, exstipulate. Peduncles axillary, few-flowered. Pedicels unibracteate at the base. Flowers white.

1 R. lanceola'ta (Gaud. l. c. t. 74.) shrub branched; leaves large, oblong-lanceolate, doubly toothed, hairy beneath; calyx 5-parted, glabrous, with ovate obtuse segments; racemes few-flowered; stamens epipetalous. ♄. G. Native of the Sandwich Islands. Lobèlia Rollandiàna, Gaud. mss. Lobèlia lanceolàta, Hook. et Arn. in Beech, voy. pt. bot. p. 88.

Lanceolate-leaved Rollandia. Shrub.

2 R. crìspa (Gaud. l. c. p. 459.) shrub branched; leaves large, oblong, tapering much to the base, sharply toothed, glabrous, with undulately curled margins; calyx 5-parted, downy, with ovate obtuse segments; stamens epipetalous. ♄. G. Native of the Sandwich Islands. Lobèlia crìspa, Gaud. mss.

Curled-leaved Rollandia. Shrub.

3 R. ? pinnatífida; leaves oblong-lanceolate, acute at both ends, running into the short petioles, remotely pinnatifid, sinuately and doubly toothed: flat and glabrous above, reticulately veined beneath and rather hairy; teeth short, and are as well as the lobes obtuse and callously mucronate; racemes axillary; calyx and corolla hairy; ovarium obconical, crowned by the auriculated, ovate, obtuse, calycine segments. ♄. G. Native of Owahu, on the mountains. Lobèlia pinnatífida, Cham. in Linnæa. 7. p. 221. Leaves like those of a species of *Sónchus*. Pedicels rising from a fleshy peduncle, and furnished with scale-formed bracteas. Corollas 2 lines long, deciduous. Stem branched. Perhaps a species of *Cyànea*.

Pinnatifid-leaved Rollandia. Shrub.

4 R. ? ambígua; leaves oblong-lanceolate, acute at both ends, sinuately and doubly toothed, flat and glabrous above, and hairy beneath and fuscescent: teeth callously mucronate; racemes axillary; ovarium obconical, smooth; calycine segments ovate, obtuse, mucronate, rather hairy; corolla hairy, especially on the nerves. ♄. G. Native of Owahu. Lobèlia ambígua, Cham. in Linnæa. 7. p. 221. Stem simple. ? Corolla deciduous.

Ambiguous Rollandia. Shrub.

5 R. CALYCÌNA; leaves oblong-lanceolate, acute at both ends, unequally and erosely crenated, flat and pilose above, and reticulately veined, fuscescent and hairy beneath; calyx glabrous, with oblong, bluntish, 1-nerved segments; ovarium olive-formed, crowned by the erect calycine teeth; limb of corolla hairy; tube of anthers hairy about the base and along the furrows. ♄. G. Native of Owahu. Lobèlia calycìna, Cham. in Linnæa. 7. p. 222. Corolla deciduous.

Large-calyxed Rollandia. Shrub.

Cult. See *Clermóntea*, p. 698. for culture and propagation.

III. CYA'NEA (from κυανεος, *kyaneos*, blue; colour of flowers). Gaud. in Freyc. voy. pt. bot. p. 457.

Lin. syst. *Pentándria, Monogýnia.* Calyx adhering to the ovarium, 10-furrowed, longer than the limb, which is foliaceous and 5-parted; segments oblong, with reflexed undulately curled margins. Corolla tubular, cylindrical, arched; limb 5-parted, somewhat bilabiate. Stamens 5, with combined filaments, and cohering bearded anthers. Stigma capitate, simple, ciliated with hairs. Capsule baccate, 10-furrowed, indehiscent, 2-celled, crowned by the permanent calyx; cells many-seeded.

1 C. GRIMESIA'NA (Gaud. l. c. p. 458. t. 75.) branched; leaves large, pinnate-parted, smoothish, with lanceolate coarsely toothed segments; petioles, rachis, and peduncles beset with tubercular prickles; segments of calyx large. ♄. G. Native of the Sandwich Islands. Lobèlia Grimesiàna, Gaud. mss. Hook. et Arn. in Beech, voy. pt. bot. p. 88.

Grimes's Cyanea. Shrub.

Cult. See *Clermóntea*, p. 698. for culture and propagation.

IV. DELI'SSEA (named after A. M. Delisse, a physician from the Isle of France, and naturalist to the French expedition under D'Entrecasteaux, to the South Seas—from 1800 to 1804). Gaud. in Freyc. voy. pt. bot. p. 457.

Lin. syst. *Pentándria, Monogýnia.* Calyx closely adnate to the ovarium; limb free, 5-toothed, permanent. Corolla tubular, arched, deciduous; tube cylindrical, undivided; limb 5-parted, somewhat bilabiate; segments narrow. Stamens 5, with connate filaments, and cohering anthers: the two lower ones bearded. Stigma 2-lobed, girded by hairs. Capsule baccate, crowned by the permanent calyx, 2-celled, indehiscent; cells many-seeded.—Shrubby lactescent plants. Leaves scattered, exstipulate, entire. Flowers racemose, axillary, pale red, or whitish red; pedicels unibracteate at the base.

1 D. SUBCORDA'TA (Gaud. l. c. p. 457. t. 77.) branched; leaves ovate, sharply toothed, glabrous. ♄. G. Native of the Sandwich islands. Lobèlia subcordàta, Gaud. mss.

Subcordate-leaved Delissea. Shrub.

2 D. UNDULA'TA (Gaud. l. c. t. 78.) stem simple; leaves oblong, sharply and coarsely toothed, glabrous, with undulated margins. ♄. G. Native of the Sandwich Islands. Lobèlia undulàta, Gaud. mss.

Undulated-leaved Delissea. Shrub.

3 D. ACUMINA'TA (Gaud. l. c. t. 76.) branched; leaves oblong, doubly denticulated, hairy on both surfaces. ♄. G. Native of the Sandwich Islands. Lobèlia Delisseàna, Gaud. mss. Lobèlia acuminàta, Hook. et Arn. in Beech. voy. pt. bot. p. 88.

Acuminated-leaved Delissea. Shrub.

4 D. ANGUSTIFÒLIA (Cham. in Linnæa. 7. p. 219.) glabrous; leaves on long petioles, narrow-lanceolate, flat, acute, bluntly serrated; calyx at first 5-toothed: teeth minute, ciliated, but afterwards toothless, with undulated edges; corolla smooth, without papillæ. ♄. G. Native of Owahu. Stem quite simple. ? Pedicels axillary at the top of the stem, forming a corymb. Filaments ciliated. Lobes of stigma pilose on the back.

Narrow-leaved Delissea. Shrub.

Cult. For culture and propagation see *Clermóntea*, p. 698.

V. PRA'TIA (named in memory of M. Prat-Bernon, of the French navy, who accompanied Freycenet, but died a few days after the expedition sailed). Gaud. in Freyc. voy. pt. bot. p. 456.—Lobèlia species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx adnate to the ovarium; limb free, 5-toothed (f. 119. *a.*). Corolla funnel-shaped, cleft on the back, even to the base; limb 5-parted, spreading, unilabiate (f. 119. *b.*). Stamens 5, with the filaments combined into the tube above, and the anthers cohering; the two lower anthers mucronate (f. 119. *d.*). Stigma 2-lobed. Capsule covered by the fleshy calyx, 2-celled (f. 119 *e.*), indehiscent; cells many-seeded.—Small herbs. Stems filiform, branched. Leaves thickish. Flowers axillary, solitary, pedunculate, rarely corymbose, of a pale violet colour; peduncles bracteolate.

1 P. RE'PENS (Gaud. in Freyc. voy. p. 456. t. 79.) glabrous; stems creeping; leaves petiolate, rather reniform, undulately subcrenated. ♃. F. Native of the Falkland Islands. Lobèlia Pratiàna, Gaud. mss. Flowers bluish-violet (f. 119.).

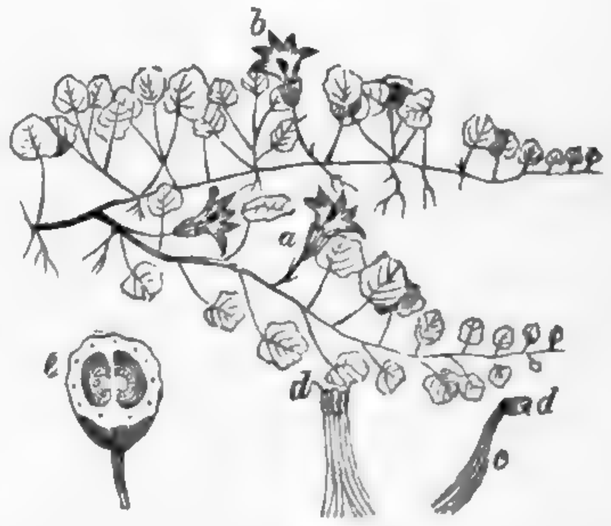
Creeping Pratia. Pl. creeping.

2 P.? ERE'CTA (Gaud. l. c.) stems nearly erect; leaves sessile, ovate-lanceolate, remotely and sharply toothed. ♃. G. Native of New Holland, on the east coast, at Port Jackson. Lobèlia ? cóncolor, R. Br. prod. p. 562.

Erect Pratia. Fl. May, June. Clt. 1819. Pl. 1 foot.

3 P. CORYMBÒSA; glabrous; stems weak, angular, branched; superior leaves linear-spatulate: lower ones roundish, running into the petioles: all deeply serrated; flowers disposed in dense pedunculate corymbs; ♃. G. Native of the Cape of Good Hope. Lobèlia corymbòsa, Hook. in bot. mag. t. 2639. Flowers pure white, richly dotted with purple, capitate. Filaments and anthers combined; the latter bluish purple. Stigma capitate, surrounded by a circle of hairs.

FIG. 119.



Corymbose-flowered Pratia. Fl. June, July. Clt. 1824. Pl. decumbent.

4 P. HEDERA'CEA (Cham. in Linnæa. 7. p. 212.) glabrous; stems filiform, creeping; leaves on short petioles, orbicular, crenately toothed. ♃. F. Native of Brazil, on the banks of the Uruquay, along with *Hydrocótyle pusílla*, and other parts of Brazil. Corolla bluish, villous inside. Filaments ciliated inside. Pedicels exceeding the leaves.

Ivy-like Pratia. Pl. creeping.

5 P. BEGONIÆFÒLIA; leaves roundish-cordate, serrated, petiolate, hairy on both surfaces, oblique at the base; pedicels solitary; calycine segments linear-subulate; stems filiform, creeping, hairy. ♃. G. Native of Nipaul, at Suembu, in fields near the town of Katmandu, and near water-courses and springs. Lobèlia begoniæfòlia, Wall. in asiat. res. 13. p. 377. Hook. bot. mag. with a figure. L. oblìqua, Ham. mss. ex D. Don, prod. fl. nep. p. 158. Herb rather canescent. Flowers small, blue. Fruit round, fleshy, about the size of a pea, purple, with numerous flattened brownish seeds attached to 2 thick septal placentas.

Begonia-leaved Pratia. Fl. June, Aug. Clt. 1827. Pl. creeping.

6 P. radi'cans; an annual, creeping, glabrous herb; leaves sessile, lanceolate, remotely serrulated; pedicels axillary, solitary, twice the length of the leaves. ♃. F. Native of China, from which place it was accidentally introduced to the botanic garden, Calcutta. Lobèlia radìcans, Willd. spec. 1. p. 948. The plant spreads over the soil and roots at every branch. The flowers are large for the size of the plant, of a pink colour. Segments of the corolla equal, unilateral, and narrow-lanceolate, with 2 green glands under the middle sinuses, opposite to the long, green, 2-lobed stigma.

Rooting Pratia. Pl. creeping.

7 P. Thunbe'rgii; glabrous; leaves sessile, decurrent, lanceolate, undulated, serrated; pedicels axillary, solitary, longer than the leaves; stems decumbent, rooting, filiform. ♃. G. Native of Japan. L. radìcans, Thunb. in Lin. trans. 2. p. 330. L. Erìnus, Thunb. jap. p. 323. Flowers red.

Thunberg's Pratia. Pl. creeping.

Cult. A mixture of loam, peat, and sand is a good soil for the species of *Pràtia;* and they will easily be increased by dividing at the root, or by seed.

VI. TU'PA (*Tùpa* is the Chili name of the first species). *Lobèlia* species of authors.

Lin. syst. *Pentándria, Monogýnia.* Calyx adhering to the spherical ovarium; limb 5-cleft. Corolla long, inflated at the base, cleft on the back its whole length, unilabiate; limb divided into 5 segments, which are all united at their tips. Stamens 5, united into a tube; anthers cohering, all bearded, or only in 2 lower ones. Style protruding beyond the anthers; stigma orbicular, 2-lobed, not bearded. Capsule 3-celled, 3-valved? cells many-seeded.—Tall strong herbaceous plants. Leaves alternate, ovate-lanceolate, downy. Flowers pedicellate, disposed in terminal racemes, or solitary from the axils of the upper leaves. Superior leaves sessile.

1 T. Feuìllei; stem erect, thick, suffruticose at the base, simple, leafy; leaves ovate-lanceolate, sessile, decurrent, clothed with soft whitish down; raceme terminal, spicate. ♃. F. Native of Chili and Peru. Lobèlia Tùpa, Lin. spec. 1318. Sims, bot. mag. 2550. Sweet. fl. gard. 284. Feuill. per. 2. p. 739. t. 29. Corollas large, of a reddish scarlet colour, and are as well as the peduncles and calyxes downy. This is a very poisonous species, even the smell of the flowers will cause vomiting, accordingly Feuillee, and the milk of it, if by any accident it touches the eyes, occasions blindness.

Feuillee's Tupa. Fl. Sept. Oct. Clt. 1824. Pl. 6 to 8 ft.

2 T. salicifòlia; leaves lanceolate, sessile, glabrous, serrulated, reticulated beneath; pedicels axillary, bracteate, 1-flowered, shorter than the leaves; stem terete, filled with medula, simple or branched. ♄. F. Native of Chili, about Valparaiso. Lobèlia Tùpa, Ait. hort. kew. 1. p. 357. Lobèlia gigántea, Sims, bot. mag. 1325. Lobèlia salicifòlia, Sweet. Corollas yellow at first, then orange, and finally blood-red. Anthers hairy.

Willow-leaved Tupa. Fl. Oct. Nov. Pl. 10 to 16 feet.

3 T. purpu'rea; leaves lanceolate, serrulated, glabrous; flowers racemose; calyx spherical, 5-toothed; stem simple suffruticose. ♄. F. Native of Chili, in the neighbourhood of Valparaiso. Anthers hairy. Lobèlia purpùrea, Lindl. bot. reg. 1325. Flowers fine purple.

Purple-flowered Tupa. Fl. Aug. Clt. 1825. Fl. 3 to 4 feet.

4 T. argu'ta; leaves linear-lanceolate, serrulated, quite glabrous on both surfaces; pedicels axillary, shorter than the leaves; stem suffruticose, simple, glabrous. ♄. F. Native of Chili. Lobèlia argùta, Lindl. in bot. reg. 973. Pedicels bibracteate in the middle. Corollas of a deep yellow colour. Tube of anthers shorter than the style. Very like *T. salicifòlia.*

Sharp-serrated-leaved Tupa. Fl. Aug. Oct. Clt. 1824. Shrub 2 feet.

5 T. Cavanillesia'na: leaves sessile, ovate-oblong, serrulated, mucronate, downy, glaucous; stem villous; raceme short, leafy; corolla downy ♄. F. Native of Chili, at the bottom of Cuchu-Cucha. Lobèlia mucronàta, Cav. icon. 6. p. 11. t. 516. Hook. bot. mag. t. 3207. Superior leaves cordate at the base. Corolla scarlet, 2 inches long.

Cavanilles's Tupa. Shrub $2\frac{1}{2}$ to 3 feet.

6 T. secu'nda; glabrous; leaves elliptic-lanceolate, wrinkled when dried, denticulated, with rather revolute edges; racemes terminal, secund, short; pedicels rising from the axils of the upper leaves or bracteas, which are small and linear; column of stamens much exserted; two upper anthers bearded. ♄. G. Native of Peru. Lobèlia secúnda, Ruiz et Pav. in herb. Lamb. Leaves dense. Segments of calyx membranous.

Secund-flowered Tupa. Shrub. ?

7 T. ova'ta; glabrous; leaves ovate, slightly and distantly denticulated on the edges, wrinkled when dried; raceme long, terminal, dense, secund; column of stamens much exserted; anthers bearded on the lower side. ♃. G. Native of Peru. (v. s. in herb. Lamb.).

Ovate-leaved Tupa. Pl.

8 T. obova'ta; leaves obovate, obtuse, clothed with rusty tomentum beneath, slightly denticulated; peduncles axillary, 1-flowered, longer than the leaves; calyx spherical; corolla rather short. ♃. F. Native of Peru. Lobèlia incàna, Ruiz et Pav. in herb. Lamb. Leaves wrinkled when dried. Flowers purple or red. Anthers all bearded.

Obovate-leaved Tupa. Pl. 2 to 3 feet.?

9 T. polyphy'lla; leaves ovate-lanceolate, mucronate, sharply serrated, quite glabrous; racemes terminal leafy; tube of corolla not much longer than the calyx; two lower anthers bearded. ♃. F. Native of Chili, on hills about Valparaiso. Lobèlia polyphýlla, Hook. et Arn. in Beech. voy. pt. bot. p. 33. Pedicels filiform, about the length of the bracteas. Corolla hardly an inch long, downy, dark purple.

Many-leaved Tupa. Fl. Aug. Sept. Clt. 1832. Pl. 5 to 6 ft.

Cult. The species of *Tùpa* are deserving of cultivation in every collection, on account of the beauty and singularity of their flowers. They are generally raised from seed imported from the places of their natural growth; and when the plants are of a sufficient size, they are planted out into the open border in front of a south wall, where they flower in great perfection. In winter they may either be protected with the haulm of herbs, or be taken up and potted, and placed in a green-house or frame till the spring, when they should again be planted out.

VII. SIPHOCA'MPYLUS (from *σιφων, siphon,* a tube, and *καμπυλος, campylos,* a curve; in reference to the curved tube of the corolla). Pohl, pl. bras. 2. p. 104.—Lobèlia species of authors.

Lin. syst. *Tetrándria, Monogýnia.* Calyx adnate to the ovarium; limb 5-parted (f. 120. *d.*), having the segments shorter than the tube of the corolla. Corolla irregular, tubular (f. 120. *a.*); tube entire, declinate, rather ventricose in the middle, and rather coarctate at the base; limb 5-parted, bilabiate (f. 120. *b.*); upper lip of 2 straight or spreading segments; the 2 lateral segments of the lower lip diverging, and the middle one more profound. Stamens and anthers combined, the latter bearded. Capsule ovate, 2-celled, 2-valved, dehiscing at the apex.—Erect shrubs or subshrubs. Leaves alternate and opposite, petiolate. Flowers axillary, solitary, rarely crowded at the tops of the stem or branches, so as

to appear racemose. The segments of the corollas are usually falcate or lanceolate; the upper ones generally the longest. The 2 lower anthers are usually bearded, and sometimes they are all bearded.

1 S. macra'nthus (Pohl. pl. bras. 2. p. 105. t. 168.) leaves oblong-ovate, acute, denticulated, quite glabrous; tube of corolla ventricose at the apex, incurved; calyx glabrous, having the segments the length of the third part of the tube of the corolla. ♄. S. Native of Brazil, about Rio Janeiro, and elsewhere in that province, in shady bushy places.—Vaud. in Rœm. script. p. 147. no. 2. Stem fistular, simple, green. Flowers axillary, solitary, approximate at the tops of the stems, and forming leafy racemes. Corollas of a bluish red colour. Anthers all much bearded at the apex.

Long-flowered Siphocampylus. Shrub 3 feet.

2 S. ca'nus (Pohl, pl. bras. p. 106. t. 169.) leaves ovate, acute, crenated, downy beneath; tube of corolla glabrous, rather ventricose; segments of calyx hairy, 4 times shorter than the tube of the corolla. ♄. S. Native of Brazil, in the province of Minas Geraes. Stem medullary in the centre, simple, hairy, a little branched. Flowers axillary, approximate at the top of the stem and branches, forming there leafy racemes. Corollas of a bluish red colour.

Hoary Siphocampylus. Shrub 2 to 3 feet.

3 S. crenatifòlius (Pohl, pl. bras. 2. p. 107. t. 170.) leaves acute, oblong, somewhat attenuated at the base, doubly crenated, downy beneath; tube of corolla glabrous, ventricose; calyx hairy, having the segments 4 times shorter than the tube of the corolla. ♄. S. Native of Brazil, in the province of Minas Geraes, among bushes about Villa St. Joao d'el Rey. Stem suffruticose, fistular, tetragonal, furrowed. Leaves 3 inches long, and $1\frac{1}{2}$ broad, yellowish green. Flowers axillary, solitary, remote, but so crowded at the tops of the stems as to appear leafy spikes; of a bluish red colour.

Crenate-leaved Siphocampylus. Shrub 2 to 3 feet.

4 S. villósulus (Pohl, pl. bras. 2. p. 108. t. 171.) leaves oblong-oval, acute, doubly serrated, hairy, rather villous beneath, and truly villous on the nerves; corolla rather hairy; calyx having the segments 4 times shorter than the tube of the corolla. ♃. S. Native of Brazil, among bushes at Estrema, not far from Rio de Jiquitinhonha. Stem fistular, tetragonal, rather villous. Leaves 2 inches long, and $1\frac{1}{2}$ broad. Flowers axillary, solitary; the upper ones forming leafy racemes. Corolla of a bluish-red colour.

Villous Siphocampylus. Pl. 2 feet.

5 S. longipeduncula'tus (Pohl, pl. bras. 2. p. 109. t. 172.) leaves cordate at the base, and acuminated at the apex, denticulated, quite glabrous; flowers solitary, on very long peduncles; tube of corolla ventricose, and is as well as the calyx glabrous; segments of the calyx 5 times shorter than the tube of the corolla. ♃. S. Native of Brazil, in the province of Rio Janeiro, among bushes. Stem suffruticose, filled with medula, simple, glabrous. Leaves more than 3 inches long, and $1\frac{1}{2}$ broad. Flowers all remote, on peduncles 4 inches in length. Corollas bluish-red.

Long-peduncled Siphocampylus. Shrub 3 feet.

6 S. cardiophy'llus (Pohl, pl. bras. 2. p. 110. t. 173.) leaves cordate, acuminated, rather undulated, quite glabrous, with remote short denticulations; flowers solitary, on long peduncles; tube of corolla as well as the calyx glabrous; calycine segments much shorter than the tube of the corolla. ♃. S. Native of Brazil, in the province of Minas Geraes, among bushes in mountainous places at Serra de Chumbo, not far from Rio Abaite. Stem suffruticose, fistular, a little furrowed, glabrous. Leaves $2\frac{1}{2}$ inches long, and more than an inch broad; the denticulations are the extension of the veins. Upper flowers forming a leafy raceme. Corolla bluish-red, having the segments ciliated.

Heart-leaved Siphocampylus. Shrub 3 feet.

7 S. nítidus (Pohl, pl. bras. 2. p. 111. t. 174.) leaves cordate, acute, simply and doubly serrated, quite glabrous, shining, opaque beneath, and the nerves are pilose when examined by a lens; tube of corolla rather ventricose, and rather hairy when examined by a lens; calyx downy, having the segments 3 times shorter than the tube of the corolla. ♃. S. Native of Brazil, in the province of Minas Geraes, about Fazendo do Apollinario, not far from Rio Abaite. Stem suffruticose, filled with medula, glabrous. Leaves $2\frac{1}{2}$ inches long, and more than an inch broad. Superior flowers forming a leafy raceme. Corolla bluish-red, hairy.

Shining-leaved Siphocampylus. Sh. 2 to 3 feet.

8 S. corymbi'ferus (Pohl, pl. bras. 2. p. 112. t. 175.) leaves cordate, acuminated, doubly and emarginately toothed, ciliated, glabrous, rather hairy on the nerves and veins beneath; tube of corolla rather ventricose, glabrous; calyx glabrous, having the segments much shorter than the tube of the corolla. ♃. S. Native of Brazil, in the province of Minas Geraes, among bushes in mountainous places about Vieira. Stem herbaceous, fistular, glabrous. Leaves more than 2 inches long and an inch broad. Corymbs terminal, simple, many flowered. Corollas scarlet, smooth.

Corymb-bearing Siphocampylus. Pl. 2 to 3 feet.

9 S. Colu'mnæ; leaves oblong, rounded at both ends, crenated, coriaceous, rugged above, glabrous, and shining, but clothed with fuscescent tomentum beneath; pedicels axillary, longer than the leaves; corolla a little curved, beset with stellate tomentum outside, having the segments linear-falcate, and nearly equal. ♄. S. Native of New Granada, in high places near the city of Santa Fe de Bogota. Lobèlia Colúmnæ, Mutis in Lin. suppl. p. 393. Smith, icon. ined. 1. p. 22. t. 22. H. B. et Kunth, nov. gen. amer. 3. p. 302. Calyx tomentose outside. Two lower anthers bearded. Corollas red.

Columna's Siphocampylus. Shrub.

10 S. barba'tus; leaves lanceolate-oblong, acute, obtuse at the base, denticulated, hairy above, and clothed with hairy tomentum beneath, particularly on the nerve and veins; pedicels axillary, longer than the leaves. ♄. S. Native of New Granada. Lobèlia barbàta, Cav. icon. 6. p. 12. t. 519. H. B. et Kunth, nov. gen. amer. 3. p. 303. Branches clothed with rusty stellate tomentum. Upper surfaces of leaves beset with stellate hairs. Calyx beset with rusty tomentum outside, and the corolla with stellate hairs. Segments of the calyx very short; of the corolla falcate. Column of stamens pilose. Two lower anthers bearded. Corollas scarlet.

Bearded Siphocampylus. Shrub 3 to 4 feet.

11 S. ferrugi'neus; leaves obovate-oblong, acutish, obsoletely denticulated, smoothish above, but clothed with rusty stellate tomentum beneath, especially on the nerve and veins; flowers axillary, pedicellate, longer than the leaves; calycine segments 4 times shorter than the tube of the corolla. ♄. S. Native of New Granada, near Santa Fe de Bogota; and of Peru, near Guamantanga and Obragillo. Lobèlia ferrugínea, Mutis, Lin. suppl. p. 394. L. asclepiádea, Willd. rel. in Rœm. et Schultes, syst. 5. p. 57. Branches clothed with rusty stellate tomentum. Calyx and corolla clothed with rusty stellate tomentum. Corolla red. Genitals exserted. Two lower anthers bearded.

Rusty Siphocampylus. Shrub.

12 S. Caoutcho'uc; leaves oblong, acute, rounded at the base, with glandularly denticulated edges, smoothish above, but clothed with rusty tomentum beneath, particularly so on the nerve and veins; flowers axillary, pedicellate, shorter than the leaves; segments of the calyx denticulated, one-half shorter

than the tube of the corolla. ♄. S. Native of the province of Popayan, in valleys near the river Mayo, near La Cruz; also in Paramo de Achupallas. Lobèlia Caoutchóuc, Willd. rel. in Rœm. et Schultes, syst. 5. p. 57. H. B. et Kunth, nov. gen. amer. 3. p. 304. Branchlets, calyx, and corolla clothed with rusty stellate tomentum. Corollas red. Genitals exserted; anthers bearded. The milk from this plant forms an elastic gum, which is called *Caoutchouc* by the natives.

Caoutchouc Siphocampylus. Shrub 10 to 15 feet.

13 S.? UMBELLA'TUS; leaves oblong-lanceolate, acuminated, denticulated, smoothish above, and downy beneath; flowers crowded into umbels at the tops of the branches, on long pedicels; segments of calyx equal in length to the tube of the corolla; lower lip of corolla entire, acute. ♄. S. Native of Peru, on the Andes, near Ayavaca; as also of Brazil. Lobèlia umbellàta, H. B. et Kunth, nov. gen. amer. 3. p. 304. t. 268. L. Ayavacénsis, Willd. rel. in Rœm. et Schultes, syst. 5. p. 57. A fetid shrub, with villous angular branches. Leaves a foot long. Calyx clothed with viscid hairs. Corolla white, downy. Anthers bearded with yellowish hairs. This will probably form a distinct genus from the lower lip of the corolla being entire.

Umbellate-flowered Siphocampylus. Shrub.

14 S. GIGA'NTEUS; leaves oblong-lanceolate, acuminated, toothed, reticulately wrinkled, glabrous above, and downy beneath, and clothed with hoary tomentum along the nerve and veins; flowers axillary, on very long peduncles; calycine segment equal in length to the tube of the corolla; filaments glabrous. ♄. S. Native of New Granada, on elevated plains about Bogota; and on the Andes. Lobèlia gigántea, Cav. icon. 6. p. 9. t. 513. H. B. et Kunth, nov. gen. 3. p. 305. Branches downy. Calycine segments irregularly crenated. Calyx and corolla downy outside. Anthers bearded, with long yellowish hairs. Corolla of a yellowish red colour. Intermediate between *Siphocámpylus* and *Tùpa*.

Giant Siphocampylus. Shrub 14 feet.

15 S. FŒ'TIDUS; leaves lanceolate-oblong, acuminated, narrowed at the base, denticulated, hairy on both surfaces; flowers axillary, on long pedicels; segments of the calyx equal in length to the tube of the corolla; filaments downy. ♄. S. Native along with the preceding. Lobèlia fœ'tida, Willd. rel. ex Rœm. et Schultes, syst. 5. p. 57. H. B. et Kunth, nov. gen. amer. 3. p. 305. Branches hairy, fuscescent. Pedicels villous, bibracteate at the base. Corolla white? Calyx and corolla hairy outside. Genitals exserted. Anthers densely bearded with yellowish hairs. A fetid shrub.

Fetid Siphocampylus. Shrub.

16 S. HI'RTUS; hairy; leaves oblong, acuminated, serrated, on very short petioles; pedicels axillary, very long, at the tops of the stem and branches. ♄. S. Native of Quito, on Mount St. Antonio. Lobèlia hírta, Cav. icon. 6. p. 13. t. 520. Branched. Leaves more than 6 inches long and 1½ broad, tapering into the petioles. Calyx globose, villous. Corollas scarlet, villous. Stamens glabrous.

Hairy Siphocampylus. Shrub 5 to 6 feet.

17 S. COMÒSUS; leaves lanceolate, toothed, powdery beneath; corymbs terminal, supported by a tuft of leaves. ♄. S. Native of New Spain. Lobèlia comòsa, Cav. icon. 6. p. 9. t. 512. f. 1. Stems simple, furrowed. Leaves on short petioles, 2 inches long, green above, and yellowish beneath. Petioles villous. Anthers and stigma bearded. Corollas yellowish.

Tufted-leaved Siphocampylus. Shrub 2 to 3 feet.

18 S. CAVANILLESIA'NUS; leaves ovate-lanceolate, biserrated; flowers axillary, solitary, pedicellate, the whole forming a leafy raceme. ♄. S. Native of Peru, about the town of Buena Ventura. Lobèlia biserràta, Cav. icon. 6. p. 10. t. 514. Branches furrowed. Leaves on short petioles, tomentose beneath: lower ones 3 inches long and 1½ broad. Pedicels bibracteate, thickened at the base and apex. Corolla of a yellowish scarlet colour, cleft a very little way on the back, glabrous.

Cavanilles's Siphocampylus. Shrub 3 feet.

19 S. BESLERIOÌDES; leaves oblong-elliptic, rounded at the apex, denticulated, hairy on both surfaces; flowers axillary, pedicellate, shorter than the leaves; segments of calyx 4 times shorter than the tube of the corolla. ♄. S. Native of the Andes, about Popayan. Lobèlia beslerioìdes, H. B. et Kunth, nov. gen. amer. 3. p. 306. Habit of a species of *Beslèria*. Branches clothed with viscid hairs. Leaves rather hairy on both surfaces. Pedicels villous, bractless. Calyx and corolla hairy outside, the latter white. Two lower anthers bearded.

Besleria-like Siphocampylus. Shrub 2 to 3 feet.

20 S. SPECTA'BILIS; leaves oblong, acute, obtuse at the base, minutely denticulated, glabrous; flowers axillary, pedicellate, shorter than the leaves; corolla glabrous, 5 times longer than the calyx. ♄. S. Native of the province of New Andalusia, on Mount Cocollar, in shady humid places. Lobèlia spectábilis, Willd. in Rœm. et Schultes, syst. 5. p. 58. H. B. et Kunth, nov. gen. amer. 3. p. 306. Branches glabrous, 3½ inches long. Pedicels bibracteate at the base. Calyx glabrous, with somewhat denticulated hairy segments. Corollas scarlet. Anthers bearded.

Showy Siphocampylus. Shrub 3 feet.

21 S. SURINAME'NSIS; leaves oblong-lanceolate, acute, obtuse at the base, remotely denticulated, glabrous; flowers pedicellate, axillary, shorter than the leaves; corollas glabrous, with the tube 3 times longer than the segments of the calyx. ♄. S. Native of Surinam, New Granada, and Brazil. Lobèlia Surinaménsis, Lin. spec. 1320. Curt. bot. mag. 225. Andr. bot. rep. 502. Bonpl. nav. p. 95. t. 39. Lodd. bot. cab. 749. Lobèlia lævigàta, Lin. fil. suppl. p. 392. Branches glabrous. Pedicels downy, bibracteate at the base. Calyx glabrous. Corollas orange-coloured or red. Anthers bearded.

Surinam Siphocampylus. Fl. Jan. July. Clt. 1786. Shrub 2 to 3 feet.

22 S. MACRÓPODUS; leaves elliptic-oblong, serrulated, villous; flowers axillary, on long pedicels; branches downy. ♄. S. Native of Brazil, on mountains about Villa Ricca. Lobèlia macrópoda, Swartz, pl. bras. dec. 1. p. 6. Branches angular, downy. Leaves petiolate. Segments of corolla undulated. Corolla scarlet. Two lower anthers bearded.

Long-pedicelled Siphocampylus. Shrub 2 to 3 feet.

23 S. WESTIA'NUS; leaves 3 in a whorl, oblong, acute, serrated, villous beneath, and glabrous above; pedicels axillary, villous; tube of corolla pentagonal. ♄. S. Native of Brazil, about Villa Rica, in humid places on the mountains. Lobèlia Westiàna, Swartz, pl. dec. bras. 1. 1817. Rœm. et Schultes, syst. 5. p. 53. Branches downy. Corollas scarlet, 2 inches long. Anthers blue, 2 lower ones bearded by white hairs.

West's Siphocampylus. Shrub 2 to 3 feet.

24 S. GRA'NDIS; leaves oblong, acute, crenately serrulated, glabrous; umbels terminal, bracteate; corollas hairy; segments of the calyx 10 times shorter than the tube of the corolla. ♄. S. Native of New Granada, near Santa Fe de Bogota. Lobèlia grándis, Mutis in Lin. suppl. 394. H. B. et Kunth, nov. gen. 3. p. 307. Branches glabrous. Leaves 5 inches long and 2 broad. Flowers pedicellate, red, hairy outside as well as the calyx. Pedicels bracteate at the base; bracteas obtuse, hairy. Two upper segments of the corolla falcate. Anthers hairy; two lower ones bearded.

Grand Siphocampylus. Shrub.

25 S. GLABRA'TA; leaves oblong-elliptic, acute, rounded at the base, obsoletely toothed at the apex; flowers axillary, pedicellate, longer than the leaves; calycine segments crenated,

about equal in length to the tube of the corolla. ♄. S. Native along with the preceding species. Lobèlia glabràta, H. B. et Kunth, nov. gen. amer. 3. p. 307. t. 270. Branches glabrous. Leaves 3-4 inches long, glabrous, pale green, petiolate. Pedicels bractless. Calyx and corolla glabrous; the latter greenish. Segments of corolla falcate. Filaments downy; anthers glabrous. Genitals exserted.

Glabrous Siphocampylus. Shrub.

26 S. Mutisia'nus; leaves oblong, short-acuminated, narrowed and acute at the base, remotely and bluntly toothed, glabrous, except the nerve and veins beneath, which are hairy; flowers axillary, pedicellate, shorter than the leaves; corollas glabrous, much longer than the calycine segments. ♄. S. Native of New Granada, on frigid mountains. Lobèlia Mutisiàna, H. B. et Kunth. nov. gen. amer. 3. p. 308. Branches rather hispid. Leaves 6-7 inches long. Petioles hairy. Pedicels bractless. Segments of calyx smooth, irregularly crenated. Corolla greenish, with falcate segments. Column of stamens glabrous; two lower anthers bearded.

Mutis's Siphocampylus. Shrub.

27 S. volu'bilis; stem twining; leaves ovate, acuminated, cordate, sharply toothed, glabrous above, and clothed with fine down beneath; flowers axillary, pedicellate; corolla hairy; segments of calyx 5-6-times shorter than the tube of the corolla. ♄. S. Native on the shady banks of the Orinoco. Lobèlia volùbilis, H. B. et Kunth, nov. gen. amer. 3. p. 309. L. cordàta, Willd. rel. ex Rœm. et Schultes, syst. 5. p. 58. Branches glabrous. Leaves cordate at the base. Pedicels downy, bractless. Corollas scarlet. Genitals exserted, glabrous. Anthers bearded (f. 120.).

FIG. 120.

Twining Siphocampylus. Shrub twining.

28 S. Berteria'nus; leaves remote, on long petioles, ovate-oblong, acuminated, erosely subcrenated, membranous, quite glabrous; pedicels solitary, axillary, loose; stem scandent. ♄. ◡. S. Native of Guadaloupe. L. scándens, Bertero. L. Berteriàna, Spreng. syst. 1. p. 712.

Bertero's Siphocampylus. Shrub cl.

29 S. sca'ndens; stem scandent; leaves oblong, obtuse, quite entire, rather fleshy, with revolute edges, glabrous; racemes terminal; flowers reflexed; corollas glabrous; calycine segments linear, slightly denticulated, 5-6 times shorter than the tube of the corolla. ♄. ◡. S. Native of Peru, in cold places between Paramo de Saraguru and the city of Loxa. Lobèlia scándens, H. B. et Kunth, nov. gen. amer. 3. p. 309. Lobèlia obtusifòlia, Willd., ex Rœm. et Schultes, syst. 5. p. 57. Branches glabrous. Pedicels furnished with one bractea at the base. Calyx glabrous. Corolla scarlet, with falcate segments. Column of stamens glabrous. Two inferior anthers bearded. Stigma girded by a pilose ring.

Climbing Siphocampylus. Shrub cl.

30 S. duplosera'tus (Pohl. pl. bras. 2. p. 114. t. 177.) leaves oblong or cordate at the base, twice serrated, petiolate; peduncles longer or shorter than the leaves; genitals exserted. ♄. S. Native of Brazil. Lobèlia triphýlla, Presl, symb. bot. 4. p. 62. t. 4. Corollas red or scarlet.

Doubly-serrated-leaved Siphocampylus. Shrub 2 to 3 feet.

31 S. andròpògon; leaves ovate, glabrous, hardly denticulated, soft; flowers axillary, solitary, pedicellate; corolla glabrous, curved. ♄. S. Native of the province of Quito, on Mount St. Antonio, in shady woods. Lobèlia Andròpògon, Cav. icon. 6. p. 10. t. 515. Stem glabrous, furrowed. Leaves 3 inches long, petiolate. Pedicels shorter than the leaves, villous at the base, bibracteate. Corolla scarlet, having the lower lip rounded, with 3 small acute teeth. Anthers bearded.

Bearded-anthered Siphocampylus. Shrub 5 to 6 feet.

32 S.? circiifòlius; leaves linear-lanceolate, toothed, glabrous: teeth subulate, distant; raceme terminal, leafy. ♄. S. Native of the Antilles and St. Vincent. Lobèlia circiifòlia, Lam. dict. 3. p. 584. no. 12.—Plum. spec. vol. 5. t. 116. Stem straight, simple, naked at the base, glabrous. Corolla curved, green or yellowish green.

Circium-leaved Siphocampylus. Shrub $1\frac{1}{2}$ foot.

33 S. verticilla'ta (Cham. in Linnæa. 7. p. 202.) leaves 6-8 in a whorl, almost sessile, narrow-oblong or linear-oblong, sharply and finely serrated, pale beneath; pedicels axillary, verticillate, shorter than the leaves, but the flowers exceed the leaves; calycine segments acute, more than 6 times shorter than the corolla; anthers glabrous on the back, and bearded in front; stem filled with medulla, erect, simple, densely leafy; root oblique. ♄. S. Native of the south of Brazil. Top of stem and ribs of leaves rather hairy, and the peduncles, calyxes, and corollas downy. Corollas red, 2 inches long, curved before expansion.

Whorled-leaved Siphocampylus. Shrub 3 to 6 feet.

34 S. betulæfòlius (Cham. in Linnæa. 7. p. 204.) leaves scattered, petiolate, cordately triangular or ovate, acuminated, somewhat doubly and acutely serrated, nerved, and veined; pedicels axillary, solitary, exceeding the leaves; calycine segments narrow, acute, serrulated, more than 6 times shorter than the corolla; anthers exserted, glabrous on the back, and bearded in front; stem flexuous, branched, terete, glabrous. ♄. S. Native of Brazil. Nerves of leaves and petioles downy. Corollas red, long. Very like *S. scándens*.

Birch-leaved Siphocampylus. Shrub 3 feet.

35 S. convolvula'cea (Cham. in Linnæa. 7. p. 205.) shrubby, climbing, and twining, glabrous; branches terete, slender; leaves petiolate, narrow, ovate-lanceolate, acuminated, with reflexed obsoletely denticulated edges; pedicels axillary, solitary, much longer than the leaves; ovarium oblong; teeth of calyx small; corolla long; anthers a little exserted, naked on the back. ♄. ◡. S. Native of Brazil. Corolla red, about 2 inches long. Leaves 3 inches long. Very like *S. scándens* and *S. volùbilis*.

Convolvulus-like Siphocampylus. Shrub cl.

36 S. imbrica'ta (Cham. in Linnæa. 7. p. 206.) leaves imbricated, almost sessile, ovate, cordate, hardly acute, serrulated, with rather reflexed edges, scabrous from hairs above, shining, flat: paler beneath, and more hairy, and reticulately veined; pedicels axillary, shorter than the leaves, and are as well as the calyxes hairy; calycine segments linear, acute, 4 times shorter than the corolla; corollas downy, exceeding the leaves; anthers exserted, naked on the back; stem with many prominent cicatrices, occasioned by the falling of the leaves, clothed at bottom with brown stiff hairs, and densely leafy at the top. ♄. S. Native of Brazil. Leaves 6 in a whorl, by threes. Corolla red.

Imbricated-leaved Siphocampylus. Shrub.

37 S. lycioìdes (Cham. in Linnæa. 7. p. 207.) erect, glabrous; leaves sessile, erect, narrow-lanceolate, acute, remotely and bluntly serrulated: lower ones somewhat verticillate, by threes, alternate; racemes leafy, terminal; floral leaves 6 in a whorl, having the pedicels by threes, verticillate; pedicels erect, a little shorter than the leaves; segments of the calyx ovate,

long-acuminated, 6 times shorter than the corolla; anthers a little exserted, glabrous. ♄. S. Native of Brazil. Stem angular. Corolla red.

Lycium-like Siphocampylus. Shrub 3 feet.

38 S. DEPE'NDENS; leaves coriaceous, ovate-lanceolate, somewhat cordate at the base, acuminated, finely and spinosely denticulated, tomentose beneath, glabrous above; branches and inflorescence downy or tomentose; pedicels from the axils of the upper leaves, and longer than them; column much exserted; calycine lobes linear-subulate. ♄. S. Native of Peru. Lobèlia depéndens, Ruiz et Pav. in herb. Lamb. Flowers racemose, at the tops of the branches. Plant scandent.

Dependent-branched Siphocampylus. Shrub cl.

39 S. ROSMARINIFÒLIUS; erect; leaves linear-lanceolate, entire, with revolute margins, tomentose beneath, and glabrous above; pedicels axillary, about the length of the leaves; column of stamens exserted; calyx with a spherical tube, and long linear segments. ♃. or ♄. S. Native of Peru. Lobèlia purpùrea, Ruiz et Pav. in herb. Lamb. Corollas red. Lower anthers bearded at top. Leaves dense, like those of some species of willow.

Rosemary-leaved Siphocampylus. Pl. 2 to 3 feet.

40 S. MACROPHY'LLUS; leaves broad, obovate, acuminated, glabrous, slightly denticulated, tapering much to the base; flowers almost forming a terminal corymb, much shorter than the leaves; calyx with a hemispherical tube and ovate-lanceolate segments; column of stamens exserted: the lower anther bearded at top. ♄. S. Native of Peru. Leaves a foot long. Pedicels crowded. Corollas red. (v. s. in herb. Lamb.)

Large-leaved Siphocampylus. Pl. 2 to 3 feet?

41 S. LACINIA'TA; leaves deeply jagged, acuminated; lobes acuminated; branches downy; lobes of corolla falcate; column of stamens downy; anthers glabrous, except the two lower ones, which are bearded at the apex; calyx spherical. ♄. H. Native of Peru. Lobèlia biserràta, Ruiz et Pav. in herb. Lamb. Corollas red or scarlet.

Jagged-leaved Siphocampylus. Shrub.

42 S. FU'SCUS; clothed with rusty tomentum in every part; calyx spherical, with reflexed denticulated lobes; leaves elliptic-lanceolate, denticulated; peduncles axillary, 1-flowered; corolla clothed with rusty wool; two lower anthers bearded. ♄. S. Native of Peru. Apparently a climbing shrub. (v. s. in herb. Lamb.)

Brown Siphocampylus. Shrub cl.

Cult. The species all bear large, showy, scarlet, or red flowers, and are therefore worth cultivating in every collection of stove plants. They are of easy culture. The soil best suited to them is a mixture of loam, sand, and peat; and cuttings of them strike readily in the same kind of soil under a hand-glass in heat.

VIII. LOBE'LIA (in honour of Matthew Lobel, author of various works, and particularly that called Icones Plantarum; he was born at Lisle in 1538, became physician and botanist to James I., and died in London in 1616). Pohl, pl. bras. 2. p. 99.—Lobèlia species, Lin. and other authors.

LIN. SYST. *Pentándria, Monogýnia.* Calyx adnate to the ovarium; limb 5-parted (f. 121. *a.*). Corolla irregular, tubular; tube cleft on the upper side, thickened or ventricose at the base; limb 5-parted, bilabiate; the 2 segments of the upper lip linear-lanceolate (f. 121. *f.*); lower lip trifid and pendulous, with lanceolate or roundish segments (f. 121. *g.*). Filaments combined above (f. 121. *e.*). Anthers cohering (f. 121. *c.*), bearded; the 2 lower ones usually bearded, and sometimes all. Capsule oval, 2-celled, 2-valved, many-seeded, dehiscing at the apex.—Erect or procumbent herbs. Leaves alternate, usually sessile. Flowers on short pedicels, usually disposed in terminal leafy spikes or racemes, rarely solitary and axillary, blue, red, or white, rarely yellow.

§ 1. *Species natives of America.*

* *Corollas blue.*

1 L. CAMPÒRUM (Pohl, bras. 2. p. 100. t. 165.) leaves linear, acute, remotely toothed, ciliated on the margins, glabrous, rather decurrent; flowers spicate, rather remote on short pedicels; bracteas oblong, acuminated, rarely toothed, pilose; calyx pilose, a little shorter than the tube of the corolla. ☉. H. Native of Brazil, in the province of Minas Geraes, in dry fields about Villa de Barbacena. Anthers all bearded. In the plant collected by Sello the lower leaves are obovate, and the upper ones lanceolate. Stem filiform, simple, pilose. Corollas blue.

Field Lobelia. Pl. 1 foot.

2 L. EXALTA'TA (Schott. in Pohl, pl. bras. 2. p. 101. t. 166.) leaves sessile, lanceolate, acuminated, rather attenuated at the base, denticulated, quite glabrous; flowers racemose, coarctate, pedicellate; bracteas lanceolate, acuminated, rather hairy; calyx pilose, exceeding the tube of the corolla in length. ♃. S. Native of Brazil, in marshy places in the province of Rio Janeiro, at Fazenda Malheas Ramos, as well as of the province of Minas Geraes. Stem fistular, furrowed, quite simple, glabrous, of a yellowish green colour. Bracteas ciliated. Corollas blue.

Exalted Lobelia. Pl. 5 feet.

3 L. THAPSOÌDES (Schott, ex Pohl, bras. 2. p. 102. t. 167.) leaves sessile, lanceolate, attenuated at the base, very long, denticulated, ciliated, rather pilose; flowers racemose, coarctate, on short pedicels; calycine segments lanceolate, acuminated, pilose, shorter than the tube of the corolla. ♃. S. Native of Brazil, about Rio Janeiro; and of the province of Goyaz. Stem tough, filled, simple, rather pilose, of a greenish brown colour. Bracteas ciliated. Flowers dense blue.

Thapsus-like Lobelia. Pl. 6 feet.

4 L. PAUCIFLÒRA (H. B. et Kunth, nov. gen. amer. 3. p. 314.) stem herbaceous, erect, simple; leaves sessile: radical ones lanceolate: cauline ones linear, remotely denticulated, glabrous; racemes terminal, few-flowered, on long peduncles; flowers on short pedicels; calycine segments hairy, as well as the corolla, one-half shorter than the tube of the corolla. ♃. S. Native of Brazil, in the province of Minas Geraes, in dry grassy places about Villa Barbacena; and of Mexico, near Valladolid de Mechoacan. L. commutàta, Willd. rel. ex Rœm. et Schultes, syst. 5. p. 73. L. símplex, Willd. herb. Corollas blue. Stem glabrous, striated. Bracteas linear, hairy, longer than the pedicels.

Few-flowered Lobelia. Fl. July, Aug. Clt. 1824. Pl. ½ ft.

5 L. RAPUNCULOÌDES (H. B. et Kunth, nov. gen. 3. p. 312.) leaves linear-lanceolate, acute, denticulated, glabrous, sessile; racemes terminal, loose-flowered; calycine segments equal in length to the tube of corolla; stems branched, procumbent. ♃. S. Native near the town of Mexico. L. dracunculoìdes, Willd. rel. ex Rœm. et Schultes, syst. 5. p. 56.? Stem hairy at bottom. Flowers remote, pedicellate. Bracteas linear, about the length of the pedicels. Corolla blue, glabrous. Leaves 1½ inch long. Two lower anthers bearded.

Rampion-like Lobelia. Pl. procumbent.

6 L. COLLÌNA (H. B. et Kunth, nov. gen. amer. 3. p. 312.) leaves lanceolate-linear, acute, denticulated, glabrous, sessile; racemes terminal, ascending; segments of the calyx one-half shorter than the tube of the corolla; stems procumbent; branches ascending, glabrous. ♃. S. Native of Peru, on dry

hills between Malacatis and Gonzanama, at the altitude of about 3000 feet. L. linifòlia, Willd. rel. ex Rœm. et Schultes, syst. 5. p. 67. Leaves 1 to 1½ inch long. Pedicels recurved, about equal in length to the bracteas, which are linear. Flowers of a violaceous blue colour. Two lower anthers bearded.

Hill Lobelia. Pl. procumbent.

7 L. FASTIGIA'TA (H. B. et Kunth, nov. gen. amer. 3. p. 313.) leaves lanceolate, remotely denticulated, glabrous, almost sessile; racemes terminal, elongated; calycine segments glabrous, about equal in length to the tube of the corolla; stem herbaceous, erect, with fastigiate branches. ♃. S. Native of Quito, near Popayan and Chillo, at the altitude of about 3000 feet. Lobèlia tenuifòlia, Willd. rel. ex Rœm. et Schultes, syst. 5. p. 56. Stems and branches angular, glabrous. Leaves 12-15 lines long. Bracteas linear, obsoletely denticulated, shorter than the pedicels. Corolla violaceous. Two lower anthers bearded.

Fastigiate-branched Lobelia. Pl.

8 L. MO'LLIS (Graham. in edinb. phil. journ. Decemb. 1829.) stem erect, branched, downy; leaves petiolate, cordately ovate, acute, downy above, and along the veins beneath, mucronately and doubly serrated: superior leaves lanceolate; racemes terminal, elongated; pedicels loose; segments of the lower lip of the calyx subulate, shorter than the corolla. ⊙. F. Native of Dominica, where it was collected by Dr. Krauss. Leaves 8 lines long and 6 broad. Calycine segment equal in length to the tube of the corolla, which is purplish, with the tube cleft along the upper side. Anthers purplish, having 2 short white awns projecting from their lower edge. Stigma almost simple, bearded. Perhaps a distinct genus.

Soft Lobelia. Fl. Sept. Nov. Clt. 1828. Pl. 1 foot.

9 L. RUPE'STRIS (H. B. et Kunth, nov. gen. amer. 3. p. 313.) leaves sessile, hairy or downy, toothed; lower ones oblong or obovate-oblong, obtuse: superior ones lanceolate, acute; racemes terminal; segments of the calyx hairy, about equal in length to the tube of the corolla; stem erect, branched a little. ♃. S. Native of the province of Popayan, on the declivities of the burning Mount Purace. Lobèlia polygalæfòlia, Willd. rel. ex Rœm. et Schultes, syst. 5. p. 56. Stems rather angular, and are as well as the branches downy. Bracteas linear, lanceolate, twice the length of the pedicels, which are distant. Flowers violaceous. Anthers blue, 2 lower ones bearded.

Rock Lobelia. Pl. 1 foot.

10 L. TE'NERA (H. B. et Kunth, nov. gen. amer. 3. p. 314.) leaves sessile, lanceolate-linear: lower ones lanceolate, remotely denticulated, glabrous; racemes terminal, few-flowered, on long peduncles; flowers on long pedicels; calycine segments glabrous, about equal in length to the tube of the corolla; stem herbaceous, erect, simple, glabrous. ♃. S. Native of the province of Quito, on hills near Puemba. Leaves 12-15 lines long. Flowers blue, remote, about the size of those of *L. ùrens*. Filaments ciliated at the base. Two lower anthers bearded.

Tender Lobelia. Fl. July. Pl. ¾ foot.

11 L. XALAPE'NSIS (H. B. et Kunth, nov. gen. amer. 3. p. 315.) leaves on long petioles, ovate-deltoid, irregularly crenated, hairy above, glabrous beneath; racemes terminal, pedunculate; calycine segments about equal in length to the tube of the corolla; stem erect, paniculately branched, angular, glabrous. ♃. F. Native of Mexico, near Xalapa and Macultipec. Leaves nearly as broad as long. Bracteas linear, much shorter than the pedicels. Filaments ciliated at the base. Two lower anthers bearded.

Xalapa Lobelia. Pl. ¾ foot.

12 L. KA'LMII (Lin. spec. 1318.) radical leaves spatulate, hairy: cauline ones linear, glabrous, sessile, denticulated or nearly entire; racemes loose, leafy; pedicels furnished with 2 bracteas at the apex, longer than the capsules; stem erect, slender, glabrous. ♃. F. Native of North America, in Canada, Carolina, and New York. Sims, bot. mag. 2238. Corollas beautiful blue, with the segments of the lower lip obovate, acute, marked by 2 white confluent spots in the centre. The variety of this which grows in Carolina has the radical leaves roundly spatulate; the stem more slender, and the flowers smaller.

Kalm's Lobelia. Fl. July, Aug. Clt. 1820. Pl. 1 to 1½ ft.

13 L. NUTTA'LLII (Rœm. et Schultes, syst. 5. p. 39.) leaves oblong-linear, denticulated, obtuse, remotish; flowers loosely racemose, distant; pedicels coloured, shorter than the flowers, bibracteate at the base; segments of the calyx obtuse; stem erect, minutely scabrous, branched. ♃. H. Native of North America, from New Jersey to Carolina, on the dry sandy edges of bogs. L. grácilis, Nutt. gen. amer. 2. p. 77. but not of R. Br. Pedicels and corollas blue; the lower lip marked by 2 acute white stripes, and 2 green dots, and other 2 towards the base of the tube. Very like *L. Kálmii*, and probably a variety of it.

Nuttall's Lobelia. Fl. July, Sept. Clt. 1824. Pl. 1 to 1½ foot.

14 L. FENESTRA'LIS (Cav. icon. 6. p. 8. t. 512. f. 2.) leaves lanceolate, acuminated, toothed, half-stem-clasping, glabrous, glaucous; spikes terminal, many-flowered; genitals shorter than the tube of the corolla. ⊙. H. Native of Mexico, near the town of St. Bartolone. Stem simple, furrowed. Leaves 2 inches long and 2 lines broad. Flowers almost sessile, disposed in leafy spikes, small, blue, fenestrate at the base, about 2 lines long. Stigma villous. Tube of corolla about 2 lines long. Genitals one-half shorter than the corolla.

Windowed Lobelia. Fl. June, Sept. Clt. 1824. Pl. 1½ foot.

15 L. CLIFFORTIA'NA (Lin. spec. p. 1320.) leaves on long petioles, ovate or roundish-ovate, rather cordate, bluntly and sinuately toothed, glabrous; racemes terminal, on long peduncles; calycine segments glabrous, about equal in length to the tube of the corolla; stem erect, nearly simple, glabrous. ⊙. H. Native of North America, in humid places; and of Cuba, about the Havannah; and of Mexico, near San Andres and Jalapa, in bushy places. Stem angular. Root perpendicular. Bracteas linear, much shorter than the pedicels, which are long and filiform. Corollas blue or violaceous.

De Cliffort's Lobelia. Pl. ½ to 1 foot.

16 L. SPICA'TA (Ruiz et Pav. in herb. Lamb.) glabrous; stem simple; leaves obovately lanceolate, obtuse, denticulated; upper ones lanceolate, sessile, denticulated; racemes simple; pedicels rising from the axils of the linear bracteas. ⊙. S. Native of Peru. Flowers small, blue. Like *L. ùrens*. Calyx tubular, with subulate segments.

Spike-flowered Lobelia. Pl. 1 foot.

17 L. MONTI'COLA (H. B. et Kunth, nov. gen. amer. 3. p. 316.) leaves petiolate, ovate, obtuse, rather cordate, doubly serrated, hairy on both surfaces; racemes terminal, on long peduncles; segments of calyx glabrous, about equal in length to the tube of the corolla; stem erect, almost simple, rather angular, glabrous, or a little hairy. ⊙. H. Native of New Granada, on the mountains between Fusagasuga and Pande. L. palmàris, Willd. rel. ex Rœm. et Schultes, syst. 5. p. 56. Root perpendicular, branched. Bracteas linear, much shorter than the pedicels. Corollas blue, glabrous. Anthers puberulous at the apex, but beardless.

Mountain Lobelia. Pl. ½ foot.

18 L. MICRA'NTHA (H. B. et Kunth, nov. gen. amer. 3. p. 316.) leaves petiolate, ovate, acuminated, dentately serrated, nearly glabrous; racemes terminal, sessile; calycine segments glabrous, about equal in length to the tube of the corolla; stem erect, paniculately branched, angular, hairy. ⊙. H. Native of the province of Quito, near Puembo. Lobèlia ruderàlis,

Willd. rel. ex Rœm. et Schultes, syst. 5. p. 56. Root perpendicular. Bracteas linear, shorter than the pedicels. Corolla blue. Two lower anthers bearded.

Small-flowered Lobelia. Pl. ½ foot.

19 L. subti'lis (H. B. et Kunth, nov. gen. amer. 3. p. 317.) leaves on short petioles, sharply toothed, hairy above, and glabrous beneath: lower ones nearly orbicular, and ovate: superior ones lanceolate; flowers axillary, on long pedicels, racemose; calycine segments glabrous, about equal in length to the tube of the corolla; stem erect, simple or branched, angular, hairy. ⊙. H. Native along with the preceding species. L. Dràba, Willd. rel. ex Rœm. et Schultes, syst. 5. p. 67. Flowers size and colour of those of the preceding.

Slender Lobelia. Pl. ½ foot.

20 L. na'na (Willd. rel. ex Rœm. et Schultes, syst. 5. p. 67. H. B. et Kunth, nov. gen. amer. 3. p. 317. t. 272.) leaves spatulate, quite entire, thickish, glabrous; flowers axillary and radical, on long pedicels; calycine segments glabrous, hardly equal in length to the tube of the corolla; stem short, erect, throwing out runners. ♃. F. Native of Mexico, near Real del Monte and Moran. Herb almost stemless, stoloniferous. Root with thick fibres. Corolla pale, violaceous. Filaments downy. Two lower anthers bearded.

Dwarf Lobelia. Pl. stoloniferous.

21 L. Claytonia'na (Michx. fl. bor. amer. 2. p. 153.) leaves oblong, obtuse, almost quite entire; lower ones spatulate, quite entire: cauline ones a little denticulated; spikes twiggy, naked; bracteas subulate; stem downy, erect, simple. ♃. H. Native of North America, from New York to Carolina, in mountain woods and other shady places. L. pállida, Muhl. L. goodenioìdes, Willd. herb. berol. 1. t. 30. L. spicàta, Lam. Stem angular. Leaves rather villous on the edges. Flowers very small, numerous, pale blue; segments of the calyx subulate, almost the length of the corolla. Lower lip of corolla reflexed. Capsules turbinate, very short.

Clayton's Lobelia. Fl. June, July. Clt. 1824. Pl. 1 to 2 ft.

22 L. syphili'tica (Lin. spec. 1320. Jacq. icon. 3. t. 597.) leaves ovate-oblong, acuminated at both ends, unequally serrated; flowers axillary, solitary, forming altogether a long leafy raceme; sinuses of calyx reflexed, and are as well as the peduncles hairy. ♃. H. Native of Virginia, in dry woods. Woodv. med. bot. 177. t. 63. Ker. bot. reg. 537. Rapúntium syphilíticum, Mill. dict. no. 2. Gærtn. fruct. 1. p. 152. t. 30. Leaves sessile, rather scabrous, decurrent. Flowers blue. Calyx serrately denticulated. Corolla angular, with nearly equal segments, having the keel ciliated, and the palate furnished with 2 gibbosities. The root is the part of the plant directed to be used in medicine; it resembles tobacco in taste, and is apt to excite vomiting. It derives its trivial name from its efficacy in the cure of syphilis, as experienced by the North American Indians, with whom it was a secret. A decoction is made of a handful of the roots, in 3 measures of water. Of this half a measure is taken in the morning fasting, and repeated in the evening; and the dose increased till its effects become too violent, when it is intermitted for a day or two. Although the plant is said to cure the disease in a very short time, yet its virtues have not been confirmed by any instances in European practice.

Var. β, maculàtus; stem more attenuated; leaves sharply denticulated, spotted with rust colour. ♃. H. Lam. dict. 3. p. 586. no. 21.

Syphilitic Lobelia. Fl. Aug. Oct. Clt. 1665. Pl. 1 to 2 ft.

23 L. infla'ta (Lin. spec. 1320. act. ups. 1741. p. 23. t. 1.) leaves sessile, dentately serrated: lower ones ovate-oblong: superior ones ovate; pedicels axillary, 1-flowered, forming a terminal leafy raceme; stem hairy; capsules inflated. ⊙. H. Native of Virginia and Canada. Bigel. mat. med. amer. 1. p. 177. t. 19. Sweet. fl. gard. 99. Rapúntium inflàtum, Mill. dict. no. 5. Stem branched at the top. Leaves rather villous beneath. Flowers small, pale blue. Segments of the calyx subulate, equal in length to the corolla. Leaves about 2 inches long.

Inflated-capsuled Lobelia. Fl. July, Aug. Clt. 1759. Pl. 1 to 1½ foot.

24 L. colora'ta (Sweet, fl. gard. n. s. t. 180.) glabrous; leaves lanceolate, acuminated, erosely toothed; raceme spicate, elongated, leafy; calycine segments linear-subulate. ♃. H. Received from North America, but probably a hybrid between *L. syphilítica* and *L. cardinàlis*. Corollas deep azure blue, crowded. Ovarium half inferior. This is probably the L. cœléstes, Nutt. and L. críspa, Graham. ex Loud. hort. brit. p. 75.

Coloured Lobelia. Pl. 4 to 5 feet.

25 L. cœle'stis (Nutt. ex Loud. hort. brit. p. 592.) this plant is in the gardens, but we are not aware of where it is described; it comes very near to *L. syphílitica*, and may only be a variety of that species. ♃. H. Native of North America. L. críspa, Graham. ex Loud. hort. brit. p. 75. Flowers of a beautiful blue, disposed in long dense terminal racemes.

Heavenly-blue Lobelia. Fl. June, Oct. Clt. 1831. Pl. 2 ft.

26 L. uranocòma (Cham. in Linnæa. 7. p. 321.) stem erect, angular, fistular; leaves hairy, erect, linear, attenuated, acute, finely denticulated; pedicels disposed in a terminal leafy raceme, shorter than the floral leaves, which are densely imbricated, ovate, acute, and shorter than the others, of a bluish colour; segments of the calyx linear, attenuated, about equal in length to the middle of the corolla, which is clothed with fine glandular down; anthers bearded in front. ♃. S. Native of tropical Brazil. Leaves a foot long. Corolla cleft on the back, nearly 2 inches long, blue.

Blue-tufted Lobelia. Pl. 5 feet.

27 L. glandulòsa (Walt. car. p. 218.) leaves lanceolate, glandularly serrated, rather fleshy, glabrous; flowers on short pedicels, racemose; segments of the calyx revolute, toothed; stem erect, branched, rather downy. ♃. H. Native of Carolina, by the sea side in marshes among grass. L. crassiúscula, Michx. fl. bor. amer. 2. p. 152. Nutt. gen. amer. 2. p. 76. Pedicels furnished with 2 bracteas, which are terminated by a gland each. Corollas blue, having the disk of the lower lip bearded. Stigma beset with white hairs.

Glandular-leaved Lobelia. Pl. 1 to 2 feet.

28 L. pube'rula (Michx. fl. bor. amer. 2. p. 152.) plant very simple, downy; leaves oblong, obtuse, repandly serrulated; flowers almost sessile, forming altogether a leafy elongated spike; calyx downy; calycine segments erect, lanceolate-subulate, entire, having the sinuses a little reflexed; stamens inclosed. ♃. H. Native from Virginia to Carolina, in mountain tracts. Pursh, fl. amer. sept. 2. p. 447. Bracteas serrulated. Flowers pale blue. Ovarium hispid. It differs from *L. Claytoniàna* in the flowers being thrice the size, and of a more beautiful blue.

Var. β, glabélla (Hook. bot. mag. t. 3292.) leaves hardly downy; calyx glabrous. ♃. H. Native of Louisiana, about Jackson Ville. Corolla bright purplish blue.

Puberulous Lobelia. Fl. June, July. Clt. 1800. Pl. 2 to 3 ft.

29 L. amœ'na (Michx. fl. bor. amer. 2. p. 153.) plant quite glabrous; leaves broad-lanceolate, serrated; spikes secund, many-flowered; segments of the calyx entire; segments of the lower lip of the corolla ovate, acute. ♃. H. Native from Virginia to Carolina, on the mountains. Leaves usually glabrous, 6-8 inches long, and 1 inch broad. Corollas pale blue. Pursh, fl. sept. amer. 2. p. 443. Nutt. gen. amer. 2. p. 76. Juss. ann. mus. 18. p. 16. t. 1. no. 1.

Pleasant Lobelia. Fl. July, Aug. Clt. 1812. Pl. 2 to 3 ft.

30 L. gruìna (Cav. icon. 6. p. 8. t. 511. f. 2.) leaves sessile,

lanceolate-linear, toothed; stem naked at the top, therefore the raceme of flowers is naked and terminal; bracteas subulate. ♃. S. Native of New Spain. Stem striated, glabrous. Leaves 2 inches long, glabrous. Corollas blue. Tube of corolla 3-4 lines long; segments of the upper lip narrower than those of the lower, and reflexed. Stigma villous. Filaments exserted, and resembling a stork's head. Very like *L. ùrens*.

Stork's Lobelia. Pl. 1 foot.

31 L. NUMMULARIOÌDES (Cham. in Linnæa. 7. p. 209.) glabrous; leaves rather fleshy, ovate, cordate, rather reniform, obtuse, quite entire, or obsoletely subsinuately crenated, on short petioles, and sessile; flowers axillary, on long pedicels; calycine segments a little shorter than the corolline tube; anthers glabrous on the back, all bearded; fruit globose; stems prostrate, radicant, but ascending and floriferous at the apex. ♃. S. Native of Brazil, within the tropics, in marshy places. Nearly allied to *L. Zeylánica*. Corolla blue or violaceous.

Moneywort-like Lobelia. Pl. prostrate and creeping.

32 L. RENIFO'RMIS (Cham. in Linnæa. 7. p. 210.) herbaceous, hairy; stems rather capillary, branched, creeping, rooting; leaves on short petioles, orbicularly reniform, obsoletely angular, membranous, nerved, and reticulately veined, pale green above, and glaucescent beneath; pedicels terminal and axillary, elongated; corolla glabrous outside, villous inside, with a broadish tube, and triangular segments; anthers glabrous on the back; calycine teeth ovate, acute, much shorter than the tube of the corolla. ♃. S. Native of Brazil. Plant tufted, creeping. Leaves hairy, ciliated on the edges. Flowers blue.

Kidney-shaped-leaved Lobelia. Pl. creeping.

33 L. AQUA'TICA (Cham. in Linnæa. 7. p. 211.) a glabrous aquatic herb; stem erect or floating, flattened in the dry state; leaves scattered, erect, sessile, narrow-lanceolate, acute, obsoletely serrated, 1-nerved; pedicels axillary at the tops of the stem, capillary, erect, twice the length of the leaves; ovarium semi-elliptic, crowned by the calycine segments, which are a little shorter than the tube of the corolla; anthers all bearded, glabrous on the back, exceeding the corolline tube, but shorter than its segments. ♃. S. Native of Brazil, on the banks of rivers, or in marshes among grasses. Flowers blue. Leaves half an inch long.

Aquatic Lobelia. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

34 L. SESSILIFÒLIA (Lamb. in Lin. trans. 10. p. 260. t. 6.) leaves sessile, oblong-lanceolate, serrulated, glabrous; pedicels axillary, shorter than the leaves; stem erect, leafy, glabrous, very simple. ♃. H. Native of Kamtschatka. L. Camtschática, Pall. mss. Habit of a *Euphórbia*. Leaves of an obscure green. Flowers blue?

Sessile-leaved Lobelia. Pl. 2 to 3 feet.

35 L. UMBELLA'TA (Vest, ex Rœm. et Schultes, syst. 5. p. 58.) glabrous; leaves sessile, linear, toothed, dilated and trifid at the apex; flowers terminal, umbellate; stem erect. ♃.? S. Native country unknown. Stem angular. Leaves like those of *Chrysánthemum leucánthemum*. Involucrum of umbel short. Corollas blue, nearly an inch long, with the segments of the upper lip linear and reflexed, and of the lower one oblong. Stamens a little shorter than the tube of the corolla. Anthers bearded at the apex.

Umbellate-flowered Lobelia. Pl. 1 foot.

* * *Corollas red, purple or scarlet, rarely yellowish.*

36 L. GRAMI'NEA (Lam. dict. 3. p. 583.) glabrous; leaves linear, ensiform, acute; racemes long, simple; stem erect, simple; bracteas linear, acute, shorter than the flowers.—Native of Peru. Leaves 5 inches long, and 2-3 lines broad. Flowers scarlet, on short pedicels, form of those of *L. cardinàlis*. Filaments and stamens combined.

Grassy-leaved Lobelia. Pl. 2 feet.

37 L. PULVERULE'NTA (Pers. ench. 2. p. 212.) leaves ovate, on very short petioles, glabrous above and wrinkled, but clothed with white tomentum beneath; corollas campanulate, powdery; stem shrubby. ♄. S. Native of South America, on the road from Guaranda to Mount Chimborazo. Stem branched, tomentose. Leaves obtuse, with subrevolute edges, 3 inches long. Pedicels longer than the leaves, altogether forming a leafy raceme. Corollas white from powdery tomentum outside, and reddish inside, less than an inch long, with equal oblong acute segments. Perhaps a species of *Clermóntea*.

Powdery Lobelia. Pl. 6 to 8 feet.

38 L. CORDI'GERA (Cav. icon. 6. p. 14. t. 523.) leaves ovate, acute, half-stem-clasping, villous, denticulated; pedicels villous, axillary, solitary; stem villous, furrowed. ♃. F. Native of Chili. Leaves 3 inches long. Calyx villous. Corolla scarlet, $1\frac{1}{2}$ inch long, with the segments of the upper lip linear, elongated, of the lower lip ovate, acute. Genitals glabrous.

Heart-bearing Lobelia. Pl. 3 feet.

39 L. DECU'RRENS (Cav. icon. 6. p. 13. t. 521.) leaves ovate-lanceolate, biserrated, decurrent, glabrous, approximate; flowers solitary, axillary, altogether forming a long leafy raceme; calyx villous, with the segments deeply serrated; tube of corolla cleft even to the base. ♄. F. Native of Chili, on the banks of the river Claro. Sweet, fl. gard. n. s. 86. Stem glabrous. Leaves 2 inches long and an inch broad, with 2 small teeth between each large one. Corolla purplish-violet, $1\frac{1}{2}$ inch long; upper lip of 2 linear segments, which are villous at the apex, of the lower acute, and are as well as the anthers pilose.

Decurrent-leaved Lobelia. Fl. June, Sept. Clt. 1826. Pl. 5 to 6 feet.

40 L. CONGLOBA'TA (Lam. dict. 3. p. 585.) leaves oblong-cuneiform, denticulated, shining; racemes globose, terminal; segments of calyx fringed; stem simple, filled with medula. ♃. S. Native of Martinico and St. Domingo. Lin. spec. 4. t. 117. Stem thick, naked at the base. Leaves a foot and more long, and 3 inches broad, exceeding the corymb of flowers. Flowers very numerous, disposed in a short raceme. Bracteas lanceolate, denticulated, shorter than the flowers. Corollas shorter than the calyx, scarlet, but in the larger variety greenish-red. Perhaps a species of *Tùpa*.

Conglobate-racemed Lobelia. Pl. 1 foot.

41 L. CAVANILLESIA'NA (Rœm. et Schultes, syst. 5. p. 43.) glabrous; leaves ovate-lanceolate, acuminated, serrated, sessile; pedicels solitary, axillary, longer than the leaves, the whole forming a leafy raceme; corollas downy. ♃. S. Native of New Spain, near Acambaro. L. persicifòlia, Cav. icon. 6. p. 12. t. 518. Stem herbaceous, striated, branched. Serratures of leaves setaceous. Calyx globose. Corolla red; with the tube nearly an inch long. Probably a species of *Tùpa*. Anthers bearded with white hairs.

Cavanilles's Lobelia. Fl. June, July. Clt. 1825. Pl. 3 ft.

42 L. PERSICIFÒLIA (Lam. dict. 3. p. 584.) leaves narrow-lanceolate, serrated; pedicels axillary, solitary, shorter than the leaves, the whole forming a leafy raceme. ♃. S. Native of Guadaloupe, in marshes. Stem fistular. Leaves numerous. Corolla purplish, glabrous, a little curved, $1\frac{1}{2}$ inch long. Perhaps a species of *Siphocámpylus*.

Peach-leaved Lobelia. Fl. June, July. Clt. 1824. Pl. $1\frac{1}{2}$ ft.

43 L. KRAU'SSII (Graham, in edinb. phil. journ. March, 1830. bot. mag. 3012.) leaves sessile, lanceolate, decurrent, sharply serrated, glabrous; pedicels axillary, solitary, longer than the leaves, the whole forming a leafy terminal raceme; calycine segments subulate, a little toothed, spreading, and are as well as the corolla glabrous; stem herbaceous, glabrous, erect, branched. ♃. S. Native of Dominica, where it was collected by Dr. Krauss. Leaves $4\frac{1}{2}$ inches long. Corolla 1 inch long, red,

cleft along the back to the base; segments linear-subulate: the 2 upper ones the broadest. Filaments white, downy; anthers lead-colour, terminated by a dense white beard. Nearly allied to *L. persicifòlia*.

Krauss's Lobelia. Fl. Jan. Feb. Clt. 1828. Pl. 1½ foot.

44 L. racemòsa (Hook. bot. mag. 2137.) stem suffruticose, erect; leaves lanceolate, spinosely serrated; racemes terminal; pedicels exceeding the flowers, at length deflexed; calycine segments awl-shaped, sharply serrated. ♄. S. Native of the Island of St. Christopher; and of Brazil, at Rio Janeiro. Leaves 9 inches long. Branches terete. Pedicels bibracteate. Bracteas serrated. Corolla plaited, cleft on the back, having the lower lip 3-lobed, and the segments of the upper lip narrow, all recoiled backwards, greenish. Anthers lead-coloured, as well as the stigma. This is a true species of *Tùpa*.

Racemose-flowered Lobelia. Fl. July, Aug. Clt. 1818. Sh. 2 to 3 feet.

45 L. acumina'ta (Swartz, prod. p. 117. fl. ind. occ. p. 1950.) glabrous; leaves lanceolate, attenuated at both ends, serrulated, glabrous; racemes terminal, many-flowered. ♄. S. Native of Jamaica and St. Domingo. L. salicìna, Lam. dict. 3. p. 583.—Sloane, jam. 1. p. 158. t. 95. f. 2. Stem glabrous. Leaves 6-8 inches long, and an inch broad. Flowers pale red, or greenish white, disposed in a compound raceme. Bracteas linear. Corolla curved, villous outside. Perhaps a species of *Siphocámpylus*.

Acuminated-leaved Lobelia. Fl. June, Aug. Clt. 1822. Pl. 3 to 4 feet.

46 L. lacinia'ta (Lam. dict. 3. p. 584.) leaves lanceolate, pinnatifidly toothed: the segments again toothed; corymbs terminal, small, sessile. ♃. S. Native of St. Domingo. Stem glabrous, a little branched. Leaves nearly glabrous, more than 2 inches long. Corolla greenish red, glabrous, an inch long.

Jagged-leaved Lobelia. Pl. 1 foot.

47 L. sonchifòlia (Swartz, fl. ind. 3. p. 1947.) leaves deeply sinuated: superior ones pinnatifid, with lanceolate denticulated segments; racemes terminal, leafy. ♃. S. Native of New Spain, on the margins of rivers. Stem simple, glabrous. Leaves petiolate, glabrous, glaucous beneath. Bracteas jagged. Corolla purplish, like that of *L. cardinàlis*. Anthers bearded.

Sow-thistle-leaved Lobelia. Pl. 2 feet.

48 L. stri'cta (Swartz, prod. 117. fl. ind. occ. p. 1952.) lower leaves elliptic, spiny-toothed, glabrous, tufted; stem simple, stiff; flowers spicate. ♄. S. Native of Guadaloupe. Lam. dict. 3. p. 584. no. 15. Radical leaves larger than the rest, attenuated at the base, 3 inches long, and an inch broad. Pedicels short, the whole forming a terminal leafy raceme. Corollas purplish.

Straight Lobelia. Shrub 2 to 3 feet.

49 L. robu'sta (Graham, in edinb. phil. journ. Dec. 1831. Hook. bot. mag. 3138.) leaves obovate-lanceolate, acuminated, coarsely toothed, glabrous, shining; racemes terminal, simple, secund. ♄. S. Native of Hayti. Leaves decurrent a little way down the stem, lilac-coloured beneath while young. Flowers numerous, on villous pedicels, furnished each with one bractea at the base, and 2 in the middle. Bracteas linear. Corollas of a deep dull purple. Calyx spherical, with serrated segments. Filaments ciliated. Two upper anthers ciliated. Stigma 2-lobed. Allied to *L. assúrgens*.

Robust Lobelia. Fl. Aug. Clt. 1830. Pl. 4 feet.

50 L. assu'rgens (Lin. amœn. acad. 5. p. 408.) leaves broad, lanceolate, serrated or denticulated and decurrent at the base; racemes simple, terminal; segments of the calyx serrated; capsule angular. ♃. S. Native of Jamaica, on the mountains, particularly on the edges of streams. Andr. bot. rep. 553. Leaves a foot long, glaucous. Stem reddish, almost simple, glabrous. Flowers crowded, large, downy, purple. The column of anthers has 5 blue grooves. Probably a species of *Tùpa*.

Assurgent Lobelia. Fl. June, Oct. Clt. 1787. Pl. 3 to 4 ft.

51 L. foliòsa (Willd. rel. ex Rœm. et Schultes, syst. 5. p. 56. H. B. et Kunth, nov. gen. amer. 3. p. 310.) leaves sessile, decurrent, lanceolate, doubly toothed, glabrous; flowers axillary, pedicellate, the whole forming a leafy raceme; corollas hairy; stem erect, simple, glabrous. ♃. S. Native of the kingdom of Quito, in humid places near Guancabamba. Leaves crowded on the stem, 3 inches long. Pedicels hairy. Segments of the calyx furnished at the base with remote subulate teeth, about equal in length to the tube of the corolla. Corolla pale purple. Two lower anthers bearded. Allied to *L. decúrrens*, Cav. and *L. cardinàlis*.

Leafy Lobelia. Pl. 2 to 3 feet.

52 L. laxiflòra (H. B. et Kunth, nov. gen. amer. 3. p. 311.) leaves almost sessile, oblong, acuminated, serrulated, glabrous; racemes terminal, secund; flowers on long pedicels; corollas hairy; stem erect, simple, angular, glabrous. ♃. F. Native of Mexico, between Quaxiniquilapa and Acaguirolla. L. físsa, Willd. rel. ex Rœm. et Schultes, syst. 5. p. 57. Leaves 2½ inches long. Rachis of raceme hairy. Calyx hairy. Corolla pale purple. Allied to *L. cardinàlis*.

Loose-flowered Lobelia. Pl. 2 to 3 feet.

53 L. rigídula (H. B. et Kunth, nov. gen. amer. 3. p. 311.) leaves short, sessile, oblong-lanceolate, acutish, sharply serrulated, stiffish, glabrous above, but rugged and hairy beneath; flowers axillary, on long pedicels; corollas hairy. ♃. S. Native of New Spain. Stems hairy above. Leaves 2 inches long. Flowers and fruit like those of the preceding species, to which it is very nearly allied.

Stiffish Lobelia. Pl. 2 to 3 feet.

54 L. fu'lgens (Willd. hort. berol. 2. p. 85. t. 85.) leaves lanceolate, denticulated, with revolute margins, downy as well as the stems; racemes terminal, leafy, somewhat secund. ♃. H. Native of Mexico. Andr. bot. rep. 659. Bonpl. malm. p. 19. t. 7. Stem reddish. Leaves 4-6 inches long. Corollas about an inch long, downy outside, of a splendid scarlet colour.

Fulgent Lobelia. Fl. May, Sept. Clt. 1809. Pl. 1 to 2 feet.

55 L. cardina'lis (Lin. spec. 1320.) leaves oblong-lanceolate, cartilaginously denticulated, glabrous as well as the stems; racemes terminal, unilateral, leafy. ♃. F. Native of Virginia and Carolina; and of Mexico, near Jalapa. Pursh, fl. amer. sept. 2. p. 448. Curt. bot. mag. 320.—Knor. del. 2. t. L. f. 2. Rapúntium cardinàlis, Mill. dict. no. 1.—Mor. hist. 2. p. 466. sect. 5. t. 5. f. 54.—Hern. mex. p. 879. t. 880. Leaves purplish beneath, 3 inches long, and 1½ broad. Flowers scarlet. It differs from *L. fúlgens* in being glabrous, and in the segments of the lower lip of the flower being obtuse, not lanceolate, and acute.

Cardinal-flowered Lobelia. Fl. July, Aug. Clt. 1626. Pl. 1 to 2 feet.

56 L. sple'ndens (Willd. hort. berol. 2. t. 86.) leaves lanceolate, denticulated, with flat margins, quite glabrous as well as the stems; racemes terminal, somewhat secund. ♃. F. Native of Mexico. Ker. bot. reg. 60. Stem purplish. Pedicels compressed, purplish. Corolla scarlet, glabrous, very like those of the two last species.

Splendent Lobelia. Fl. May, Sept. Clt. 1814. Pl. 1 to 2 feet.

57 L. speciòsa (Hort. Lindl. bot. reg. 1445. Sweet. fl. gard. n. s. 174.). This is a hybrid between *L. syphilítica* and *L. cardinàlis, spléndens* or *fúlgens*. The flowers are purple.

Showy Lobelia. Fl. June, Oct. Hybrid. Pl. 2 to 5 feet.

§ 2. *Species natives of the East Indies and other parts of Asia.*

58 L. Chine'nsis (Lour. coch. p. 514.) glabrous; leaves sessile, lanceolate, quite entire; flowers solitary, terminal; stem creeping; branches ascending. ⊙. H. Native of China, about Canton. Flowers pale blue, pedicellate. Segments of the corolla lanceolate, unequal. Stigma bifid, revolute.

China Lobelia. Pl. creeping.

59 L. Heynea'na (Rœm. et Schultes, syst. 5. p. 56.) stem filiform, erect, winged; leaves subrhomboid, serrated, decurrent, setosely ciliated at the base; peduncles axillary, solitary, length of leaves; calyxes glabrous.—Native of the East Indies. L. decúrrens, Roth, nov. pl. spec. mss. The stem is winged from the leaves being decurrent.

Heyne's Lobelia. Pl. ½ to 1 foot?

60 L. Zeyla'nica (Lin. spec. 1322.) stems prostrate and creeping, downy; leaves on short petioles, ovate, somewhat cordate, serrated, acute: lower ones obtuse; peduncles solitary, 1-flowered, axillary, equal in length to the leaves, villous; capsules rather villous. ♃. S. Native of China and the East Indies, in fields. L. nummularifòlia, Lam. dict. 3. p. 563.?—Seb. thes. 1. p. 37. t. 22. f. 12. Var. β, hírta, Lin. spec. 935. Plant small. Leaves like those of *Verónica chamæ'dryos*, fleshy, beset with a few pellucid hairs; lower ones crenated; upper ones serrated. Peduncles downy. Flowers purple. This is a very pretty plant when in blossom. It differs from *L. trigòna*, Roxb. by its petioled more rounded leaves, terete stems, and its pubescence.

Ceylon Lobelia. Fl. June, July. Clt. 1821. Pl. creeping.

61 L. chenopodiifòlia (Wall. cat. no. 1312.) stem branched at the base; lower leaves roundish-ovate, obtuse, broadly crenated: upper ones ovate-lanceolate or deltoid, acuminated, coarsely toothed; peduncles elongated, terminal, bearing loose racemes of flowers at the apex; calycine segments subulate. ⊙. H. Native of the East Indies.? Flowers small, probably pale blue.

Goose-foot-leaved Lobelia. Pl. 1 foot.

62 L. affìnis (Wall. cat. no. 1311.) plant downy, creeping at the base; leaves ovate, petiolate, membranous, cuneated at the base, slightly denticulated; peduncles axillary, 1-flowered; calyx hairy, with linear segments; stems angular. ♃. S. Native of the East Indies, in Silhet and Goalpara. Flowers blue. Stems creeping at the base. This species is very like *L. Zeylánica* and *L. trigòna*.

Allied Lobelia. Pl. ½ foot.

63 L. nummula'ria (Lam. dict. 3. p. 589.) stems creeping, filiform; leaves roundish-cordate, crenated; peduncles 1-flowered, axillary, a little longer than the leaves. ♃.? S. Native of Java. Habit of *Sibthórpia*. Stem rather villous. Leaves small, rather villous beneath, unequal. Petioles 2-3 lines long. Corolla 4-5 lines long, longer than the stamens.

Money-wort-leaved Lobelia. Pl. creeping.

64 L.? pu'mila (Burm. prod. 1. t. 60. f. 3.) glabrous; stems procumbent; leaves opposite, ovate, quite entire; panicles terminal. ♃. S. Native of Coromandel. Leaves petiolate. Flowers small.

Dwarf Lobelia. Pl. procumbent.

65 L. triala'ta (Ham. mss. ex D. Don, prod. fl. nep. p. 157.) leaves roundish-ovate, serrated, glabrous; petioles dilated, decurrent at the base; pedicels solitary, axillary, longer than the leaves; flowers somewhat racemose; segments of the calyx filiform; stem ascending, triquetrous, branched, winged, glabrous. ♃. F. Native of Nipaul. L. micrántha, Hook. exot. fl. t. 44. Stem hardly a hand high, rooting at the base. Pedicels longer than the leaves. Corollas small, red. Very like *L. gratioloìdes*, Roxb., but in that species the leaves are sessile and cordate.

Three-winged-stemmed Lobelia. Fl. July, Aug. Clt. 1822. Pl. ascending.

66 L. trigòna (Roxb. fl. ind. 2. p. 111.) glabrous; leaves subsessile, cordate, coarsely serrated; pedicels axillary, bibracteate, longer than the leaves; stems creeping at the base, erect parts 3-sided. ⊙. H. Native of the East Indies, delighting in pasture-ground, appearing in the wet season. L. stipulàris, Roth. Flowers small, blue. Corolla inserted in the mouth of the calyx. Roth has mistaken the 2 small bracteas on the pedicels to be stipulas.

Trigonal-stemmed Lobelia. Pl. ½ to 1 foot.

67 L. campanuloìdes (Thunb. in Lin. trans. 2. p. 331.) leaves on short petioles, lanceolate-oblong, toothed; pedicels elongated; stems decumbent. ♃.? H. Native of China and Japan. Ker. bot. reg. 733. L. erinoìdes, Thunb. jap. p. 326. L. Japónica, Dietr. gærtn. 5. p. 552. Stems nearly simple, elongated, filiform, glabrous. Leaves almost sessile, glabrous; obsoletely serrated. Flowers terminal, on elongated branches, white.

Campanula-like Lobelia. Fl. May, Aug. Clt. 1820. Pl. decumbent.

68 L. pyramida'lis (Wall. in asiat. res. 13. p. 379.) smooth; leaves lanceolate, long-acuminated, serrated: upper ones linear, attenuated; racemes panicled, leafy; calycine segments linear-subulate, about equal in length to the corolla; stems erect, branched. ♃. H. Native of Nipaul, on the mountains at Narainhetty. This is the most common and most ornamental plant in Nipaul, where it grows both in low and elevated situations. It is found from the entrance of that country at Bechiaco, up to the mountains that bound the valley to the north, and where it grows at an elevation of at least 8000 feet. It is also found in the hilly country of Silhet. D. Don, in bot. mag. t. 2387. L. stímulans, Hamilt. mss. ex D. Don, prod. fl. nep. p. 157. Plant variable in height, and is often found altogether of a deep purple, but chiefly the floral branches and leaves. Stem pyramidally branched. Leaves downy beneath. Corollas purplish-violet. Anthers deep blue, pilose. Lobes of stigma hollow beneath.

Pyramidal Lobelia. Fl. Sept. Clt. 1822. Pl. 3 to 4 feet.

69 L. exce'lsa (Wall. in Roxb. fl. ind. 2. p. 114.) leaves oblong-lanceolate, acuminated, denticulated, attenuated at both ends, densely clothed with villi, on short petioles; racemes terminal, erect, villous, leafy, dense-flowered; calycine segments linear, as long as the tube of the corolla. ⊙. H. Native of the Nelligherry mountains, near Coimbetore, where it was collected by Leschenault, and where it is called by the natives *Oumari*. Leaves 10 inches long, and 1 broad. Petioles marked by the decurrent base of the leaf. Flowers large.

Tall Lobelia. Pl. 10 to 12 feet.

70 L. ròsea (Wall. in Roxb. fl. ind. 2. p. 118.) plant covered with glaucous short dense villi; stem panicled; leaves lanceolate, ensiform, acuminated, finely denticulated; racemes terminal, with unilateral flowers; calycine segments equalling the tube of the corolla. ⊙. F. Native of Nipaul, in the valley of Noakote. Leaves from 8-12 inches long; floral ones linear-lanceolate, rounded at the base. Flowers numerous, nodding, downy, like those of *L. pyramidàlis*, but larger, of a pale rose-colour. Anthers connected into a long purple incurvated tube, bearded. Filaments downy. Ovarium bi-trilocular. Stigma pubescent.

Rose-coloured-flowered Lobelia. Pl. 4 to 6 feet.

71 L. nicotianæfòlia (Heyne, mss. ex Rœm. et Schultes, syst. 5. p. 47.) leaves oblong-lanceolate, attenuated at both ends, serrated, rather scabrous; stem erect, angular; racemes terminal, equal, downy; flowers very numerous. ♃.? H. Native of the East Indies, in the vicinity of Bangulore. A stout plant. Leaves a foot long. Racemes angular, above a foot long. Corollas downy, showy. Calyx and capsules downy, and the anthers glabrous.

Tobacco-leaved Lobelia. Fl. June, July. Clt. 1822. Pl. 2 to 3 feet.

§ 3. *Species natives of Africa, particularly of the Cape of Good Hope. Flowers generally violaceous or blue, rarely white or yellow.*

* *Stems erect. Leaves entire.*

72 L. LINEA'RIS (Thunb. prod. 1. p. 39. fl. cap. 2. p. 35.) leaves linear, quite entire, glabrous; stems erect, terete, striated, glabrous; pedicels solitary, axillary, much shorter than the leaves. ♄. G. Native of the Cape of Good Hope, near Paardeberg. Ait. hort. Kew. ed. 2. vol. 1. p. 356. Stems many from the same root, simple. Flowers blue.

Linear-leaved Lobelia. Fl.? Clt. 1791. Shrub ½ to ¾ ft.

73 L. SETA'CEA (Thunb. phyt. bl. p. 21. act. gorenk. 1811. f. 11. fl. cap. 2. p. 34.) leaves filiform, setaceous, glabrous, quite entire; pedicels axillary, solitary, length of leaves. ♃. G. Native of the Cape of Good Hope. Flowers nutant, blue.? Stems erect, glabrous.

Setaceous-leaved Lobelia. Fl. May, July. Clt. 1816. Pl. ½ foot.

74 L. SCA'BRA (Thunb. phyt. bl. p. 21. fl. cap. 2. p. 35.) leaves linear, emarginate, scabrous, quite entire; stems weak, filiform, hairy; pedicels axillary, solitary, flexuous, longer than the leaves. ♃.? G. Native of the Cape of Good Hope. Leaves sessile, subsecund. Calyx and corolla hairy.

Scabrous Lobelia. Pl. ½ foot.

75 L. COMMUTA'TA (Rœm. et Schultes, syst. 5. p. 36.) lower leaves ovate: superior ones oblong: all sessile, retuse, and emarginate, with revolute margins, beset with a few hairs on the nerve and on the edges; floriferous branches and stems naked at the apex; flowers racemose, on short pedicels, reflexed. ♃. G. Native of the Cape of Good Hope.? Stems ascending, beset with a few white bristles. Leaves rather distich. Calyx hispid. Corolla violaceous, with a long white hispid tube. Anthers bearded by white hairs.

Changed Lobelia. Pl. ascending.

76 L. SÍMPLEX (Thunb. prod. 1. p. 39. fl. cap. 2. p. 35.) leaves linear, villous, sessile, quite entire; stems simple, erect, smooth; pedicels solitary, axillary, twice the length of the leaves. ☉. or ♃. G. Native of the Cape of Good Hope. Flowers blue. Calycine segments linear-lanceolate, villous. Capsule turbinate.

Simple-stemmed Lobelia. Fl. May, Aug. Clt. 1794. Pl. ½ foot.

77 L. PINIFÒLIA (Lin. spec. 1318. Thunb. fl. cap. 2. p. 36.) shrubby; leaves linear-lanceolate, erect, crowded, quite entire, but according to Thunberg they are trigonal; pedicels terminal, few. ♄. G. Native of the Cape of Good Hope, on the sides of mountains near Cape Town. Andr. bot. rep. 273. Young branches downy. Segments of calyx linear. Corolla blue.

Pine-leaved Lobelia. Fl. May, Aug. Clt. 1786. Shrub 1½ ft.

78 L. DEPRE'SSA (Thunb. prod. 1. p. 39. fl. cap. 2. p. 36.) leaves oblong or lanceolate, obtuse, glabrous, quite entire; stem branched, denticulated, varicose; pedicels length of leaves, solitary. ♃. G. Native of the Cape of Good Hope. Stems much depressed. Leaves a little decurrent. Flowers deep purple, minute.

Depressed Lobelia. Pl. prostrate.

79 L. PANICULA'TA (Lin. spec. 1319.) leaves linear, quite entire; stems leafy at the base, and naked at the apex, branched, panicled; panicle dichotomous. ♃.? G. Native of Æthiopia. Burm. afr. t. 38. f. 3. Leaves short, sessile. Branches loose, furnished with 2 small opposite leaves under each fork. Flowers small, blue.

Panicled Lobelia. Pl. ½ to 1 foot.

** *Stems erect. Leaves serrated or crenated.*

80 L. BELLIDIFÒLIA (Thunb. prod. 1. p. 40. fl. cap. 2. p. 47.) leaves ovate, toothed, hairy, or obovate crenated, downy beneath; stems hispid at the base, simple, divided into a panicle at the top; lower pedicels the longest. ♃. G. Native of the Cape of Good Hope. Corollas blue. Leaves of the ramifications of the panicle subulate, smooth.

Daisy-leaved Lobelia. Fl. May, Aug. Clt. 1790. Pl. ¼ to ½ foot.

81 L. RHIZOPHY'TA (Spreng. nov. prov. 1818. ex Rœm. et Schultes, syst. 5. p. 44.) lower leaves petiolate, obovate, repandly toothed, glabrous, rather fleshy: superior ones lanceolate, sessile, rather decurrent: uppermost ones ciliated, quite entire; pedicels short, axillary; capsules cylindrical, glabrous; stems radicant at the base, and ascending at the apex, triquetrous, glabrous. ♃. G. Native of the Cape of Good Hope. Sims, bot. mag. 2519. Flowers white, marked with blue. It differs from *L. bellidifòlia* in the smoothness of its parts; and from *L. cuneifórmis*, R. Br. in the decumbent radicant stems.

Rooting Lobelia. Fl. Sept. Oct. Clt. 1800. Pl. ascending.

82 L. TRÍQUETRA (Lin. mant. p. 120.) glabrous; leaves lanceolate, pinnatifidly toothed, sessile; racemes terminal; branches and pedicels trigonal. ♃. G. Native of the Cape of Good Hope. Thunb. fl. cap. 2. p. 48. L. capitàta, Burm. prod. p. 25. Leaves as if they were agglutinated at the base. Racemes erect, pedunculate. Corollas blue.

Var. β, comòsa; leaves linear, toothed; flowers terminal. ♃. G. Native of the Cape of Good Hope. L. corymbòsa, Berg. cap. p. 344. Flowers blue.

Var. γ, álba; corymbs leafy; flowers white. ♃. G. Native of the Cape of Good Hope.

Triquetrous-stemmed Lobelia. Fl. May, Aug. Clt. 1774. Pl. 1 foot.

83 L. DECU'MBENS (Sims, bot. mag. t. 2277.) glabrous; stems decumbent; leaves obovate, toothed: superior ones dissimilar; pedicels axillary, shorter than the bracteas, which are linear, quite entire, and decurrent. ♃. G. Native of the Cape of Good Hope. L. bellidifòlia, Hortul. Calycine teeth short, spreading, subulate. Flowers blue, smaller than in *L. bicolor*, with a white or yellowish throat.

Decumbent Lobelia. Fl. June. Clt. 1820. Pl. dec.

84 L. CINE'REA (Thunb. prod. 1. p. 40. fl. cap. 2. p. 44.) leaves linear, spiny-toothed, clothed with grey tomentum; flowers almost sessile, forming a terminal raceme. ♃. G. Native of the Cape of Good Hope, in Roggeweld. Root fusiform, simple. Stems many from the same root, terete, smooth. Leaves sessile, acute, with thickened margins; lower ones glabrous. Calyx tomentose. Corollas white.

Grey Lobelia. Pl. ½ foot.

85 L. TOMENTÒSA (Lin. fil. suppl. p. 394.) tomentose; leaves linear, toothed; peduncles terminal, very long, 1-2-flowered. ♃. G. Native of the Cape of Good Hope. Stems numerous, ascending, simple, having the leaves imbricated at the base. Leaves like those of *Corónopis*, having 4-6 obtuse teeth on each side, with revolute edges, clothed with hairy tomentum; peduncles clothed with adpressed hairs, bearing 2 small opposite leaves in the middle, or towards the base, and above these 2 opposite setaceous ones. Corolla blue or violaceous, half an inch long. Anthers beset with white hairs at the apex.

Tomentose Lobelia. Fl. May, Sept. Clt. 1821. Pl. ascending.

86 L. SECU'NDA (Lin. fil. suppl. p. 395. Thunb. fl. cap. 2. p. 45.) glabrous; lower leaves oblong, toothed: superior ones lanceolate, entire; peduncles racemose, secund. ♃. G. Native

of the Cape of Good Hope, in sandy inundated places. The plant can hardly be said to be truly glabrous. There are floriferous branches in the axils of nearly all the leaves, and the flowers are all drooping to one side. Stems numerous, filiform, striated and downy, simple. Lower leaves obovate, obsoletely denticulated, obtuse. Pedicels solitary, 1-flowered, shorter than the leaves. Corollas white, and are as well as the calyx downy outside.

Secund-flowered Lobelia. Fl. May, Aug. Clt. 1790. Pl. $\frac{1}{2}$ *foot.*

87 L. PA'TULA (Thunb. prod. 1. p. 40. fl. cap. 2. p. 41.) leaves ovate, sinuately toothed, villous; stems diffuse, spreading, filiform; pedicels solitary, axillary, capillary, downy, longer than the leaves. ♃. G. Native of the Cape of Good Hope. Leaves petiolate; superior ones lanceolate. In Lin. fil. suppl. p. *395.* the plant is said to be glabrous.

Spreading Lobelia. Pl. 1 foot.

88 L. FE'RVENS (Thunb. fl. cap. 2. p. 46.) leaves sessile, ovate-oblong: upper ones lanceolate: all serrated, glabrous; pedicels 1-flowered, much shorter than the leaves in the superior axils. ♃. G. Native of the Cape of Good Hope. Stems erectish, branched a little, glabrous. Flowers blue.

Fervent Lobelia. Pl. $\frac{1}{2}$ foot.

89 L. BÍFIDA (Thunb. prod. 1. p. 40. fl. cap. 2. p. 46.) leaves obovate, toothed, glabrous; stems filiform, downy, bifid or twice bifid at the apex; flowers terminal, solitary. ♃. G. Native of the Cape of Good Hope, on Mount Bockland. Stems erect, simple. Radical leaves subpetiolate, obovate, denticulated, hardly downy, a line long, but only a solitary cauline one on each stem, or 2 small alternate ones. Flowers blue. Bracteas lanceolate in the forks of the stem.

Bifid-stemmed Lobelia. Pl. 1 to 3 inches.

90 L. DE'BILIS (Lin. fil. suppl. p. 395. Thunb. fl. cap. 2. p. 45.) leaves lanceolate, serrated, glabrous; pedicels lateral, longer than the leaves; stems much branched from the base; calycine segments linear-subulate, a little shorter than the corolla. ☉. G. Native of the Cape of Good Hope. Very like *L. deprèssa.* Upper leaves nearly linear. Corollas blue, villous outside.

Weak Lobelia. Fl. July, Aug. Clt. 1774. Pl. $\frac{1}{2}$ foot.

91 L. MINU'TA (Lin. mant. p. 292.) leaves radical, ovate, obtuse, hardly crenated; scapes or pedicels capillary, 1-flowered, 2 inches long; corolla funnel-shaped. ♃. H. Native of the Cape of Good Hope, in fissures of rocks on Mount Taffelberg. Sims, bot. mag. t. 2590. Root throwing out off-sets. Flowers pale blue. Habit of *Móntia fontàna* or *Béllium minùtum.*

Minute Lobelia. Fl. June, Sept. Clt. 1772. Pl. 1 inch.

92 L. MÍNIMA (Sims, bot. mag. 2077.) stems prostrate; leaves ovate, crenated, petiolate, glabrous; pedicels long, axillary, 1-flowered, furnished with 2-3 linear hairy bracteas below the middle. ♃. G. Native of the Cape of Good Hope. Flowers white inside, and red outside, with a yellow throat.

Least Lobelia. Fl. June, Sept. Clt. 1800. Pl. 1 to 2 inches.

93 L. PUSI'LLA; leaves roundish, lobed: lobes obtuse; pedicels axillary, 1-flowered. ♃. G. Native of the Cape of Good Hope. Flowers white. L. minùta, Thunb. prod. 1. p. 40. fl. cap. 2. p. 43.

Small Lobelia. Pl. 1 inch.

* * * *Stems prostrate. Leaves cut or toothed.*

94 L. ERÌNUS (Lin. spec. 1321. Thunb. fl. cap. 2. p. 39.) leaves toothed; lower ones obovate, petiolate: superior ones almost sessile, narrow-lanceolate; peduncles 1-flowered, longer than the bracteas; stems spreading. ♃. G. Native of the Cape of Good Hope. Curt. bot. mag. 901. Rapúntium erìnum, Mill. dict. no. 8.—Herm. lugdb. 110. t. 110. Stems branched at bottom. Leaves glabrous. Pedicels axillary, solitary, naked, much longer than the leaves. Flowers slender, blue, with a white or yellowish throat. Fruit 3-celled. According to Thunberg there is a variety of this, having numerous radical stems, which are as well as the leaves villous.

Erinus Lobelia. Fl. June, Sept. Clt. 1752. Pl. $\frac{1}{2}$ foot.

95 L. ALSINOÌDES (Lam. dict. 3. p. 586. no. 29.) plant creeping, glabrous; stems branched; leaves roundish-oval, toothed; peduncles long, 1-flowered, axillary, much longer than the leaves. ♃. G. Native of the Cape of Good Hope. Stem erect at the top, but radicant at the base. Radical leaves like those of *Sibthórpia;* the rest ovate, toothed, and subpetiolate.

Chick-weed-like Lobelia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

96 L. MUSCOÌDES (Cham. in Linnæa. 7. p. 215.) herb small, slender, trailing, quite glabrous; stems filiform, rooting at the nodi; leaves roundish, deeply 5-7-cleft, truncate or cuneated at the base: segments elliptic, acute, mucronulate; pedicels axillary, bracteate, erect, much longer than the leaves; ovarium obconical. ♃. G. Native of the Cape of Good Hope. Herb tufted, pale green. Corollas purple.

Moss-like Lobelia. Pl. tufted.

97 L. MUNDTIA'NA (Cham. in Linnæa. 7. p. 215.) plant trailing; stems filiform, angular; leaves sessile, decurrent, lanceolate and elliptic, acute at both ends, with a few acute serratures; flowers axillary, solitary, on short pedicels; calycine segments lanceolate, acute, erect, more than one-half shorter than the tube of the corolla; anthers all bearded. ♃. G. Native of the Cape of Good Hope, at Gamka, where it was collected by M. Mundt. Ovarium, calyxes, pedicels, stems, and outside of corolla beset with long spreading white hairs.

Mundt's Lobelia. Pl. trailing.

98 L. CAMPANULA'TA (Lam. dict. 3. p. 588. no. 30.) plant small; leaves linear-lanceolate, toothed; pedicels very long, 1-flowered; calyx hairy, a little reflexed. ☉. H. Native of the Cape of Good Hope. Stem simple, slender, leafy, glabrous. Leaves glabrous, sessile, hardly an inch long. Pedicels filiform, $2\frac{1}{2}$ inches long, pilose at the apex, solitary in the axils of the superior leaves. Flowers erect, campanulate, blue. Limb spreading, hardly divided, rather irregular. Calycine segments narrow.

Bell-flowered Lobelia. Fl. June, July. Clt. 1821. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

99 L. BRE'YNII (Lam. dict. 3. p. 588.) leaves sessile, lanceolate, toothed, minute, usually unilateral; flowers almost sessile; the pedicels are short and alternate; stems procumbent. ♃. G. Native of the Cape of Good Hope. Breyn. cent. p. 175. t. 89. Stems long, filiform. Flowers blue. Bracteas much shorter than the flowers.

Breynius's Lobelia. Pl. procumbent.

100 L. CHAMÆPÌTYS (Lam. dict. 3. p. 590.) leaves linear, channelled, numerous, bidentate at the apex, clothed with hairy tomentum; pedicels very long, naked, axillary and terminal, furnished with narrow acute scales; stem shrubby. ♄. G. Native of the Cape of Good Hope. L. scàbra, Spreng. neu. entd. ex syst. Habit of *Lavándula,* with the leaves of *Ajùja chamæpìtys.* Stems leafy, slender. Pedicels longer than the stem, 6 inches long. Corollas of a pale violaceous colour, 6 lines long, inflated at the base.

Ground-pine-like Lobelia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

101 L. ERINOÌDES (Lin. mant. p. 291. Thunb. fl. cap. 2. p. 39.) leaves petiolate, oblong, toothed, bluntish, glabrous; pedicels axillary, solitary, shorter than the leaves; corolla funnel-shaped; stems prostrate or erectish. ♃. or ♂. G. Native of the Cape of Good Hope. Rapúntium erinoìdes, Mill. dict. no 9.—Herm. lugdb. p. 108. t. 109. Corollas funnel-shaped, an-

gular, equal, blue, with spreading segments. Filaments combined into a 5-striped, club-shaped tube. Stigma hairy.

Erinus-like Lobelia. Fl. June, Aug. Clt. 1759. Pl. prostrate, or $\frac{1}{2}$ foot.

102 L. bícolor (Curt. bot. mag. t. 514.) leaves downy, serrated: lower ones oblong, nearly sessile: superior ones lanceolate; pedicels solitary, axillary, longer than the leaves. ♃. G. Native of the Cape of Good Hope. Willd. enum. 1. p. 218. Corollas blue, with a sulphur-coloured throat. Curtis says the leaves are downy and nearly sessile, while Willdenow says they are glabrous and petiolate.

Two-coloured-flowered Lobelia. Fl. June, Aug. Clt. 1795. Pl. $\frac{1}{2}$ foot.

103 L. illicifòlia (Ker. in bot. mag. t. 1896.) leaves ovate-lanceolate, deeply and remotely toothed: teeth acute; pedicels axillary, solitary, much longer than the leaves. ♃. G. Native of the Cape of Good Hope. Lower leaves ovate-spatulate: superior ones lanceolate: all glabrous. Calyx with subulate toothed segments. Corollas resupinate, twice the length of the calyx, pink or flesh-coloured. Anthers almost naked. Barren stems prostrate; floriferous stems erect. Perhaps a species of *Parastránthus*.

Holly-leaved Lobelia. Fl. May, Sept. Clt. 1815. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

104 L. a'nceps (Lin. fil. suppl. p. 395. Thunb. fl. cap. 2. p. 41.) radical leaves obovate, crenated, glabrous above, and downy beneath, petiolate: cauline leaves lanceolate, decurrent; pedicels solitary, from the axils of the upper leaves; stems 2-edged, winged. ⊙. H. Native of the Cape of Good Hope. Stems simple, smooth. Flowers blue.

Two-edged-stemmed Lobelia. Fl. Ju. July. Clt. 1818. Pl. $\frac{1}{2}$ ft.

105 L. pube'scens (Ait. hort. kew. 3. p. 498.) lower leaves ovate: upper ones lanceolate, toothed, hairy; pedicels axillary, solitary; stems angular, decumbent, villous. ♃. G. Native of the Cape of Good Hope. Jacq. hort. schoenb. 2. t. 178. L. rèpens, Thunb. prod. 1. p. 40. fl. cap. 2. p. 41. L. alyssifòlia, Salisb. stirp. rar. 19. t. 10. Flowers blue or white, with a reddish tube.

Downy Lobelia. Fl. June, July. Clt. 1780. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

106 L. therma'lis (Thunb. prod. 1. p. 40. fl. cap. 2. p. 42.) leaves ovate, serrated, attenuated at both ends, acute, glabrous above, and pilose beneath; pedicels solitary, axillary, shorter than the leaves, and are as well as the calyxes clothed with strigose white hairs; stems decumbent, hairy. ♃. G. Native of the Cape of Good Hope, in the region of the hot springs near Elephants' river. Corolla yellow.

Hot-spring Lobelia. Pl. decumbent.

107 L. leptoca'rpa (Griess. in Linnæa. 5. p. 419.) stem herbaceous, decumbent, branched; branches flaccid; leaves ovate-lanceolate, sharply serrated, quite glabrous, with cartilaginous edges; pedicels axillary, solitary; capsule elongated, clavate, hispid from bristles. ♃. G. Native of the Cape of Good Hope. Branches beset with white hairs. Leaves sessile. Calyx bristly. Corolla downy, white, having the segments bearded at their tips, and ciliated on the margins. Filaments and style glabrous.

Slender-fruited Lobelia. Pl. decumbent.

108 L. hirsu'ta (Lin. spec. 1322.) leaves ovate, toothed, or crenated, hairy or woolly; peduncles lateral, solitary, very long, 2-3-flowered; stem shrubby, hairy, prostrate, or erect. ♃. G. Native of the Cape of Good Hope. Thunb. fl. cap. 2. p. 37. Rapúntium hirsùtum, Mill. dict. no. 9.?—Burm. afr. 105. t. 40. f. 2. Flowers blue, drooping, small.

Hairy Lobelia. Fl. May, Sept. Clt. 1759. Pl. $\frac{1}{2}$ foot.

109 L. se'rpens (Lam. dict. 3. p. 588.) leaves ovate, crenated, glabrous; pedicels axillary, solitary, shorter than the leaves; stems prostrate, a little branched. ♃.? ⊙.? G. Native of the Cape of Good Hope. Stems slender, flexuous. Leaves thin, hardly an inch long. Flowers small, blue.

Creeping Lobelia. Pl. prostrate.

110 L. pygmæ'a (Thunb. prod. 1. p. 40. fl. cap. 2. p. 43.) leaves roundish, serrated, hairy; stems decumbent, hairy, branched; pedicels axillary, solitary, longer than the leaves, hairy. ♃. G. Native of the Cape of Good Hope, on Mount Ribeck-Castel. Stems very slender. Petioles capillary, hairy. Corollas white.

Pygmy Lobelia. Pl. decumbent.

111 L. coronopifòlia (Lin. spec. 1322.) leaves lanceolate, toothed; peduncles long, few-flowered. ♃. G. Native of the Cape of Good Hope. Curt. bot. mag. 644.—Breyn. cent. t. 88. Stems and petioles hairy. The 3 segments of the lower lip of the corolla obovate, emarginate. Leaves with 3 or more teeth on each side. Flowers beautiful blue. Stems procumbent.

Buckhorn-leaved Lobelia. Fl. July, Aug. Clt. 1752. Pl. procumbent.

112 L. Thunbe'rgii (Sweet, hort. brit. p. 247.) leaves oblong, dentately pinnatifid, hairy; stem erect, hairy. ♃. G. Native of the Cape of Good Hope. Flowers beautiful blue. L. coronopifòlia, Thunb. prod. 1. p. 40. fl. cap. 2. p. 48.

Thunberg's Lobelia. Fl. July, Sept. Clt. 1812. Pl. $\frac{3}{4}$ foot.

113 L. cœru'lea (Hook. bot. mag. 3701.) stem short, decumbent at the base, densely leafy; leaves lanceolate, dentately pinnatifid, downy, attenuated at the base; peduncles terminal, very long, bearing a few-flowered secund racemes at the apex; segments of the corolla longer than the tube. ♃. G. Native of the Cape of Good Hope. Pedicels bracteated. Corollas drooping, large, purplish blue; lower lip of 3 obovate emargined mucronate segments, having 3 small yellow raised marks at the base, the upper lip of 2 small bent back segments. Anthers purple, fringed at the top. Like *L. coronopifòlia*. (f. 121.).

FIG. 121.

Blue-flowered Lobelia. Pl. 1 foot.

114 L. Si'msii (Sweet, hort. brit. p. 247.) leaves petiolate, recurved, pinnatifid, with bifurcate lobes; peduncles elongated, lateral, 2-3-flowered; stem shrubby. ♄. G. Native of the Cape of Good Hope. L. pedunculàta, Sims, bot. mag. t. 2251. Flowers blue, having the tube purple outside. Calycine segments short. Lower lip furnished with 2 yellow marks at the base.

Sims' Lobelia. Shrub 1 foot.

115 L. crena'ta (Thunb. prod. 1. p. 39. fl. cap. 2. p. 40.) leaves lanceolate, crenated, glabrous; stems herbaceous, filiform, decumbent; pedicels capillary, axillary, hardly the length of the leaves. ♃. G. Native of the Cape of Good Hope. Stems branched a little. Leaves about an inch long: lower ones acute: superior ones smaller and obtuse. Flowers blue?

Crenated-leaved Lobelia. Fl. April, May. Clt. 1794. Pl. decumbent.

§ 4. *Species natives of the Isle of France, the Society Islands, and New Zealand.*

116 L. arbòrea (Forst. prod. no. 308.) stem arboreous; leaves petiolate, ovate-oblong, serrately toothed; peduncles axillary, solitary, 1-flowered. ♄. G. Native of the Society Islands.

Tree Lobelia. Tree.

117 L. supe'rba (Cham. in Linnæa. 7. p. 223.) arboreous, palm-formed; stem quite simple, straight, with a tuft of leaves at top; leaves glabrous, oblong-obovate, acuminated, narrowed into the petioles, undulated, denticulated, with reflexed edges, almost quite entire towards the base, and revolute; inflorescence and corollas tomentose. ♄. S. Native of the Island of Owahu, in woods. Ribs of leaves thick, and prominent beneath; veins feathered and prominent. Peduncles longer than the leaves, declinate, nutant, furnished with many oblong-elliptic sessile densely imbricated bracteas, bearing a globose head of flowers each. Corolla curved, cleft on the back, $2\frac{1}{2}$ inches long. Column of stamens glabrous, exceeding the corolla. Two lower anthers bearded. Leaves $2\frac{1}{2}$ feet long and 1 foot broad. This is a most superb species.

Superb Lobelia. Tree 10 to 15 feet.

118 L. macro'stachys (Hook. et Arn. in Beech. voy. pt. bot. p. 88.) glabrous; stem tall, straight; leaves linear-lanceolate, attenuated at both ends, subcrenated; racemes simple, terminal, very long; pedicels secund, horizontal; bracteas linear, shorter than the pedicels; tube of calyx hemispherical, with the segments obtuse; corollas twice the length of the pedicels. ♄. S. Native of the Sandwich Islands. Calyx closely adhering to the ovarium; with a free 5-parted limb, which is about equal in length to the tube. Corolla tubular, 3 inches long; tube cylindrical, 5-cleft, split on the back. Stamens with a free tube, and cohering anthers; the two lower ones bearded. Stigma 2-lobed; lobes flat, thick, cartilaginous, rounded, divaricate, beardless. Fruit unknown.

Long-spiked Lobelia. Shrub tall.

119 L. filifórmis (Lam. dict. 3. p. 588.) leaves linear, narrow, toothed; pedicels 1-flowered, axillary, length of leaves; stem filiform, quite simple. ⊙. H. Native of the Isle of France. Leaves sessile, glabrous. Flowers minute, ringent, violaceous. Calycine teeth subulate. Said to be nearly allied to *L. Lauréntia.*

Var. β, Luzoniénsis (Rœm. et Schultes, syst. 5. p. 61.) lower leaves ovate, very minute.—Native of the island of Luzon, near the town of Santa Cruz de la Laguna. L. filifórmis, Cav. icon. 6. p. 7. t. 511. f. 2. Flowers pale blue.

Filiform Lobelia. Pl. $\frac{1}{2}$ to 1 foot.

120 L. angula'ta (Forst. prod. no. 309.) stem prostrate, quite simple; leaves roundish, repandly toothed; peduncles axillary, solitary, 1-flowered. 4. G. Native of New Zealand. L. repánda, Mart. Mill. no. 33. Perhaps a species of *Prátia.*

Angular-leaved Lobelia. Pl. prostrate.

§ 5. *Species natives of New Holland.*

* *Herbaceous plants, with axillary* 1*-flowered peduncles.*

121 L. ala'ta (Labill. nov. holl. 1. p. 51. t. 72.) plant glabrous, erect; stem trigonal: angles a little winged; leaves linear or cuneated, decurrent, toothed: teeth divaricate or reflexed; pedicels shorter than the leaves; ovarium glabrous; capsules cylindrical. 4. G. Native of New Holland. Flowers blue?

Var. α. angustifòlia (Rœm. et Schultes, syst. 5. p. 68.) superior leaves linear; angles of stem marginated; radical leaves ovate-lanceolate. 4. G. Native of the south coast of New Holland, and about Port Jackson; and of Van Diemen's Land.

Var. β, cuneifórmis (Rœm. et Schultes, l. c.) leaves cuneiform, toothed at top, decurrent; flowers axillary. 4. G. Native of the south coast of New Holland. L. cuneifórmis, Labill. nov. holl. 1. p. 51. t. 73.

Winged-stemmed Lobelia. Fl. May, Aug. Clt. 1804. Pl. $1\frac{1}{2}$ foot.

122 L. quadrangula'ris (R. Br. prod. p. 562.) glabrous; stem tetragonal, ascending; leaves ovate, toothed, almost sessile, 3 or 4 times shorter than the peduncles; segments of the superior lip of the corolla narrow, linear. 4. G. Native of New Holland, on the shore, within the tropic.

Quadrangular-stemmed Lobelia. Pl. ascending.

123 L. rugulòsa (Graham. in edinb. phil. journ. Dec. 1829.) leaves roundish, repand, wrinkled with the nerves, glabrous; pedicels much longer than the leaves; calycine segments entire, glandular at the base; stem spotted, prostrate, rooting. 4. G. Native of New Zealand. L. maculàta, Penny. Plant glabrous. Corolla white, split on the upper side. Segments of corolla rather unequal, arranged like the radii of a semi-circle. Anthers lead-coloured, with 2 short awns projecting downwards from their apex. Nearly allied to L. membranàcea, R. Br. prod. Perhaps a species of *Prátia.*

Wrinkled-leaved Lobelia. Pl. creeping.

124 L. membrana'cea (R. Br. l. c.) glabrous, procumbent; leaves roundish, repandly toothed, membranous, somewhat 3-nerved, shorter than the peduncles; segments of the calyx toothed a little. 4. G. Native of New Holland, within the tropic, on the shore. Flowers beautiful, purple.

Membranous-leaved Lobelia. Pl. procumbent.

125 L. purpura'scens (R. Br. l. c.) glabrous; stem ascending, tetragonal; leaves ovate-lanceolate, deeply serrated, one-half shorter than the peduncles; segments of the upper lip of corolla narrower, linear. 4. G. Native of New South Wales, about Port Jackson. Flowers purplish or blue.

Purplish-flowered Lobelia. Fl. June, Aug. Clt. 1809. Pl. ascending.

126 L. fluvia'tilis (R. Br. l. c.) plant creeping, smoothish; branches ascending; leaves ovate, serrated on the outside, rather ciliated; peduncles bractless, downy, as well as the calyxes and ovaria; stamens epipetalous. 4. G. Native of New South Wales, at Port Jackson.

River Lobelia. Pl. ascending.

127 L. inunda'ta (R. Br. l. c.) plant creeping, glabrous, tufted; leaves roundish, repandly toothed, longer than the peduncles, which are bractless and glabrous; segments of the calyx a little shorter than the tube of the corolla; stamens epipetalous. 4. G. Native of New South Wales, at Port Jackson. Flowers blue.

Inundated Lobelia. Fl. June, July. Clt. 1821. Pl. creeping.

128 L. pedunicula'ta (R. Br. l. c.) plant creeping, rather downy; branches ascending, filiform; leaves remote, ovate, angularly toothed, acute, a little ciliated; peduncles very long, furnished with 2 minute bracteas; stamens epigynous. 4. G. Native of New South Wales, at Port Jackson. Flowers blue.

Pedunculate Lobelia. Fl. Oct. Nov. Clt. 1819. Pl. ascending.

129 L. irri'gua (R. Br. l. c) plant creeping, moss-like, glabrous; leaves roundish, thickish, dentately crenated, petiolate, longer than the peduncles, which are bractless; tube of corolla cleft longitudinally, with the segments of the limb nearly equal; stamens epigynous. 4. G. Native of Van Diemen's Land, and on the south coast of New Holland. Flowers purplish?

Irrigated Lobelia. Pl. creeping.

** *Racemes or peduncles few-flowered, terminal. Tube of corolla cleft longitudinally, with the lips of the limb very unequal.*

130 L. gra'cilis (Andr. bot. rep. t. 340.) plant glabrous, erect, branched a little; racemes rather secund; calyx length of filaments; superior lip of the corolla densely bearded: middle segment of the lower lip almost square, broader than long; lower leaves nearly ovate, deeply pinnatifid: superior ones

linear-lanceolate, nearly entire. ⊙. H. Native of New South Wales. Curt. bot. mag. t. 741. Flowers deep blue.

Slender Lobelia. Fl. July, Oct. Clt. 1801. Pl. 2 feet.

131 L. DENTA'TA (Cav. icon. 6. p. 14. t. 522.) plant erect, glabrous, a little branched; racemes few-flowered, secund; calyx one-half shorter than the filaments; superior lip of corolla a little bearded: middle segment of the lower lip oblong; lower leaves ovate-lanceolate, deeply toothed on the outer side: superior ones lanceolate, toothed. ♃. G. Native of New South Wales, about Port Jackson. Root fusiform, fibrous. Segments of the calyx subulate. Corolla blue, with a white throat. Two upper segments of the corolla very short.

Toothed-leaved Lobelia. Fl. Ju. July. Clt. 1824. Pl. 1 foot.

132 L. GIBBÒSA (Labill. nov. holl. 1. p. 50. t. 71.) glabrous; stem terete, simple; racemes secund, many-flowered; leaves linear, quite entire, rather fleshy; superior lip of corolla beardless: and with the segments of both lips lanceolate; capsule gibbous on one side. ♃. G. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. Root perpendicular, almost simple. Racemes very long. Bracteas subulate, hardly the length of the pedicels. Corollas blue. Anthers hispid at the apex.

Gibbous-fruited Lobelia. Fl. May, July. Clt. 1824. Pl. 1 to 2 feet.

133 L. SIMPLICICAU'LIS (R. Br. prod. p. 564.) glabrous; stem quite simple, terete; raceme secund, few-flowered; leaves linear, toothed, remote: lower ones lanceolate; upper lip of corolla bearded, the segments of both lips acute; capsules erect, rather gibbous on one side. ♃.? G. Native of Van Diemen's Land. Flowers blue?

Simple-stemmed Lobelia. Pl. 1 foot.

134 L. BROWNIA'NA (Rœm. et Schultes, syst. 5. p. 71.) stem terete, a little branched; raceme secund; leaves linear, lower ones toothed; superior lip of corolla ciliated: the segments of both lips acute; capsules gibbous on one side. ♃.? G. Native of New Holland, within the tropic, on the shore. L. strícta, R. Br. l. c. Flowers blue.

Brown's Lobelia. Pl. 1 foot.

135 L. HETEROPHY'LLA (Labill. nov. holl. 1. p. 52. t. 74.) plant smoothish; stem angular, simple; raceme secund; leaves thickish: lower ones dentately pinnatifid: superior ones linear, quite entire; middle segment of the lower lip of the corolla obcordate, and the lateral ones dimidiate. ♃. G. Native of New Holland, in Van Lewin's Land. Root simple, perpendicular. Bracteas lanceolate, solitary or twin, shorter than the pedicels. Calyx inflated, with very acute segments.

Variable-leaved Lobelia. Pl. 1 foot.

136 L. TENU'IOR (R. Br. in prod. p. 564.) plant rather pilose; stem filiform, divided; branches peduncle-formed, 1-flowered; lower leaves pinnatifid, of an ovate outline: superior leaves linear, trifid or quite entire; middle segment of the lower lip of the corolla obcordate: lateral ones dimidiate; capsule subcylindrical. ♃.? G. Native of New Holland, on the south coast, within the tropic. Flowers blue?

Slender Lobelia. Pl. 1 foot.

137 L. PARVIFÒLIA (R. Br. l. c.) glabrous; stem subpanicled, terete; branches usually 1-flowered, peduncle-formed; superior lip of corolla beardless: segments of the lower lip oblong, acutish. ♃.? G. Native of New Holland, on the south coast.

Small-leaved Lobelia. Pl. 1 foot.?

§ 6. *Species natives of Europe.*

138 L. U'RENS (Lin. spec. 1321.) leaves glabrous: lower ones obovate, denticulated: upper ones sessile, lanceolate, serrated: racemes terminal, secund: stem erect. ⊙. H. Native of Spain, France, &c. In Britain, on bushy heaths in Devonshire; on the slope of Kilmington Hill, 2 miles from Axminster, and between Axminster and Honiton. Curt. fl. lond. 6. t. 63. Bull. herb. t. 9. Smith, engl. bot. t. 953. Rapúntium ùrens, Mill. dict. no. 4.—Moris. hist. 2. p. 467. sect. 5. t. 5. f. 56.—Bocc. sic. 20. t. 11. Angles of stem scabrous. Calyx scabrous. Bracteas setaceous, at the base of the pedicels. Corolla purplish-blue, marked with 2 pale spots on the palate; lower lip dependent: upper lip of 2 narrow segments. The whole plant is milky, like the rest of the species, and if chewed, especially the root, excites a pungent sense of burning on the tongue.

Stinging Lobelia. Fl. Ju. July. England. Pl. 1 to 1½ foot.

139 L. SERRULA'TA (Brot. fl. lus. p. 304.) glabrous; leaves linear-lanceolate, sharply serrated; racemes long; stem erect. ⊙. H. Native of Gibraltar, in sandy humid places. Bracteas a little longer than the pedicels. Corolla rather roughish. Middle segment of the lower lip narrower than the lateral ones; segments of the upper lip linear. Flowers blue. Perhaps not distinct from *L. ùrens*.

Serrulated-leaved Lobelia. Fl. June, July. Clt. 1820. Pl. 1 foot.

140 L. LAURE'NTIA (Lin. spec. Gouan. monsp. 466. Schreb. in nov. act. a. n. c. p. 480.) leaves oval-lanceolate, crenated; peduncles solitary, 1-flowered, very long; stem branched, prostrate. ⊙. H. Native of Italy, Corsica, and Morocco. Brot. fl. lus. 1. p. 304. Michel. gen. 18. t. 14. Bocc. mus. p. 35. t. 27. Bracteas setaceous, in the middle of the pedicels. Flowers blue.

Var. β; leaves somewhat spatulate. Gouan. l. c.

Laurentian Lobelia. Fl. July. Clt. 1778. Pl. prostrate.

141 L. SALZMANNIA'NA (Presl. symb. bot. p. 31. t. 20.) plant quite glabrous; stem quite simple, erect, leafy; leaves lanceolate, obtuse, crenated, tapering into the petioles: uppermost ones disposed in aggregate whorles; pedicels axillary, filiform, bibracteate in the middle. ⊙. H. Native of Corsica, at Ajaccio by the sea side. L. Lauréntia, Salzm. pl. cors. exsic. Flowers blue?

Salzmann's Lobelia. Pl. ½ foot.

142 L. TENE'LLA (Biv. pl. sic. cent. 1. p. 53.) radical leaves spatulate, repand, glabrous; cauline leaves setaceous; stems very simple, 1-flowered, erectish. ⊙. H. Native of Portugal, Candia, Sicily, &c.; on the edges of rivers and rivulets. L. setàcea, Smith, fl. græc. t. 221. L. Lauréntia, Brot. fl. lus. 1. p. 304. L. minùta, D. C. fl. fr. no. 2871. Lower leaves disposed in a rosulate manner. Peduncles radical, furnished with linear bracteas in the middle. Corolla bilabiate, with a white tube, a pale blue limb, and a yellow throat. Lower lip with a white centre; throat bearded. Anthers red.

Delicate Lobelia. Fl. May, July. Clt. 1821. Pl. ¼ foot.

143 L. FARSE'TIA (Vand. in Rœm. script. pl. hisp. p. 66. Vittm. suppl. 1. p. 261.) lower leaves ovate-lanceolate, obsoletely toothed; floral leaves linear. ♃. H. Native of Portugal, in humid places. Stem 2 hands high, many-angled, branched at the base. Leaves glabrous. Calyx gibbous, with linear spreading segments. Corolla pentagonal, blue, the segments of the lower lip the largest. In the base of the inner part of the limb there are two oblong parallel callosities, as in the genus *Dólichos*. Style longer than the stamens. Capsule ventricose.

Var. α; leaves oval-oblong, acuminated, denticulated; stem leafy, somewhat spicate; anthers hairy, joined at the apex.

Var. β; stem suffruticose; leaves cordate, acute, serrated; flowers axillary, pedunculate.

Farseti's Lobelia. Pl. 1 to 1½ foot.

† *Species not sufficiently known.*

144 L. CORNU'TA (Lin. spec. p. 1319.) leaves ovate, petiolate;

stamens very long. ♄.? S. Native of Cayenne. Leaves said to be quite entire.

Horned Lobelia. Pl.?

145 L. BRYOÌDES (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 41.) stems tufted; leaves sessile, lanceolate, quite entire, acute; flowers sessile, terminal. ♃. S. Native of South America, on Mount Antisana. Humb. et Bonpl. Habit of a moss or *Arètia*. Leaves imbricated, shining, coriaceous, denticulated. Flowers among the terminal connivent leaves. Perhaps a species of *Lysipòmia*.

Bryum-like Lobelia. Pl. ¼ foot.

146 L. VERONICÆFÒLIA (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 57.) stem erect; leaves downy: radical ones obtuse, obovate; cauline leaves lanceolate, dentate, acute; flowers terminal, racemose. ♃. S. Native of South America. Humb. et Bonpl.

Speedwell-leaved Lobelia. Pl.?

147 L. AMYGDALÌNA (Willd. l. c. p. 57.) stem erect; leaves ovate, acuminated, serrated; pedicels axillary; corolla cleft.—Native of South America. Humb. et Bonpl.

Almond-like Lobelia. Pl.?

148 L. RETRÓRSA (Willd. l. c.) stem arboreous; branches scabrous; leaves petiolate, elliptic, mucronate, with retrograde serratures, wrinkled, veiny; flowers terminal, racemose. ♄. S. Native of South America. Humb. et Bonpl.

Retrograde-serrated-leaved Lobelia. Shrub.

149 L. Bonplandia'na (Willd. l. c.) stem arboreous; leaves lanceolate, sharply serrated, flat, downy, on short petioles; pedicels axillary, shorter than the leaves. ♄. S. Native of South America. Humb. et Bonpl. L. dentàta, Willd. herb.

Bonpland's Lobelia. Shrub.

150 L. ELLI'PTICA (Willd. l. c.) stem arboreous; leaves elliptic, obtuse, rugged, veiny, denticulated; branches, petioles, and peduncles clothed with hairy tomentum, as well as the leaves; calyxes reflexed; corollas downy. ♄. S. Native of South America. Humb. et Bonpl.

Elliptic-leaved Lobelia. Shrub.

151 L. NÌVEA (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 58.) stem arboreous; leaves elliptic, with revolute edges, toothed, shining and wrinkled above, but clothed with white tomentum beneath, as well as on the pedicels and corollas; flowers axillary. ♄. S. Native of South America. Humb. et Bonpl.

Snowy Lobelia. Shrub.

152 L. RETICULA'TA (Willd. l. c.) stem arboreous; leaves ovate-lanceolate, acuminated, crenated, wrinkled from veins, downy beneath; corymbs terminal, racemose. ♄. S. Native of South America. Humb. et Bonpl.

Reticulated-leaved Lobelia. Shrub.

153 L. Madagascarie'nsis (Rœm. et Schultes, syst. 5. p. 67.) lower leaves ovate: superior ones lanceolate, denticulated, decurrent; flowers axillary, length of leaves; stem prostrate. ☉. H. Native of Madagascar. L. decúrrens, Willd. herb.

Madagascar Lobelia. Pl. prostrate.

154 L. PHYTEUMOÌDES (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 68.) leaves lanceolate, toothed, sessile, glabrous; racemes terminal; stem ascending, a little branched. ♃.? S. Native of South America. Humb. et Bonpl.

Phyteuma-like Lobelia. Pl. ascending.

155 L. Humboldtia'na (Rœm. et Schultes, syst. 5. p. 68.) leaves roundish, acute, sessile, with cartilaginously serrated edges; flowers sessile, axillary; stem weak. ♄.? S. Native of South America. Humb. et Bonpl. L. sessilifòlia, Willd. herb.

Humboldt's Lobelia. Pl.?

156 L. POLYMO'RPHA (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 68.) stems prostrate; lower leaves serrated, oblong; superior ones quite entire, lanceolate; pedicels axillary, elongated. ♃. S. Native of the island of Bourbon, Bory de St. Vincent.

Polymorphous Lobelia. Pl. prostrate.

157 L. Loxe'nsis (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 72.) plant clothed with scabrous tomentum; leaves oblong, petiolate, wrinkled, and shining above; flowers terminal, panicled. ♄. S. Native of South America, about Loxa. Humb. et Bonpl.

Loxa Lobelia. Shrub.

158 L. Megapota'mica (Spreng. syst. add. p. 75.) stem erect, branched, glabrous; leaves linear, very narrow, erectly spreading, glabrous; flowers terminal, corymbose. ♄.? S. Native of Brazil, at the banks of the Rio Grande, where it was collected by Sello.

Rio Grande Lobelia. Shrub.

Cult. All the species of this genus are truly ornamental when in blossom. The hardy herbaceous kinds thrive and flower best in light rich earth or peat soil; but in winter most of the kinds require to be protected by planting them in pots and placing them in a frame or green-house. They increase freely by the suckers from the roots or by seed. The green-house and stove perennial herbaceous kinds grow well in a mixture of peat and sand, and are easily increased by dividing, and by seeds. The shrubby, stove, and greenhouse kinds grow well in the same kind of soil recommended for the perennial herbaceous species, and are easily increased by cuttings in the same kind of soil. The seeds of annual species require only to be sown where they are intended to remain.

IX. DORTMA'NNA (named after — Dortmann, a Dutch apothecary, according to Clusius). Rudb. act. ups. ann. 1720. 97. t. 2. Neck. elem. Lobèlia species, Lin. and Nutt.

Lin. syst. *Pentándria, Monogýnia*. Calyx of 5 deep segments. Corolla bilabiate, with a bearded mouth, cleft on the back; lower lip trifid; upper lip of 2 smaller segments. Stamens with free filaments, and cohering bearded anthers. Stigma capitate, hairy. Capsule half superior, 3-valved, 3-celled, 5-angled, surrounded by the segments of the calyx below the summit, many-seeded.—Aquatic, smooth, fleshy plants. Leaves numerous, mostly radical, recurved. Scapes hollow, with a few leaves at the base, bearing a lax raceme of flowers at the top. Bracteas solitary at the base of the pedicels.

1 D. LACU'STRIS (Rubb. l. c. Gerard, emac. 105. f. 1.) leaves linear, fistular, and bilocular; scape simple. ♃. H. Native of Europe, in lakes with a gravelly bottom; in Britain abundant in the lakes of Wales, Scotland, Ireland, and the north of England; in most of the lakes with clear gravelly bottoms in Westmoreland and Cumberland. Lobèlia Dortmánna, Lin. spec. 1318. Smith, engl. bot. 2. p. 140. Lightf. scot. 505. f. 21. Fl. dan. t. 39. Gladìolus palústris, Bauh. pin. 41. Rudb. elys. vol. 2. p. 17. f. 7.—Clus. cur. post. 40. f. 1. Leaves 2 inches long. Flowers pale blue. Mouth of corolla bearded.

Lake Dortmanna. Fl. July. Britain. Pl. ½ to 1 foot.

2 D. PALUDÒSA; leaves flat, linear-oblong, with obsoletely crenated margins; scape nearly simple and naked, bearing a few remote flowers at the apex. ♃. H. Native of North America, in deep sphagnose swamps, from Sussex county in Delaware to Georgia. Lobèlia paludòsa, Nutt. nov. gen. 2. p. 75. Leaves 4-6 inches long, and hardly 5 lines wide. Flowers pale blue, small. Corolla with the disk of the lower lip downy.

Marsh Dortmanna. Pl. 2 feet.

Cult. The species of *Dortmánna* are singular, and beautiful plants, but difficult of culture. However, *D. lacústris* may be

grown for a time, if planted in a pot of gravel, and placed in a pond or cistern, so that the plants may be about 6 inches below the surface of the water; and *D. paludòsa* may be grown in a pot half filled with peat earth, and the other half with sphagnum, in which the plants are to be set, and the pot placed in a shallow pan of water, or in a cistern or pond, but not so deep as to immerse the plants.

X. PARASTRA'NTHUS (from *παραστρεφω*, *parastrepho*, to invert, or to distort, and *ανθος*, *anthos*, a flower; the flowers are upside down, compared with those of other genera of *Lobeliàceæ*). Lobèlia species, Lin. Thunb.

LIN. SYST. *Pentándria*, *Monogy'nia*. Calyx 5-cleft. Corolla bilabiate, with hardly any tube: upper lip of 3 segments, lower one of 2 segments, smaller. Stamineous column under the lower lip. Anthers and filaments connected into a column; the former bearded at the apex. Ovarium inferior, 2-3-celled. Stigma bifid or trifid.—Herbaceous plants, with toothed leaves, and terminal racemes of almost sessile yellow flowers.

1 P. SI'MPLEX; glabrous; stems assurgent, simple; leaves lanceolate, serrated; flowers almost sessile, at the tops of the stems, forming a loose spike; bracteas toothed, shorter than the calycine segments. ♃. H. Native of the Cape of Good Hope. Lobèlia lùtea, Lin. spec. 1322. Sims, bot. mag. t. 1319.—Burm. afr. p. 101. t. 39. Flowers deep yellow.

Simple-stemmed Yellow-Lobelia. Fl. June, July. Clt. 1774. Pl. ½ foot.

2 P. VARIIFÒLIA; stems erectish, branched at top; leaves linear, quite entire, and toothed, particularly the upper ones; flowers solitary, axillary, nearly terminal, almost sessile; stigma tripartite. ♃. H. Native of the Cape of Good Hope. Lobèlia variifòlia, Sims, bot. mag. 1692. Flowers yellow.

Various-leaved Yellow-Lobelia. Fl. June, July. Clt. 1812. Pl. ½ to 1 foot.

3 P. UNIDENTA'TA; leaves linear-lanceolate, furnished with a tooth on each side, rather hairy above, and discoloured beneath; pedicels solitary, terminal; stems angular from the decurrent bases of the leaves. ♃. G. Native of the Cape of Good Hope. Lobèlia unidentàta, Ait. hort. kew. ed. 2. 1. p. 356. Sims, bot. mag. t. 1484. L. bidentàta, Donn, hort. cant. ed. 4. p. 41. Flowers deep blue. Anthers yellow. Stigma 2-lobed.

Unidentate-leaved Parastranthus. Fl. May, Aug. Clt. 1794. Pl. ¼ foot.

Cult. Beautiful plants, of easy culture. A mixture of loam, peat, and sand is the best soil for them; and they are easily increased by dividing at the root.

XI. ISO'TOMA (from *ισος*, *isos*, equal, and *τομα*, *toma*, a section; in reference to the segments of the corolla being nearly equal.) Lindl. bot. reg. 964. Lobèlia Isótoma, R. Br. prod. fl. nov. holl. p. 564.

LIN. SYST. *Pentándria*, *Monogy'nia*. Limb of calyx 5-parted (f. 122. *c*.), nearly equal. Corolla salver-shaped (f. 122. *d*.) or funnel-shaped, with an entire or cleft tube, and a nearly equal 5-parted limb. Filaments combined into a tube. Anthers cohering, beardless; two lower ones mucronate. Stigma capitate, protruding beyond the anthers. Capsule 2-celled, many-seeded. —Herbaceous plants. This genus differs from all the other genera of Lobeliaceous plants, in the 2 lower anthers being mucronate, except *Pràtia*.

1 I. AXILLA'RIS (Lindl. bot. reg. 964.) plant rather downy; leaves sessile, pinnatifid, toothed; peduncles axillary, naked, elongated, 1-flowered; corolla salver-shaped, with an entire tube. ♃. G. Native of New Holland, on the south coast. L. senecioìdes, Cunningh. L. seneciònis, Spreng. syst. add. p. 75. Corolla with green tube, and light blue linear-lanceolate segments. The segments of the calyx are narrow, distant, and at length reflexed. (f. 122.).

FIG. 122.

Axillary-flowered Isotoma. Fl. July, Sept. Clt. 1824. Pl. 1 foot.

2 I. BRO'WNII; glabrous; stems almost simple; leaves linear, quite entire; corolla salver-shaped, with an entire tube, and a somewhat unequal limb; flowers racemose. ⊙. H. Native of New Holland, on the south coast. Lobèlia hypocrateriformis, R. Br. prod. 564. Hook. bot. mag. t. 3075. Flowers beautiful purple.

Brown's Isotoma. Fl. Sept. Clt. 1829. Pl. 1 foot.

3 I. SCAPI'GERA; stems short; leaves lanceolate, a little toothed; corolla funnel-shaped, having the tube cleft above at the apex; peduncles scape-formed, 1-flowered. ♃. G. Native of New Holland, on the south coast. Lobèlia scapígera, R. Br. prod. p. 564. Flowers blue or purple.

Var. α, biunciàlis (R. Br. l. c.) stem 6-10 lines long; leaves ovate-lanceolate, 4-6 lines long; scapes many, 2-3 inches long. ♃. G.

Var. β, pusílla (R. Br. l. c.) stems almost wanting; leaves ovate, obtuse, 2 lines long; scapes almost solitary, 3-8 lines long. ♃. G.

Scape-bearing Isotoma. Pl. 1 to 3 inch.

Cult. The species of this genus are very elegant while in blossom, and are of easy culture. A light soil suits them best; and they are easily increased by cuttings or seeds. They answer well if planted out during summer in the open border, with a south aspect.

XII. HOLOSTI'GMA (from *ὁλος*, *holos*, entire, and *στιγμα*, *stigma*, a stigma; in reference to the entire stigma). Lobèlia, Sect. III. R. Br. prod. p. 564.

LIN. SYST. *Dioècia*, *Pentándria*. Flowers dioecious. Limb of calyx 5-parted. Corolla having the tube cleft above, and a nearly equal 5-lobed limb. Anthers cohering, bearded. Stigma undivided. Capsule 2-celled, many-seeded. — A herbaceous plant.

1 H. DIOÍCA; male flowers corymbose and terminal; female ones axillary and solitary; cauline leaves lanceolate, toothed or entire. ♃. G. Native of New Holland, within the tropic, on the shore. Flowers blue.?

Dioecious-flowered Holostigma. Pl.?

Cult. See *Isótoma* above for culture and propagation.

XIII. LYSIPO'MIA (from *λυω*, *luo*, to solve, and *πωμα*, *poma*, a lid; in reference to the capsule, which opens by an operculum at the apex). H. B. et Kunth, nov. gen. amer. 3. p. 318.

LIN. SYST. *Pentándria*, *Monogy'nia*. Limb of calyx 5-parted. Corolla with a campanulate entire tube, and a 5-parted sub-bilabiate limb; the 2 lobes of the upper lip a little longer than those of the lower lip: lobes valvate in æstivation. Anthers cohering; the 2 inferior ones a little shorter than the rest, bearded at

the apex, or terminating in a membranous process. Stigma 2-lobed, ciliated outside. Capsule somewhat 5-ribbed, 1-celled, opening by an orbicular convex, umbonate, deciduous operculum. Seeds numerous, adnate to parietal placentas.—Small, tufted, stemless or caulescent herbs, with the habit of *Arètia* or *Móntia*. Leaves alternate, linear or spatulate, quite entire, stiff and crowded, or fleshy and remote. Flowers minute, axillary, solitary, white, pedunculate. This genus is easily distinguished from all the other genera of the present order.

1 L. montioìdes (H. B. et Kunth, nov. gen. amer. 3. p. 320. t. 266. f. 2.) stems creeping; leaves spatulate, rather fleshy; peduncles axillary; calycine segments unequal, glabrous, 4 times shorter than the tube of the corolla. ♃. S. Native of Quito, in humid places on the high plains of Mount Antisana, at the altitude of above 6000 feet. Lobèlia limoselloìdes, Willd. in Rœm. et Schultes, syst. 5. p. 41. Herb glabrous, with the habit of *Móntia fontàna*.

Montia-like Lysipomia. Pl. procumbent.

2 L. renifórmis (H. B. et Kunth, nov. gen. amer. 3. p. 320. t. 266. f. 1.) stems creeping; leaves orbicularly reniform, emarginate; flowers axillary; calycine segments equal, acute, glabrous, 3 times shorter than the tube of the corolla. ♃. S. Native of South America, near the Cave of Antisana. Herb glabrous, with the habit of *Viola palústris*.

Reniform-leaved Lysopomia. Pl. creeping.

3 L. aretioìdes (H. B. et Kunth, nov. gen. amer. 3. p. 321. t. 267. f. 1.) plant tufted; stems short, leafy; leaves crowded in a stellate manner, oblong-spatulate, acute, stiff; peduncles axillary; segments of the calyx equal, acute, ciliated, one-half shorter than the corolla. ♃. S. Native of the Andes of Peru, near Loxa, in Cerro de Vinajacu, at the altitude of about 4000 feet. Lobèlia glandulòsa, Willd. in Rœm. et Schultes, syst. 5. p. 41. Plant glabrous, with the habit of a species of *Arètia*.

Aretia-like Lysipomia. Pl. tufted, an inch high.

4 L. acau'lis (H. B. et Kunth, nov. gen. amer. 3. p. 321. t. 267. f. 2.) plant tufted, stemless; leaves radical, crowded in a stellate manner, linear, obtuse, stiff; peduncles radical; segments of the calyx unequal, obtuse, glabrous. ♃. S. Native of South America, on the high plains of Mount Antisana, and roots of Chussulongi, above the altitude of 6000 feet. Lobèlia androsàcea, Willd. in Rœm. et Schultes, syst. 5. p. 41. Plant glabrous, with the habit of *Valeriàna rígida*.

Stemless Lysipomia. Pl. tufted.

5 L. subula'ta; leaves radical, crowded in a stellate manner, subulate, mucronate, hairy at the base; peduncles elongated; calycine lobes acute. ♃. F. Native on the Cordillera of Peru. Peduncles 1-flowered, an inch long. (v. s. in herb. Lamb.).

Subulate-leaved Lysipomia. Pl. 1 inch.

Cult. The species of *Lysipòmia* are very remarkable little plants, but none of them have been as yet introduced to our gardens; but should they ever be, we would recommend their being grown in a mixture of loam and peat, in small pots, well drained with sherds. They will be easily increased by dividing.

XIV. MONO'PSIS (from *μονος, monos*, one, and *οψις, opsis*, a face; in reference to the flowers being regular, not bilabiate). Salisb.—Lobèlia spéculum, Andr. bot. rep. 664. Speculària, Soland. mss.

Lin. syst. *Pentándria, Monogýnia.* Calyx tubular with 5 equal spreading linear-acute segments. Corolla salver-shaped, with a terete tube, which is split on one side, allowing the stamens and style to escape, and a rotate equal limb; segments obtuse, mucronate. Anthers cohering. Capsule inferior, 2-celled, many-seeded.—A small elegant plant, with prostrate branches; very long, solitary, axillary, 1-flowered, naked peduncles; linear-lanceolate, irregularly toothed, or entire alternate leaves; and showy deep blue flowers, with yellow anthers.

1 M. conspi'cua (Salisb.) ⊙. H. Native of the Cape of Good Hope. Lobèlia spéculum, Andr. bot. rep. t. 664. Sims, bot. mag. t. 1499.

Conspicuous Monopsis. Fl. July, Aug. Clt. 1812. Pl. prostrate.

Cult. A little annual plant, worth cultivating in every collection, for the sake of its neat, elegant, deep blue flowers. The seeds should be raised in the hot-bed, and the plants, when about an inch above ground, should be planted separately into small pots, filled with a mixture of peat and sand, and others may be planted out into the open border in May, in warm sheltered situations.

XV. HIPPOBRO'MA (from *ιππος, hippos*, a horse, and *βρομος, bromos*, poison; the plant is a very strong poison, and proves fatal to horses that eat it). Lobèlia species of authors.

Lin. syst. *Pentándria, Monogýnia.* Limb of calyx 5-parted; segments linear, ciliated. Corolla with a very long straight entire tube, and a 5-parted nearly equal limb. Stamineous tube exserted beyond the throat of the corolla. Stamens and anthers connate; the latter bearded. Stigma 2-lobed. Capsule 2-celled, 2-valved, many-seeded.—A herbaceous plant, with short axillary pedicels, runcinate or coarsely toothed leaves, and long white flowers, resembling those of *Mirábilis longiflòra*.

1 H. longiflòra; leaves obovate-lanceolate, coarsely toothed; tube of corolla very long and slender. ♃. S. Native of Jamaica and St. Domingo, and others of the West India Islands, on the banks of rivers. Lobèlia longiflòra, Jacq. amer. 219. ed. pict. p. 107. t. 200. Jacq. hort. vind. 1. t. 27. Lindl. bot. reg. t. 1200. Rapúntium longiflòrum, Mill. dict. no. 7.—Sloan. jam. 158. t. 101. f. 2. Plant hairy. Ovarium turbinate, pentagonal. Tube of anthers 10-furrowed. This is a very poisonous plant. If it be handled, and the hand unawares be applied to the eyes, it brings on an inflammation. The Spanish Americans call it *Rebenta Cavallos*, because it proves fatal to horses that eat it; it acts as a violent cathartic. It is well known in St. Domingo under the name of *Quedec*.

Long-flowered Hippobroma. Fl. May, Aug. Clt. 1752. Pl. 1 foot.

Cult. A mixture of peat, loam, and sand suits this plant, and it is easily increased by cuttings, in the same kind of soil, under a hand-glass in heat.

XVI. CLINTO'NIA (named in honour of the late De Witt Clinton, governor of the State of New York, author of several ingenious treatises on different branches of natural history). Doug. in bot. reg. 1241.

Lin. syst. *Pentándria, Monogýnia.* Calyx adhering to the ovarium, with a 5-lobed equal limb. Corolla bilabiate, with hardly any tube; lower lip cuneated, 3-lobed; superior one straight, bipartite. Stamens combined into an incurved tube: anthers cohering; the 2 lower ones bearded at the apex. Ovarium silique-formed, triangular, twisted, 1-celled, with 2 parietal placentas. Capsule dry, chartaceous, many-seeded, opening by 3 thong-formed valves.—Herbaceous, procumbent, glabrous plants, with small linear-lanceolate leaves: and axillary, solitary, almost sessile blue flowers.

1 C. e'legans (Dougl. l. c.) glabrous; root annual; stem procumbent, branched, rather angular; leaves sessile, ovate, 3-veined; flowers solitary, axillary, sessile; ovarium sessile, long, acuminated. ⊙. H. Native of North America, on the banks

of the Columbia river. Flowers blue; the lower lip having a large white streak on the base. Stigma girded by a papillose beard. Two lower anthers alone bearded.

Elegant Clintonia. Fl. July, Aug. Clt. 1827. Pl. ½ ft.

2 C. BERGIA'NA (Cham. in Linnæa. 7. p. 217.) glabrous; root perennial, creeping; stems erect or decumbent, branched, triangular at bottom; leaves linear-lanceolate, acute, remotely denticulated, sessile: lower ones ovate; flowers axillary, almost sessile, at the tops of the branches; ovarium elongated. ♃. S. Native of the Cape of Good Hope, near Hangkliph, where it was collected by Mundt. Capsule elongated, crowned by the segments of the calyx, which are spreading, fleshy, and stellately disposed; anthers all bearded. Corolla pale blue.

Bergius's Clintonia. Pl. decumbent.

3 C. PUSÍLLA; we have not been able to see the work in which this plant is described, as it has not yet been received in this country. ⊙. H. Native of Chili. L. pusílla, Poepp. pl. chil. exsic. 3. no. 171. syn. pl. amer. austr. misc. diar. 731. Flowers blue.

Small Clintonia. Pl. decumbent.

XVII. CY'PHIA (from *κυφος, kyphos*, curved; in reference to the stigma being gibbous). Berg. fl. cap. p. 173. Lobèlia species, Thunb.

LIN. SYST. *Pentándria, Monogýnia*. Calyx turbinate, 5-cleft. Corolla bilabiate; segments easily separated to the base, spreading at the apex. Filaments hairy, cohering; anthers free, bearded. Stigma drooping, hollow, gibbous. Capsule 2-celled, many-seeded.—Herbaceous plants, natives of the Cape of Good Hope, with alternate, undivided, pinnate, and pinnatifid leaves; and blue or red flowers.

1 C. VOLU'BILIS (Willd. spec. 1. p. 952.) glabrous; leaves entire and toothed, linear; stem twining. ⊙. G. Native of the Cape of Good Hope. Lobèlia volùbilis, Lin. fil. suppl. p. 396. Thunb. fl. cap. 2. p. 38. Stems filiform, twining contrary to the sun. Leaves often trifid at the apex: the lateral segments short. Flowers axillary, solitary, pedicellate. Corolla ringent or bilabiate.

Var. α, vulgàtior (Cham. in Linnæa. 7. p. 224.) flowers nearly an inch long; genitals half an inch, one-half shorter than the tube; segments of corolla narrow-lanceolate.

Var. β, intermèdia (Cham. l. c.) flowers 9 lines long; throat of corolla more bearded; segments of corolla more elliptic; genitals shorter than the corolline tube.

Var. γ, parviflòra (Cham. l. c.) flowers not half an inch long; genitals exceeding the corolline tube; filaments villous. Perhaps a proper species.

Twining Cyphia. Fl.? Clt. 1795. Pl. twining.

2 C. DIGITA'TA (Willd. spec. 1. p. 953.) glabrous; leaves digitate; stem twining. ♃. G. Native of the Cape of Good Hope. Lobèlia Cýphia, Thunb. prod. 1. p. 39. Lobèlia digitàta, Thunb. in act. gor. and fl. cap. 2. p. 50. Root bulbous, esculent, fleshy. Stems filiform, simple. Leaves sessile, digitately pinnate; segments linear. Pedicels filiform, purplish, striated, length of leaves or bracteas. Corolla monopetalous, ringent or bilabiate: upper lip bipartite: lower ones tripartite, pale blue. Capsule roundish, angular.

Digitate-leaved Cyphia. Pl. twining.

3 C. BULBÒSA (Berg. fl. cap. 172.) glabrous; leaves digitate; leaflets pinnatifid; stem erect. ♃. G. Native of the Cape of Good Hope, on hills. Cýphia Capénsis, Gmel. syst. 5. p. 370. Lobèlia bulbòsa, Lin. spec. 1319. Thunb. prod. 1. p. 39. fl. cap. 2. p. 49. Lobèlia Cýphia, Gmel. syst. 5. p. 357.—Burm. afr. 99. t. 38. f. 1. Root fibrous, descending, terminating in a bulb. Stems usually simple, rarely branched. Lower leaves pinnatifid, with unequal lanceolate lobes; the upper ones often simple, ex Thunb. Flowers pale blue.?

Bulbous-rooted Cyphia. Fl. Aug. Sept. Clt. 1791. Pl. ½ foot.

4 C. CARDA'MINES (Willd. spec. 1. p. 953.) villous; leaves pinnate, with ovate, toothed leaflets; scape erect. ♃. G. Native of the Cape of Good Hope, in sandy places on the outskirts of Cape Town. Lobèlia Cardámines, Thunb. prod. 1 p. 39. fl. cap. 2. p. 49. Stem scape-formed, simple. Leaves radical, pinnatifid; ultimate leaflets 3-lobed. Flowers racemose, on very short pedicels.

Lady's-smock-like Cyphia. Fl. July, Aug. Clt. 1823. Pl. ½ ft.

5 C. SERRA'TA (Spreng. syst. 1. p. 809.) leaves radical, oblong, attenuated at the base, sessile, crenately serrated, quite glabrous, as well as the scape, which is scaly; flowers racemose; segments of the calyx reflexed, serrated. ♃. G. Native of the Cape of Good Hope.

Serrated-leaved Cyphia. Pl. ½ foot.?

6 C. INCÌSA (Willd. spec. 1. p. 953.) villous; leaves deeply subpinnatifid; scapes erect. ⊙. ♃. G. Native of the Cape of Good Hope, on hills on the outskirts of Cape Town. Lobèlia incìsa, Thunb. prod. 1. p. 39. fl. cap. 2. p. 50. Root descending. Stem scape-formed, simple, furrowed. Leaves radical, petiolate. Flowers racemose, on very short pedicels. Corolla bilabiate, very pale red.

Cut-leaved Cyphia. Fl. July, Aug. Clt. 1819. Pl. ½ ft.

7 C. PHYTEU'MA (Willd. spec. 1. p. 953.) leaves oblong, crenated; scape erect. ⊙. ♃. G. Native of the Cape of Good Hope. Ker. bot. reg. t. 625. Lobèlia Phyteùma, Lin. spec. p. 1319. Thunb. prod. 1. p. 39. fl. cap. 2. p. 47. Lobèlia nudicaûlis, Lam. dict. 3. p. 591. no. 41. Stem scape-formed, striated, glabrous. Leaves radical, attenuated at the base, or on short petioles, obtuse, villous. Flowers pink, spicate, alternate. Bracteas ovate, acute, toothed, reflexed; upper ones ciliated.

Phyteuma-like Cyphia. Fl. Feb. Clt. 1822. Pl. 1 to 1½ foot.

8 C.? PINNA'TA (Rœm. et Schultes, syst. 5. p. 477.) stem shrubby, erect, branched at top; leaves pinnate, smooth: leaflets very narrow, capillary. ♄. G. Native of the Canary Islands. Lobèlia pinnàta, Lam. dict. 3. p. 591. no. 44. Shrub milky. Leaves like those of *Ipomæ'a Quamóclit*. Branches very leafy. Leaves shining; leaflets 1½ inch long.

Pinnate Cyphia. Shrub 3 feet.

9 C. BÓTRYS (Willd. rel. ex Rœm. et Schultes, syst. 5. p. 477.) leaves bipinnatifidly jagged; stem furrowed. Native of the Cape of Good Hope. There is a smoother and broader leaved variety of this, with larger pinnatifid bracteas, which are about the length of the flowers.

Racemed Cyphia. Pl. 1 foot.?

Cult. The species of this genus thrive well in an equal mixture of loam, peat, and sand; and cuttings of them root readily under a hand-glass. Some of the species have large tuberous roots; these must be kept quite dry when not in a growing state, or they will rot. These tuberous-rooted kinds may be increased just as the stems begin to push out from the root, by cutting off as many of the shoots as are wanted, and planting them in a small pot, in the same kind of soil recommended for the species, keeping them dry till the wound has healed, but never covering them with glass; they will soon form tubers of themselves, and the old plant will make fresh shoots.

XVIII. CANONA'NTHUS (from *κανονικος, kanonicos*, regular, and *ανθος, anthos*, a flower; the flowers are regular, like those of *Campanulàceæ*, not bilabiate, as in the rest of the Lobeliaceous genera). Lobèlia species, Cav. icon. 6. p. 11. t. 517.

Lin. syst. *Pentándria, Monogýnia.* Calyx regular, with a campanulate tube, and ovate-lanceolate segments. Corolla tubularly campanulate, entire, with 5 equal, ovate, acute segments. Filaments and anthers combined; the latter beardless. Ovarium 2-celled. ?—A branched shrub, clothed in every part with white tomentum. Leaves ovate, quite entire, glabrous above, and densely clothed with tomentum beneath. Peduncles long, axillary, solitary, 1-flowered. Calyx tomentose. Corolla red inside, and clothed with obscure white powdery tomentum outside.

1 C. campanula'tus; ♄. F. Native of Peru, on the road from Guaranda to Chimborazo. Lobèlia campanulàta, Cav. icon. 6. p. 11. t. 517.

Campanulate-flowered Canonanthus. Shrub 8 feet.

Cult. See *Tùpa*, p. 700. for culture and propagation.

Order CXXXV. STYLI'DEÆ (plants agreeing with *Stylidium* in important characters). R. Br. prod. fl. nov. holl. p. 565.

Calyx superior, 2-6-parted, bilabiate or regular (f. 123. *a.*), permanent. Corolla monopetalous, with a 5-6-cleft, irregular (f. 123. *b.*), rarely equal limb, which is imbricate in æstivation, and at length falling off. Stamens 2 (f. 123. *d.*); filaments combined with the style into a column. Anthers didymous (f. 123. *d.*), and sometimes simple, lying upon the stigma. Pollen globose, simple, sometimes angular. Ovarium 2-celled, but sometimes almost 1-celled from the middle dissepiment being short, many-seeded; furnished with a gland in front, or crowned by 2 opposite glands. Style one; stigma undivided or bifid. Capsule 2-valved, 2-celled, with a parallel dissepiment; or almost 1-celled from the dissepiment being short, or at length released from the inflexed margins of the valves. Seeds fixed to the axis of the dissepiment, erect, small, sometimes pedicellate. Albumen conforming to the seed, fleshy, and rather oily. Embryo inclosed, minute.—Caulescent scarpigerous nonlactescent herbs or shrubs, beset with simple hairs, which are either tipped with capitate glands or acute. Leaves usually scattered, but sometimes verticillate, entire, with naked or ciliated edges; radical leaves crowded in the scapigerous species. Flowers spicate, racemose, corymbose, and solitary; terminal, rarely axillary; pedicels usually furnished with three bracteas.

This order is nearly allied to both *Campanulàceæ* and *Goodenòvieæ*, from both of which it is distinguished by the gynandrous stamens, and from the latter by the want of an indusium to the stigma. The structure of the sexual organs is highly curious; the stamens and style are closely combined into a solid irritable column, at the top of which is a cavity, including the stigma, and bounded by the anthers.

Synopsis of the genera.

1 Styli'dium. Calyx 2-parted, bilabiate (f. 123. *a.*). Column with a double flexure. Anthers 2-lobed (f. 123. *d.*); lobes divaricate. Stigma undivided. Capsule 2-celled.

2 Levenhoòkia. Calyx 5-parted, bilabiate. Column erect, adnate to the lower side of the tube. Lobes of anthers one above the other, divaricate. Stigmas 2. Capsule 1-celled.

3 Forste'ra. Calyx double, both composed of 2-3 sepals. Corolla tubularly campanulate, 5-6-parted. Column straight, bearing 2 anthers. Stigmas 2. Capsule 1-celled.

1 STYLI'DIUM (from στυλος, *stylos*, a column; in reference to the stamens and style being combined into a column). Swartz, in nov. act. nat. scrut. berol. ex Willd. spec. 4. p. 146. Labill. nov. holl. 2. p. 63. t. 213. p. 566. R. Br. prod. p. 566.—Ventenàtia, Smith, exot. bot. 2. p. 13. t. 66.—Candóllea, Labill. in ann. mus. 6. p. 414. t. 64. f. 2.

Lin. syst. *Gynándria, Diándria.* Calyx bilabiate (f. 123. *a.*). Corolla irregular, 5-cleft (f. 123. *b.*); the fifth segment or labellum dissimilar to the others, deflexed, smaller, rarely stretched out; the rest spreading, rarely joined by pairs. Column reclinate (f. 123. *d.*), with a double flexure. Anthers 2-lobed (f. 123. *d.*); lobes divaricate. Stigma obtuse, undivided. Capsule 2-celled, having the dissepiment sometimes incomplete above.—Scapigerous or caulescent herbs or subshrubs. Radical leaves crowded, sometimes attenuated into the petioles; cauline ones scattered, and sometimes verticillate, often small and bracteaformed, rarely cirrhose at the apex or loosened at the base. Inflorescence variable. Outer lip of calyx bidentate or bipartite, inner one tridentate or tripartite. Corollas purple, white, violaceous, rarely yellow, usually beset with pili on the outside, which are tipped with capitate glands: tube twisted at the base, sometimes very short; throat usually crowned by teeth or glands, but sometimes naked: the 4 larger segments of the limb approximating by pairs, one of the pair often smaller than the other. Labellum or lip narrower than the other segments, opposite the front of the calyx, but from the contortion of the tube has at length become lateral, with its disk often thickened, and rather convex inside, usually appendiculated by a small segment on each side, but sometimes simple. Column linear, longer than the limb of the corolla, on the same side as the labellum, exserted, reclinate, having the outer bend so irritable that if touched with a pin it instantly starts from its place to the opposite side of the flower with great impetuosity. Anthers dehiscing lengthwise. Stigma at first obsolete, and hidden by the incumbent anthers, but exserted at length, and sometimes hispid or papulose.

Sect. I. Ventena'tia. Capsule ventricose, subovate, sometimes spherical or oblong.

§ 1. *Scales scarious. Leaves radical, attenuated at the base, Outer lip of calyx 2-parted, inner one tripartite.—Scapigerous herbs, with racemose flowers.*

1 S. pilòsum (Labill. nov. holl. 2. p. 63. t. 213.) scape a little branched, clothed with glandular pubescence; leaves flat, lanceolate-ensiform. ♃. G. Native of New Holland, on the south coast. Flowers pale red.

Pilose Stylidium. Pl. 1½ foot.

2 S. reduplica'tum (R. Br. prod. p. 568.) scape beset with acute hairs; racemes a little branched; leaves narrow, ensiform, reduplicate, with broader scales outside. ♃. G. Native of New Holland, on the southern coast. Flowers red or pink?

Reduplicate-leaved Stylidium. Pl. ½ to 1 foot.

3 S. hirsu'tum (R. Br. prod. p. 568.) scape beset with acute hairs; raceme nearly simple; leaves linear, with rather revolute edges; scales distinct. ♃. G. Native of New Holland, on the south coast. Hook. bot. mag. t. 3194. Corolla of a purplish rose-colour.

Hairy Stylidium. Fl. May. Clt. 1830. Pl. ½ to ¾ foot.

§ 2. *Leaves radical, crowded, without scales. Outer lip of calyx bidentate, inner one tridentate. Scapes leafless.*

4 S. umbella'tum (Labill. nov. holl. 2. p. 66. t. 217.)

racemes of scape umbellate, involucrated. ♃. G. Native of Van Diemen's Land.

Umbellate-flowered Stylidium. Pl. 1½ foot.

5 S. arme'ria (Labill. nov. holl. 2. p. 66. t. 216.) leaves linear, ensiform, with quite entire margins; scape glabrous; raceme simple, downy; lip of corolla appendiculated. ♃. G. Native of Van Diemen's Land. Perhaps the same as the following.

Thrift-like Stylidium. Pl. 1 foot.

6 S. mela'stachys (R. Br. prod. p. 568.) leaves linear, with rather revolute smooth margins; scape rather pilose; spike simple, beset with glandular hairs; flowers imbricate, almost sessile; lip of corolla appendiculate at the base. ♃. G. Native of Van Diemen's Land. The leaves are sometimes beset with a few denticulations.

Black-spiked Stylidium. Pl. 1 foot.

7 S. graminifòlium (Swartz, in nov. act. scrut. berol. ex Willd. spec. 4. p. 146.) leaves linear, with denticulated edges; raceme subspicate, simple, and is as well as the scape beset with glandular hairs; lip of corolla appendiculate at the base. ♃. G. Native of New South Wales and Van Diemen's Land. Ker. bot. reg. t. 90. Ventenàtia màjor, Smith, exot. bot. 2. p. 13. t. 66. Candóllea serrulàta, Labill. in ann. mus. 6. p. 414. t. 64. f. 2. Flowers purplish red.

Grass-leaved Stylidium. Fl. April, Aug. Clt. 1803. Pl. 1 ft.

8 S. linea're (Swartz, l. c.) leaves compressed, filiform, 1-1½ inch long, with denticulated margins; raceme simple; pedicels equal in length to the ovarium; scape glabrous, filiform; lip of corolla appendiculate at the base. ♃. G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 568. Ventenàtia mìnor, Smith, exot. bot. 2. p. 15. t. 67. Flowers purple or red.

Linear-leaved Stylidium. Fl. June, July. Clt. 1812. Pl. 1 foot.

9 S. seta'ceum (Labill. nov. holl. 2. p. 65.) leaves setaceous, mucronulate, an inch long; raceme simple, subspicate; scape quite glabrous; capsule clavate-oblong; lip of corolla inappendiculate. ♃. G. Native of New Holland, on the south coast. Flowers red.

Setaceous-leaved Stylidium. Pl. 1 foot.

§ 3. *Leaves radical, crowded, without scales. Scape leafless or with a few very small scattered leaves. Outer lip of calyx bipartite, inner one tripartite.*

10 S. spinulòsum (R. Br. prod. p. 569.) leaves linear, mucronate, attenuated at the base, with spinulose edges; scape clothed with glandular pubescence; raceme simple, rarely subcorymbose; throat of corolla crowned: lip inappendiculate. ♃. G. Native of New Holland, on the south coast.

Spinulose-leaved Stylidium. Pl.

11 S. cœspitòsum (R. Br. l. c.) leaves linear, glabrous, setaceously mucronate, with quite entire edges; raceme often divided; rachis and scape glabrous; throat of corolla naked; lip appendiculate. ♃. G. Native of New Holland, on the south coast.

Tufted Stylidium. Pl. tufted.

12 S. pili'ferum (R. Br. l. c.) leaves linear-lanceolate, glabrous, piliferous, with entire margins; raceme simple; rachis downy; scape glabrous; throat of corolla naked; lip appendiculate. ♃. G. Native of New Holland, on the south coast.

Piliferous Stylidium. Pl.

13 S. assi'mile (R. Br. l. c.) leaves narrow-spatulate, glabrous, thickish, with quite entire margins; raceme divided a little; rachis and scape downy; throat of corolla naked; lip appendiculate. ♃. G. Native of New Holland, on the south coast.

Similar Stylidium. Pl.

14 S. spatula'tum (R. Br. l. c.) leaves spatulate, clothed with glandular pubescence on both surfaces, with quite entire edges; raceme many-flowered, and is as well as the radical scape glabrous; throat of corolla crowned; lip appendiculate. ♃. G. Native of New Holland, on the south coast.

Spatulate-leaved Stylidium. Pl. ½ to 1 foot.

15 S. glau'cum (Labill. nov. holl. 2. p. 64. t. 214.? R. Br. l. c.) leaves lanceolate-spatulate, clothed with glandular down on both surfaces, with quite entire edges; raceme few-flowered, subcorymbose, glabrous; scape furnished with a few leaves. ♃. G. Native of New Holland, on the south coast. Perhaps the plant of Labillardiere is referrible to the following.

Glaucous Stylidium. Pl. ½ foot.

16 S. eriorhi'zum (R. Br. l. c.) leaves spatulate, setaceously mucronate, glabrous on both surfaces, but tomentose on the margins; raceme somewhat panicled, and is as well as the scape clothed with glandular down; root thick, woolly; throat of corolla naked; lip appendiculate. ♃. G. Native of New Holland, within the tropic.

Woolly-rooted Stylidium. Pl.

17 S. floribu'ndum (R. Br. l. c.) leaves oblong, glabrous on both surfaces, with quite entire margins; scapes numerous, panicled, woolly from acute villi; throat of corolla naked: lip appendiculate. ♃. G. Native of New Holland, within the tropic.

Bundle-flowered Stylidium. Pl.

18 S. ju'nceum (R. Br. l. c.) radical leaves linear, those of the scape minute, distant, and are as well as the bracteas adnate to the middle; calycine segments subulate, simple at the base; throat of corolla crowned by stipitate glands: lip inappendiculate. ♃. G. Native of New Holland, on the south coast. Scape straight, glabrous.

Rushy Stylidium. Fl. Sept. Clt. 1830. Pl. 2 feet.

19 S. viola'ceum (R. Br. l. c.) radical leaves narrow, linear, those of the scape, which is quite glabrous, small and adpressed, and are as well as the bracteas sessile; calycine segments gibbous at the base; throat of corolla crowned; lip inappendiculate. ♃. G. Native of New Holland, on the south coast. Flowers violaceous.

Violaceous-flowered Stylidium. Pl.

§ 4. *Leaves of scape or stem verticillate. Outer lip of calyx bipartite, inner one tripartite.*

20 S. lu'teum (R. Br. prod. p. 570.) scape inarticulated, glabrous; whorles of leaves 1-2 on each scape, besides some scattered leaves at the top; radical leaves linear; calycine segments rather gibbous at the base; throat of corolla crowned: lip inappendiculate. ♃. G. Native of New Holland, on the south coast. Flowers yellow.

Yellow-flowered Stylidium. Pl.

21 S. amœ'num (R. Br. prod. p. 570.) scape inarticulate, glabrous, furnished with one whorl of leaves beyond the middle, without any scattered leaves above the whorl; radical leaves spatulate, acuminated; throat of corolla crowned: lip inappendiculate. ♃. G. Native of New Holland, on the south coast. Flowers red?

Pleasant Stylidium. Pl.

22 S. articula'tum (R. Br. l. c.) scape furnished with 2 joints, and 2 whorles of leaves; radical leaves spatulate, coriaceous: lip of corolla inappendiculate. ♃. G. Native of New Holland, on the south coast.

Jointed-scaped Stylidium. Pl. ½ foot?

23 S. diversifòlium (R. Br. l. c.) scape straight, inarticulated, furnished with 3-4 whorles of filiform leaves: radical

leaves lanceolate; throat of corolla crowned: lip appendiculate. ♃. G. Native of New Holland, on the south coast.

Diverse-leaved Stylidium. Pl. 1 foot?

24 S. sca'ndens (R. Br. l. c.) stem scandent; leaves linear, spiral, and cirrhose at the apex; throat of corolla crowned: lip appendiculate; column downy above. ♃. ◡. G. Native of New Holland, on the south coast. Flowers lilac or rose-coloured. Leaves whorled.

Climbing Stylidium. Fl. July, Nov. Clt. 1803. Pl. cl.

§ 5. *Stem shrubby. Leaves numerous, scattered.*

25 S. fruticòsum (R. Br. l. c.) leaves narrow-linear, decurrent, glabrous; throat of corolla half crowned: lip appendiculate. ♄. G. Native of New Holland, on the south coast. Stylidium glandulòsum, Salisb. par. t. 77. Flowers pink.

Shrubby Stylidium. Fl. May, Oct. Clt. 1803. Shrub 1 to 1½ foot.

26 S. tenuifòlium (R. Br. l. c.) leaves setaceously linear, sessile, rather hairy; throat of corolla naked: lip appendiculate. ♄. G. Native of New South Wales, about Port Jackson. Sims, bot. mag. 2249. L. laricifòlium, Rich. Flowers pink.

Fine-leaved Stylidium. Fl. July, Aug. Clt. 1818. Sh. 1 ft.

§ 6. *Tube of corolla very short. Lip of corolla stretched out.*

27 S. calcara'tum (R. Br. l. c.) plant small; stem few-flowered; leaves oval; corolla with a naked throat, and rather toothed segments: lip inappendiculate. ♃. G. Native of New Holland, on the south coast.

Spurred Stylidium. Pl. small.

Sect. II. Andersònia. J. G. Kœnig. mss. ex R. Br. prod. p. 570. Capsules linear, or linear-lanceolate.

§ 1. *Scapigerous. Flowers spicate or corymbose, rarely almost solitary.*

28 S. capilla're (R. Br. l. c.) scape capillary, 1-2 inches high, 1-2-flowered; leaves radical oval; calyx glabrous, very acute; limb tripartite, with the middle segment bifid; throat of corolla crowned; lip inappendiculate. ♃. G. Native of New Holland, within the tropic.

Capillary-scaped Stylidium. Pl. 2 inches.

29 S. tene'llum (R. Br. prod. p. 571.) scape capillary; spike few-flowered; leaves radical roundish; lips of calyx parted, glandular; the 2 larger segments of the limb of the corolla semi-bifid; throat naked: lip inappendiculate. ♃. G. Native of New Holland, within the tropic.

Slender Stylidium. Pl. ¼ foot.

30 S. rotundifòlium (R. Br. l. c.) scape capillary, 1-4-flowered; leaves radical roundish; lips of calyx undivided; 4 of the segments of the limb of the corolla nearly equal; throat naked. ♃. G. Native of New Holland, within the tropic.

Round-leaved Stylidium. Pl. ¼ to ½ foot?

31 S. crassifòlium (R. Br. l. c.) scape terete, 1-2 feet high; spike racemose, elongated; leaves radical lanceolate, elongated. ♃. G. Native of New Holland, on the south coast.

Thick-leaved Stylidium. Pl. 1 to 2 feet.

32 S. corymbòsum (R. Br. l. c.) scape terete, 2-3 inches high, corymbiferous; leaves radical linear, ending each in a setaceous mucrone; lips of calyx parted. ♃. G. Native of New Holland, on the south coast.

Corymbose-flowered Stylidium. Pl. ¼ foot.

§ 2. *Caulescent plants. Flowers alternate or solitary. Capsules terete-linear, the same breadth at the apex.*

33 S. inunda'tum (R. Br. prod. p. 571.) stem branched, an inch and a half high, leafy below the division; leaves linear; larger segments of the limb of the corolla obovate: smaller ones linear; throat naked; lip inappendiculate, adnate to the tube at the base. ♃. G. Native of New Holland, on the south coast, in inundated places.

Inundated Stylidium. Pl. 1½ inch.

34 S. despe'ctum (R. Br. l. c.) stem parted, an inch and a half high; branches few-flowered; leaves linear; segments of the limb linear-oblong, rather unequal; throat naked; lip inappendiculate, adnate to the tube at the base. ♃. G. Native of Van Diemen's Land. Very like *S. inundàtum*.

Despised Stylidium. Pl. 1½ inch high.

35 S. diffu'sum (R. Br. l. c.) stem branched, diffuse, filiform; leaves linear: cauline ones distant; the 2 larger segments of the limb bifid; throat crowned; lip inappendiculate, adnate to the tube at the base. ♃. S. Native of New Holland, within the tropic.

Diffuse Stylidium. Pl. diffuse.

36 S. pygmæ'um (R. Br. l. c.) stem simple, erect, an inch high, 2-3-flowered; leaves linear; lips of calyx parted; segments of the limb entire; throat naked; lip inappendiculate. ♃. G. Native of New Holland, on the south coast.

Pygmy Stylidium. Pl. 1 inch.

§ 3. *Peduncles 1-flowered from the axils of the leaves or top of the scape or branches, which are crowded. Capsule nearly terete, not tapering at the top.*

37 S. re'pens (R. Br. prod. p. 571.) stem creeping; branches ascending; leaves subulate, adnate: upper ones much crowded; throat of corolla crowned; lip inappendiculate. ♃. G. Native of New Holland, on the south coast.

Creeping Stylidium. Pl. creeping.

38 S. gutta'tum (R. Br. l. c.) scape simple; flowers nearly sessile, in fascicles; bracteas foliaceous; throat of corolla crowned: lip appendiculate; leaves radical linear. ♃. G. Native of New Holland, on the south coast.

Spotted-flowered Stylidium. Pl. ¼ foot.?

39. S. peduncula'tum (R. Br. l. c.) scape simple; flowers umbellate; pedicels capillary; leaves of involucrum linear; segments of the limb of the corolla unequal; throat naked; lip inappendiculate; leaves radical lanceolate. ♃. S. Native of New Holland, within the tropic.

Pedunculate Stylidium. Pl.

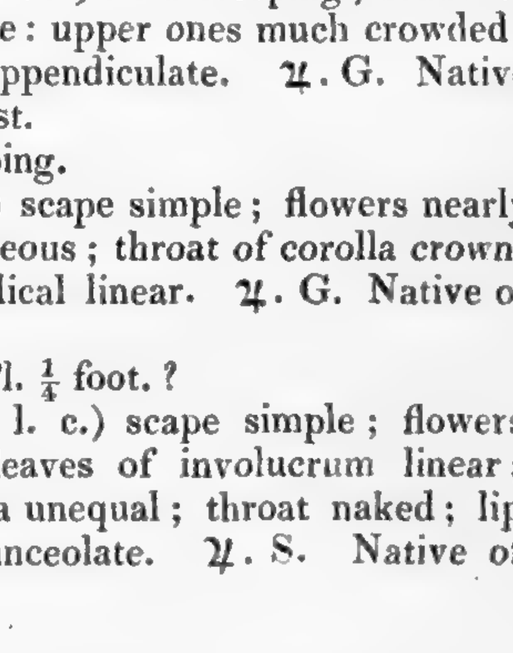
§ 4. *Racemes terminating the leafy stems. Capsule compressed, lanceolate or linear, constricted at the neck.*

40 S. brevisca'pum (R. Br. prod. p. 572.) stem simple; leaves compressed, filiform: upper ones much crowded; raceme pedunculate, rather panicled, having the rachis villous; capsule lanceolate, equal-valved, downy. ♄. G. Native of New Holland, on the south coast.

Short-scaped Stylidium. Pl. ¼ foot.

41 S. fascicula'tum (R. Br. l. c.) stem branched a little, glabrous; leaves linear; spikes pedunculate, subracemose, having the rachis glabrous; capsule lanceolate, having both the cells seminiferous. ♄. G. Native of New Holland, on the south coast. Lindl. bot. reg. 1459. Flowers pink. (f. 123.)

FIG. 123.



Fascicled-leaved Stylidium. Fl. Aug. Clt. 1830. Shrub ½ ft.

42 S. falca'tum (R. Br. l. c.) stem nearly simple, and is as

well as the rachis downy; leaves linear; spike pedunculate, subracemose; capsule divaricate, lanceolate, with both the cells seminiferous, the superior one one-half narrower than the other, and closed. ♄. G. Native of New Holland, on the south coast. Flowers pink?

Falcate Stylidium. Shrub ½ foot.

43 S. adna'tum (R. Br. l. c.) stem multiple; branches undivided; leaves linear; spike almost sessile, divided, with the divisions few-flowered; capsule linear, adnate at the base, having the neck shorter than the calyx: the superior cell empty, and very narrow. ⊙. G. Native of New Holland, on the south coast. Lindl. bot. reg. t. 914. Flowers pink.

Adnate-leaved Stylidium. Fl. July, Aug. Clt. 1824. Pl. ½ ft.

44 S. propínquum (R. Br. l. c.) stem multiple; partial ones divided in an umbellate manner; leaves linear; spikes sessile, nearly simple; capsule adnate at the base, linear, having the neck equal in length to the calyx: the superior cell very narrow and empty. ⊙.? ♄.? G. Native of New Holland, on the south coast. Flowers pink. Very nearly allied to the preceding.

Allied Stylidium. Pl. ½ foot.

§ 5. *Limb of corolla bipartite: lobes bifid. Capsule linear.*

45 S. alsinòides (R. Br. prod. p. 572.) stem erect; leaves ovate; floral ones opposite; flowers axillary, sessile, solitary, bractless. ♃.? S. Native of New Holland, within the tropic.

Chickweed-like Stylidium. Pl. ¼ to ½ foot?

Cult. All the species of this genus are rare, elegant, and singular. The best soil for them is a mixture of sand, loam, and peat. Some of the species may be increased by parting at the root; but most of them by seed. Cuttings of the shrubby kinds strike root readily under a hand-glass either in sand or mould.

II. LEVENHOO'KIA (named in memory of Anthony Van Leeuwenhoek, a celebrated micrographist, whose numerous works and observations on the structure of plants are still extant). R. Br. prod. p. 572.

Lin. syst. *Gynándria, Diándria.* Calyx 5-parted, bilabiate. Limb of corolla 5-parted, irregular: the fifth segment or lip dissimilar to the others, arched, and longer than the column, articulated with the tube, moveable. Column erect, adnate to the side of the tube where the labellum is. Lobes of anthers one above the other, divaricate. Stigmas 2, capillary. Capsule 1-celled.—A small glabrous plant, with the habit of *Radìola millegràna*. Leaves alternate, petiolate, crowded at the tops of the branches, intermixed with fascicles of flowers. The irritability of the joint of the lip is analogous to that of the column in *Stylídium*, and answers the same end, the protection of the sexual organs at the time of flowering. In *Levenhoòkia* the labellum is deflexed when the flower is expanded, but from its irritability when touched it rises up, and is applied with great force to the erect immoveable column, which it covers by its spoon-shaped lamina.

1 L. pusi'lla (R. Br. prod. p. 578.) ⊙.? G. Native of New Holland, on the south coast.

Least Levenhookia. Pl. 1 to 2 inches.

Cult. See *Stylídium* above for culture and propagation.

III. FORSTE'RA (in honour of John Reinald Forster, and his son George Forster, who both accompanied Captain Cook in his second voyage in the quality of naturalists). Lin. nov. act. ups. 3. t. 9. Swartz, in Schrad. journ. 1799. 1. t. 1, 2. f. 2.—Phyllàchne, Forst. char. p. 58.

Lin. syst. *Gynándria, Diándria.* Calyx superior, of 2-3 sepals, girded by an involucrum composed of 2-3 leaves. Corolla tubularly campanulate, 5-6-parted. Column of genitals straight, bearing 2 2-celled anthers at top, which dehisce transversely. Stigmas 2, roundish, covered by the revolute valves of the anthers. Capsule inferior, 1-celled, many-seeded. Placenta central, free.

1 F. edifòlia (Lin. nov. act. ups. 3. t. 9.) leaves imbricated, ovate-oblong, coriaceous, marginated, smooth, recurved; peduncles terminal, solitary, elongated, 1-flowered; involucrum short, spreading. ♄. G. Native of New Zealand.

Edible-leaved Forstera. Shrub.

2 F. muscifòlia (Swartz, in Schrad. journ. 1779. 1. t. 1, 2. f. 2.) leaves imbricated, erect, lanceolate, triquetrous, and mucronated at the apex, having the keel and margins serrulated; flowers terminal, solitary, sessile; involucrum exceeding the calyx. ♄. G. Native of Terra del Fuego. Phyllàchne uliginòsa, Forst. char. p. 58. and Lin. fil. suppl.

Moss-leaved Forstera. Shrub.

Cult. See *Stylídium* above for culture and propagation.

Order CXXXVI. GOODENO'VIÆ (this order contains plants agreeing with *Goodènia* in important characters). R. Br. prod. p. 573.—Genera of Campanulàceæ, Juss.

Calyx superior (f. 124. *a.*) or semi-superior (f. 126. *a.*), rarely inferior, 5-cleft (f. 124. *a.* f. 125. *a.*), sometimes 5-3-parted, sometimes short, entire, and sometimes obsolete, usually equal, rarely unequal, permanent. Corolla monopetalous (f. 124. *b.* f. 125. *h.*), more or less irregular, deciduous or marcescent; tube cleft on the back (f. 125. *h.*), sometimes 5-parted, and only adhering with the ovarium at the base, while that of the calyx is free; limb 5-parted (f. 124. *b.* f. 125. *h.*), bilabiate (f. 124. *b.*), or unilabiate (f. 126. *b.*); disks of the segments lanceolate, flat: having the sides thinner in texture and elevated, induplicate in æstivation, rarely obsolete or wanting. Stamens 5, free; from the corolla and style (f. 125. *c.*), alternating with the segments of the corolla; filaments distinct (f. 125. *c.*); anthers distinct or cohering, linear, vertical, fixed by the base, undivided, 2-celled; cells dehiscing lengthwise; pollen usually simple, but sometimes compound. Ovarium 1-2-celled, rarely 4-celled, sometimes furnished with a gland between the 2 anterior filaments; ovula definite or indefinite. Style 1, simple, rarely divided; stigma fleshy, obtuse, or 2-lobed, girded by a rather membranous, entire or 2-lobed, cup-shaped indusium. Capsule 2-celled or half 2-celled, (rarely 4-celled); dissepiment usually parallel, rarely contrary to the valves, which are entire or bipartite; having the axis seminiferous when the seeds are indefinite: but when the seeds are definite, there is one in each cell. Seeds sometimes nucumentaceous, but usually with a thickish testa. Albumen fleshy, conforming to the seeds, rarely deficient. Embryo erect, almost the length of the albumen, with middle-sized usually foliaceous cotyledons, and an inconspicuous plumule.—Non-lactescent herbs or shrubs, usually clothed with simple and sometimes with glandular down, rarely with stellate down. Leaves scattered, exstipulate, simple, usually undivided, sometimes lobed, and often toothed. Inflorescence terminal or axillary, variable. Flowers distinct, rarely aggregate, yellow, blue, and purplish, rarely reddish.

Nearly related to *Campanulàceæ* and *Lobeliàceæ*, from which it differs in the æstivation of the flower, and in the peculiar in-

dusium to the stigma, and which exists in a remarkable degree in the sect. *Brunoniècæ*. Upon the nature of the indusium of the stigma, Mr. Brown makes the following remarks:—"Is this remarkable covering of the stigma merely a process of the apex of the style? or is it a part of distinct origin, though intimately cohering with the pistillum? On the latter supposition, may it not be considered as analogous to the glandular disk, surrounding or crowning the ovarium in many other families? And in adopting the hypothesis I have formerly advanced, respecting the nature of this disk in certain families—merely that it is composed of a series of modified stamina—has not the part in question a considerable resemblance, in apparent origin and division, to the stamina of the nearly-related family *Stylideæ*? To render this supposition somewhat less paradoxical, let the comparison be made especially between the indusium of *Brunònia* and the imperfect anthers in the female flowers of *Forstèra*. Lastly, connected with this view, it becomes of importance to ascertain whether the stamina in *Stylideæ* are opposite to the segments of the calyx or corolla. The latter disposition would be in favour of the hypothesis. This, however, is a point which will not be very easily determined, the stamina being lateral. In the meantime, the existence and division of the corona faucis in *Stylidium* render it not altogether improbable that they are opposite to the segments of the corolla." R. Br. in Lin. trans. 12. p. 134.

Synopsis of the genera.

Tribe I.

Goodeniècæ. Seeds indefinite.

1 Goode'nia. Calyx superior; limb 5-parted (f. 124. *a*.), with equal segments. Anthers distinct. Style simple. Capsule 2-celled (rarely 4-celled), with a parallel dissepiment, which in some species is short. Seeds imbricated, compressed. Corolla bilabiate, rarely unilabiate (f. 124. *c*.).

2 Dístylis. Calyx superior, with a 5-parted limb. Corolla deciduous, having the tube cleft on the upper side, with a 5-parted, spreading, sub-bilabiate limb. Stamens distinct. Style bipartite. Indusium of stigma cup-shaped, and ciliated. Capsule half bilocular. Seeds imbricated, compressed, bordered.

3 Calógyne. Calyx superior, with an equal 5-parted limb. Corolla bilabiate. Anthers distinct. Style trifid. Gland epigynous between the 2 lower filaments. Capsule almost 1-celled, from the dissepiment being short. Seeds imbricated, compressed.

4 Eutha'les. Calyx inferior, with an unequal 5-cleft limb. Corolla adhering to the tube below the ovarium, cleft on the upper side, with a bilabiate limb. Style undivided. Indusium of stigma bilabiate. Capsule 4-valved, 2-celled at the base. Seeds imbricated, compressed.

5 Velle'ia. Calyx inferior, of 3-5 unequal leaves. Corolla having the base of the tube adnate to the ovarium, and cleft on the upper side at the apex; limb bilabiate. Anthers distinct. Style undivided. Gland epigynous between the 2 anterior filaments. Capsule 2-celled at the base; valves bipartite. Seeds imbricated, compressed.

6 Lechenau'ltia. Calyx superior (f. 125. *a*.). Corolla with the tube cleft on the upper side (f. 125. *h*.). Anthers at first cohering. Stigma obsolete, bilabiate (f. 125. *d*.), in the bottom of the indusium. Capsule prismatic, 2 celled, 4-valved. Seeds cubical or nucumentaceous.

7 Anthòtium. Calyx superior, 5-parted. Corolla having the tube cleft on the upper side, and the limb bilabiate; segments of the upper lip auricled on the inner side. Anthers cohering. Ovarium 2-celled, many-seeded. Indusium of stigma contrary to the lips of the corolla.

Tribe II.

Scævòleæ. Seeds definite. Drupe inferior.

8 Scævòla. Corolla cleft on the upper side, exceeding the genitals; limb unilabiate, secund, 5-parted, with equal winged segments. Anthers free. Indusium of stigma ciliated.

9 Diaspa'sis. Corolla nearly regular, salver-shaped; tube 5-parted, inclosing the genitals. Anthers free. Ovarium 1-celled, 2-seeded. Indusium of the stigma with a naked border. Nut corticate.

10 Dampie'ra. Corolla bilabiate (f. 126. *a*.), having the tube cleft on the upper side (f. 125. *d*.); segments of the upper lip auricled on the inner margin. Anthers cohering (f. 126. *d*.). Ovarium 1-seeded. Indusium of the stigma with a naked border. (f. 126. *c*.). Nut crustaceous.

Tribe III.

Brunonie'æ. Utriculus superior, 1-seeded.

11 Brunònia. Heads of flowers involucrated. Calyx 5-cleft, and furnished with 4 bracteas. Corolla monopetalous, funnel-shaped; limb 5-parted, having the 2 superior segments more deeply divided. Stamens 5, hypogynous. Anthers connate. Indusium of stigma 2-valved. Utriculus inclosed within the indurated tube of the calyx.

Tribe IV.

Campanie'æ. Corolla campanulate, regular. Capsule 3-4-celled, many-seeded.

12 Pentaphra'gma. Calyx 5-lobed. Corolla 5-lobed, regular. Stamens 5. Indusium of stigma 3-lobed.

Tribe I.

GOODENIE'Æ (this tribe contains plants agreeing with *Goodènia*, in the capsules being many-seeded). Capsules 2-celled, containing an indefinite number of seeds.

1. GOODE'NIA (named in honour of Dr. Goodenough, bishop of Carlisle, a lover of natural history, and author of a Monograph of the genus *Càrex*, published in the Linnæan Transactions). Smith, in Lin. trans. 2. p. 347. Labill. nov. holl. 1. p. 52. t. 75. R. Br. prod. p. 575.

Lin. syst. *Pentándria, Monogýnia*. Calyx superior, with a 5-parted limb (f. 124. *a*.) and equal segments. Anthers distinct. Style simple. Capsule 2-celled (rarely 4-celled), with a parallel dissepiment, which is sometimes short. Seeds imbricated, compressed.—Herbs, rarely subshrubs, usually caulescent. Leaves alternate, entire, toothed or cut. Flowers

axillary or terminal; pedicels bibracteate or bractless. Corollas usually yellow, although sometimes blue and purplish, bilabiate, rarely unilabiate; segments winged, rarely wingless; wings induplicate in æstivation; tube sometimes furnished with a little nectariferous sack, which is opposite to the fissure of the corolla, adnate to the ovarium. Anthers cohering before expansion, beardless, rarely bearded at the apex. Capsule variable in form, with the top for the most part superior; valves entire or bipartite.

Sect. I. Ochrosa'nthus (from *ωχρος, ochros*, yellow, and *ανθος, anthos*, a flower; colour of flowers). Corolla bilabiate, yellow; segments winged. Capsule 2-celled, or almost 1-celled from the dissepiment being short. Stigma parallel with the lips of the corolla.

§ 1. *Peduncles terminal, spicate or panicled; pedicels bibracteate.*

1 G. bellidifòlia (Smith, in Lin. trans. 2. p. 349.) stem naked; spike nearly simple, downy; corolla clothed with simple down outside; radical leaves flat, lanceolate-spatulate, toothed or cut. ♃. G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 573. Corolla yellow.

Daisy-leaved Goodenia. Fl. June, Aug. Clt. 1823. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

2 G. stellígera (R. Br. prod. p. 575.) stem nearly naked; spike almost simple, downy; corolla clothed with simple hairs and stellate down outside; valves of capsule bipartite; radical leaves fleshy, semi-terete or linear, glabrous, a little toothed at the apex. ♃. G. Native of New South Wales, about Port Jackson. Corolla yellow.

Stellate-haired Goodenia. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

3 G. panicula'ta (Smith, in Lin. trans. 2. p. 348. R. Br. prod. p. 575.) stem few-leaved; panicle almost simple, downy; ovarium beset with glandular and simple hairs; radical leaves long-lanceolate, a little toothed or cut. ♃. G. Native of New South Wales, about Port Jackson. Cav. icon. 6. p. 5. t. 507. Corollas yellow.

Panicled-flowered Goodenia. Fl. June, Aug. Clt. 1823. Pl. 1 foot.

4 G. hu'milis (R. Br. prod. p. 575.) stem few-leaved; panicle simple, downy; ovarium beset with acute hairs; radical leaves long-lanceolate, a little toothed. ♃. G. Native of New Holland, on the south coast. Corollas yellow.

Humble Goodenia. Pl. $\frac{1}{2}$ foot.

5 G. gra'cilis (R. Br. l. c.) plant glabrous; stem few-leaved; panicle simple; ovaries glabrous; corolla clothed with glandular down outside; radical leaves linear-lanceolate, elongated, thickish. ♃. G. Native of New Holland, within the tropic. Lodd. bot. cab. t. 1032. Corollas yellow.

Slender Goodenia. Fl. June, July. Clt. 1822. Pl $1\frac{1}{2}$ ft.

6 G. decu'rrens (R. Br. l. c.) plant quite glabrous; stem many-leaved; spike racemose, divided a little at the base; corolla downy outside; cauline leaves oblong, toothed, decurrent. ♃. G. Native of New Holland, about Port Jackson. Corollas yellow.

Decurrent-leaved Goodenia. Pl. 1 foot.?

§ 2. *Peduncles axillary, trifid or simple; pedicels bibracteolate.*

7 G. acumina'ta (R. Br. prod. p. 575.) suffruticose, erect, glabrous, painted; peduncles trifid or trichotomous; leaves ovate, acuminated, dentately serrated, with beardless axils; calycine segments flat, one-half shorter than the capsule, which is prismatic; seeds disposed in 2 rows. ♄. G. Native of New South Wales, about Port Jackson. Corollas yellow. Like the following, and probably only a variety of it.

Acuminated-leaved Goodenia. Pl. 1 to 2 feet.

8 G. ova'ta (Smith, in Lin. trans. 2. p. 347. R. Br. l. c.) suffruticose, erect, glabrous, sometimes painted; peduncles trifid or trichotomous; leaves ovate, acute, dentately serrated, bearded in the axils; calycine segments subulately filiform, a little shorter than the capsule, which is linear; seeds disposed in one series. ♄. G. Native of New Holland, about Port Jackson and the south coast, as well as of Van Diemen's Land. Andr. bot. rep. t. 68. Vent. cels. t. 3. and in mem. de l' institut. sc. phys. 2. p. 321. pl. 10. Cav. icon. 6. p. 4. t. 506. Corollas yellow.

Ovate-leaved Goodenia. Fl. June, Oct. Clt. 1793. Shrub 1 to 2 feet.

9 G. va'ria (R. Br. prod. p. 576.) suffruticose, glabrous; peduncles trifid or simple; leaves obovate and obtuse, or ovate and acutish, toothed, coriaceous, with naked axils; calycine segments shorter than the stamens; corollas and styles glabrous; capsule ovate. ♄. G. Native of New Holland, on the south coast. Corollas yellow.

Var. α; leaves obovate and oval, a little toothed, attenuated at the base; branches flexuous; stems diffuse.

Var. β; leaves roundish, almost sessile, toothed; peduncles usually 1-flowered; stems depressed.

Var. γ; leaves oval, acutish, toothed; peduncles 3-flowered; stem erect.

Variable Goodenia. Shrub $\frac{1}{2}$ to 2 feet.

10 G. grandiflòra (Sims, bot. mag. 890. R. Br. prod. 576.) plant herbaceous, erect, clothed with glandular pubescence; peduncles trifid, trichotomous or simple; branches angularly striated; lower leaves lyrate: rameal ones rather ovate, acute; style longitudinally woolly. ♃. G. Native of New South Wales, about Port Jackson. Corollas yellow.

Great-flowered Goodenia. Fl. June, Aug. Clt. 1803. Pl. 2 to 3 feet.

11 G. heterophy'lla (Smith, in Lin. trans. 2. p. 349. R. Br. prod. p. 576.) plant herbaceous, erectish, downy, intermixed with glandless hairs; leaves ovate, cut or lobed; bracteas one-half shorter than the upper half of the one-flowered peduncle; style glabrous. ♃. G. Native of New South Wales, about Port Jackson. Cav. icon. 6. p. 6. t. 508. Corollas pale red.

Various-leaved Goodenia. Fl. June, Oct. Clt. 1826. Pl. 1 ft.

12 G. rotundifòlia (R. Br. prod. 576.) plant herbaceous, erectish; leaves roundish, deeply serrated, membranous; bracteas longer than the upper half of the one-flowered peduncle; styles glabrous; capsules ovate. ♃. G. Native of New South Wales, about Port Jackson; and of New Holland, within the tropic. Corollas yellow.

Var. α; plant quite glabrous, erectish.

Var. β; plant downy; hairs simple, sometimes diffuse.

Round-leaved Goodenia. Pl. 1 foot.

13 G. barba'ta (R. Br. prod. p. 576.) plant herbaceous? erect, clothed with glandular down, scabrous; leaves lanceolate-linear, entire; peduncles 1-flowered; throat of corolla bearded; styles longitudinally hairy; capsule 1-celled, 2-3-seeded. ♃. G. Native of New South Wales, about Port Jackson, and of Van Diemen's Land. Corollas yellow.

Bearded Goodenia. Pl. 1 foot.?

14 G. lana'ta (R. Br. prod. p. 577.) plant herbaceous, downy, glandless, almost stemless; branches prostrate; leaves obovate or oval, obtuse, a little toothed, hairy; young leaves and ovaria woolly; peduncles scape-formed; corolline segments ciliated on the margins. ♃. G. Native of Van Diemen's Land. Corollas yellow.

Woolly Goodenia. Pl. prostrate.

15 G. genicula'ta (R. Br. l. c.) plant herbaceous, downy,

glandless; stem erect, sometimes short; leaves long-lanceolate, a little toothed; peduncles scape-formed, elongated, when bearing the fruit geniculately compressed. ♃. G. Native of New Holland, on the South Coast.

Geniculated-peduncled Goodenia. Pl. 1 foot.?

16 G. HEDERA'CEA (Smith, in Lin. trans. 2. p. 349. R. Br. l. c.) plant herbaceous, downy, glandless, almost stemless; branches filiform, prostrate; leaves oval, toothed; radical leaves sometimes lobed; peduncles 1-3-flowered; corolline segments naked on the margins. ♃. G. Native of New South Wales, about Port Jackson, and of Van Diemen's Land. Corollas yellow.

Ivy-like Goodenia. Fl. June, Aug. Clt. 1823. Pl. prostrate.

17 G. GLA'BRA (R. Br. prod. p. 577.) plant herbaceous, glabrous, almost stemless; branches prostrate; radical leaves somewhat oval and spatulate, few-toothed: rameal leaves almost sessile; pedicels 1-flowered; corollas glabrous outside. ♃. G. Native of New Holland, within the tropic. Corollas yellow.

Glabrous Goodenia. Pl. prostrate.

§ 3. *Peduncles bractless, axillary or terminal, 1-flowered.*

18 G. MÔLLIS (R. Br. l. c.) peduncles axillary; leaves ovate, subcordate, acute, serrated, villous, soft; tube of corolla saccate. ♃. G. Native of New Holland, within the tropic. Corollas yellow.

Soft Goodenia. Pl. ½ to 1 foot?

19 G. ELONGA'TA (Labill. nov. holl. 1. p. 52. t. 75.) pilose; peduncles solitary, axillary and nearly terminal, elongated, reflexed while bearing the fruit; stem erect, filiform; radical leaves oblong-spatulate, toothed: cauline leaves lanceolate, nearly entire, attenuated at the base. ♃. G. Native of Van Diemen's Land. R. Br. prod. 577. Corollas yellow.

Elongated-peduncled Goodenia. Pl. 1 foot.

20 G. HI'SPIDA (R. Br. prod. 577.) plant erect, beset with strigose hairs; cauline leaves sessile, elongated, lanceolate, a little toothed; peduncles solitary, axillary, elongated, erect while bearing the fruit; calyxes hispid. ♃. G. Native of New Holland, within the tropic. Corollas yellow.

Hispid Goodenia. Pl. 1 foot.?

21 G. CORONOPIFÒLIA (R. Br. l. c.) glabrous; leaves linear: radical ones pinnatifidly toothed: cauline ones quite entire, and the seminal ones permanent; peduncles almost solitary, alternate, erect while bearing the fruit. ♃. G. Native of New Holland, within the tropic. Corollas yellow.

Buck-horn-leaved Goodenia. Pl.

22 G. TENE'LLA (R. Br. l. c.) plant rather downy, intermixed with a few adpressed hairs; stem simple or wanting; radical leaves flat, lanceolate or spatulate; peduncles radical or terminal, elongated, erect while bearing the fruit. ♃. G. Native of New Holland, on the South Coast. Sims, bot. mag. 1137. Erithòdes tenélla, Ait. hort. kew. Corollas yellow.

FIG. 124.

Slender Goodenia. Pl. ¼ to ½ foot.

23 G. FILIFÓRMIS (R. Br. prod. p. 578.) plant smoothish; stem simple; radical leaves filiform: cauline leaves smaller; peduncles terminal, subumbellate. ♃. G. Native of New Holland, on the South Coast. Corollas yellow.

Filiform-leaved Goodenia. Pl. ½ foot.

Sect. II. Tetrathy'lax (from *τετρας, tetras*, four-fold; and *θυλαξ, thylax*, a cell: capsule 4-celled). Corolla bilabiate, yellow, having the segments winged. Capsule 4-celled.

24 G. QUADRILOCULA'RIS (R. Br. prod. p. 578.) plant glabrous, erect; leaves nearly oval, toothed; flowers spicate or axillary. ♃. G. Native of New Holland, on the South Coast.

Four-celled-fruited Goodenia. Pl.

Sect. III. Porphyra'nthus (from *πορφυρεος, porphyreos*, purple; and *ανθος, anthos*, a flower; colour of flowers). Corolla bilabiate, purple or blue, having the segments winged. Capsule 2-celled, or half 2-celled. Stigma parallel with the lips of the corolla.

25 G. PURPURA'SCENS (R. Br. l. c.) plant glabrous; panicle effuse; stem naked; leaves radical, elongated-lanceolate. ♃. G. Native of New Holland, within the tropic. Corolla purple.

Purple-flowered Goodenia. Pl. ½ foot.

26 G. PTERIGOSPE'RMA (R. Br. l. c.) plant glabrous; stem almost simple, few-flowered; flowers alternate; radical leaves linear, a little toothed: cauline ones smaller, remote; calyx bluntish, and is, as well as the ovarium, glabrous. ♃. G. Native of New Holland, on the South Coast. Corollas blue or purple.

Wing-seeded Goodenia. Pl. ½ foot.?

27 G. CŒRU'LEA (R. Br. l. c.) plant glabrous; partial stems or branches nearly simple, few-flowered; radical leaves linear: cauline ones remote; calyxes acute, and are, as well as the ovaria, glandular. ♃. G. Native of New Holland, on the South Coast. Corollas blue.

Blue-flowered Goodenia. Pl. ½ foot.

28 G. INCA'NA (R. Br. l. c.) plant clothed with hoary tomentum; partial stems or branches almost simple, few-flowered; cauline leaves remote, oblong-linear; corollas woolly on the outside, as well as the ovaria. ♃. G. Native of New Holland, within the tropic. Corollas blue or purple.

Hoary Goodenia. Pl. ½ foot.?

Sect. IV. Monochìla (from *μονος, monos*, alone; and *χειλος, cheilos*, a lip, in reference to the unilabiate corolla). Corollas unilabiate, having the segments winged. Stigma 2-lobed, having the indusium ciliated, and contrary to the lip of the corolla.

29 G. SCAPI'GERA (R. Br. l. c.) plant glabrous, erect; leaves toothed; spike terminal, pedunculate; segments of the calyx subulate, longer than the ovarium, which is tubuliferous on one side. ♃. G. Native ot New Holland on the South Coast.

Var. α; common peduncle elongated, scape-formed; leaves linear-lanceolate, elongated.

Var. β; common peduncle not elongated; leaves oval-lanceolate.

Scape-bearing Goodenia. Pl. ½ foot.?

30 G. VI'SCIDA (R. Br. l. c.) plant glabrous, painted, erect; leaves lanceolate, toothed; peduncles axillary, 1-flowered, very short; stigma bifid. ♃. G. Native of New Holland, on the South Coast.

Viscid Goodenia. Pl.

Sect. V. Sellie'ra (named after Natali Sellier, a Spanish artist). Sellièra, Cav. icon. 5. p. 49. t. 47. f. 2. Corolla subunilabiate, purplish, having the segments wingless, and valvate in æstivation.

§ 1. *Peduncles bibracteate. Indusium of stigma with a naked border. Capsule fleshy.*

31 G. RE'PENS (Labill. nov. holl. 1. p. 53. t. 76.) plant glabrous, creeping; leaves lanceolate, fleshy. ♃. G. Native of New Holland, on the South Coast, and about Port Jackson; and of Van Diemen's Land; and of Chili, about Talcaguana, in humid sandy places by the sea shore. Sellièra radicans, Cav. icon. 5.

p. 49. t. 474. f. 2. G. radìcans, Pers. ench. 1. p. 195. Lysipòmia sérpens, Kunz, Poeppig, pl. chil. 3. p. 34. no. 103. Perhaps a proper genus. Flowers variegated with white and blue. Stem woody, glabrous.

Creeping Goodenia. Pl. creeping.

§ 2. *Peduncles bractless. Indusium of the stigma ciliated. Capsule membranous.*

32 PUMÍLIO (R. Br. prod. p. 579.) plant creeping, downy; leaves ovate, membranous: upper ones crowded; peduncles 1-flowered, from the axils of the upper leaves. ♃. G. Native of New Holland, within the tropic. Corolla purplish. Perhaps the corolla is unilabiate, or probably nearly regular.

Dwarf Goodenia. Pl. creeping.

Cult. All the species of this genus are worth cultivating for ornament. They grow freely in a mixture of sand, loam, and peat; and young cuttings of most of the species strike root freely in the same kind of soil, under a hand-glass; and all may be raised from seed, which ripen plentifully.

II. DI'STYLIS (from δις, *dis*, twice, and στυλος, *stylos*, a style; in reference to the style being bipartite). Gaud. in Freyc. voy. pt. bot. p. 45. t. 80.

Lin. syst. *Pentándria, Monogýnia.* Calyx adnate to the ovarium; limb free, 5-parted. Corolla deciduous, with the tube cleft behind, 5-parted, spreading, somewhat bilabiate; segments with winged margins. Stamens 5, distinct. Style bipartite. Indusium of stigma membranous, cup-shaped, and ciliated. Capsule crowned by the permanent calyx, semi-bilocular in consequence of the dissepiment being short; valves parallel. Seeds imbricate, compressed, orbicular, girded by a membranous border.—An annual hairy plant, with almost simple stems. Leaves alternate, toothed. Flowers axillary, solitary, on long peduncles, racemose, bractless, yellow.

1 D. Berardia'na (Gaud. l. c.). ⊙. G. Native of New Holland, on the Western Coast, in Sharks' Bay. Goodènia Berardiàna, Gaud.

Berard's Distylis. Pl. ½ foot.

Cult. Rear the seeds in a frame in the spring, and about the end of May put the plants out into the open border in a warm situation.

III. CALO'GYNE (from καλος, *kalos*, beautiful, and γυνη, *gune*, a female; in reference to the stigma). R. Br. prod. p. 579.

Lin. syst. *Pentándria, Monogýnia.* Calyx superior; limb 5-parted, with equal segments. Corolla bilabiate. Anthers distinct. Style trifid. Gland epigynous between the 2 lower filaments. Capsule subunilocular from the dissepiment being short. Seeds imbricate, compressed.—A pilose annual herb, with the habit of *Goodènia*, and when dry having an odour like that of vernal grass. Leaves toothed or cut; floral ones auriculated at the base. Peduncles axillary, 1-flowered, bractless, reflexed while bearing the fruit.—This genus is separated from *Goodènia* alone from the trifid style; each division being furnished with an indusiate stigma.

1 G. pilòsa (R. Br. l. c.). ⊙. G. Native of New Holland, within the tropic.

Pilose Calogyne. Pl. ½ foot.

Cult. Sow the seeds of this plant in spring, in a pot filled with a mixture of sand, loam, and peat, and place it in a hot-bed; and when the plants are of sufficient size, plant them separately into other pots.

IV. EUTHA'LES (from ευ, *eu*, well, and θαλλω, *thallo*, to sprout). R. Br. prod. p. 579.

Lin. syst. *Pentándria, Monogýnia.* Calyx inferior, tubular, 5-cleft, unequal. Corolla adhering to the tube beneath the ovarium, cleft on one side at the apex; limb bilabiate. Anthers distinct. Style undivided. Indusium of stigma bilabiate. Capsule 4-valved, 2-celled at the base. Seeds imbricated, compressed.—A stemless herb, with the habit and inflorescence of *Vellèia.* The corolla in this genus and *Vellèia* is semi-superior, and joined with the calyx at the base. The genus is intermediate between *Goodènia* and *Vellèia*, but differs from them in the calyx being tubular.

1 E. trine'rvis (R. Br. prod. 580.). ♃. G. Native of New Holland, on the South Coast. Vellèia trinérvis, Labill. nov. holl. 1. p. 54. t. 77. Goodènia tenélla, Andr. rep. t. 466. Sims, bot. mag. 1137. Corolla pale yellow.

Three-nerved-leaved Euthales. Fl. May, Sept. Clt. 1803. Pl. 1 foot.

Cult. A mixture of loam, peat, and sand is the best soil for this plant; and it must be but sparingly watered, as it is very delicate, and apt to damp off. It is increased, but sparingly, by dividing, and by seed.

V. VELLE'IA (named after Major Velley, who paid much attention to the marine Algæ). Smith, in Lin. trans. 4. p. 217. R. Br. prod. p. 580.

Lin. syst. *Pentándria, Monogýnia.* Calyx inferior, 3-5-leaved, unequal. Corolla having the tube joined with the ovarium at the base, and cleft on the upper side at the apex; limb bilabiate. Anthers distinct. Style undivided. Gland epigynous between the 2 anterior filaments. Capsule 2-celled at the base; valves bipartite. Seeds imbricate, compressed.—Stemless herbs. Leaves radical, subspatulate, usually toothed, but sometimes lyrate. Scapes dichotomous, with the most of the axils floriferous. Bracteas opposite, foliaceous, sometimes large, and sometimes connate. Upper segment of the calyx broad, and often toothed at the base. Corolla yellow, adhering at the base, beneath the gibbosity or spur. Style somewhat tetragonal. Indusium of stigma large.

Sect. I. Menoceras (from μενω, *meno*, to abide; and κερας, *keras*, a horn; in reference to the permanent spur). R. Br. prod. p. 580. Calyx 5-leaved. Corolla spurred at the base: spur permanent.

1 V. paradóxa (R. Br. prod. p. 580.) plant downy; leaves bluntly toothed. ♃. G. Native of New South Wales, about Port Jackson; on the south coast of New Holland; and of Van Diemen's Land. Lind. bot. reg. 971. Corolla yellow.

Paradoxical Velleia. Fl. July. Clt. 1824. Pl. ¼ foot.

2 V. argu'ta (R. Br. l. c.) plant glabrous; leaves sharply toothed. ♃. G. Native of New Holland, on the south coast. Corolla yellow.

Sharp-toothed-leaved Velleia. Pl. ¼ foot.

Sect. II. Velle'iæ-ve'ræ (this section is supposed to contain the true species of the genus). R. Br. prod. 580. Calyx 3-leaved. Corolla rather gibbous on one side at the base.

3 V. lyra'ta (R. Br. l. c.) glabrous; bracteas of the forks distinct; leaves lyrate or deeply toothed at the base; segments of the calyx ovate-orbicular. ♃. G. Native of New South Wales, about Port Jackson. Ker. bot. reg. 551. Corollas yellow.

Lyrate-leaved Velleia. Fl. April. Clt. 1819. Pl. ½ foot.

4 V. spatula'ta (R. Br. l. c.) glabrous; bracteas of the forks distinct; leaves spatulate, almost toothless, but quite entire at the base, with the axils bearded. ♃. G. Native of New South Wales, about Port Jackson; and of New Holland, within the tropic. Juss. ann. mus. 18. t. 1. Corolla yellow.

Spatulate-leaved Velleia. Fl. April. Clt. 1825. Pl. ½ foot.

5 V. pube'scens (R. Br. prod. p. 581.) downy; bracteas of the forks distinct; leaves toothed; segments of the calyx oblong-ovate, acute. 4. G. Native of New Holland, within the tropic. Corolla yellow.

Downy Velleia. Pl. ½ foot.

6 V. perfolia'ta (R. Br. l. c.) glabrous; bracteas of the forks large, connate, roundish, toothed. 4. G. Native of New South Wales, about Port Jackson. Corolla yellow.

Perfoliate-bractead Velleia. Pl. ½ foot.

Cult. The soil recommended for the two preceding genera is also suited for the species of *Velleia*; and they may be increased by seeds, which are sometimes produced in this country.

VI. LECHENAU'LTIA (named after M. Lechenault, a French botanist and traveller). R. Br. prod. p. 581.

Lin. syst. *Pentándria, Monogýnia.* Calyx superior (f. 125. *a.*). Tube of corolla cleft on one side (f. 125. *h.*); limb bilabiate (f. 125. *i.*). Anthers cohering (f. 125. *c.*) at the time the flower is expanded. Grains of pollen compound. Stigma obsolete, in the bottom of the bilabiate indusium (f. 125. *f.*). Capsule prismatic, 2-celled, 4-valved; opposite valves septiferous in the middle. Seeds cubic or cylindrical, nucumentaceous.—Small glabrous heath-like shrubs, rarely herbs. Leaves narrow, quite entire. Flowers axillary or terminal, almost solitary. The pollen in all the species is composed of 4 combined sperules.

§ 1. *Small shrubs, with heath-like leaves. Flowers axillary or terminal. Capsule valvate. Seeds cubic.*

1 L. formòsa (R. Br. prod. p. 581.) flowers axillary, solitary, bractless, drooping; corollas bilabiate, glabrous; upper lip of corolla rounded, entire; lower ones tripartite: segments cuneated; filaments glabrous. ħ. G. Native of New Holland, on the south coast. Sweet. fl. austr. 26. Flowers scarlet.

Handsome Lechenaultia. Fl. June, Sept. Clt. 1824. Shrub 1 ft.

2 L. obla'ta (Sweet, fl. austr. t. 46.) flowers axillary and terminal, solitary, bractless, rather drooping; corollas bilabiate, downy outside: upper lip 2-lobed: lower one tripartite: segments oblate; filaments clothed with downy tomentum. ħ. S. Native of New Holland, on the south coast. L. formòsa, Lindl. bot. reg. t. 916. Hook. bot. mag. t. 2600. L. Baxtèri, G. Don, in Loud. hort. brit. p. 79. Flowers copper-coloured. (f. 125.)

FIG. 125.

Oblate Lechenaultia. Fl. April, Aug. Clt. 1824. Shrub 1 foot.

3 L. tubiflòra (R. Br. prod. 581.) flowers nearly terminal, solitary, almost sessile; corolla tubular, curved, with a conniving limb; leaves subulate, ending each in a pellucid point. ħ. G. Native of New Holland, on the south coast.

Tube-flowered Lechenaultia. Shrub 1 foot.

4 L. expa'nsa (R. Br. l. c.) flowers axillary, crowded into a few-flowered corymb; pedicels bibracteate; limb of corolla unilabiate, with ciliated segments. ħ. G. Native of New Holland, on the south coast.

Expanded-flowered Lechenaultia. Shrub 1 foot.

§ 2. *Plant herbaceous. Flowers opposite the leaves. Capsule slowly valvate; valves cohering, coarctate at the neck. Seeds cylindrical.*

5 L. filifo'rmis (R. Br. l. c.) leaves alternate, compressed, filiform. 4. G. Native of New Holland, within the tropic.

Filiform-leaved Lechenaultia. Pl.

Cult. The species of *Lechenaúltia* are elegant plants while in blossom. They thrive best in a mixture of turfy loam, peat, and sand; and young cuttings strike root freely in the same kind of mould under a hand or bell-glass.

VII. ANTHO'TIUM (from ανθος, *anthos*, a flower, and ους ωτος, *ous otos*, an ear; in reference to the segments of the superior lip of the corolla being auriculated on the inner margin). R. Br. prod. p. 582.

Lin. syst. *Pentándria, Monogýnia.* Calyx superior, 5-parted. Tube of corolla cleft lengthwise on the upper side; limb bilabiate; segments of the upper lip auriculated on the inner margin. Anthers cohering. Grains of pollen simple. Ovarium 2-celled, many-seeded. Indusium of stigma contrary to the lips of the corolla, beardless. Capsule unknown.—A glabrous dwarf stemless herb. Leaves radical, nearly terete, dilated a little at the base. Scapes numerous, spreading, undivided. Flowers crowded in fascicles. Bracteas foliaceous. Corolla violaceous, 5-parted, with the margins of the claws loose and truly inflexed.

1 A. hu'mile (R. Br. l. c.) 4. G. Native of New Holland, on the south coast. There are two varieties of this plant, one twice the size of the other in all its parts.

Humble Anthotium. Pl. ¼ foot.

Cult. See *Velleìa*, above, for culture and propagation.

Tribe II.

SCÆVO'LEÆ (this tribe contains plants agreeing with *Scævola* in important characters). R. Br. prod. p. 582. Seeds definite. Drupe or nut inferior.

VIII. SCÆVO'LA (from *scæva*, the left hand; in reference to the form of the corolla). Lin. gen. no. 224. Juss. gen. 165. R. Br. prod. p. 582.—Lobèlia species. Plum. gen. t. 31. Jacq. amer. 219. Gærtn. fruct. 1. p. 119. t. 25.

Lin. syst. *Pentándria, Monogýnia.* Corolla cleft longitudinally on the upper side; limb 5-parted, all to one side; segments winged, about equal in size and shape. Anthers free. Indusium of stigma ciliated.—Shrubs and herbs very variable in habit. Down on hairs simple. Leaves alternate, rarely opposite, hardly divided, often toothed. Inflorescence axillary or disposed in a leafy spike. Ovaria bibracteate, usually 2-celled (rarely 4-celled); cells 1-seeded; sometimes 1-celled and 1-2-seeded. Calyx 5-cleft, equal, sometimes obsolete. Corolla white or blue, rarely yellow, deciduous, for the most part downy outside; wings of the segments often fringed at the base, rarely longitudinally; the fringe for the most part floccosely branched at the top, and appears capitate to the naked eye; tube villous inside, and the throat beset with ramentæ, which are disposed in continuous lines, with the fringes of the segments. Stamens flaccid after the dehiscence of the corolla, and falling off with it. Anthers for the most part beardless, but sometimes bearded at the apex.—This genus is divided into natural groups below. Those species with 1-celled ovaria will probably constitute a separate genus from those with 2-celled ovaria.—*S. spinéscens* has a very different habit from the other species, and is probably a distinct genus, from the bracteas being deciduous, and the wings of the segments of the corolla being fringed lengthwise, but the mature fruit is not known.

Sect. I. Sarcoca'rpa (from σαρξ σαρκος, *sarx sarkos*, flesh; and καρπος, *karpos*, a fruit; in reference to the baccate fruit of the species). Drupe baccate, 2-celled. Peduncles axillary, dichotomous, bearing flowers in the forks, rarely 1-flowered. Leaves alternate, bearded in the axils. Shrubs, natives of the sea shore.

1 S. Kœni'gii (Vahl, symb. 2. p. 36.) cymes glabrous; flowers

pedicellate in the forks of the peduncles; calyx 5-parted, equal in length to the ovarium; leaves obovate, subrepand at the apex, quite glabrous on both surfaces, as well as the branches. ♄. S. Native of New Holland, within the tropic; of the East Indies, Cochinchina, and the Sandwich Islands, on the sea shore; and of Romanzoff's Island, in the South Sea. S. Lobèlia, Lin. herb. Cerbèra salutàris, Lour. coch. 136. Flowers pale red or white.

Kœnig's Scævola. Fl. July, Aug. Clt. 1820. Shrub 2 ft.

2 S. Plumie'ri (Vahl, symb. 2. p. 36.) cymes glabrous; calyx with an entire margin; leaves obovate, quite glabrous; calyx truncate. ♄. S. Native of the West Indies, by the sea shore. S. Lobèlia, Willd. spec. 1. p. 956. Lobélia Plumièri, Lin. spec. 2. p. 1317. Lobèlia Americàna, Willd. herb. no. 820. Plum. icon. 165. f. 1. Catesb. car. 1. t. 79. Flowers white.

Plumier's Scævola. Clt. 1724. Shrub 2 to 3 feet.

3 S. móllis (Hook. et Arn. in Beech. voy. pt. bot. p. 89.) shrubby, erect, densely clothed with down; leaves oblong-lanceolate, glabrous above, and clothed with silky tomentum beneath, petiolate, glandularly denticulated, with bearded axils; peduncles shorter than the petioles, axillary, divaricate, with flexuous few-flowered branches; bracteoles subulate, recurved; corolla clothed with silky tomentum; calycine teeth 5, very short, obtuse. ♄. G. Native of the Sandwich Islands. Very closely allied to S. serícea, Forst. The whole plant is very brittle.

Soft Scævola. Shrub 2 to 3 feet.

4 S. Gaudichau'di (Hook. et Arn. in Beech. voy. pt. bot. p. 89.) shrubby, erect, glabrous; leaves lanceolate, acute, narrowed at the base, quite entire, rather falcate; fruit axillary, solitary, on short peduncles, somewhat racemose, crowned by the blunt 5-toothed obtuse calyx, 2-seeded; bracteoles linear, quite entire. ♄. G. Native of the Sandwich Islands, at the altitude of 1200 to 1500 feet. S. montàna, Gaud. in Freyc. voy. pt. bot. p. 460. but not of Labill.

Gaudichaud's Scævola. Shrub 3 to 4 feet.

5 S. cilia'ta; shrubby, erect, glabrous; leaves rather membranous, broad-lanceolate, acuminated at both ends, acute, with a few almost obsolete teeth on the margins, narrowed into the short petioles, toothed at the base, with bearded axils; peduncles axillary, equal in length to the leaves or exceeding them, 5-8-flowered, cymosely dichotomous; bracteas linear; flowers sessile; calycine teeth short, ciliated; corolla glabrous on the outside, and inside of the tube rather villous: segments winged; style villous; drupe olive-formed, containing one 2-seeded pyrenæ. ♄. G. Native of the island of O Wahu. S. Chammissoniàna, Cham. in Linnæa. 7. p. 226. but hardly of Gaud. Leaves $3\frac{1}{2}$ inches long, and an inch broad.

Ciliated-calyxed Scævola. Shrub 2 to 3 feet.

6 S. Tacca'da (Roxb. fl. ind. 2. p. 146.) shrubby, with smooth branches; leaves sessile, obovate, rounded at the apex, tapering much to the base, entire, shining, with bearded axils; peduncles axillary, solitary, 2 or 3 times forked. ♄. S. Native of the East Indies, on the sea shore. Lobèlia Taccàda, Gærtn. fruct. 1. p. 119. t. 25. Buglóssum littòreum, Rumph. amb. 4. t. 54. Flowers white, slightly fragrant, villous inside, and shaggy round the mouth. Drupe size of a gooseberry, white when ripe, 2-celled; cells 1-seeded.

Taccada Scævola. Fl. Aug. Clt. 1810. Shrub 5 to 6 feet.

7 S. seri'cea (Forst. prod. no. 504.) cymes and corollas tomentose outside; flowers pedicellate in the forks of the peduncles; calyx 5-parted, about equal in length to the ovarium; leaves obovate, entire or repand, clothed with soft tomentum on both surfaces, and on the branches. ♄. S. Native of New Holland, within the tropic; and of the Society Islands, on the sea shore. Vahl, symb. 2. p. 37. R. Br. prod. p. 583. S. Kœnígii, Lamark, aus. p. 108. Very like the two preceding species, but differs in being tomentose. There are varieties of this with more or less tomentose entire and repandly toothed leaves, and with the style either glabrous or longitudinally villous.

Silky Scævola. Shrub 2 to 3 feet.

8 S. Chammissonia'na (Gaud. in Freyc. voy. pt. bot. p. 461. t. 82.) shrubby, erect, glabrous; leaves oblong, acuminated at both ends, sharply denticulated, with bearded axils; peduncles axillary, dichotomous, about equal in length to the leaves, with sessile flowers in the forks; calyx short, 5-toothed; corollas downy; drupe 2-celled. ♄. G. Native of the Sandwich Islands.

Chammisso's Scævola. Shrub 2 to 3 feet.

9 S. tomentòsa (Gaud. in Freyc. voy. pt. bot. p. 460. t. 81.) shrubby, erect, clothed with brownish stellate tomentum; leaves soft, somewhat rhomboid-ovate, obtuse, sinuately toothed; flowers axillary, solitary, pedunculate; calyx short, 5-toothed; corollas downy; bracteoles unilateral, half connate, quite entire; fruit 2-seeded. ♄. G. Native of New Holland, on the western coast, in Shark's Bay.

Tomentose Scævola. Shrub 2 to 4 feet.

10 S. Menziesia'na (Cham. in Linnæa. 7. p. 227.) shrubby, erect; leaves obovate or lanceolate, obtuse or acutish, quite entire, or a little serrated, narrowed into the petioles, bearded at the axils, rather fleshy, downy beneath or glabrous; peduncles shorter than leaves, bearing 3 flowers at the apex, and often only one; bracteas linear; flowers sessile; calycine teeth short, ciliated; corolla pilose outside or glabrous, villous inside, having the segments hardly winged; style villous; drupe olive-formed, 1-2-seeded. ♄. G. Native of O Wahu. Stamens glabrous. Fruit 2-celled, fleshy.

Var. β, glàbra (Cham. l. c.) leaves narrower, and more cuneated at the base, obtuse, mucronulate, nearly entire, glabrous on both surfaces. Corollas glabrous on the outside.

Menzies' Scævola. Shrub 2 to 3 feet.

11 S. gla'bra (Hook. et Arn. in Beech. voy. pt. bot. p. 89.) shrubby, erect, glabrous; leaves cuneate-obovate, obliquely acuminated, on long petioles, with obscure remote glandular denticulations, and bearded axils; pedicels axillary, 1-flowered, naked, one-half shorter than the leaves; corolla glabrous, equal in length to the teeth of the calyx. ♄. G. Native of the Sandwich Islands. Very like S. Chammissoniàna, Gaud.

Glabrous Scævola. Shrub 2 to 3 feet.

12 S. monta'na (Labill. sert. cal. p. 41. t. 42.) cymes and corollas tomentose; flowers sessile in the forks of the corymb; leaves obovate-oblong, glabrous, rather coriaceous. ♄. G. Native of New Caledonia. Leaves entire, undulated or crenulated, with silky hairy axils.

Mountain Scævola. Shrub 4 to 6 feet.

13 S. oppositifòlia (Roxb. fl. ind. 2. p. 148.) leaves opposite, on short petioles, elliptic, entire, smooth; peduncles axillary, few-flowered. ♄. S. Native of the Moluccas. A slender shrubby species, very different in habit from *S. Kœnígii*.

Opposite-leaved Scævola. Shrub.

Sect. II. Xeroca'rpa (from *ξηρος, xeros*, dry; and *καρπος, karpos*, a fruit; in reference to the dry fruit of the species). Drupe usually dry, 1-4-celled. Bracteas foliaceous, lateral, permanent. Spikes terminal, but sometimes axillary.

§ 1. *Leaves all or for the most part toothed or cut.*

14 S. attenua'ta (R. Br. prod. p. 583.) shrubby, erect, pilose; leaves lanceolate, toothed; bracteas stretched, quite entire; corolla hairy outside, with the margins naked above; styles very villous. ♄. G. Native of New Holland, on the south coast.

Attenuated-leaved Scævola. Shrub 2 to 3 feet.

15 S. nítida (R. Br. prod. p. 584.) shrubby, erect, quite

glabrous; leaves elliptic, sharply toothed; bracteas toothed; corollas glabrous outside, with the margins villous above; styles rather villous. ♄. G. Native of New Holland, on the south coast.

Shining-leaved Scævola. Shrub 1 to 2 feet.

16 S. crassifòlia (Labill. nov. holl. 1. p. 56. t. 79.) suffruticose, ascending, quite glabrous; leaves elliptic, sharply toothed, obovate-lanceolate, and are as well as the branches often painted; bracteas entire; indusium of stigma with a naked border. ♄. G. Native of New Holland, on the south coast. Flowers white.

Thick-leaved Scævola. Fl. Aug. Oct. Clt. 1805. Shrub 2 to 3 feet.

17 S. globulífera (Labill. nov. holl. 1. p. 55. t. 78.) suffruticose, erect, glabrous? leaves lanceolate, few-toothed; bracteas entire; ovarium 4-celled. ♄. G. Native of New Holland, on the south coast. The fringe at the base of the wings of the segments of the corolla, and the ramenta in the throat of the corolla, are floccosely branched at the tops; therefore they appear globular at the apex, hence the name.

Globule-bearing Scævola. Shrub 1 to 2 feet.

18 S. ovalifòlia (R. Br. prod. p. 584.) suffruticose, ascending; leaves oval or elliptic, toothed; bracteas rhomboid-elliptic, very acute, nearly entire; calyx obsolete; style bearded at the top on one side. ♄. S. Native of New Holland, within the tropic.

Var. α, cinerascens (R. Br. l. c.) clothed with fine cinereous tomentum; corolla downy outside.

Var. β, glàbra (R. Br. l. c.) glabrous; corolla beardless on the outside.

Oval-leaved Scævola. Shrub 1 to 2 feet.

19 S. æ̀mula (R. Br. l. c) plant herbaceous, erect; leaves cuneated or obovate, toothed, smoothish; spike simple; bracteas lanceolate, nearly entire; calyx lobed; style glabrous below, furnished on one side at the apex with a straight coloured beard, which is equal in length to the indusium of the stigma; ovarium 2-celled. ♃. G. Native of New Holland, on the south coast. It agrees with the figure given of the next species, except in the lower bracteas of the spikes being many-flowered, while in the present plant they are always 1-flowered.

Emulating Scævola. Pl. 1 foot.

20 S. cuneifórmis (Labill. nov. holl. 1. p. 56. t. 80.) plant herbaceous, erect? rather pilose; leaves cuneated, toothed; spike divided at bottom into 2-3-flowered spikelets; bracteas lanceolate, entire; calyx lobed; style glabrous below, but furnished with a straight beard on one side at the apex, which is equal in length to the indusium of the stigma. ♃. G. Native of Van Diemen's Land. Flowers blue?

Wedge-formed-leaved Scævola. Clt. 1824. Pl. 1 foot.

21 S. sinua̓ta (R. Br. prod. p. 584.) plant herbaceous, diffuse, downy, with the hairs adpressed; leaves obovate or cuneated, toothed or sinuated; spike compound: spikelets few-flowered; bracteas elliptic, entire; calyx lobed; style glabrous below, but furnished at the apex on one side with a straight, coloured beard, which exceeds the indusium of the stigma. ♃. G. Native of New Holland, on the south coast. An intermediate plant between *S. æ̀mula* and *S. cuneifórmis*.

Sinuated-leaved Scævola. Pl. diffuse.

22 S. hu̓milis (R. Br. prod. p. 585.) plant herbaceous, ascending or diffuse, downy; leaves sharply toothed: lower ones obovate-cuneated: rameal ones lanceolate; spike simple; bracteas linear-lanceolate, a little toothed; calyx lobed; style furnished with a straight coloured beard on one side at top, which is equal in length to the indusium of the stigma; ovarium 2-celled. ♃. G. Native of New Holland, on the south coast.

Humble Scævola. Pl. ascending.

23 S. microca̓rpa (Cav. icon. 6. p. 6. t. 509.) plant herbaceous, downy; leaves cuneated, oval, or orbicular, toothed, attenuated at the base; spike simple; bracteas toothed; calyx lobed; tube of corolla bearded inside; hairs in the throat of the corolla, acute, and capitate; style longitudinally villous; ovarium 1-celled, 2-seeded. ♃. G. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. R. Br. prod. p. 585. Goodènia álbida, Smith, in Lin. trans. 2. p. 347. Goodènia lævigàta, Curt. bot. mag. 287. Willd. spec. 1. p. 954. Flowers purple, with a white throat. This is a very polymorphous species, sometimes diffuse, and sometimes erect, varying much in the consistence and form of the leaves.

Small-fruited Scævola. Fl. May, Sept. Clt. 1790. Pl. ½ to 1 ft.

24 S. pa̓llida (R. Br. prod. l. c.) plant herbaceous, diffuse, downy; leaves toothed, attenuated at the base, cuneated or lanceolate; spike simple; bracteas usually toothed; calyx lobed; tube of corolla almost naked inside; style glabrous; ovarium 1-celled, 2-seeded. ♃. G. Native of New Holland, on the south coast. Like the preceding, but smaller in all its parts.

Pale-flowered Scævola. Pl. diffuse.

§ 2. *Leaves all or for the most part quite entire.*

25 S. suave̓olens (R. Br. prod. p. 585.) plant herbaceous, diffuse, downy; leaves spatulate, fleshy, with bearded axils; bracteas linear-lanceolate; ovarium 2-celled; drupe baccate. ♃. G. Native of New Holland, on the south coast, and within the tropic; and of New South Wales, about Port Jackson. Goodènia calendulàcea, Andr. bot. rep. 22. Flowers blue.

Sweet-scented-flowered Scævola. Fl. Aug. Sept. Clt. 1793. Pl. 1 to 2 feet.

26 S. cæspitòsa (R. Br. l. c.) plant suffruticose, erectish, glabrous; leaves linear-lanceolate, with rather recurved margins, a little toothed, with beardless axils; calyx short, 5-lobed; ovarium 2-celled. ♄. G. Native of New Holland, on the south coast. In many points this species agrees with *S. globulífera*, but differs in the ovarium being truly 2-celled.

Tufted Scævola. Shrub 1 foot?

27 S. revolu̓ta (R. Br. prod. p. 586.) suffruticose, erect, downy, greyish; leaves oblong-lanceolate, sessile, with revolute edges; spike compact; bracteas lanceolate, rather concave; calyx obsoletely crenated; ovarium 2-celled. ♄. S. Native of New Holland, within the tropic.

Revolute-leaved Scævola. Shrub 1 foot.

28 S. linea̓ris (R. Br. l. c.) suffruticose, erect, much branched, pilose, and scabrous; leaves and bracteas linear, recurved on the margins; spike terminal; ovarium 1-seeded. ♄. G. Native of New Holland, on the south coast.

Linear-leaved Scævola. Shrub 1 foot.

29 S. paludòsa (R. Br. l. c.) plant subherbaceous, erect, a little branched, pilose, scabrous; leaves linear-lanceolate, flattish, about equal in length to the axillary spikes; ovarium 1-seeded. ♃. G. Native of New Holland, on the south coast.

Marsh Scævola. Pl. 1 foot?

30 S. angula̓ta (R. Br. l. c.) suffruticose, erect; branches angular; leaves sessile, oblong-lanceolate; spikes seldom simple; bracteas conforming to the rameal leaves; calyx 5-cleft, about equal in length to the 2-celled wrinkled ovarium. ♄. S. Native of New Holland, within the tropic. There is a variety of this having few-toothed leaves, usually quite glabrous, but sometimes furnished with a few scattered hairs.

Angular-branched Scævola. Shrub.

Sect. III. Pogonanthe̓ra (from *πωγων, pogon*, a beard; and *ανθηρα, anthera*, an anther: the anthers are bearded). Calyx length of ovarium. Anthers bearded at the apex. Drupe nearly dry. Herbaceous plants. Peduncles axillary, 1-flowered, elongated, each furnished with 2 foliaceous permanent bracteas.

31 S. híspida (Cav. icon. 6. p. 7. t. 510.) wings of the segments of the corolla veinless. ♃. G. Native of New South Wales, within the tropic. R. Br. prod. p. 586. Goodènia ramosíssima, Smith, in Lin. trans. 2. p. 349. new holl. 15. t. 5. Flowers lilac.

Hispid Scævola. Fl. July. Clt. 1827. Pl. 1 to 2 feet.

32 S. stria'ta (R. Br. prod. p. 586.) wings of the segments of the corolla furnished with parallel veins. ♃. G. Native of New Holland, on the south coast.

Striated Scævola. Pl. 1 foot?

Sect. IV. Crossótoma (from *κροσσος*, *krossos*, a fringe; and *τομα*, *toma*, a section; in reference to the fringed segments of the corolla). Calyx obsolete. Wings of the segments of the corolla fringed longitudinally. Peduncles axillary, 1-flowered, furnished with deciduous bracteas at the apex.

33 S. spine'scens (R. Br. prod. p. 586.) shrubby, spinescent; leaves oval or obovate, quite entire. ♄. G. Native of New Holland, on the south coast.

Spinescent Scævola. Shrub.

Cult. All the species grow freely in a mixture of turfy loam, turfy peat, and sand; and cuttings planted in the same kind of soil, with a hand-glass placed over them, strike root readily; those of the stove species in heat.

IX. DIASPA'SIS (from *διασπασις*, *diaspasis*, a pulling asunder; segments of corolla). R. Br. prod. p. 586.

Lin. syst. *Pentándria*, *Monogýnia*. Corolla almost regular, salver-shaped, with a 5-parted tube. Genitals inclosed. Anthers free. Ovarium 1-celled, 2-seeded. Indusium of stigma with a naked border. Nut corticate.—An erect smooth branched herb, besprinkled with a little simple down. Leaves alternate, nearly terete. Peduncles axillary, 1-flowered, furnished with 2 leaves at the apex, in the manner of those of *Scævòla hispida*. Flowers drooping. Calyx short, 5-cleft. Claws of corollas connate at the base, and connected by very short capitate down above. Wings of the broader laminæ of the corolla ascending, with flat disks: the superior 2 dissimilar. Anthers beardless. Indusium of stigma somewhat 2-valved. Drupe dry, 1-seeded.—This genus is nearly allied to *Scævòla*, and particularly to sect. 3. of that genus, with which it agrees in the inflorescence.

1 D. filifòlia (R. Br. prod. p. 587.) ♃. G. Native of New Holland, on the south coast.

Thread-leaved Diaspasis. Pl. 1 foot?

Cult. See *Scævòla* above for culture and propagation.

X. DAMPIE'RA (named in memory of Capt. William Dampier, R.N., the celebrated circumnavigator; he paid great attention to natural history in all his voyages). R. Br. prod. 587. Juss. ann. mus. vol. 18.

Lin. syst. *Pentándria*, *Monogýnia*. Corolla bilabiate (f. 126. *a*.), having the tube cleft on the upper side (f. 126. *c*.); segments of the upper lip auricled on the inner margin. Anthers closely cohering (f. 126. *d*.). Ovarium 1-seeded. Indusium of stigma with a naked border (f. 126. *c*.). Nut crustaceous.—Arid downy subshrubs or herbs: hairs usually of two forms; the longer ones in most of the species are branched, and rather plumose; and the shorter ones stellate. Leaves alternate, undivided, or a little toothed, coriaceous. Flowers axillary or terminal, sub-spicate or solitary; bracteas small or wanting. Calyx short, usually obsolete. Corolla blue or purple, 5-parted; with the margins of the claws truly inflexed, and the laminæ hairy on the outside: deciduous, but sometimes with the base permanent and entire. Stamens remaining after the corolla has fallen; anthers beardless.

1 D. undula'ta (R. Br. prod. p. 587.) suffruticose, erect, tomentose; leaves petiolate, roundish, toothed, undulated, scabrous above, longer than the peduncles, which are axillary and 2-4-flowered; corolla bearded with black plumose villi outside. ♄. G. Native of New South Wales, about Port Jackson. Flowers blue.

Undulated-leaved Dampiera. Shrub 1 foot.

2 D. rotundifòlia (R. Br. l. c.) suffruticose, erect, tomentose; leaves petiolate, roundish, entire, flat, scabrous above, very blunt at the base; peduncles axillary, usually 1-flowered, very short: terminal ones subcorymbose; corolla bearded with black plumose villi outside. ♄. S. Native of New South Wales, about Port Jackson. Flowers blue.

Round-leaved Dampiera. Shrub 1 foot.

3 D. ovalifòlia (R. Br. prod. p. 588.) suffruticose, erect, clothed with scurfy tomentum; leaves petiolate, oval, nearly entire, flat, scabrous above; peduncles 2-4-flowered, axillary, about equal in length to the leaves: terminal ones corymbose; corollas bearded with black plumose villi outside. ♄. G. Native of New Holland, about Port Jackson. Juss. ann. mus. 18. t. 2. no. 1. Flowers blue. (f. 126.)

FIG. 126.

Oval-leaved Dampiera. Fl. Ju. Aug. Clt. 1824. Shrub 1 to 2 feet.

4 D. purpu'rea (R. Br. l. c.) suffruticose, erect, tomentose; leaves petiolate, ovate, acutely toothed, scabrous above; peduncles axillary, 1-3-flowered; corollas bearded with black plumose villi outside. ♄. G. Native of New Holland, about Port Jackson. Flowers purple. In this and the preceding species the outside of the corollas, as well as the peduncles, are densely bearded with spreading plumose villi.

Purple-flowered Dampiera. Shrub 1 foot.

5 D. ferrugínea (R. Br. l. c.) suffruticose, erect, tomentose; leaves petiolate, ovate, acutish, repandly toothed, 3-nerved at base, smooth above in the adult state; flowers almost terminal; corollas clothed with branched wool outside. ♄. S. Native of New Holland, within the tropic. Flowers blue.

Rusty Dampiera. Shrub 1 foot.

6 D. hedera'cea (R. Br. l. c.) plant herbaceous, procumbent, tomentose; leaves for the most part petiolate, somewhat cordate, angularly cut: superior ones quite entire, glabrous above in the adult state; corollas bearded on the outside by spreading plumose cinereous villi. ♃. G. Native of New Holland, on the south coast. Flowers blue.

Ivy-like Dampiera. Pl. procumbent.

7 D. inca'na (R. Br. l. c.) suffruticose? erect? clothed with hoary tomentum; leaves sessile, obovate, quite entire. ♄. G. Native of New Holland, on the western coast about Cape Lewin and Wit's Land, where it was collected by Dampier and Baudin.

Hoary Dampiera. Shrub.

8 D. cunea'ta (R. Br. l. c.) plant herbaceous, erectish, downy; leaves sessile, toothed, obovate-cuneated, upper ones elliptic-lanceolate, adult ones smoothish; spikes pedunculate; bracteas opposite; flowers alternate; corollas woolly on the outside from simple spreading villi. ♃. G. Native of New Holland, on the south coast. Flowers blue.

Cuneated-leaved Dampiera. Pl. ½ to 1 foot?

9 D. linea'ris (R. Br. l. c.) plant herbaceous, erect, downy; leaves sessile, for the most part linear and few-toothed, lower ones cuneated, adult ones smoothish; spikes pedunculate;

bracteas opposite; flowers alternate; corollas woolly outside from simple spreading villi. ♃. G. Native of New Holland, on the south coast. Flowers blue. In this and *D. cuneàta* the calyx is obsolete, the base of the corolla entire and permanent, clothed with simple villi on the outside; and the inflorescence is peculiar in these two plants.

Linear-leaved Dampiera. Pl. ½ to 1 foot?

10 D. fasciula'ta (R. Br. l. c.) plant herbaceous, erect; stem compressedly tetragonal; leaves sessile, cuneated, a little toothed, upper ones crowded in a verticillate manner, adult ones glabrous and smooth on both surfaces; peduncles in fascicles, few-flowered; corollas clothed with adpressed hairs outside: branches of pili approximate and parallel. ♃. G. Native of New Holland, on the south coast. Flowers blue.

Fascicled-peduncled Dampiera. Pl.

11 D. oblonga'ta (R. Br. l. c.) plant herbaceous, erect; stem compressedly trigonal; leaves sessile, oblong, entire, and few-toothed, glabrous and smooth on both surfaces in the adult state; peduncles almost terminal, very short, 1-3-flowered; corollas clothed with adpressed pili on the outside: divisions of pili approximate and parallel. ♃. G. Native of New South Wales, about Port Jackson. Flowers blue.

Oblong-leaved Dampiera. Pl. ½ to 1 foot?

12 D. stri'cta (R. Br. prod. p. 589.) plant herbaceous, erect; stem compressedly trigonal; leaves sessile, cuneated, a little toothed, scabrous above in the adult state; peduncles few-flowered, axillary and terminal; corollas clothed with adpressed pili on the outside: divisions of pili parallel and approximate. ♃. G. Native of New Holland, on the south coast, and about Port Jackson; as well as of Van Diemen's Land. Juss. ann. mus. 18. t. 2. no. 2. Goodènia stricta, Smith, in Lin. trans. 2. p. 349. Flowers blue. This and the two preceding species are very nearly allied, and are easily distinguished from the rest on account of the peculiar hairs on the outside of the corolla.

Straight Dampiera. Fl. June, Aug. Clt. 1814. Pl. 1 foot.

13 D. parvifòlia (R. Br. prod. p. 589.) plant herbaceous, erect, glabrous in the adult state; stem compressedly trigonal, panicled; leaves sessile: cauline ones linear-lanceolate, smooth: upper rameal ones subulate; flowers solitary, sessile; bracteas imbricated. ♃. G. Native of New Holland, on the south coast. Flowers blue.

Small-leaved Dampiera. Pl. 1 foot?

Cult. See *Scævòla*, p. 730. for culture and propagation.

Tribe III.

BRUNONIE'Æ (this tribe only contains the genus *Brunònia*,) Utriculus superior, 1-seeded.

XI. BRUNO'NIA (named by Sir James Edward Smith in honour of Robert Brown, D.C.L. Cantab. F.R.S. V.P.L.S., &c. &c., who is justly considered the first botanist in the world; author of Prodromus Floræ Novæ Hollandiæ et Insulæ Van Diemen, 1 vol. Lond. 1810, &c. &c.) Smith, in Lin. trans. 10. p. 366, t. 28. R. Br. prod. p. 589. and in Lin. trans. 12. p. 132.

Lin. syst. *Pentándria, Monogýnia*. Heads of flowers involucrated. Calyx 5-cleft, furnished with 4 bracteas. Corolla monopetalous, funnel-shaped; limb 5-parted, the 2 superior segments more deeply divided than the rest. Stamens 5, hypogynous. Anthers connate. Ovarium 1-seeded. Indusium of stigma 2-valved. Utriculus inclosed within the indurated calyx, which spreads at top with plumose segments. Seed without albumen.—Stemless herbs, with the habit of *Scabiòsa*, *Jasiòne*, and *Globulària*, downy from glandless simple pili. Radical leaves quite entire, spatulate. Scapes undivided, bearing each one head. Head hemispherical, lobate: lobes involucrated by foliaceous bracteas. Flowers distinct, nigh a whorl of 5 membranous bracteas, the fifth bractea rather dissimilar. Tube of calyx very short when in flower. Corolla azure blue, marcescent, having the tube at length cleft. Filaments almost hypogynous, permanent, inserted in the very short stipe of the ovarium, which is only obvious after fecundation. Anthers inclosed in the tube of the corolla. Stigma fleshy, retuse, inclosed within the bifid indusium, which has a naked border. This genus agrees in many points of structure with *Compósitæ*, *Campanulàceæ*, *Dipsàceæ*, and *Globulàriæ*.

1 B. serîcea (Smith, in Lin. trans. 10. p. 366. t. 28. R. Br. prod. p. 590.) leaves as well as the scapes silky from adpressed villi; calycine segments ending each in a thick coloured naked point. ♃. G. Native of New Holland, within the tropic. Flowers azure blue.

Silky Brunonia. Pl. 1 foot.

2 B. austra'lis (Smith, in Lin. trans. 10. p. 366. t. 28. R. Br. l. c.) leaves as well as the bottom of the scapes villous from spreading hairs; calycine segments plumose, with an acute apex. ♃. G. Native of Van Diemen's Land and New Holland, on the south coast. Flowers azure blue.

Southern Brunonia. Pl. 1 foot.

Cult. See Scævola, p. 730. for culture and propagation.

Tribe IV.

CAMPANIE'Æ (from *campana*, a bell; shape of flowers). Corolla regular, campanulate. Capsule 3-4-celled, many-seeded.

XII. PENTAPHRA'GMA (from *πεντε, pente*, five, and *φραγμος, phragmos*, a dissepiment; in reference to the 5 longitudinal septa, or processes, from which the stamens spring). Wall. cat. no. 1313. Alph. D. C. mon. camp. p. 95.—Phyteùma, Wall.

Lin. syst. *Pentándria, Monogýnia*. Calyx semi-superior, ovate, villous, 5-lobed; lobes obtuse. Corolla campanulate, permanent, inserted in the calyx; with a recurved 5-lobed limb; lobes obtuse. Stamens 5, short. Anthers distinct, linear. Ovarium surrounded by the calyx, and connected with it by 5 longitudinal septa or processes, from which the stamina spring, 3-4-celled, many-seeded. Placentas from the inner angle of the cells. Style short, thick. Stigma concave, surrounded by the thick fleshy 3-lobed indusium. Capsule 3-4-celled, combined with the villous tube of the calyx in its lower part, and surrounded by the segments. Seeds adhering to long filiform free receptacles, which are attached to the apex of the capsule.—A creeping woolly herb. Leaves alternate, broad, semi-cordate, like those of some species of *Begònia*, petiolate, serrated, acute, pretty smooth. Racemes axillary, secund, recurved, twice the length of the petioles. Flowers unilateral, arrayed in 2 rows, nearly sessile. Corollas white.

1 P. begoniæfòlia. ♃. S. Native of Pulo-Penang, in forests. Phyteùma begoniæfòlia, Roxb. hort. beng. p. 85. Wall. in Roxb. fl. ind. 2. p. 109. Stems villous. Leaves villous beneath and glabrous above.

Begonia-leaved Pentaphragma. Pl. creeping.

Cult. A mixture of vegetable mould and sand will be a good soil for this plant; and it will be easily propagated by dividing the creeping stems.

Order CXXXVII. CAMPANULA'CEÆ (this order contains plants agreeing with the genus *Campánula* in the flowers being bell-shaped, and in other characters). Campanùleæ, Alph. D. C. mon. p. 97. Campanularum pars, Adan. fam. 2. p. 132. Campanulaceàrum pars, Juss. gen. p. 164. Campanaceàrum pars, Gis. ord. nat. Lin. no. 29. Campanulàcea, §. 1. R. Br. prod. p. 559. Campanulàceæ et pars Lobeliacearum, Juss. ann. mus. 18. p. 1.

Calyx regular, of from 3 to 8 lobes, but usually of 5 lobes, very rarely destitute of the limb. Corolla monopetalous, regular, permanent, usually 5-lobed, rarely 3 to 8-lobed; lobes alternating with the calycine segments, each having a conspicuous central nerve, valvate in æstivation. Stamens like the corolla, inserted in the margin of the disc of the ovarium, and combined with it, distinct from the corolla, but equal in number to its segments, and alternating with them; filaments usually expanded at the base and membranous, and bending towards the base of the style above the disc; anthers fixed by the base, free, rarely more or less combined into a tube, 2-celled; cells dehiscing lengthwise when the flower is in bud; pollen copious, adhering, yellow or violaceous, and clothed with very short papillæ. Style one, more or less hairy; stigma naked (not covered by an indusium, as in the order *Scævòleæ*,), rarely capitate, but usually divided into from 2 to 8 lobes, or as many lobes as there are cells in the ovarium; lobes erect while the flower is in æstivation, pilose on the back, and hardly distinct, but they diverge and become recurved and glabrous on the expansion of the flower. Ovarium combined with the tube of the calyx, sometimes half superior, many-celled; cells from 2 to 8 in number, but usually 2, 3 or 5, (never 4, unless a monstrosity) opposite the calycine lobes, and sometimes alternating with them. Capsule many-seeded, dehiscing at the sides or apex, having the valves usually septiferous in the middle. Seeds numerous, small, inserted in the placentas on the inner side of the cells. Albumen fleshy. Embryo slender, straight, with opposite, ovate or roundish small foliaceous cotyledons.—Usually milky herbs, rarely shrubs. Leaves exstipulate, alternate, but sometimes opposite, rarely entire, usually toothed or crenated, never fleshy; the radical ones often different from the cauline ones. Flowers rarely involucrated, number and situation variable, terminal and axillary, racemose, panicled or spicate, and glomerate, usually drooping; pedicels always reflexed in those species in which the capsules burst at the base, but on the contrary they are erect in those species whose capsules burst at the apex.—Corollas usually blue or white, rarely yellow or purple.

Campanulàceæ differ from Compositæ in not having the flowers in heads, in their usually distinct anthers; in their polyspermous fruit. It differs from Lobeliàceæ in the regular flowers, and in the usually distinct anthers, and from Goodenòviæ in the flowers being regular, and in the want of an indusium to the stigma. All the plants are pretty, and some highly ornamental. The roots of Camp. Rapunculus are used as a vegetable under the name of Rampion.

Synopsis of the genera.

TRIBE I.

JASIÒNEÆ. *Capsule dehiscing at the apex. The plants contained in this tribe are most frequent in the southern hemisphere.*

§ 1. *Corolla 5-parted.*

* *Anthers combined.*

1 JASIÒNE. Capsule 2-celled, inferior: valves dehiscing but a very little way at top.—Herbs with capitate flowers.

** *Anthers distinct.*

2 LIGHTFOÒTIA. Stigmas filiform. Capsule 3-5-celled, half superior; when 5-celled the cells are opposite the stamens and calycine segments.—African subshrubs or herbs.

3 CEPHALOSTI'GMA. Stigma capitate. Capsule 2-3-celled.—Herbs.

4 CAMPANU'MÆA. Calyx without a limb. Stigmas ovate, thick. Capsule 3-celled.—Herbs, with opposite leaves, and large involucrated flowers.

§ 2. *Corolla 3-6-cleft or 3-6-lobed at the apex. Anthers always distinct.*

* *Capsule with the valves opening regularly.*

5 CODONÓPSIS. Calyx usually destitute of a limb. Corolla 5-lobed. Stamens 5. Stigmas 3, ovate, thick. Capsule 3-celled.—Usually climbing glaucescent herbs, with opposite leaves.

6 CANARI'NA. Calyx and corolla 6-lobed. Stamens 6. Stigmas 6. Cells of fruit opposite the stamens and calycine segments.—Climbing glaucescent herbs, with opposite leaves.

7 PLATYCÒDON. Calyx and corolla 5-lobed. Stamens and stigmas 5. Capsule 3-5-celled; cells when 5 alternating with the stamens and calycine segments. Seeds ovate, flat.—Rather glaucescent herbs, with alternate or subopposite leaves, and large campanulate corollas.

8 MICROCÒDON. Calyx and corolla 5-lobed. Stamens and stigmas 5. Capsule 5-celled; cells alternating with the stamens and calycine segments. Seeds small, ovoid.—Humble herbs, with narrow alternate leaves, and small cylindrical corollas.

9 WAHLENBE'RGIA. Calyx and corolla 3-5-lobed. Stamens 3-5; stigmas 2-5. Capsule 2-5-celled; cells when 5 opposite the stamens and calycine segments. Seeds small, usually ovoid. Herbs usually with alternate and narrow leaves.

** *Capsule elongated, bursting at the top or opening by a pore.*

10 PRISMATOCA'RPUS. Calyx and corolla 5-lobed. Stamens 5. Capsule 2-celled, naked, at length bursting irregularly at the apex. Seeds angular, thick.—Herbs or subshrubs, with alternate narrow stiff leaves, and axillary sessile flowers.

11 ROE'LLA. Calyx and corolla 5-lobed. Stamens 5. Capsule 2-celled, always terminated by the permanent calycine segments, dehiscing irregularly at the apex.—Small shrubs, with alternate narrow stiff leaves; and sessile, usually solitary, terminal flowers.

TRIBE II.

CAMPANU'LEÆ. *Capsule dehiscing at the sides.—The plants contained in this tribe are all indigenous to the northern hemisphere.*

§ 1. *Capsule dehiscing by valves, which are equal in number to the cells.*

* *Corolla 5-8-parted.*

12 PHYTEU'MA. Calyx and corolla 5-parted. Stamens 5. Capsule 2-3-celled. Stigmas filiform.—Herbs, with small usually glomerate flowers.

13 PETROMA'RULA. Calyx and corolla 5-parted. Stigma

capitate. Capsule 3-celled.—Herbs, with pinnatifid leaves, and racemose flowers.

14 Michau'xia. Calyx and corolla 8-parted. Stigmas 8, filiform. Capsule 8-celled.—Herbs, with the radical leaves pinnate.

** *Corolla 5-cleft or 5-lobed at the apex.*

15 Campa'nula. Corolla campanulate, funnel-shaped, or broadly tubular. Nectarium none. Capsule 3-5-celled, not elongated; cells when 5 opposite the stamens and calycine segments.—Herbs variable in habit.

16 Specula'ria. Corolla rotate. Nectarium none. Capsule elongated, 3-celled.—Dwarf annual herbs, with sessile flowers.

17 Trache'lium. Corolla salver-shaped, with a very narrow elongated tube. Nectarium wanting. Style only pilose at the apex; stigmas small, hardly distinct. Capsule 2-3-celled, not elongated.—Herbs.

18 Adenóphora. Corolla campanulate. Nectarium cylindrical, girding the base of the style. Stamens distinct. Capsule 2-3-celled, not elongated.—Herbs.

19 Symphya'ndra. Corolla campanulate. Nectarium wanting. Anthers combined. Stigmas distinct. Capsule 3-celled, not elongated.—Herbs.

§ 2. *Capsule dehiscing laterally by numerous transverse fissures.*

20 Mu'sschia. Calyx and corolla 5-cleft. Stamens 5. Capsule 5-celled; cells alternating with the lobes of the calyx and stamens.—A subshrub, with broad serrated leaves, and racemose yellow flowers.

† *A genus doubtful whether it belongs to the order.*

21 Mercie'ra. Calyx 5-lobed, with a very hispid tube. Corolla 5-lobed, with a narrow tube as in *Trachèlium*. Stamens 5, free; filaments long and slender. Stigmas 2, very short. Capsule inferior, indehiscent? 1-celled, containing probably always 4 ovula in the bottom.—Cape shrubs, with the leaves of *Roélla*, and slender lateral flowers.

Tribe I.

JASIO'NEÆ (this tribe contains plants agreeing with Jasiòne in the dehiscence of the capsule). Capsule dehiscing at the apex.

I. JASIO'NE (ιασωνη, a name applied by Theophrastus to a wild pot-herb, now unknown). Lin. hort. cliff. p. 426. gen. no. 1005. Juss. gen. p. 166. Lam. ill. t. 724. f. 1. Neck. elem. 1. p. 232. Gessn. phyt. p. 104. t. 13. f. 896. Vent. tabl. 2. p. 475. Alph. D. C. mon. p. 101.—Ovílla, Adans. fam. 2. p. 134.—Scabiòsa species, Lob. adv. nov. p. 232.—Aphyllántes, Dalech. hist. p. 864. &c.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla deeply 5-parted; segments linear-lanceolate. Stamens 5, with slender filaments, and with the anthers combined into a tube at the base; pollen blue or purplish. Style pilose from the middle to the apex: the pili or hairs disposed in 10 rows; stigmas 2, short. Capsule 2-celled, spheroid or ovoid, dehiscing by a broad hole at top, with very short valves. Seeds small, ovoid, shining.—Dwarf herbs, with the habit of *Scabiòsa*. Leaves alternate, narrow. Flowers collected into terminal bracteated heads: the flowers expanding from the top of the head.

1 J. monta'na (Lin. spec. 1317.) stems erect, simple, terete; leaves lanceolate, undulated, hairy; peduncles naked; bracteas glabrous. ⊙. H. Native of Europe, Siberia, and the north of Africa, in sandy fields and heaths; plentiful in Britain. Œd. fl. dan. 3. t. 319. Lam. ill. t. 724. f. 1. Curt. lond. fasc. 4. t. 58. Smith, engl. bot. 882. J. undulàta, Lam. fl. fr. 2. p. 3. exclusive of var. β.—Lob. icon. 536.—Column. ecphr. 1. p. 226. with a good figure. Stems ascending, leafy. Heads of flowers globose. Corollas pale blue, and sometimes white.

Var. β, *marítima* (Alph. D. C. mon. p. 102.) stems prostrate, elongated, hoary, almost simple; leaves thickish, pilose; calyxes hoary. ⊙. H. Native of the west of France, on the sea shore. J. marítima, Duf. ined. in herb. D. C. J. montàna γ, Dub. et D. C. bot. gall. p. 311.

Var. γ, *littoràlis* (Alph. D. C. mon. p. 102.) plant humble, tufted; stems simple, ascending; heads small; bracteas obtuse, rounded. ⊙. H. Native of Sweden, in the sand by the sea-side. J. montàna littoràlis, Fries, nov. fl. suec. pt. 2. p. 29.

Var. δ, *prolífera* (Alph. D. C. l. c.) heads proliferous. ⊙. H. Native of Piedmont, about Lutetia.

Mountain or Common Sheep's Scabious, or Sheep's-bit. Fl. June, July. Britain. Pl. ½ to 1 foot.

2 J. corymbòsa (Poir. suppl. 3. p. 131.) stems erect, branched, angular; leaves decurrent, oblong-linear, rather hairy, undulated; peduncles leafy; bracteas pilose. ♂. H. Native of the kingdoms of Tangiers and Morocco, in sandy places. J. arenària, Salzm. in herb. D. C. Root perpendicular. Heads of flowers numerous, globose, terminating the branches; stems therefore somewhat corymbose. Corollas blue.

Corymbose-flowered Sheep's Scabious. Pl. ½ foot.

3 J. pere'nnis (Lam. dict. 3. p. 216. ill. t. 724. f. 2.) stems erect, simple; leaves rather hairy: radical ones obovate: cauline ones oblong-linear, flat; peduncles naked; bracteas pilose inside. ♃. H. Native of the Pyrenees, Dauphiny, Auvergne, on the mountains, and elsewhere. Ker. bot. reg. 505. Sims, bot. mag. 2198. Lodd. bot. cab. t. 923. J. montàna β, Willd. spec. 1. p. 888. J. læ'vis, Lam. fl. fr. 2. p. 3. J. montàna, Vill. dauph. 2. p. 670. exclusive of the synonyme. J. montàna β, radici perénni, Lin. fil. suppl. p. 329. Root fibrous. Stems glabrous or pilose, simple or branched from the base. Heads of flowers large, subglobose. Corollas blue, pedicellate. This is a very elegant plant when in blossom.

Perennial Sheep's Scabious. Fl. June, July. Clt. 1787. Pl. 1 foot.

4 J. Lusita'nica (Alph. D. C. mon. 105.) stems branched, diffuse; leaves obovate-lanceolate, rather pilose, and somewhat sinuated; peduncles naked; bracteas smoothish. ♃.? H. Native of Portugal, about Lisbon. Plant dwarf. Stems rather pilose, very leafy. Heads of flowers globose. Corollas blue. Flowers few in each head.

Portugal Sheep's Scabious. Pl. ¼ foot.

5 J. hu'milis (Lois. not. p. 42. D. C. fl. fr. suppl. no. 2872.) downy; stems ascending, simple; leaves linear-obovate, flat: radical ones rosulate; peduncles leafy. ♃. H. Native of the Eastern Pyrenees, in elevated dry pastures. J. montàna, β, hùmilis, Pers. ench. 2. p. 215. exclusive of the synonyme of J. foliòsa, Cav. J. perénnis, β, minor alpìna, Lapeyr. abr. pyr. p. 103. J. montàna, γ, Lam. et D. C. fl. fr. edit. 3d. no. 2879. J. undulàta, β, Lam. dict. 3. p. 215. Phyteùma críspa, Pourr. act. tol. 3. p. 324. Plant tufted. Root simple. Heads of flowers globose. Flowers sessile, blue.

Humble Sheep's Scabious. Pl. ¼ feet.

6 J. foliòsa (Cav. icon. 2. p. 38. t. 148. f. 1.) glabrous; stems ascending, simple; radical leaves rosulate, rather spatulate: cauline ones linear-lanceolate. ♃. H. Native of Spain; plentiful near the top of Mount Orospeda, on the north side, in the fissures of rocks; and in the boundaries of the kingdoms

of Valencia and Murcia. Phyteùma? rigidifòlia, Duf. ined. in herb. D. C. Root simple. Heads globose, few-flowered. Flowers pedicellate, of a deep violet colour. This is a dwarf, but very elegant plant when in blossom.

Leafy Sheep's Scabious. Fl. Aug. Pl. 1 to 3 inches.

7 J. trístis (Bory, ann. gen. 3. (1820.) p. 3.) stems prostrate, diffuse, almost simple; leaves alternate, rather spatulate, ciliately tomentose; flowers in dense heads; bracteas ovate, coloured. ♃. H. Native of Spain, on Sierra Nevada, at a place called Valleta. Flowers of a greyish-blue colour.

Sad-coloured-flowered Sheeps' Scabious. Pl. prostrate.

Cult. The species of *Jasiòne* are all very elegant while in blossom, and they are, therefore, well fitted for decorating the front of flower-borders and rock-work. They grow best in light soil, and are readily increased by parting at the root, by seed, or by cuttings. Plants of all the kinds should be kept in pots, so as to be placed under shelter in severe weather in winter, or else they are liable to be killed, and the species lost to the gardens.

II. LIGHTFOO'TIA (named after the Rev. J. Lightfoot, author of the first Flora Scotica). Lher. sert. ang. (1788.) p. 3. Ait. hort. kew. 1. p. 217. Alph. D. C. mon. p. 107.—Campánula species, Thunb. prod. p. 38. Lin. fil. suppl. 141. Willd. spec. 1. p. 915. Rœm. et Schultes, syst. 5. p. 474.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla usually 5-parted, sometimes 5-cleft. Stamens 5; filaments broad, ciliated; anthers free, caducous. Stigmas 3-5, short, filiform. Capsule 3-5-celled, usually half superior, dehiscing by the valves at the apex; cells, when 5, opposite the stamens and calycine segments. Seeds ovoid-trigonal, minute.—Small shrubs, rarely perennial herbs. Leaves alternate, and sometimes opposite, sessile, small, scattered equally over the whole plant. Flowers usually racemose, and on short pedicels; pedicels erect after the flowers begin to fade, and usually stiff. All natives of the Cape of Good Hope, except one, which is a native of Madagascar.

§ 1. *Capsule 5-celled.*

1 L. subula'ta (Lher. sert. angl. t. 5.) stem ascending or erect, rather woody, simple or branched; leaves alternate, erectish, subulate, narrow, somewhat denticulated; flowers racemose, on short pedicels; corolla 5-parted, with the segments rather longer than the calycine lobes; valves acute, longer than the entire base of the capsule. ♃. G. Native of the Cape of Good Hope; very common on the mountains about Cape Town. Rœm. et Schultes, syst. exclusive of the synonyme of Campánula capillàcea. Campánula subulàta, Spreng. syst. 1. p. 728. Lightfoòtia, Burch. cat. pl. afr. austr. no. 284. Campánula fruticòsa, Lin. spec. 1. p. 238.? Root simple, perpendicular. Leaves numerous, stiff. Flowers numerous, terminal and axillary, solitary, disposed along the branches in a racemose manner, blue.

Subulate-leaved Lightfootia. Fl. Aug. Clt. 1787. Pl. ½ to 1 foot.

§ 2. *Capsule 3-celled.*

2 L. longifòlia (Alph. D. C. mon. p. 108.) stem erect, quite simple, woody at the base; leaves alternate, erect, subulate, a little denticulated; flowers subspicate; corolla 5-parted, having the segments twice longer than the calycine lobes; capsule almost wholly inferior, with very short valves. ♃. G. Native of the Cape of Good Hope. L. lineàris, Eklon, ined. in herb. Dunant. Campánula sessiliflòra, Lin. suppl. p. 139.? Thunb. prod. p. 38. fl. cap. 2. p. 171. mem. acad. Petersb. 4. p. 367. t. 5. f. 1. Leaves stiff. Flowers numerous at the tops of the branches, on short pedicels, 1-3 from each leaf or bractea.

Var. β, *canéscens* (Cham. in Linnæa. 7. p. 192.) stem, leaves, and corollas clothed with hoary down; leaves 4 lines long, straight, with revolute edges; inflorescence more loose than in the species; axillary flowers nearly sessile: terminal ones on long pedicels.

Var. γ, *lanuginòsa,* (Cham. l. c. p. 193.) corollas, inflorescence, and stem rather woolly from long white villi; leaves 2 lines long, with finely-revolute edges, densely imbricated; inflorescence contracted, subcapitate.

Long-leaved Lightfootia. Pl. 1 foot.

3 L. unidenta'ta (Alph. D. C. mon. p. 109.) stem erect, woody, simple; leaves alternate, erect, linear-lanceolate, acuminated, toothed at the base: teeth 1-2 on each side, setaceous; flowers loosely racemose; corolla 5-cleft, having the segments 3 times longer than the calycine lobes; valves obtuse, shorter than the base of the capsule. ♄. G. Native of the Cape of Good Hope. Campánula unidentàta, Thunb. prod. 39. Lin. fil. suppl. p. 139. Thunb. mem. acad. petersb. 4. p. 371. t. 7. f. 2. Stem reddish. Flowers terminating the branches, disposed in loose racemes. Branches downy. Leaves revolute.

One-toothed-leaved Lightfootia. Shrub 1 foot.

4 L.? adpre'ssa (Alph. D. C. mon. p. 110.) stem erect, woody, simple; leaves alternate, reflexed, linear-lanceolate, setaceously-toothed; flowers panicled; corolla semi-5-cleft, twice longer than the calycine lobes. ♄. G. Native of the Cape of Good Hope. Campánula depréssa, Thunb. prod. p. 38. mem. acad. petersb. 4. p. 368. t. 7. f. 2. Leaves a little decurrent, ciliated with white hairs at the base. Flowers panicled on the upper part of the stem, which is leafless.

Adpressed Lightfootia. Shrub 1 foot.

5 L. a'lbens (Spreng. in Zeiher, fl. cap. exsic. p. 266.) stem erect, woody, branched; leaves alternate, usually in fascicles, spreading, linear, very narrow, entire; flowers loosely racemose; corolla 5-parted, having the segments 3 times longer than the calycine lobes; valves acute, about equal in length to the base of the capsule. ♄. G. Native of the Cape of Good Hope. Campanulàceæ, Burch. cat. geogr. pl. afr. no. 1720. Flowers terminal and axillary, loosely racemose at the tops of the branches.

Whitish Lightfootia. Shrub 1 foot.

6 L. tene'lla (Alph. D. C. mon. p. 111. t. 3. f. B.) stem erect, woody, branched; leaves alternate, usually in fascicles, reflexed, ovate, obtuse, thick, nearly entire; flowers racemose; corolla sub-5-parted, having the segments twice longer than the calycine lobes; valves acute, equal in length to the base of the capsule. ♄. S. Native of the Cape of Good Hope. Campánula tenélla, Lin. fil. suppl. p. 141. Thunb. prod. p. 39. mem. acad. petersb. 4. t. 7. f. 3. with a bad figure, Rœm. et Schultes, syst. 5. p. 117. exclusive of the syn. *L. oxycoccoìdes.* Roélla recúrva, Banks, herb. Roélla filifórmis, Poir. dict. 6. p. 232. but not of Lam. ill. Roélla glàbra, Poir. dict. 6. p. 232. L. fasciculàta, Eklon, in herb. Dunant.—Burch. cat. pl. afr. no. 2675. Flowers axillary and terminal, disposed in loose racemes at the tops of the branches.

Slender Lightfootia. Shrub 1 foot.

7 L. fasciula'ta (Alph. D. C. mon. p. 112.) stem erect, woody, branched; leaves alternate, reflexed, ovate, acute, thickish, remotely denticulated; flowers in fascicles; corolla 5-parted, hardly longer than the calycine lobes. ♄. G. Native of the Cape of Good Hope. Campánula fasciculàta, Lin. suppl. p. 139. Thunb. prod. 39. Lam. ill. 2524. Thunb. mem. acad. petersb. 4. p. 372. t. 6. f. 1. Roélla refléxa, Banks, herb. Leaves very numerous. Stem rather hairy, purplish. Flowers collected into round fascicles at the tops of the branches.

Fascicled-flowered Lightfootia. Shrub 1 foot.

8 L. oxycoccoìdes (Lher. sert. angl. t. 4. exclusive of the syn. Campánula tenélla, Lin.) stem erectish or ascending, much

branched, woody at the base; branches diffuse; leaves alternate, reflexed, ovate-lanceolate, acute, thin, denticulated at the base: flowers loosely racemose; corolla 5-parted, having the segments hardly twice the length of the calycine lobes; valves acute, equal to the base of the capsule. ♄. G. Native of the Cape of Good Hope, on the Table Mountain. Smith, exot. fl. 2. t. 69. Alph. D. C. mon. p. 113. Lobèlia tenélla, Lin. mant. p. 120. Thunb. prod, p. 40. Lobèlia parviflòra, Berg. cap. 345. Campánula Ottoniàna, Rœm. et Schultes, syst. 5. p. 113. Branches purplish. Flowers terminal and axillary, at the tops of the branches, white, with reddish nerves.

Cranberry-like Lightfootia. Fl. July. Clt. 1787. Shrub $\frac{1}{2}$ to 1 foot.

9 L. LANCEOLA'TA (Link, enum. 1. p. 217.) stem decumbent, downy; leaves lanceolate, glabrous, furnished with 1 or 2 teeth; peduncles downy; calyx glabrous, one-half shorter than the corolla. ♄. G. Native of the Cape of Good Hope. L. oxycoccoìdes, var. Spreng. syst. 1. p. 809. Corollas white and bluish, larger than those of L. oxycoccoìdes.

Lanceolate-leaved Lightfootia. Fl. July. Clt.? Shrub decumbent.

10 L. MUSCÒSA (Link, enum. 1. p. 217.) stem decumbent, glabrous; leaves lanceolate, glabrous, quite entire: rameal ones opposite; peduncles glabrous; calyx shorter than the corolla. ♄. G. Native of the Cape of Good Hope. L. oxycoccoìdes, var. Spreng. syst. 1. p. 809. Leaves 3-4 lines long, and half a line broad. Corolla 2-3 lines long, whitish-blue.

Mossy Lightfootia. Shrub decumbent.

11 L. LODDIGE'SII (Alph. D. C. mon. p. 114.) stem decumbent, woody at the base, branched; leaves alternate, somewhat reflexed, ovate-lanceolate, acute, entire; flowers loosely racemose; corolla 5-parted, having the segments 4 times longer than the calycine lobes. ♄. G. Native of the Cape of Good Hope. L. tenélla, Lodd. bot. cab. t. 1038. Branches purplish. Flowers axillary and terminal, disposed in loose racemes at the tops of the branches. Corolla bluish.

Loddiges's Lightfootia. Fl. June, July. Clt. 1822. Shrub decumbent.

12 L. LYCOPODIOÌDES (Alph. D. C. mon. p. 114.) branches woody, simple, very leafy; leaves alternate, and sometimes subverticillate, erect, adpressed to the branches, linear, very narrow; flowers few, sessile; corolla 5-parted, with the segments 3 times longer than the calycine lobes. ♄. G. Native of the Cape of Good Hope. Leaves revolute on the margins. Flowers sessile, usually 3 on the top of each branch, the middle one expanding before the lateral ones.

Club-moss-like Lightfootia. Shrub 1 foot.?

13 L. OPPOSITIFÒLIA (Alph. D. C. mon. p. 115.) branches erect, slender, stiff, simple; leaves opposite, somewhat reflexed, linear, acuminated, narrow, slightly denticulated; flowers few, usually terminal; corolla deeply 5-cleft, twice longer than the calycine lobes. ♄. G. Native of the Cape of Good Hope, on the Table Mountain. Campánula ericoìdes, Lam. Lightfoòtia, Burch, cat. geogr. pl. afr. austr. no. 606. Branches reddish. Flowers solitary, terminal, rarely axillary. Habit of *L. oxycoccoìdes*. L. muscòsa and L. lanceolàta, Link. are probably hardly varieties of this species.

Opposite-leaved Lightfootia. Shrub 1 foot.?

14 L. RUBIOÌDES (Alph. D. C. mon. p. 116.) branches procumbent, diffuse; leaves opposite, spreading, or a little reflexed, lanceolate, acute, remotely denticulated; flowers few, terminal and axillary; corolla 5-parted, with the segments longer than the calycine lobes. ♄. G. Native of the Cape of Good Hope. Campánula rubioìdes, Banks, herb. Plant trailing, much branched. Branches reddish. Leaves glabrous, or furnished with a few white hairs. Flowers axillary and terminal, solitary, at the extremities of the branches.

Madder-like Lightfootia. Pl. trailing.

15 L. MADAGASCARIE'NSIS (Alph. D. C. mon. p. 116.) stem erect, woody at the base, simple; leaves alternate, erect, linear-acuminated, remotely denticulated; flowers somewhat panicled; segments of the corolla, which is deeply 5-parted, about 3 times longer than the calycine lobes; capsule wholly inferior, with short valves. ♄. S. Native of Madagascar, where it was collected by Commerson. Campánula Madagascariénsis, Juss. herb. Flowers at the top of the stem, and along one side of the peduncles, about 10 towards the upper part of the stem.

Madagascar Lightfootia. Pl. $\frac{1}{2}$ to 1 foot.

Cult. All the species grow freely in a mixture of loam, peat, and sand; and young cuttings strike root readily in the same kind of soil, with a hand-glass over them.

III. CEPHALOSTI'GMA (from κεφαλη, *kephale*, a head, and στιγμα, *stigma*, a stigma; in reference to the stigma, which is capitate). Alph. D. C. mon. p. 117.—Campánula species, Wall. herb.—Wahlenbérgia species, Perrot. et Lepr. herb.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla 5-parted; segments alternating with the calycine lobes, and longer than them. Stamens 5, free; filaments broadest at the base; anthers 2-celled. Style usually exserted, more or less hairy; stigma simple, capitate, pilose. Capsule 2-3-celled, dehiscing by 2-3 short valves at the apex, which are septiferous in the middle. Seeds numerous, small, ovoid, triquetrous.—The species of this genus have a habit intermediate between *Wahlenbérgia* and *Lightfoòtia*, but differs from both these genera in the capitate stigma; but it has a capsule like that of the first, and a corolla like that of the latter.

§ 1. *Capsule half superior, 3-celled. Style rather shorter than the segments of the corolla.*

1 C. PANICULA'TA (Alph. D. C. mon. p. 117.) stem herbaceous, much branched, leafy; leaves ovate, acute at both ends, broad, subsinuated; flowers loosely panicled; segments of corolla 2 or 3 times longer than the calycine lobes; capsule obconical. ⊙.? F. Native of the Burmese empire, about Prome, on the banks of the Irrawaddi. Campánula paniculàta, Wall. mss. Stem hairy. Leaves downy beneath. Panicle much branched; pedicels filiform, 1-flowered, glabrous.

Panicled-flowered Cephalostigma. Pl. 1 foot.

§ 2. *Capsule 2-celled, almost wholly inferior. Style rather longer than the segments of the corolla.*

2 C. PERROTTE'TII (Alph. D. C. mon. p. 118.) stems herbaceous, simple, leafy at the base; leaves lanceolate; flowers disposed in a long raceme; segments of corolla 3 times longer than the calycine lobes; capsule obovoid. ⊙. F. Native of Cape Verd, at Khana, in humid sandy places. Wahlenbérgia, spec. herb. Lepr. and Perrott. Root simple. Stem leafy, and pilose at the base. Leaves rather pilose, with white undulated edges. Peduncles and pedicels glabrous.

Perrottet's Cephalostigma. Pl. $\frac{1}{4}$ foot.

3 C. PRIEU'REI (Alph. D. C. mon. p. 118.) stem woody, humble, much branched, naked at the base; leaves small, linear; flowers panicled; segments of corolla hardly twice the length of the calycine lobes; capsule obconical. ♃. S. Native of Senegal, about Jonal, where it was collected by Leprieur and Perrottet. Root simple. Branches very slender, many-flowered, glabrous.

Le Prieur's Cephalostigma. Pl. $\frac{1}{4}$ foot.

Cult. For culture and propagation see *Microcòdon*, p. 737.

IV. CAMPANU'MÆA (altered from Campánula). Blum. bijdr. p. 726. Alph. D. C. mon. p. 118.

Lin. syst. *Pentándria, Monogýnia.* Flowers involucrated. Involucrum 5-parted. Calyx hemispherical, combined with the involucrum at the base, truncate at the apex, bearing the corolla. Corolla 5-parted? (5-petalled, ex Blum.). Stamens 5, free, opposite the lobes of the involucrum, inserted at the base of the corolla or top of the calyx, and in the ovarium; filaments broadest at the base; anthers 2-celled. Style inclosed, divided into 3 ovate thick stigmas at the apex, which are pilose before the expansion of the flower. Ovarium combined with the tube of the calyx, 3-celled. Capsule globose, terminated by a broad flat 5-angled umbilicus, which is girded by the cicatrices occasioned by the falling of the corollas and stamens, many-valved, ex Blum. Seeds very numerous, ovoid-cylindrical, dotted, inserted on the thick placentas, which are inflexed on both sides, and situated at the inner angle of the cells.—Quite glabrous lactescent herbs, with tuberous roots, ex Blum. Stems and branches terete. Leaves opposite, glaucescent beneath. Peduncles axillary and terminal.

1 C. Java'nica (Blum. bijdr. p. 727.) stem climbing; leaves on long petioles, ovate-cordate; flowers solitary, scattered. ♃. ◡. S. Native of Java, in humid woods on the mountains of Salak and Gede. Leaves 1-2 inches long, and 6-12 lines broad. Flowers green, axillary, and terminal. Peduncles 1-flowered.

Java Campanumæa. Pl. cl.

2 C. Cele'bica (Blum. bijdr. p. 727.) stem erect; leaves on short petioles, oblong-lanceolate; flowers subcorymbose, terminal. ♃. S. Native of Celebes. Leaves ovate, acute: superior ones lanceolate, nearly entire, or serrulated.

Celebes Campanumæa. Pl. 1 foot.

Cult. A mixture of sand, loam, and peat will be a good soil for the species of *Campanùmæa;* and they are to be increased by cuttings or seeds.

V. CODONO'PSIS (from *κωδων, kodon,* a bell, and *οψις, opsis,* resemblance; in reference to the shape of the flowers). Wall. in Roxb. fl. ind. 2. p. 103. Alph. D. C. mon. p. 120.

Lin. syst. *Pentándria, Monogy'nia.* Calyx 5-lobed or truncate. Corolla inserted in the top of the calyx, 5-lobed; lobes alternating with the calycine segments when there are 5. Stamens 5, free, alternating with the lobes of the corolla; filaments broadest at the base; anthers 2-celled, length of filaments. Style inclosed; stigmas 3, thick. Ovarium 3-celled, almost combined with the whole of the tube of the calyx. Capsule dehiscing by 3 acute valves at the apex, which are septiferous in the middle. Seeds inserted in the inner angle of the cells to a thick placenta, furnished with albumen and a straight embryo.—Usually quite glabrous herbs, inhabitants of the north of India on the mountains. Stems erect or scandent, and even twining, branched, terete, rising from a woody root, probably always. Leaves usually strictly opposite, ovate, acuminated, not entire, on short petioles, glaucous, rarely hoary beneath. Branches usually opposite, more or less articulated at their origin. Flowers terminal and axillary, pedunculate, sometimes involucrated. Corollas whitish, yellowish or deep purple. The habit of the species is variable.

Sect. I. Megasa'nthes (from *μεγας, megas,* large, and *ανθος, anthos,* a flower; in reference to the size of the flowers). Involucrum none. Flowers large. Corolla firm, rather fleshy. Calyx 5-cleft. Seeds ovoid-cylindrical.

1 C. vi'ridis (Wall. fl. ind. 2. p. 103.) stem ascending, twining; leaves alternate and opposite, downy, hoary beneath, a little crenulated; corollas large, yellowish-green. ♃. ◠. G. Native of Nipaul, about Gosaingsthan, Kamaon, and in an obscure wood on the top of Sheopore. Plant scandent, much branched, with the habit of *Convólvulus.* Leaves ovate-oblong. Flowers axillary and terminal, solitary, often opposite the leaves, with an ungrateful scent.

Green-flowered Codonopsis. Pl. twining.

2 C. purpu'rea (Wall. in Roxb. fl. ind. 2. p. 105.) stems ascending, twining a little, manifestly articulated; leaves strictly opposite, glabrous, glaucescent beneath, a little crenulated; corollas deep purple. ♃.? ◠. G. Native of Nipaul, on the mountains towards the Himalaya. Leaves obovate-oblong. Flowers solitary, usually terminal, and terminating axillary branchlets.

Purple-flowered Codonopsis. Pl. twining.

Sect. II. Microsa'nthes (from *μικρος, micros,* small, and *ανθος, anthos,* a flower; in reference to the small flowers). Flowers small, white, involucrated. Calyx probably always truncate. Seeds rather lenticular, small. Leaves strictly opposite, glabrous, glaucescent beneath.

3 C. trunca'ta (Wall. cat. no. 1301.) stem erect; leaves sharply serrated; involucrum combined with the base of the calyx. ♃.? S. Native of the Burman Empire, at Pingue on the banks of the Irrawaddi. Stem branched; branches stiffish. Leaves ovate, acuminated. Flowers 2-6 on the top of each branch; pedicels terminal and axillary, 1-flowered.

Truncate-calyxed Codonopsis. Pl. 1 to 2 feet?

4 C. parviflòra (Wall. cat. no. 1300. Alph. D. C. mon. p. 123.) stem erect; leaves remotely and setaceously denticulated; involucrum distinct from the calyx. ♃.? G. Native on the Pundua mountains, on the north-east of Bengal. Stem branched; branches opposite. Leaves ovate-acuminated. Flowers small, numerous, and as if they were panicled; peduncles trichotomous or dichotomous.

Small-flowered Codonopsis. Pl. 2 feet.

Cult. For culture and propagation see *Campanùmæa* above.

VI. CANARI'NA (so named from the first species being a native of the Canary Islands). Juss. gen. p. 164. Lam. ill. gen. t. 259. Gærtn. fruct. suppl. p. 163. t. 211. Vent. tabl. 2. p. 470. Alph. D. C. mon. p. 123.—Canària, Lin. mant. p. 148. and p. 225.—Pernètya, Scop. introd. p. 150. Neck. elem. 1. p. 233.—Campánula species, Pluk. phyt. t. 276. f. 1. Tourn. inst. 1. p. 109. Lin. spec. 1. p. 168.

Lin. syst. *Hexándria, Monogýnia.* Calyx 6-cleft. Corolla 6-lobed at the apex, large, campanulate. Stamens 6, free; filaments thickest at the base, glabrous. Style inclosed, hispid above, the hairs disposed in 12 rows. Stigmas 6. Capsule 6-celled, dehiscing at the apex; cells opposite the calycine lobes and stamens. Seeds small, angular.—Large herbs, with thick perennial roots: having the stem, leaves, and calyxes glaucescent, and quite glabrous. Leaves opposite. Flowers terminal, solitary.

1 C. campanula'ta (Lam. dict. 1. p. 598. ill. t. 259.) plant glaucescent; root tuberous, fusiform; stems ascending; leaves hastately subcordate, irregularly toothed; flowers solitary, terminating axillary branchlets. ♃. G. Native of the Canary Islands. Curt. bot. mag. 444. Gærtn. fruct. suppl. p. 63. t. 211. Lodd. bot. cab. t. 376. Herb. amat. t. 142. C. lævigàta, G. Don, in Loud. hort. brit. p. 139. Canària campanulàta, Lin. mant. p. 225. Campánula Canariénsis, Lin. spec. ed. 1. p. 168. Hill. veg. syst. 8. t. 8.—Lin. hort. cliff. p. 65. t. 8.—Pluk. phyt. t. 276. f. 1. alm. p. 76. Flowers drooping, of a yellowish purple or orange colour, having the nerves red.

Campanulate-flowered Canarina. Fl. Jan. March. Clt. 1696. Pl. 3 to 4 feet.

2 C.? Zanqueba'rica (Alph. D. C. mon. p. 125.) stem shrubby, scandent, branched; leaves hastately cordate, quite en-

tire, glabrous; flowers solitary, lateral. ♄. S. Native of Africa, on the coast of Zanquebar. C. Zanquebárica, Lour. coch. p. 195. Flowers pale. This plant agrees with the present genus in the calyx being 6-cleft, in the corolla being 6-lobed, in the stamens being 6, and in the capsule being 6-celled; but differs in the capsule dehiscing at the base, not at the apex, in the flowers being lateral, and in the leaves being alternate.

Zanquebar Canarina. Shrub climbing.

Cult. *C. campanulàta* is very desirable, as it flowers in autumn and winter, when few other plants are in bloom. After flowering the stem dies down, and the root continues dormant all the summer, when it needs but little water. When the stem begins to push forth the plants had better be removed to the stove, as they will not flower so abundantly in the green-house. A light loamy soil, or a mixture of loam and peat, is the best soil for it; and the plant is readily increased by dividing at the root or by cuttings, planted in the same kind of soil under a hand-glass. The *C. Zanguebárica* being a stove shrub will grow in the same kind of soil recommended for the first species, and will be easily increased by cuttings.

VII. PLATYCO'DON (from πλατυς, *platys*, broad, and κωδων, *kodon*, a bell; in reference to the shape and breadth of the flowers). Alph. D. C. mon. p. 125.—Campánula species, Jacq. hort. vind. 3. p. 4. t. 2. Lam. ill. no. 2513.—Wahlenbérgia species, Schrad. cat. hort. gott. ann. 1814.—Campánula sect. Codònia, Spreng. syst. 1. p. 735.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft (f. 127. *c.*). Corolla 5-lobed at the apex (f. 127. *d.*), large, funnel-shaped. Stamens 5 (f. 127. *a.*), free; filaments broadest at the base. Stigmas 3-5 (f. 127. *b.*). Capsule 3-5-celled, dehiscing by 3-5 valves at the apex, which are septiferous in the middle; cells when 5 alternate with the calycine lobes and stamens. Seeds ovoid, larger than in any genus of the order, shining, but not angular.—Perennial usually glaucescent herbs, natives of Eastern Asia. Leaves alternate or nearly opposite, sessile, of a middle size; upper ones the smallest. Flowers few, terminal, solitary, pedunculate.

1 P. grandiflòrum (Alph. D. C. mon. p. 125.) plant quite glabrous, glaucescent; leaves ovate-lanceolate, coarsely serrated; corollas large, somewhat 5-cleft; stigmas 5, and capsule 5-celled. ♃. H. Native of Dahuria. Gmel. Campánula grandiflòra, Jacq. hort. vind. 3. p. 4. t. 2. Curt. bot. mag. 252. Herb. amat. t. 112. Campánula gentianoides, Lam. dict. 1. p. 781. ill. 2513. Wahlenbérgia grandiflòra, Schrad. cat. hort. gott. 1814. diss. de gen. Blumenb. p. 38.—Gmel. sib. 3. p. 153. t. 28.—Amm. stirp. rar. ruth. no. 16. p. 11. Stems simple. Corollas deep blue. Peduncles terminal. (f. 127.)

FIG. 127.

Great-flowered Platycodon. Fl. July, Aug. Clt. 1782. Pl. ½ to 1 foot.

2 P. homalla'nthinum (Alph. D. C. mon. p. 126.) plant rather pilose at the top; leaves lanceolate or linear-lanceolate; corolla deeply 5-cleft; stigmas 3; capsule 3-celled. ♃. H. Native of the east of Siberia, near Ijiga, ex Fisch.; of Kamtschatka, ex Redowsk; and of China, ex Sir G. Staunton. Stems simple. Leaves coarsely and unequally serrate-toothed, glabrous. Flowers usually 4-6, disposed in a loose raceme; pedicels hairy, 1-flowered. Calyx hairy. Corolla downy.

Var. a, latifòlium (Alph. D. C. l. c.) leaves broader, coarsely serrated. ♃. H. Campánula Redowskiàna, Cham. et Schlecht. in Linnæa. 4. p. 41. Camp. homallánthina, Led. act. petrop. 5. p. 524. Wahlenbérgia Kruhsiàna, Fisch. in herb. D. C.

Var. β, angustifòlium (Alph. D. C. l. c.) leaves linear-lanceolate, quite entire. ♃. H. Campánula homallánthina, Led. act. petrop. 5. p. 524.

Equal-flowered Platycodon. Pl. ½ to 1 foot.

Cult. These species of *Platycòdon* are neat elegant plants when in blossom. They do best in pots in a mixture of sand and peat, placed among other alpine plants; they will also grow very well planted in a peat border. We know of no way of increasing them but by seeds.

VIII. MICROCO'DON (from μικρος, *mikros*, small, and κωδων, *kodon*, a bell; in reference to the shape and smallness of the flowers). Alph. D. C. mon. p. 127.—Campánula spec. Eklon.—Wahlenbérgia spec. Schrad.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla 5-lobed at the apex, small, cylindrical, permanent. Stamens 5, free; filaments very slender, not expanded at the base. Style filiform; stigmas 5. Capsule 5-celled, dehiscing by 5 valves at the apex; cells alternating with the calycine segments and stamens. Seeds ovoid, small, shining, but not angular.—Humble annual herbs, natives of the Cape of Good Hope. Leaves alternate or nearly opposite, small, narrow, sessile: superior ones rather the longest. Branches at the base of the plant opposite and diverging. Flowers almost sessile. Tube of calyx spherical and very hairy.

1 M. glomera'tum (Alph. D. C. mon. p. 127. t. 19.) stem branched; branches simple; leaves linear, acuminated; flowers glomerate, terminal. ⊙. H. Native of the Cape of Good Hope. Campánula hispídula, Eklon, in herb. Dunant, but not of Lin. Campanulàceæ, Burch. cat. pl. afr. austr. no. 189. Stems rather pilose. Leaves somewhat denticulated, rather hairy.

Glomerate-flowered Microcodon. Pl. ¼ to ½ foot.

2 M. sparsiflòrum (Alph. D. C. mon. p. 128.) stem branched: branches subdivided; leaves linear-lanceolate; flowers solitary. ⊙. H. Native of the Cape of Good Hope. Wahlenbérgia hispídula, Schrad. in herb. D. C. Campánula hispídula, Link, enum. p. 215. Stem pilose. Leaves rather pilose. Flowers solitary towards the tops of the branches, not terminal, but rising from the axils of the upper leaves or bracteas.

Scattered-flowered Microcodon. Pl. ¼ foot.

Cult. The seeds of these plants should be raised on the hot-bed; and when the plants are of sufficient size they may be planted out into the open border in May in a warm sheltered situation.

IX. WAHLENBE'RGIA (named after George Wahlenberg, M.D., author of Flora Lapponica, 1 vol. 8vo. Berlin, 1812, Flora Carpathorum præcipiorum, 1 vol. 8vo. Gottingen, 1814. &c.) Schrad. cat. hort. gott. 1814. Roth, nov. spec. ind. orient. p. 399. D. Don, prod. fl. nep. 156. Schrad. diss. de gen. Blumenb. &c. 1827. p. 37. (exclusive of Campánula grandiflòra, Jacq.) but not of Blum.—Campánula (Codònia), Spreng. syst. 1. p. 735.—Schultèsia, Roth, enum. pl. phan. germ. pars. 1827. but not of Spreng. and others.—Cervícina, Delile, fl. d'egypt. p. 7. t. 5. f. 2.—Campánula (Campanópsis) R. Br. prod. p. 561.—Campánula species, Lin. gen. 88. spec. 240. Juss. gen. 164.

Lin. syst. *Pentándria, Monogýnia.* Calyx 3-5-cleft (f. 128. *a.*). Corolla 3-5-lobed at the apex (f. 128. *b.*), rarely divided to the middle. Stamens 3-5, free; filaments rather broadest at

the base. Style inclosed, pilose, but most so towards the upper part. Stigmas 2-5 (f. 128. *c.*). Ovarium combined with the tube of the calyx. Capsule 2-5-celled (f. 128. *e.*) each opening by so many valves at the apex, which bear each a dissepiment in the middle. Seeds very numerous, minute.—Herbs, rarely shrubs, for the most part annual. Leaves usually alternate, rarely opposite, generally most numerous towards the lower part of the plant. Flowers for the most part on long peduncles; pedicels drooping at first, but when bearing the capsules are perfectly erect. The species of this genus are most plentiful in the southern hemisphere, particularly at the Cape of Good Hope.

Sect. I. Edraia'ntha (from *εδραιος*, *edraios*, sedentary, and *ανθος*, *anthos*, a flower; in reference to the flowers being sessile, and usually capitate). Alph. D. C. mon. p. 130.—Campánula species, Lin. and others. Corolla and calyx 5-lobed. Stamens 5. Capsule 2-3-celled. Seeds ovate, flat —Humble perennial herbs. Leaves alternate, narrow; radical ones crowded; cauline ones stem-clasping. Flowers sessile, usually capitate.—Inhabitants of Italy and the adjacent countries.

* *Plants caulescent. Flowers aggregate.*

1 W. graminifòlia (Alph. D. C. mon. p. 130.) stems and leaves clothed with soft down; leaves entire: radical ones linear or linear-spatulate: cauline ones linear, and somewhat stem-clasping; bracteas ovate, acute, entire, rather downy; tube of calyx smoothish: but the lobes are downy, and the sinuses are toothless. ♃. H. Native of Sicily; south of Italy, even to Rome; and the Island of Zante. Campánula graminifòlia, Lin. spec. 1. p. 234. Sibth. et Smith, fl. græc. t. 206. but not of Waldst. et Kit.—Barr. icon. t. 332.—Mor. ox. 2. p. 454. sect. 5. t. 1. f. 9. Cup. panph. 1. p. 736.—Bocc. icon. rar. p. 78. f. 2. Mor. ox. 2. p. 461. sect. 5. t. 4. f. 41. Colum. phyt. p. 25. t. 26. ed. 2. p. 118. t. 34. Flowers disposed in solitary, bracteated, terminal heaps. Corolla blue; filaments white; anthers yellow.

Grass-leaved Wahlenbergia. Fl. May, July. Clt. 1816, Pl. $\frac{1}{2}$ foot.

2 W. Garga'nica; perennial, downy, canescent; stems diffuse or pendulous, simple; leaves roundish, cordate: lower ones on long petioles, deeply and unequally crenated: upper ones dentate; crenatures and teeth mucronate; racemes loose, leafy; pedicels filiform, 1-flowered; calycine segments lanceolate, acuminated, reflexed. ♃. H. Native of Abruzzo, in the fissures of rocks on Mount Gangano, now St. Angelo. W. flaccida, Presl, symb. p. 29. t. 18. but not of Alph. D. C.

Gargano Wahlenbergia. Pl. diffuse.

3 W. Kitaibe'lii (Alph. D. C. mon. p. 131.) stems beset with soft pili; leaves ciliated a little: radical ones linear-subulate, remotely denticulated; bracteas ovate, acuminated, dentately subserrated, ciliated with villi; tube of calyx villous, and the lobes subdenticulated, as well as the sinuses, and downy on both surfaces. ♃. H. Native of Croatia, on chalky mountains; and of Transylvania, in the fissures of calcareous rocks. Campánula graminifòlia, Waldst. et Kit. pl. rar. hung. 2. p. 166. t. 154. exclusive of the synonymes. Host, fl. austr. 1. p. 268. exclusive of the synonyme of Camp. tenuifòlia, Waldst. et Kit. Plant tufted. Stems purplish. Radical leaves crowded. Flowers disposed in terminal bracteated heaps. Corolla blue, with a tinge of purple; filaments white; anthers yellowish.

Kitaibel's Wahlenbergia. Pl. $\frac{1}{2}$ foot.

4 W. tenuifòlia (Alph. D. C. mon. p. 133.) stems pilose; leaves linear, entire, with bristly margins; bracteas ovate, acuminated, ciliated with bristles; tube of calyx rather pilose; lobes of calyx ciliated with bristles, and the sinuses toothless. ♃. H. Native of Croatia, at the foot of the mountain called Plisswicza; also near Fiume. Campánula tenuifòlia, Waldst. et Kit. pl. rar. hung. 2. p. 168. t. 155. Campánula graminifòlia, Host, fl. austr. 1. p. 268. exclusive of the synonymes of Column. and Waldst. et Kit. Campánula graminifòlia, *β*, Schow. plan. ein. pfl. geogr. ital. p. 11. Stems tufted, purplish. Flowers disposed in dense terminal bracteated tufts, 6-10 in each tuft. Corolla of a violet-blue colour, white at the base; filaments white; anthers yellow.

Fine-leaved Wahlenbergia. Fl. June, July. Clt. 1817. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

5 W. Dalma'tica (Alph. D. C. mon. p. 134.) stems glabrous; leaves linear-lanceolate, entire, ciliated with hairs; bracteas ovate-acuminated, entire, ciliated; tube of calyx rather pilose; lobes of calyx entire, ciliated, rather pilose on the back, with the sinuses toothless. ♃. H. Native of Dalmatia, on the east of Salona. Stems reddish. Leaves 1-2 inches long. Heads containing 6-10 flowers, bracteate. Corolla blue; filaments ciliated; anthers yellow. Plant tufted.

Dalmatian Wahlenbergia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

** *Stems short. Flowers solitary.*

6 W. pumìlio (Alph. D. C. mon. p. 134.) plant tufted; stems short, very leafy; leaves linear, entire, glabrous beneath, revolute on the margins at top, and pilose in the middle: hairs addressed, pencilled or in tufts at the tops of the leaves; upper leaves broadest at the base, and covering the flower; tube of calyx obconical, glabrous; lobes of calyx entire, similar to the leaves. ♃. H. Native of Dalmatia, in the higher alpine ranges of Mount Bioccovo. Campánula silenifòlia, Host, fl. austr. 1. p. 268. but not of Fisch. Campánula pumìlio, Portenschl. ined. Rœm. et Schultes, syst. 5. p. 136. Visian. stirp. dalm. spec. p. 29. Plant with the habit of *Silène acaúlis*. Flowers sessile, solitary, numerous. Corolla azure blue; anthers yellow.

Dwarf Wahlenbergia. Pl. tufted.

Sect. II. Aikínia (named in honour of John Aikin, a British botanist). Alph. D. C. mon. p. 135.—Campánula species, Lin. Camp. sect. Codonópsis, R. Br. prod. 561.—Wahlenbérgia species, Schrad. Corolla and calyx 5-lobed. Stamens 5. Capsule 3-5-celled. Seeds ovoid.—Usually annual herbs. Leaves for the most part alternate. Flowers on more or less elongated peduncles and pedicels. Generally inhabitants of the southern hemisphere, particularly of the Cape of Good Hope; also of Australia and India.

§ 1 *Capsule 5-celled. Seeds shining. Stems erect or ascending. Peduncles elongated, naked. Leaves alternate, sessile. All natives of the Cape of Good Hope.*

7 W. Cape'nsis (Alph. D. C. mon. p. 136. t. 18.) stem erect, simple or branched, pilose at the bottom; leaves ovate-lanceolate, pilose, irregularly toothed: tube of calyx ovoid, very hairy; corolla 5-cleft, hardly one-half longer than the calycine lobes; capsule ovoid, pilose. ⊙. H. Native of the Cape of Good Hope, in sandy places. Campánula Capénsis, Lin. spec. p. 240. Thunb. prod. p. 39. mem. acad. petersb. 4. p. 374. t. 6. f. 3. Sims, bot. mag. 782. Roélla decúrrens, Andr. bot. rep. t. 238. Wahl. elongàta, Schrad. cat. hort. gott. 1814. Willd. enum. suppl. p. 10. Campánula elongàta, Willd. herb. Flowers large, at first drooping, but at length nearly erect. Corolla bluish-green on the outside, dark blue inside at the bottom, but greenish at the origin of the lobes, spotted with black within the lobes at the recesses, and the lobes are violaceous.

Cape Wahlenbergia. Fl. July, Aug. Clt. 1803. Pl. 1 to 2 feet.

8 W. DIFFU'SA (Alph. D. C. mon. p. 137.) stem weak, much branched, glabrous, or rather pilose; leaves linear, acuminated, somewhat denticulated; calyx glabrous or pilose, with a spherical tube; corolla 5-lobed at the apex, hardly longer than the calycine lobes; capsule spherical, glabrous. ⊙. H. Native of the Cape of Good Hope. Campánula rubioìdes, Banks, herb.—Comm. hort. t. 37.? Calyx quadrifid.

Diffuse Wahlenbergia. Fl. June, July. Clt.? Pl. 1 foot.

9 W. LINEA'RIS (Alph. D. C. mon. p. 137.) stem flexuous, erect, filiform, simple and glabrous at the base; leaves linear, entire, glabrous; calyx glabrous or pilose, with a spherical tube; corolla 5-lobed at the apex, hardly longer than the calycine lobes; capsule spherical, glabrous. ⊙. H. Native of the Cape of Good Hope, in sandy places. Campánula lineàris, Lin. suppl. p. 140. Thunb. prod. p. 38. mem. acad. petersb. 4. t. 5. f. 3. Stem purplish. Flowers somewhat panicled, white; peduncles and pedicels capillary, drooping when bearing the flowers, and erect while bearing the fruit.

Linear-leaved Wahlenbergia. Pl. $\frac{1}{2}$ foot.

§ 2. *Capsule 3-celled. Seeds shining or dotted. Stems erect or procumbent. Peduncles naked, more or less elongated. Leaves alternate, rarely opposite.*

* *Seeds usually dotted. Stems branched, slender, usually procumbent. Leaves sessile or petiolate, and opposite or alternate in the same specimen.*

10 W. FLA'CCIDA (Alph. D. C. mon. p. 138.) plant rather pilose; stem erect, simple, rather leafy; leaves opposite and alternate, ovate, acute, entire; calyx pilose, with an ovoid tube; corolla 5-lobed, one-half longer than the calycine lobes; capsule ovoid, spherical. ⊙. H. Native of the Cape of Good Hope, where it was collected by Masson. Campánula fláccida, Banks, herb. Flowers solitary, terminal. Peduncle not different from the stem, being leafy like it.

Flaccid Wahlenbergia. Pl. $\frac{1}{4}$ foot.

11 W. DIVERSIFÒLIA (Alph. D. C. mon. p. 139.) stem procumbent, branched, not very leafy, glabrous above, and pilose below; leaves alternate and opposite, smoothish: lower ones obovate-roundish, crenately toothed: the rest ovate-lanceolate, acute, toothed; calyx glabrous, with an ovoid-spherical tube; corolla one-half longer than the calycine lobes; capsule obconically ovoid. ⊙. H. Native of the Cape of Good Hope. Campánula Eklon, in herb. Dunant. Flowers on long pedicels, which are either terminal or axillary on the upper part of the plant.

Diverse-leaved Wahlenbergia. Pl. procumbent.

12 W. MADAGASCARIE'NSIS (Alph. D. C. mon. p. 139.) stem erect, branched, glabrous, not very leafy, rather pilose above; leaves strictly opposite, ovate, acute, crenated, glabrous; calyx rather pilose, with a spherical tube; corolla profoundly 5-cleft, length of the calycine segments; capsule spherical. ⊙.? H. Native of Madagascar. Stem branched from the base. Flowers solitary, pedicellate, situated in the axils of the forks of the branches.

Madagascar Wahlenbergia. Pl. $\frac{1}{2}$ foot.

13 W. PROCU'MBENS (Alph. D. C. mon. p. 140. t. 15.) plant glabrous or rather pilose; stems creeping, branched, very leafy; leaves opposite or verticillate, ovate or obovate, nearly entire; tube of calyx ovoid; corolla 5-lobed at top, 3 times longer than the calycine lobes; capsule ovoid, spherical. ♃. G. Native of the Cape of Good Hope, in watery places. Campánula procúmbens, Thunb. fl. cap. p. 174. mem. acad. petersb. 4. p. 375. Lin. fil. suppl. 141. Wahl. rèpens, Schrad. diss. de Blumenb. p. 37.—Burch. cat. pl. afr. austr. no. 355. Flowers solitary, usually terminal, but sometimes axillary, pedicellate. Corolla pale blue; anthers yellow.

Var. β, foliòsa (Alph. D. C. mon. p. 140. t. 15. f. 6.) stems shorter; leaves approximate and smaller. ♃. G. Campánula, Burch. cat. pl. afr. no. 361. and no. 508.

Procumbent Wahlenbergia. Pl. creeping.

** *Seeds dotted. Stems branched, slender, usually procumbent. Leaves petiolate, alternate.*

14 W. HEDERA'CEA (Alph. D. C. mon. p. 146.) glabrous; stems slender, ascending; leaves on long petioles, cordate-roundish, bluntly 5-7-angled; corolla 5-lobed at the apex, 4 times longer than the calycine segments; capsule hemispherical. ♃. H. Native of the west of Europe and North America, in watery places. In Europe, from the north of Portugal to Denmark, but towards the east it becomes more rare. In Britain, abundant in Cornwall, and in many parts of the west of England; in Sussex abundant; Keston Common, near Bromley, Kent; on Hartlebury Common, Worcestershire; on a bog near High-Beech, Epping Forest. In the county of Cork, Ireland. In several parts of the lowlands of Scotland; and in the Scilly Islands. Campánula hederàcea, Lin. spec. p. 240. Oed. fl. dan. t. 330. Smith, engl. bot. t. 73. Hook. fl. lond. t. 93. Campánula hederæfòlia, Salisb. prod. 127. Campánula arvática, Lag. in variet. de cienc. litt. &c. no. 29. oct. 1805. p. 40. Aikínia hederàcea, Salisb. in herb. D. C. Schultèsia, Roth, enum. pl. 1. p. 1807.—Moris. oxon. 2. p. 456. sect. 5. t. 2. f. 18. Pluk. phyt. 23. f. 1. Petiv. gaz. t. 51. f. 1. —Tourn. inst. 1. p. 112. Garid. aix. 1. p. 76. Stems filiform, creeping and ascending. Peduncles naked, one-flowered, usually terminal, but sometimes axillary. Corolla pale blue.

Ivy-like Wahlenbergia. Fl. May, June. England. Pl. $\frac{1}{2}$ foot.

*** *Seeds shining. Stems more or less erect. Leaves alternate, sessile, narrow.*

a. Peduncles elongated.

15 W. GRA'CILIS (Alph. D. C. mon. p. 142.) stem simple or branched, glabrous or pilose; leaves alternate or nearly opposite, linear-lanceolate, sinuately toothed, glabrous; calyx smoothish, with an ovoid tube; corolla funnel-shaped, 5-cleft; capsule obovate. ♂.? G. Native of Van Diemen's Land; and of New Holland, about Port Jackson; and of New Caledonia and New Zealand. All the varieties grow in New Holland, except var. ε, which only grows in New Zealand. Campánula grácilis, Forst. prod. no. 84. Sims, bot. mag. 691. R. Br. prod. p. 561. Campánula vincæflòra, Vent. malm. t. 12. Campánula capillàris, Lodd. bot. cab. t. 1406. Peduncles terminal and axillary, elongated, 1-flowered. Corolla blue, with a white or yellowish bottom. Anthers yellowish.

Var. β, stricta (Alph. D. C. mon. p. 142.) stem branched, straight; leaves more numerous, opposite, linear-lanceolate; calycine segments linear, exceeding the tube of the corolla a little, which is discoloured on the outside. ♂. G. Campánula grácilis, Smith, exot. fl. t. 45. Campánula grácilis, β, stricta, R. Br. prod. p. 561.

Var. γ, littoràlis (Alph. D. C. l. c.) stem simple, elongated; leaves few, alternate, linear, narrow; calycine lobes acuminated, length of the tube of the corolla. ♂. G. Campánula littoràlis, Labill. nov. holl. 1. p. 69. t. 70. Camp. grácilis, γ, littoràlis, R. Br. prod. p. 561.

Var. δ, capillàris (Alph. D. C. l. c.) stem capillary, panicled; leaves linear, remote; segments of the calyx one-half shorter than the capsule, which is nearly globose. ♂. G. Campánula grácilis, δ, capillàris, R. Br. prod. p. 561.

Var. ε, polymórpha (Alph. D. C. l. c.) lower leaves obovate, obtuse: middle ones lanceolate: upper ones linear-lanceolate; calycine segments broadish, one-half shorter than the corolla

ƒ. H. Native of New *Z*ealand. Campánula polymórpha diffûsa, Soland. in herb. Banks.

Weak Wahlenbergia. Fl. April, May. Clt. 1794. Pl. ½ to 1 foot.

16 W. CHAMISSONIA'NA; stems ascending, branched at the base, and leafy, but naked at the apex, and forming erect, few-flowered, elongated peduncles, which are furnished with a few bracteas; leaves ovate-lanceolate, sessile, marginated by a nerve, obscurely few-toothed, sinuated and undulated, having the keel and margins running down the stem, sometimes beset with a few spreading, stiff, white hairs, and sometimes glabrous; sterile branches always pilose; bracteoles ovate, acute, ciliated. ⊙.? ♃.? G. Native of the Cape of Good Hope. Wahlenbérgia, no. 3. Cham. in Linnæa. 7. p. 194. Ovarium obconical, 10-nerved. Segments of the calyx ovate, acute, ciliated. Corolla funnel-shaped, with an ample deeply 5-cleft limb, and narrow-elliptic, acute segments. Capsule 2-celled, 2-valved. Stamens 5. Stigma trifid. Seeds ovoid, smooth, shining, brown.

Var. β, micrántha (Cham. l. c.) plant taller and slenderer; stems erect, 2-3 feet high; leaves 15 lines long and 3 broad, less undulated and flatter; diameter of corolla half an inch.

Var. γ, macrántha (Cham. l. c. p. 195.) old branches nearly naked; stem erect, hardly a foot high; leaves more crowded, 9 lines long and 4 lines broad at the base, or oblong-elliptic, blunter, more undulated; diameter of corolla an inch.

Chamisso's Wahlenbergia. Pl. 1 to 3 feet.

17 W. MARGINA'TA (Alph. D. C. mon. p. 143.) stem branched, glabrous; leaves alternate or nearly opposite, lanceolate and linear-lanceolate, undulately subserrated, with pilose margins; calyx glabrous, with an obovate tube; corolla funnel-shaped, hardly one-half longer than the calycine lobes. ♃. G. Native of Japan, by road sides between Arai and Quana. Campánula marginàta, Thunb. fl. jap. p. 89. pl. jap. dec. with a figure. Campánula grácilis, var. Spreng. pug. no. 28. Rœm. et Schultes. syst. 5. p. 133. Root or lower part of stem thick and woody, decumbent. Branches herbaceous, erect and branched. Margins of leaves white. Peduncles terminal and axillary, elongated, 1-flowered. Corolla small, blue.

Marginate-leaved Wahlenbergia. Pl. ½ foot.

18 W. LAVANDULÆFÒLIA (Alph. D. C. mon. p. 144.) stem filiform, angular, striated; branches 1-3-flowered; leaves sessile, linear, obtuse, obsoletely and remotely serrulated; flowers quinquefid; corolla exceeding the ovarium a little. ♃. G. Native of Japan, on the mountains. Campánula lavandulæfòlia, Blum. bijdr. p. 726.

Lavender-leaved Wahlenbergia. Pl. ½ foot.?

19 W. QUADRÍFIDA (Alph. D. C. mon. p. 144.) stem filiform, angularly striated, pilose as well as the leaves, which are linear; flowers quadrifid; corolla hardly exceeding the ovarium; stigmas 3. ♃? G. Native of New South Wales, about Port Jackson. Campánula quadrífida, R. Br. prod. p. 561. Flowers blue. This species comes very near to *Wahl. grácilis*, and is probably only an earlier variety of it.

Quadrifid-flowered Wahlenbergia. Fl. June, Aug. Clt. 1820. Pl. ½ to 1 foot.

20 W. SAXÍCOLA (Alph. D. C. mon. p. 144.) glabrous; stem short; leaves crowded, lanceolate, a little toothed; peduncles 1-flowered, scape-formed; flowers quadrifid; capsule globose. ♃.? G. Native of Van Diemen's Land. Campánula saxícola, R. Br. prod. p. 561. This is very nearly allied to *W. quadrífida*.

Rock Wahlenbergia. Pl. ½ foot.

21 W. SIEBE'RI (Alph. D. C. mon. p. 144) stem branched, very hispid at the base; leaves somewhat denticulated, acute: lower ones obovate-lanceolate, pilose: superior ones linear-lanceolate, smoothish; calyx glabrous, with an ovoid tube; corolla tubular, nearly 3 times larger than the calycine lobes; capsule obovoid. ⊙. H. Native of New Holland. Campanulàceæ, Sieb. fl. nov. holl. no. 577. Peduncles naked, divided into 1-flowered pedicels; the flowers are therefore somewhat panicled. Corolla blue, small. Stem angular at the base.

Sieber's Wahlenbergia. Pl. ½ foot.

22 W. DEHÍSCENS (Alph. D. C. mon. p. 145.) stem branched or simple, rather pilose at the base; leaves rather pilose: lower ones lanceolate-obovate, bluntish, undulately toothed; calyx glabrous, with an obovate tube; corolla funnel-shaped, one half longer than the calycine lobes; capsule obovoid. ⊙. H. Native of Bengal and Nipaul. Campánula dehíscens, Roxb. hort. beng. p. 85. fl. ind. 2. p. 96. Wall. in asiat. researc. 12. p. 571. with a figure. Lower leaves numerous. Peduncles terminal and axillary, nearly naked, divided into 1-flowered filiform pedicels. Corollas small, white. Capsule dehiscing by 3 valves at the top.

Dehiscent Wahlenbergia. Fl. Aug. Clt. 1818. Pl. 1 foot.

23 W. AGRE'STIS (Alph. D. C. mon. p. 145.) stem branched from the base, pilose and leafy at bottom, but naked and smoothish above; leaves linear, narrow, nearly entire, with undulated margins; peduncles subdichotomous, erect; tube of calyx obovate; corolla funnel-shaped, twice longer than the calycine segments; capsule obovate. ⊙. H. Native of Nipaul. Campánula agréstis, Wall. in Roxb. fl. ind. 2. p. 97. Leaves rather pilose. Peduncles elongated, erect, naked, sometimes dichotomous; pedicels terminal, 1-flowered. Corolla blue.

Field Wahlenbergia. Pl. 1 foot.

24 W. I'NDICA (Alph. D. C. mon. p. 146.) stem branched, rather pilose at the base; leaves linear, rather pilose, entire, accuminated; tube of calyx ovoid, glabrous; corolla one-half longer than the calycine lobes; capsule obconical. ⊙.? H. Native of the East Indies, on the Nellyghery mountains, where it was collected by Leschenault, and where it is called Aleka. Habit of *W. linarioìdes*. Peduncles 1-flowered, glabrous. Flowers terminal, nutant. Capsule erect.

Indian Wahlenbergia. Pl. ½ foot.

25 W. RIPA'RIA (Alph. D. C. mon. p. 146.) plant pilose at the base, and glabrous at top; leaves few, undulately toothed, rather hairy: lower ones obovate-lanceolate: the rest narrower, glabrous, and accuminated; calyx glabrous, with an ovoid narrow tube; corolla one-half longer than the calycine lobes; capsule obovoid. ⊙. H. Native of Senegal, in the regions called Podor and Walo, where it was collected by Leprieur and Perrottet. Campánula ripària Lepr. et Perrott. in lit. Stem simple or branched, leafy at the base, and naked at the top. Peduncles erect, divided into filiform 1-flowered pedicels.

River-side Wahlenbergia. Pl. 1 to 1½ foot.

26 W. HU'MILIS (Alph. D. C. mon. p. 147.) plant pilose at the base, and glabrous at top; leaves much crowded at the bottom, linear-lanceolate: upper ones ligulate; calyx glabrous, with an ovoid narrow tube; corolla one-half longer than the calycine lobes; capsule ovoid. ⊙. H. Native of Senegal. Stem very leafy at the base, divided into many 1-flowered pedicels at top.

Humble Wahlenbergia. Pl. ¼ foot.

27 W. DENUDA'TA (Alph. D. C. mon. p. 147.) plant quite glabrous; stem simple, few-flowered; leaves linear-lanceolate, with undulated, nearly entire margins; tube of calyx, obconical, elongated: capsule elongated, obovate. ⊙. ♄. H. Native of the Cape of Good Hope. Campanulàceæ, Burch. cat. pl. af. no. 2769. Habit of *W. Capénsis*. Stem erect, only leafy at the base. Leaves greyish-green, with white edges. Flowers solitary, terminal.

Naked Wahlenbergia. Pl. 1 foot.

28 W. CE'RNUA (Alph. D. C. mon. p. 148.) stem much

branched, pilose at the base; lower and middle leaves ovate, acute, irregularly toothed, and pilose: superior ones narrower, nearly entire, smoothish; tube of calyx glabrous and obconical; lobes of calyx with revolute serrulately ciliated margins; corolla funnel-shaped, 2 or 3 times longer than the calycine lobes, somewhat 5-cleft at the apex; capsule obovate. ⊙. H. Native of the Cape of Good Hope. Campánula cérnua, Thunb. prod. p. 39. mem. acad. petersb. 4. p. 376. t. 7. f. 1.—Comm. hort. 2. t. 36. Stem very leafy at the base. Peduncles erect, elongated, terminating in numerous 1-flowered filiform pedicels. Corolla funnel-shaped, with a white base, and blue lobes, drooping in the bud state.

Drooping-flowered Wahlenbergia. Fl. June, Aug. Clt. 1804. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

29 W. undula'ta (Alph. D. C. mon. p. 148.) stem ascending, simple at the base, pilose; leaves somewhat stem-clasping, ovate, or ovate-lanceolate, coarsely crenated, pilose; calyx glabrous, with an obconical tube, and broad flat serrately ciliated lobes; corolla funnel-shaped, 5-cleft, 3 times longer than the calycine lobes; capsule obconical. ⊙. H. Native of the Cape of Good Hope, in Swartland. Campánula undulàta, Thunb. prod. p. 39. Lin. suppl. p. 142. Campánula glabràta, Banks, herb. Stem branched, naked and glabrous at top. Peduncles elongated, nearly naked, panicled; pedicels 1-flowered, rising from the axils of the bracteas. Flowers rather nutant.

Undulated-leaved Wahlenbergia. Pl. 1 to $1\frac{1}{2}$ foot.

30 W. nudicau'lis (Alph. D. C. mon. p. 149.) stem branched, rather pilose at the base; leaves obovate or lanceolate, undulately crenated, rather pilose; calyx glabrous, with a nearly spherical tube, and entire lobes; corolla broadly funnel-shaped, deeply 5-cleft, 3 or 4 times longer than the calycine lobes; capsule spherical. ⊙.? G. Native of the Cape of Good Hope. Root cylindrical at its top, branched at the base. Stems numerous, branched, usually dichotomous. Leaves nearly all at the base of the plant, obtuse or acute. Flowers very numerous, terminating the slender naked pedicels. Corolla funnel-shaped, blue, ? drooping in æstivation.

Var. β. Flowers larger. — Campánula elongàta, Banks, herb.

Naked-stemmed Wahlenbergia. Pl. 1 foot.

31 W. androsa'cea (Alph. D. C. mon. p. 150. t. 19. f. 1.) stem simple, naked, few-flowered, glabrous; radical leaves rosulate, ovate-lanceolate, on short petioles, acute, denticulated, pilose; calyx glabrous, with a hemispherical tube, and short broad entire lobes; corolla broadly funnel-shaped, profoundly 5-cleft, 2 or 3 times longer than the calycine segments; capsule spheroid. ⊙. G. Native of the Cape of Good Hope. Campanulàceæ, Burch, cat. geog. pl. afr. austr. no. 2273. Stem twice dichotomous at top, and nearly naked, except the bracteas at the base of the pedicels. Branches 2, divided into 2 1-flowered pedicels at the apex. Flowers erect in the expanded state, but drooping in the bud state, probably blue.

Androsace-like Wahlenbergia. Pl. $\frac{1}{4}$ foot.

32 W. stellarioi'des (Cham. in Schlecht. in Linnæa, 7. p. 196.) stems ascending, a little tufted, filiform, tetragonal, glabrous; leaves opposite, somewhat connately approximate, lanceolate, acute, with revolute edges, and the nerve slender, pilose, or glabrous beneath; flowers terminal and lateral, on long pedicels; ovarium elliptic, short; calycine segments very like the leaves, but one-half shorter than the corolla; corolla funnel-shaped, 5-cleft to the middle, with acute ovate segments. ♃. G. Native of Caffraria. Stem branched at the base. Stamens 5. Calycine segments reflexed.

Stichwort-like Wahlenbergia. Pl. 1 to $1\frac{1}{2}$ foot.

33 W. nutabu'nda (Alph. D. C. mon. p. 151.) plant pilose at the base; stem simple, or branched at the base; lower leaves lanceolate-obovate, nearly entire, with the nerves and margins pilose: the rest lanceolate, acute, smoothish, and irregularly toothed; calyx glabrous, with an ovoid tube; corolla cylindrical, 5-lobed, hardly one-half longer than the calycine lobes; capsule obovate. ⊙.? H. Native of Calabria, near Reggio, on very arid hills; and of Sardinia, in the fields of Carbonara and Tortote, ex Moris. Campánula nutabúnda, Guss. in Ten. append. 5. ad fl. neap. prod. p. 8. pl. rar. p. 94. t. 18. Mor. stirp. sard. elench. p. 30. Habit of *W. lobelioìdes* Leaves numerous at the base of the plant. Peduncles nearly naked, elongated, drooping when bearing the flowers, but at length erect, 1-flowered, glabrous. Corolla white.

Nodding-flowered Wahlenbergia. Pl. $\frac{1}{4}$ foot.

b. Peduncles shorter.

34 W. exìlis (Alph. D. C. mon. p. 151.) stem much branched, rather pilose at the base; branches glabrous, filiform; leaves linear, subulate, entire, rather pilose; tube of calyx glabrous or roughish, obconical; corolla tubular, 5-cleft at the apex, scarcely one-half longer than the calycine lobes; capsule obovate, narrow. ⊙. H. Native of the Cape of Good Hope. Burch. cat. no. 105. Stem quite glabrous at top. Pedicels mostly axillary, 1-flowered, reddish.

Slender Wahlenbergia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

35 W. denticula'ta (Alph. D. C. mon. p. 152. t. 16.) stem much branched, glabrous, but rather scabrous above; leaves narrow-linear, acuminated, glabrous, remotely denticulated; calyx glabrous or scabrous, with a hemispherical tube, and denticulated lobes; corolla deeply 5-cleft; capsule spheroid. ⊙. H. Native of the Cape of Good Hope, in the interior of the country. Campánula denticulata, Burch. cat. pl. afr. no. 2000. trav. 1. p. 538. Flowers numerous towards the tops of the branches. Pedicels axillary and terminal, 1-flowered, diverging much from the stem. Corollas blue?

Var. β, scábra (Alph. D.C. l. c.) peduncles and calyxes rather scabrous. Burch. cat. pl. afr. no. 2302.

Denticulated calyxed Wahlenbergia. Pl. $\frac{1}{4}$ foot. Var. β, 2 in.

36 W. Kre'bsii (Cham. in Schlecht. Linnæa. 7. p. 195.) stems rather herbaceous, filiform, procumbent, very leafy at the origin of the fertile branches, tetragonal: angles beset with retrograde bristles; leaves crowded, spreading, rather stiff, lingulate or obovate-oblong, obtuse or acute, sinuately-toothed, with reflexed margins, having the keel and margins pilose or glabrous; branches erect, naked above, elongated, divided into an irregular branched panicle; bracteoles quite entire, acute; ovarium globose; calycine segments oblong-triangular, bluntish, almost nerveless, pellucid, with scabrous edges; corolla funnel-shaped, quinquefid, 3 times longer than the calyx: lobes short. ♃. G. Native of Caffraria. Stem tumid below the leaves. Stamens 5. Stigma bifid. Panicle 4-8-flowered. Pedicels half an inch long, furnished each with one bractea. Capsule half inferior, 3-celled, 3-valved. Seeds ovate or elliptic, smooth, shining brown.

Krebs's Wahlenbergia. Pl. procumbent.

37 W. Duna'ntii (Alph. D. C. mon. p. 152.) stem branched, stiffish; leaves linear-lanceolate, narrow, acuminated, entire, pilose; tube of calyx pilose, small, hemispherical; lobes of calyx long, subulate; corolla tubular, 5-lobed at the apex, rather longer than the calycine lobes. ⊙. H. Native of the Cape of Good Hope, where it was collected by Eklon. Stem slightly pilose. Peduncles dichotomous, diverging, rather pilose. Pedicels 1-flowered. Flowers drooping.

Dunant's Wahlenbergia. Pl. $\frac{1}{2}$ foot.

38 W. Massònii (Alph. D. C. mon. p. 153.) plant small; stem branched, pilose; leaves linear, narrow, entire; calyx pilose, with a hemispherical tube and capillary lobes; corolla narrow,

funnel-shaped, 5-lobed at the apex, 2 or 3 times longer than the calycine lobes; capsule spherical. ⊙. ? G. Native of the Cape of Good Hope. Flowers racemose or panicled at the tops of the branches, numerous. Pedicels 1-flowered.

Masson's Wahlenbergia. Pl. $\frac{1}{4}$ foot.

39 W. Brasilie'nsis (Cham. in Linnæa, 7. p. 318.) glabrous; branches almost radical, simple, angular; leaves few, small, subulate, entire, concave, keeled, bluntish; panicle terminal, subfastigiately corymbose and spike-formed, coarctate; ovarium obconical; calycine segments like the leaves; corolla 5-cleft to the middle. ♃. S. Native of Brazil within the tropic. Very like *W. linarioìdes*. Flowers white. Corolla very like that of *Campánula rotundifòlia*, but much smaller.

Brazilian Wahlenbergia. Pl. $\frac{1}{2}$ foot.

40 W. panicula'ta (Alph. D. C. mon. p. 153.) stem much branched, pilose; leaves linear, rather pilose, entire, or a little denticulated; calyx pilose, with an ovoid narrow tube and entire acuminated lobes; corolla funnel-shaped, 5-lobed at the apex, twice longer than the calycine lobes; capsule ovoid. ⊙. H. Native of the Cape of Good Hope. Campánula paniculàta, Thunb. prod. p. 38. Lin. suppl. p. 139. Thunb. mem. acad. petersb. 4. t. 7. f. 4. Flowers panicled, terminal, and axillary. Pedicels 1-flowered.

Panicled-flowered Wahlenbergia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

41 W. Banksia'na (Alph. D. C. mon. p. 154.) stem glabrous, simple at the base, but panicled at the apex; leaves linear, narrow, remotely denticulated, acuminated; tube of calyx quite glabrous, spherical; calycine lobes linear, narrow, denticulated; corolla funnel-shaped, 5-lobed at the apex, one-half longer than the calycine lobes. ⊙. ? H. Native of the Cape of Good Hope. Campánula paniculàta, Smith, in herb. Banks. Peduncles and pedicels slender, but stiff and divaricate. Flowers erect, 6-10 in number.

Banks's Wahlenbergia. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

42 W. hispídula (Alph. D. C. mon. p. 155.) stem branched; branches thick, hispid; leaves linear-lanceolate, acuminated, rather pilose, stiff, somewhat denticulated; tube of calyx hispid, ovoid; calycine lobes very long and very like the leaves; corolla tubularly funnel-shaped, 5-lobed at the apex, rather shorter than the calycine lobes; capsule spherical. ⊙. H. Native of the Cape of Good Hope, in Swartland, on sandy hills. Campánula hispídula, Thunb. prod. p. 38. Lin. suppl. p. 142. Thunb. voy. 4. p. 352. t. 4. exclusive of the syn. of Comm. hort. t. 37. Flowers 2-5 in number at the tops of the branches, nearly sessile. Corolla blue.

Hispid Wahlenbergia. Fl. sept. oct. Clt. 1817. Pl. $\frac{1}{4}$ foot.

43 W. spinulòsa (Alph. D. C. mon. p. 155.) plant humble, much branched; branches stiff, glabrous, or rather scabrous; leaves narrow-linear, glabrous or pilose, denticulated, stiff, ending each in a hard point; tube of calyx glabrous, spherical; lobes of calyx with revolute ciliated margins; corolla narrow, 5-lobed at the apex; capsule spherical.—Native of the Cape of Good Hope. Campánula spinulòsa, Banks, herb. Flowers terminal and axillary, solitary; pedicels stiff, and appearing like spines after the capsules have fallen.

Spinulose Wahlenbergia. Pl. 1 to 3 inches.

44 W. capilla'cea (Alph. D. C. mon. p. 156.) stem branched from the base, glabrous; leaves scattered, linear-filiform, entire, with revolute margins; calycine segments setaceous.—Native of the Cape of Good Hope. Campánula capillàcea, Thunb. prod. p. 38. mem. acad. petersb. 4. p. 366. t. 5. f. 4. Branches radical, numerous, filiform. Flowers terminal, subracemose, blue. Pedicels capillary, drooping.

Capillary-peduncled Wahlenbergia. Pl. 1 foot.

Sect. III. Cervícina (from *cervix*, the neck; because some plants of this order are called *Throat-wort*). Alph. D. C. mon. p. 156.—Cervícina, Del. fl. d'egypt. p. 7. t. 5. f. 2. Calyx and corolla 3-5-lobed. Stamens 3. Capsule 2-celled. Seeds triquetrous, acute at one extremity, and truncated at the other. —An humble annual herb. Leaves alternate, sessile, narrow. Flowers on short pedicels.

45 W. cervícina (Alph. D. C. mon. p. 156.) plant small; stem much branched; branches diverging, rather pilose; leaves linear-lanceolate, a little denticulated; tube of calyx rather pilose, ovoid; corolla tubular, rather longer than the calycine lobes; capsule spherical. ⊙. F. Native of Egypt and Senegal, in sandy and arid places. Cervícina campanuloìdes, Del. fl. egypt, p. 7. t. 5. f. 2. Leaves with white margins. Flowers numerous, pedicellate, solitary from the axils of all the leaves and tops of the branches.

Throatwort Wahlenbergia. Pl. $\frac{1}{4}$ foot.

Sect. IV. Lobelioìdes (this section contains plants having the habit of *Lobèlia*). Alph. D. C. mon. 157. Calyx and corolla 3-5-lobed in the same plant. Stamens 3. Capsule 2-celled. Seeds ovoid, nitid.—Slender annual herbs, with the habit of *Lobèlia*. Leaves alternate, sessile. Flowers on long peduncles.

46 W. lobelioìdes (Alph. D. C. mon. 157. t. 17.) plant glabrous, simple at the base, erect; leaves denticulated: lower ones lanceolate-obovate: middle ones linear-lanceolate: superior ones few, narrower; tube of calyx obconical, narrow; corolla cylindrical, hardly one-half longer than the calycine lobes; capsule ovoid, elongated. ⊙. H. Native of Madeira and Teneriffe. Campánula lobelioìdes, Lin. suppl. p. 140. Ait. hort. kew. 1. ed. 1. p. 219. Campánula parviflòra, Salisb. prod. p. 126. Lobèlia Broussonètii, Bory, ann. gen. p. 330. Campánula inconspícua, Banks, herb. Roélla cérnua, Brouss. cat. hort. monsp. 1804. p. 49. Lobèlia Canariénsis, Hort. par. Camp. júncea, and C. juncifòlia, Hort. Wahl. péndula, Schrad. cat. hort. gott. 1814. p. 3. diss. gen. de Blum. p. 38. Stem more or less branched at top. Flowers on long, slender, filiform, nearly naked pedicels, nutant. Corollas of a very pale red.

Lobelia-like Wahlenbergia. Fl. July, Aug. Clt. 1777. Pl. $\frac{1}{2}$ to 1 foot.

Sect. V. Linarioìdes (the species contained in this section have the habit of *Linària*). Alph. D. C. mon. p. 158. Calyx and corolla 5-lobed. Stamens 5. Capsule 2-celled. Seeds lenticular, shining.—Perennial herbs, with alternate, sessile, narrow leaves. Flowers on long peduncles and pedicels.

47 W. linarioìdes (Alph. D. C. mon. p. 158.) stem erect, simple at the base, glabrous or scabrous; leaves linear, acuminated, narrow, glabrous, subdenticulated; tube of calyx glabrous, obconical; corolla funnel-shaped, deeply 5-cleft, one-half longer than the calycine segments; capsule obconical. ♃. G. Native of South America, about Monte-Video; and of Chili. Campánula linarioìdes, Lam. dict. 1. p. 580. Rœm. et Schultes syst. 5. p. 107. Campánula Chilénsis, Presl. in herb. Hænke. Stem more or less panicled at top. Flowers panicled, terminating the branchlets and peduncles, and also axillary. Branches nakedish. 1-3 flowered. Flowers drooping when open. Corollas blue.

Var. β, *filifòrmis* (Alph. D. C. l. c.) leaves shorter, less acuminated. ⊙. G. Native of Chili, in arid places about Conception. Campánula Chilénsis, Molino, saggio. 2. p. 281. ex Rœm. et Schultes. Campánula filifórmis, Ruiz et Pav. fl. per. 2. p. 55. t. 200. f. c. Rœm. et Schultes, syst. 5. p. 117. Campánula linoìdes, Presl. in herb. Hænke.

Var. γ, *árida* (Alph. D. C. mon. p. 158.) lobes of calyx denticulated; corolla small. ♃. G. Native of Quito, near the river Guallabamba.

Linaria-like Wahlenbergia. Pl. 1 foot.

SECT. VI. NESÓPHILA (from νησος, *nesos*, an island, and φιλεω, *phileo*, to love; the species contained in this section are inhabitants of islands). Alph. D. C. mon. p. 160. Calyx and corolla 5-lobed. Stamens 5. Capsule 2-3-celled. Seeds ovate, flattish.—Suffruticose plants, with alternate, firm, sessile, broad, sharply serrated leaves. Flowers pedunculate and pedicellate.

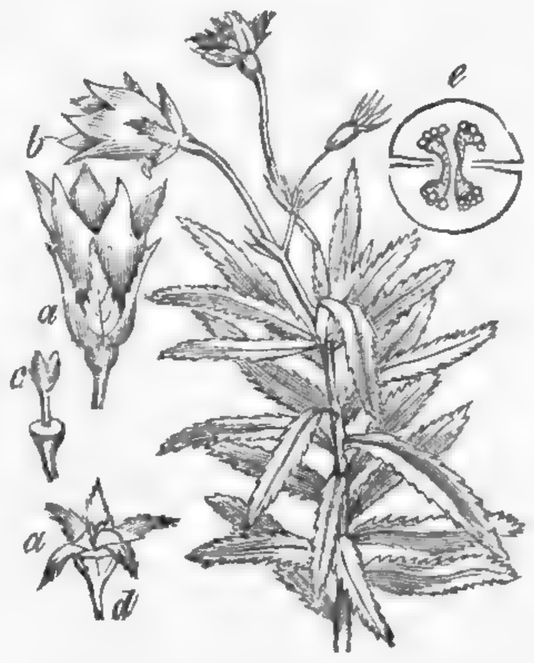
§ 1. *Capsule 2-celled.*

48 W. FERNANDEZIA'NA (Alph. D. C. mon. p. 160.) stem rather woody, erect, glabrous or pilose, leafy in every part; leaves lanceolate, acute, serrated, glabrous or pilose; calyx with a glabrous obconical tube, and subserrated lobes; corolla funnel-shaped, semiquinquefid, 3 times longer than the calycine lobes; capsule obconical. ♃. F. Native of the island of Juan Fernandez. Flowers panicled, numerous. Pedicels erect, terminal and axillary, with a small subulate bractea at the base of each. Corolla white, with purplish nerves.

Juan Fernandez Wahlenbergia. Pl. ½ to 1 foot.

49 W. FOLIÒSA (Alph. D. C. mon. p. 160. t. 16.) stem woody, erect, very leafy in every part; glabrous, or rather pilose; leaves linear, acute, serrated, glabrous or pilose on the middle nerve; tube of calyx glabrous, obconical; lobes of calyx subserrated; corolla cylindrical, semi-5-cleft, one half longer than the calycine lobes; capsule turbinate. ♃. G. Native of St. Helena and Ascension. Stem branched or simple, inflated at the origin of the leaves, as in many species of *Scævòla*. Leaves sessile, an inch long, paler beneath. Peduncles terminating the branches, rather leafy; pedicels slender, erect, 1-flowered, reddish. (f. 128.)

FIG. 128.



Leafy Wahlenbergia. Pl. 1 to 2 feet.

50 W. CLIVÒSA (Alph. D. C. mon. p. 161.) glabrous; stems subherbaceous, procumbent, leafy at the origin of the peduncles; leaves linear-lanceolate, deeply serrated; calyx with an obconical elongated tube, and entire segments; corolla campanulate, 3 times longer than the calycine segments, 5-lobed at the apex; capsule obconical. ♃. G. Native of St. Helena. Campánula clivòsa, Banks, herb. Stems hanging from rocks, naked at the base. Flowers and capsules erect, but the alibastra are drooping.

Craggy Wahlenbergia. Pl. procumbent.

51 W.? ROXBU'RGHII (Alph. D. C. mon. p. 162.) shrubby; erect; branches pilose; leaves scattered, sessile, cuneate-lanceolate, serrulated, pilose; panicle slender, erect, pilose. ♄. G. Native of St. Helena, in dense woods on the mountains. Roélla paniculàta, Roxb. in Beats. St. Hel. p. 320. A shrub with few erect branches. Corollas large, white. Perhaps allied to *W. foliòsa*.

Roxburgh's Wahlenbergia. Shrub.

52 W.? ANGUSTIFÒLIA (Alph. D. C. l. c.) plant diffuse; branches elongated, slender, scabrous; leaves linear-lanceolate, remotely and acutely glandularly serrated; peduncles lateral, much longer than the leaves, dichotomous, many-flowered. ♃. G. Native of St. Helena, in the fissures of rocks in Sandy Bay. Flowers pure white, erect, and rather large. Roélla angustifòlia, Roxb. in Beats. St. Hel. p. 320. Perhaps the same as *W. clivòsa*.

Narrow-leaved Wahlenbergia. Pl. procumbent.

53 W.? LINIFÒLIA (Alph. D. C. l. c.) frutescent; leaves scattered, sessile, numerous, linear, glabrous, finely serrulated; peduncles terminal, few-flowered. ♄. G. Native of St. Helena, parasitical upon *Dicksònia arboréscens*, on the tops of hills in Sandy Bay, particularly on Diana's Peak. Roélla linifòlia, Roxb. in Beats. St. Hel. p. 321. A small branched plant. Flowers white, mixed with red.

Flax-leaved Wahlenbergia. Shrub.

§ 2. *Capsule 3-celled. Perhaps a proper genus.*

54 W. ENSIFÒLIA (Alph. D. C. mon. p. 162.) plant frutescent, simple; stem thick, erect, naked at the base, but very leafy in the middle; leaves long-lanceolate, acuminated, ciliated, sharply serrated: teeth setaceous; calyx with a glabrous obconical tube, and entire ciliated lobes; corolla large, campanulate, somewhat 5-cleft, one-half longer than the calycine lobes. ♄. S. Native of Bourbon, on the Burning Mount. Campánula ensifòlia, Lam. dict. 1. p. 582. ill. no. 2518. Bracteas ciliated. Flowers 1-3 at the top of each peduncle. Corollas large, an inch long, dirty yellow, marked with 5 purple spots at bottom. Habit between *Músschia* and *Wahl. foliòsa*.

Sword-leaved Wahlenbergia. Shrub 1 foot.

† *A doubtful species.*

55 W.? OVA'TA (D. Don. prod. fl. nep. p. 156. Alph. D. C. mon. p. 163.) leaves ovate, petiolate, repandly denticulated; flowers axillary, solitary, pedunculate, erect. ⊙. H. Native of Nipaul. Stem erect, branched, glabrous. Leaves rather pilose on both surfaces, an inch long. Stigma 3-lobed. Capsule trigonal, 3-celled, dehiscing by 3 holes at the apex. Stamens unequal. Corollas blue?

Ovate-leaved Wahlenbergia. Pl. ½ foot.

Cult. For the culture and propagation of the annual species of this genus, see *Microcòdon*, p. 737. The frame and greenhouse perennial and shrubby species, as *Lightfoòtia*, p. 735. The hardy perennial species should be grown in pots, in a mixture of peat and loam, and kept rather moist; and they are easily increased by division.

X. PRISMATOCA'RPUS (πρισμα πρισματος, *prisma prismatos*, a prism, and καρπος, *karpos*, a fruit; in reference to the long prismatical form of the fruit). Alph. D. C. mon. p. 164. Prismatocárpus species, Lher. sert. angl. p. 1. exclusive of the European species.—Campánula, sect. Legoúsia, Pers. ench. 1. p. 192. exclusive of the European species.

LIN. SYST. *Pentándria, Monogýnia*. Calyx 5-lobed, with a cylindrical elongated tube. Corolla 5-lobed at the apex. Stamens 5, alternating with the lobes of the corolla. Anthers distinct. Style permanent at the base; stigmas 2. Capsule 2-celled, wholly inferior, prismatic or cylindrical, elongated, splitting from the top towards the base into 5 segments. Seeds inserted the whole length of the central placenta, ovoid, somewhat compressed, obtuse, dotted.—Subshrubs and stiff herbs, all natives of the Cape of Good Hope. Leaves alternate. Flowers sessile, solitary or approximate, always inserted in the axils of the leaves or bracteas.

• *Corolla narrow. Style exserted. Leaves few on the upper parts of the plants.*

1 P. DIFFU'SUS (Alph. D. C. mon. p. 164.) suffrutescent; leaves linear, very narrow, entire; flowers in loose panicles; peduncles diverging, stiff; bracteas subulate; calycine lobes

ovate, acuminated, glabrous. ♄. G. Native of the Cape of Good Hope. Trachèlium diffùsum, Thunb. prod. p. 38. Lin. fil. suppl. 143. Ait. hort. kew. ed. 2d. 1. p. 355. Stem branched, glabrous. Leaves glabrous or pilose. Flowers disposed in a loose nearly naked panicle. Peduncles stiff, axillary and terminal. Corollas blue; anthers yellow.

Diffuse Prismatocarpus. Fl. July, Sept. Clt. 1787. Shrub 1 foot.

** *Corolla funnel-shaped. Style inclosed. Leaves few on the upper part of the plant.*

2 P. PANICULA'TUS (Lher. sert. angl. p. 1. exclusive of the syn. *Polemònium roelloìdes*, ex Alph. D. C. mon. p. 165. t. 20.) suffrutescent; leaves linear-subulate, entire, setaceously ciliated; flowers loosely panicled; peduncles nearly naked; bracteas subulate; calycine lobes acuminated, glabrous. ♄. G. Native of the Cape of Good Hope. Campánula ericoìdes, Lam. ill. no. 2574. Rœm. et Schultes, syst. 5. p. 156. Camp. pedunculàta, Gmel. syst. p. 352. Campánula roelloìdes, Juss. herb. Roélla ericoìdes, Spreng. syst. 1. p. 723. Stem branched, leafless at the base, but leafy in the middle part. Leaves numerous at the base of the floriferous branches, with tufts of smaller leaves in their axils. Peduncles naked, subdivided, glabrous or rather scabrous. Flowers in loose panicles.

Panicled-flowered Prismatocarpus. Shrub 1 foot.

3 P. INTERRU'PTUS (Lher. sert. angl. p. 1. Alph. D. C. mon. p. 166.) suffrutescent; leaves linear, acuminated, entire, ciliated; flowers approximate, on the tops of the peduncles; bracteas subulate; lobes of calyx ciliated. ♄. G. Native of the Cape of Good Hope. Roélla interrúpta, Banks, herb. Campánula interrúpta, Pers. ench. 1. p. 192. Stem branched, glabrous or velvety. Leaves scattered over the branches, with fascicles of smaller ones in their axils.

Interrupted Prismatocarpus. Fl. May, July. Clt. 1818. Shrub ½ foot.

4 P.? SUBULA'TUS (Alph. D. C. mon. p. 166.) suffrutescent; ? leaves linear-subulate, narrow, entire, ciliated at the base; flowers disposed in loose panicles; bracteas subulate; calycine lobes acuminated, glabrous. ♄. G. Native of the Cape of Good Hope. Campánula subulàta, Thunb. prod. p. 38. mem. acad. petersb. 4. p. 369. t. 6. Rœm. et Schultes, syst. 5. p. 156. Lightfoòtia ciliàta, Spreng. syst. 1. p. 809. Habit of *P. paniculàta*. Stem purplish, glabrous. Leaves often with fascicles of smaller ones in their axils. Flowers disposed in a loose, nearly naked panicle.

Subulate-leaved Prismatocarpus. Shrub 1½ foot.

5 P. ALTIFLÒRUS (Lher. sert. angl. p. 1. Alph. D. C. mon. p. 167.) suffrutescent; leaves linear-subulate, entire, ciliated; flowers few, approximate at the tops of the peduncles; bracteas subulate; lobes of calyx ovate, acute, velvety. ♄. G. Native of the Cape of Good Hope. Roélla erécta, Banks, herb. Campánula altiflòra, Poir. suppl. 2. p. 66.—Habit of *P. paniculàtus*, Stem nearly simple, glabrous, naked at the base and top, but leafy in the middle, divided at the top into 2 peduncles. Leaves often having fascicles of smaller ones in their axils.

High-flowered Prismatocarpus. Shrub 1 foot.

6 P. FRUTICÒSUS (Lher. sert. angl. p. 2. Alph. D. C. mon. p. 167.) suffrutescent; leaves linear, very narrow, erect, entire, a little ciliated; flowers few, racemose; bracteas subulate; calycine lobes ovate, acute, glabrous. ♄. G. Native of the Cape of Good Hope. Roélla fruticòsa, Lher. in herb. Banks. Campánula fruticulòsa, Banks, herb. Stem nearly simple, glabrous, ending in a naked few-flowered raceme.

Shrubby Prismatocarpus. Fl. Aug. Clt. 1787. Shrub 1 ft.

7 P. EKLÒNII (Alph. D. C. mon. p. 168.) suffrutescent; leaves linear-subulate, long, erect, entire, glabrous; flowers disposed in loose spikes; bracteas subulate, broader than the leaves at the base; calycine lobes linear-lanceolate, glabrous. ♄. G. Native of the Cape of Good Hope. P. fruticòsus, Eklon, in herb. Dunant, but not of Lher. Stem branched; branches erect, leafy at the base and rather velvety, and reddish at top. Flowers solitary in the axils of the bracteas.

Eklon's Prismatocarpus. Shrub ½ foot.

8 P. CRÍSPUS (Lher. sert. angl. p. 2. Alph. D. C. mon. p. 168.) stem herbaceous; leaves long, linear, erect, undulately toothed; flowers at the tops of the branches; bracteas subulate; calycine lobes linear, acuminated, glabrous. ♃. G. Native of the Cape of Good Hope. Campánula plicàta, Pers. ench. 1. p. 193. Rœm. et Schultes, syst. 5. p. 153. Camp. longiróstris and C. crícpa, Banks, herb. Stem simple, furnished with peduncles at top, pilose and leafy to the middle, but quite glabrous and naked at top. Leaves with white edges; lower and upper ones shortest. Peduncles bearing a solitary flower at top, and sometimes pedicellate flowers in the axils of the bracteas.

Curled-leaved Prismatocarpus. Pl. ½ foot.

9 P. LINARIÆFÒLIUS (Alph. D. C. mon. p. 169.) stem herbaceous; leaves few, linear, narrow, ciliated a little at the base; flowers spicate, solitary or twin; bracteas broad-ovate, acuminated, ciliated; calycine lobes oblong-linear, glabrous. ♃. G. Native of the Cape of Good Hope. Stem erect, simple, furnished with a few floriferous leafy branches, striated with white nerves. Flowers disposed in loose spikes.

Toad-flax-leaved Prismatocarpus. Pl. 1 to 2 feet.

10 P. STRÍCTUS (Alph. D. C. mon. p. 169.) plant herbaceous, simple; leaves linear, acuminated, erect, glabrous, serrately toothed; flowers in fascicles; bracteas ovate, acute, setaceously ciliated; lobes of calyx linear, acuminated, glabrous. ♃. G. Native of the Cape of Good Hope. Lightfoòtia sessiliflòra, Spreng. in Zeyhr. fl. cap. no. 203. and probably of Spreng. syst. 1. p. 809. Stem simple, stiff, furnished at top with few-flowered peduncles, glabrous, very leafy from the base to the middle, but naked at top. Leaves decurrent. Flowers sessile, usually 2-3 in a fascicle, from the axils of the bracteas, at the upper part of the stem.

Straight Prismatocarpus. Pl. 1 foot.

*** *Corolla funnel-shaped. Style inclosed. Leaves scattered equally over the whole plant.*

11 P. NÍTIDUS (Lher. sert. angl. p. 2. t. 3. Alph. D. C. mon. p. 170.) plant rather woody; leaves ovate-oblong, spreading, serrated; flowers in fascicles; bracteas like the leaves; calycine lobes lanceolate, glabrous. ♃. G. Native of the Cape of Good Hope. Campánula prismatocárpus, Ait. hort. kew. 1. ed. 1. p. 224. Rœm. et Schultes, syst. 5. p. 153. Hook. in bot. mag. 2733. Stem branched; branches diffuse, woody. Flowers 2-4 in a cluster, towards the tops of the branches, sessile in the axils of the bracteas, and sometimes solitary in the axils of the leaves. Corollas white.

Shining Prismatocarpus. Fl. Aug. Sept. Clt. 1787. Pl. ½ to 1 foot.

12 P. SE'SSILIS (Eklon, in herb. Dunant. ex Alph. D. C. mon. p. 171.) plant rather woody, glabrous; leaves spreading, linear, narrow, entire; flowers solitary, in the axils of the upper leaves; calycine lobes subulate, glabrous. ♃. G. Native of the Cape of Good Hope. Stem much branched; branches diffuse, erect or ascending, reddish. Flowers small.

Sessile-flowered Prismatocarpus. Pl. ½ foot.

Cult. All the species of this genus are rather showy when in flower. A mixture of sand, loam, and peat is the best soil for them. They are readily increased by seed; or young cuttings grow freely if planted in the same kind of soil, with a hand-glass placed over them.

XI. ROE'LLA (in honour of William Roell, professor of anatomy in the academy of Amsterdam). Lin. hort. cliff. p. 492. t. 35. Gener. no. 219. Adans. fam. nat. 2. p. 134. Juss. gen. 165. Neck. elem. 1. p. 235. Gærtn. fruct. 1. p. 154. t. 31. f. 3. Lam. ill. no. 346. t. 123. Gessn. phyt. p. 105. t. 13. f. 202. Alph. D. C. mon. p. 172.—Campánula species Seb. thes. 1. p. 25. t. 16. f. 5.—Aculeòsa, Pluk. alm. 8. t. 252. f. 4.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla funnel-shaped or tubular, large, 5-lobed (129. *b*). Stamens 5; filaments broadest at the base. Anthers free. Stigmas 2, thick. Capsule cylindrical, 2-celled, wholly inferior, perforated by the permanent base of the style, and therefore appearing as if it was covered by an operculum, and at length dehiscing by a large hole at the apex, without valves. Seeds angular, scabrous, thick.—Subshrubs, rarely herbs. Leaves numerous, always alternate, scattered over the whole plant, usually narrow and stiff. Flowers sessile, terminal, and sometimes axillary. All the species are natives of the Cape of Good Hope.

* *Plants perennial. Stem woody, more or less erect. Leaves stiff. Tube of calyx covered by the leaves.*

1 R. incu'rva (Banks, herb. ex Alph. D. C. mon. p. 172.) leaves linear, acuminated, incurved at the apex: lower ones setaceously ciliated: superior ones laciniately toothed; flowers solitary; lobes of calyx glabrous, laciniately toothed; corolla variegated, length of the calycine lobes. ♄. G. Native of the Cape of Good Hope. Flowers solitary, terminal, surrounded by imbricate leaves.

Incurved-leaved Roella. Shrub 1 foot.

2 R. cilia'ta (Lin. spec. 1. p. 241.) leaves erect, linear, acuminated, ciliated: superior ones longer and entire; flowers solitary; lobes of calyx ciliated, and laciniately toothed; corolla variegated, large, longer than the calycine lobes. ♄. G. Native of the Cape of Good Hope and Barbary. Gærtn. fruct. 1. p. 154. t. 21. f. 3. Lam. ill. t. 123. f. 1. Curt. bot. mag. t. 378. Lodd. bot. cab. 1156. Delaun. herb. amat. 56. fasc. t. 332. Roélla, Lin. hort. cliff. p. 492. t. 35. Flowers solitary, terminal, surrounded by imbricated leaves. Corollas white at bottom, even to the base of the lobes, where there is a deep purple circle, and above the circle pale violet, girded by white, and lastly the lobes themselves are rose-coloured (f. 129).

FIG. 129.

Ciliated-leaved Roella. Fl. Sept. Clt. 1774. Shrub ½ to 1 foot.

3 R. reticula'ta (Lin. spec. 1. p. 241.) leaves erect, subulate, ciliated; flowers solitary; lobes of calyx ciliated, short, entire; corolla white, twice the length of the calycine lobes. ♄. G. Native of the Cape of Good Hope. Lam. ill. 2577.—Petiv. mus. 21. f. 157. ex Lin.—Roy. lugdb. 248. Stems or branches pilose, very leafy. Flowers solitary, terminating the branches, and axillary at the top of the stem.

Reticulated-leaved Roella. Shrub ½ to 1 foot.

4 R. Thunbe'rgii (Rœm. et Schultes, syst. 5. p. 185.) leaves lanceolate, ciliated; flowers solitary; stem glabrous. ♄. G. Native of the Cape of Good Hope. Campánula ciliàta, Thunb. fl. cap. ed. Schultes, p. 172. Stem filiform, erect, branched at the top, weak. Leaves glabrous, with revolute margins. Flowers terminal.

Thunberg's Roella. Shrub 1 foot.

5 R. Duna'ntii (Alph. D. C. mon. p. 175.) leaves erectish, linear, acuminated, ciliated; flowers solitary or glomerate; lobes of calyx downy inside, remotely toothed; corolla longer than the calycine lobes. ♄. G. Native of the Cape of Good Hope. Roélla, Eklon, in herb. Dunant. Stem branched, naked at the base; branches diffuse. Leaves most numerous on the upper part of the branches. Flowers terminal, solitary, or 1-3 in a fascicle. Corollas white.

Dunant's Roella. Shrub 1 foot.

6 R. cine'rea (Alph. D. C. mon. p. 175.) leaves erect, linear-subulate, remotely denticulated, rather tomentose at the base; flowers solitary or in fascicles; lobes of calyx entire, glabrous; corolla twice the length of the calycine lobes. ♄. G. Native of the Cape of Good Hope. Campánula cinèrea, Thunb. prod. p. 38. mem. acad. petersb. 4. p. 368. t. 6. f. 4. R. glabrélla, Banks, herb. Stem simple. Leaves usually furnished with smaller ones in their axils. Flowers sessile, 4-6 at the top of each stem, surrounded by leaves.

Cinereous Roella. Shrub 1 foot.

7 R. spica'ta (Thunb. prod. p. 38. Lin. suppl. p. 143.) leaves lanceolate, ciliated; flowers terminal, aggregate. ♄. G. Native of the Cape of Good Hope. Stem very short, branched at the base, and rather decumbent. Leaves rising in fascicles from the buds, glabrous, reflexed at the points. Corollas white.

Spiked Roella. Shrub decumbent.

8 R. squarròsa (Thunb. in Lin. suppl. p. 134.) leaves ovate, acute, decurrent, cuspidate at the apex, and recurved, with ciliated and setaceously toothed margins; flowers glomerate; bracteas broad, ovate, acuminated; lobes of calyx ovate, acuminated, ciliated, one-half shorter than the corolla, which is white. ♄. G. Native of the Cape of Good Hope. Lam. ill. 2579. Ait. hort. kew. ed. 2d. vol. 1. p. 354. Stem branched, reddish; branches diffuse, reddish. Flowers disposed in terminal fascicles.

Var. β, Bérgii (Alph. D. C. mon. p. 176.) flowers solitary. ♄. G. Native of the Cape of Good Hope. R. squarròsa, Berg. pl. cap. p. 42. R. filifórmis, Lam. ill. no. 2580. t. 123. f. 2. but not of Poir. R. rigídula, Banks, herb.

Squarrose-leaved Roella. Fl. July. Clt. 1787. Shrub ½ to 1 foot.

** *Perennial, trailing, branched plants. Branches filiform, very leafy. Leaves stiff. Tube of calyx naked, filiform.*

9 R. muscòsa (Thunb. in Lin. suppl. p. 143. prod. p. 38.) leaves spreading, ovate, acute, remotely serrated, glabrous; flowers solitary; lobes of calyx ovate-acuminated, entire, glabrous, or a little ciliated, 3 or 4 times shorter than the corolla, which is blue. ♃. G. Native of the Cape of Good Hope, in a large ditch in front of the Table Mountain. Rœm. et Schultes, syst. 5. p. 75. Alph. D. C. mon. p. 177. R. cæspitòsa, Banks, herb. Burch. cat. pl. afr. no. 636. A humble trailing plant, with diffuse branches. Flowers terminal, sessile.

Mossy Roella. Fl. July, Sept. Clt. 1802. Pl. trailing.

*** *Plant annual. Stem herbaceous, erect. Leaves thin, broad. Tube of calyx naked, ovoid.*

10 R. decu'rrens (Lher. sert. angl. p. 2. t. 6.) leaves spreading, decurrent, ovate-oblong, ciliated at the base, nearly entire; flowers solitary; lobes of calyx acuminated, ciliated, 3 times shorter than the corolla. ☉. F. Native of the Cape of Good Hope. Ait. hort. kew. ed. 1st. vol. 1. p. 226. Lam. ill. no. 2582. Rœm. et Schultes, syst. 5. p. 74. exclusive of syn. bot. rep. t. 238. Stem branched, very leafy, pilose. Flowers terminal, blue.?

Decurrent-leaved Roella. Fl. July, Sept. Clt. 1787. Pl. ½ foot.

† *Doubtful species.*

11 R.? PEDUNCULA'TA (Berg. pl. cap. p. 42.) leaves linear, narrow, glabrous, spiny-ciliated at the base; peduncles terminal, solitary, nearly naked; flowers pedicellate; bracteas ciliated; segments of the calyx lanceolate, acute, ciliated, shorter than the capsule. ♄. G. Native of the Cape of Good Hope. Rœm. et Schultes, syst. 5. p. 73. Alph. D. C. mon. p. 179. Habit of *R. ciliàta*. Leaves keeled below. Peduncles 2-flowered.

Peduncled-flowered Roella. Shrub 1 foot.

12 R.? BRACTEA'TA (Alph. D. C. mon. p. 179.) leaves acute, entire, linear-trigonal, reflexed, glabrous; flowers terminal, almost solitary; bracteas ovate, acuminated, ciliated. ♄. G. Native of the Cape of Good Hope. Campánula bracteàta, Thunb. phyt. bl. p. 20. Rœm. et Schultes, syst. 5. p. 115. Stem downy, branched. Branches subsecund. Leaves furnished with smaller ones in their axils. Flowers surrounded by bracteas.

Bracteate-flowered Roella. Shrub 1 foot.

Cult. For culture and propagation, see *Prismatocárpus*, p. 744.

Tribe II.

CAMPANU'LEÆ (this tribe contains plants agreeing with the genus *Campánula* in the fruit dehiscing laterally). Capsules dehiscing at the sides.

XII. PHYTEU'MA (a name adopted by Dioscorides). Cæsal. l. ix. cap. 30. Gessn. tab. phyt. Lin. gen. no. 292. Gærtn. fruct. 1. p. 194. t. 30. Juss. gen. p. 165. Lam. ill. no. 2589. t. 124. f. 1. Schkuhr, ench. no. 118. t. 39. Juss. dict. sc. nat. p. 40. p. 154. Alph. D. C. mon. p. 180. but not of Diosc. Column. Dalesch. nor Matth.—Rapúnculus, Dalesch. hist. p. 641. Tourn. elem. 1. p. 92. pl. 38. inst. 1. p. 113. Adans. fam. 2. p. 134. &c.—Rapúntum, Lob. hist. p. 178. t. 329.—Rapúnculum, Lag. hist. p. 576. Lonic. p. 413. Dodon. pempt. p. 165.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla 5-parted; segments cohering together a long time, and in one species always. Stamens 5, alternating with the lobes of the corolla; filaments long, filiform, broadest at the base; anthers free; pollen violaceous or reddish. Style filiform, pilose. Ovarium inferior, 2-3-celled. Capsule dehiscing laterally by 2-3 valves at the base or middle part. Seeds ovoid, sometimes a little compressed, usually shining.—Perennial herbs. Leaves alternate; radical ones petiolate, different from the cauline ones, larger and broader. Flowers sessile, or on short pedicels, disposed in spikes or heads.—Natives of the temperate parts of Europe, or nearly in the same latitudes in Asia.

SECT. I. SYNÓTOMA (from *συν, syn*, together; and *τομα, toma*, a section; in reference to the cohesion of the segments of the corolla). Segments of corolla always cohering at the apex. Filaments hardly broader at the base. Stigmas 2. Capsule 2-celled.

1 P. COMÒSUM (Lin. spec. 1. p. 242.) leaves coarsely and acutely toothed: radical ones on long petioles, cordate, ovate-roundish: cauline ones on short petioles, ovate-lanceolate, acute; bracteas large, obovate, coarsely toothed. ♃. H. Native of Dalmatia, Carniola, south of Tyrol, and in the region of Mount Baldo, on the alps, among rocks. Jacq. fl. austr. append. t. 50. Host, fl. austr. 1. p. 275. Alph. D. C. mon. p. 181. but not of Vill. Gouan, nor D. C. fl. fr.—Ponæ, descript. mont. bald. in Clus. hist. p. 336. with a figure. Barr. pl. obs. t. 889.—Bauh. prod. p. 33. with a figure. Moris. oxon. sect. 5. t. 5. f. 49.—J. Bauh. hist. 2. p. 811. with a figure.—Pluk. phyt. t. 152. f. 6. Root woody. Plant glaucous. Leaves glabrous or pilose. Flowers on short peduncles, disposed in loose umbel-formed fascicles. Corolla inflated at the base, tube-formed, purple or blue.

Tufted Rampion. Fl. July. Clt. 1752. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

SECT. II. HEDRA'NTHUM (from *ἑδρα, hedra*, a seat; and *ανθος, anthos*, a flower; in reference to the flowers being sessile). Segments of corolla cohering a long time at the apex, but at length becoming free. Filaments expanded at the base. Stigmas 2-3. Capsule 2-3-celled. Flowers sessile, densely crowded, usually many from the axil of each bractea.

§ 1. *Heads at the time of blossoming hemispherical or globose, but at length either globose or somewhat egg-shaped.*

* *Bracteas numerous, equal, and broad.*

2 P. GLOBULARIÆFÒLIUM (Stenrb. in Hoppe, denk. bot. in regensb. 2. p. 100.) radical leaves crowded, obovate, broad, a little toothed at the apex: cauline leaves few, sessile, obovate-lanceolate, somewhat ciliated; heads few-flowered; bracteas very broad, ovate-roundish, ciliated, a little toothed at the apex. ♃. H. Native of Illyria, Carniola, and Carinthia, on the alps, and on the alps of Salisburgh. Rchb. icon. bot. cent. 4. p. 49. t. 365. Rœm. et Schultes, syst. 5. p. 76. exclusive of syn. of All. Vill. Lam. and D. C. Hall. and Bauh. P. pauciflòrum, Hænke, in Jacq. coll. 2. p. 63. Host, fl. austr. 1. p. 274. but not of Lin.—Mor. oxon. 2. p. 464. sect. 5. t. 5. f. 50. Plant glabrous, except the ciliæ at the base of the leaves. Corollas blue.

Globularia-leaved Rampion. Fl. May, July. Clt. 1820. Pl. 1 to 2 inches.

3 P. PAUCIFLÒRUM (Lin. spec. 1. p. 241.) leaves entire; radical ones crowded, short, narrow-linear, or obovate-lanceolate; cauline leaves few, sessile, linear-lanceolate; heads few-flowered; bracteas ovate, acute, ciliated, a little toothed at the base. ♃. H. Native of the Central and Eastern Pyrenees, especially on the alps at Col de Tende; Dauphiny, Mount Cenis, Vallais, Carinthia, on the alps; and probably on the alps of Carniola, Transylvania, and France. All. ped. 1. p. 115. Vill. dauph. 2. p. 515. Rchb. icon. bot. cent. 4. p. 48. t. 364. Rapúnculus pauciflòrus, Scop. carn. ed. 2. no. 241. ex Rœm. et Schultes. P. lanceolàtum, Schleich. cat. 1821. Heads of flowers globose; corollas blue.

Var. β; flowers white or yellow. ♃. H. Native of Switzerland.

Hemispherical-headed Rampion. Fl. July. Clt. 1752. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

5 P. CARE'STIÆ (Birol, in act. taur. 5. p. 315. with a figure). radical leaves crowded, lanceolate, on long petioles, nearly quite entire: cauline leaves linear-lanceolate, somewhat serrated; bracteas spreading or reflexed, broad-ovate, acuminated, acutely serrated, glabrous. ♃. H. Native of Corsica, on the moun-

tains; and in valleys among the mountains of Sesia. Brugnat. giorn. di. fisic. 1. dec. 2. p. 37. Lois. fl. gall. 1. p. 145. exclusive of the syn. *P. Siebèri*. Plant glabrous. Heads of flowers spherical. Corollas blue.?

Carestia Rampion. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

6 P. HU'MILIS (Schleich. exsic. Murr. guid. en. val. p. 84.) radical leaves crowded, linear-lanceolate, narrow at the base, nearly entire: cauline leaves few, linear, entire; bracteas ovate-lanceolate, long-acuminated, toothed and serrulated, somewhat ciliated. ♃. H. Native of Vallais, in the fissures of rocks; on Mount Reffel, in the valley of St. Nicholas, and elsewhere in the same valley, &c. Hegetschw. reis. p. 146. t. 16. fl. helv. 2. p. 422. in add. ex Gaud. fl. helv. 2. p. 173. exclusive of the syn. *P. Caréstiæ*. Plant glabrous. Heads of flowers globose. Corollas blue.

Var. β, humíllima (Alph. D. C. mon. p. 186.) root thick; stems very short. ♃. H. P. hùmile *β*, Gaud. l. c. P. hùmile, Rchb. icon. bot. t. 364. f. 546.

Humble Rampion. Fl. July, Aug. Clt. 1825. Pl. $\frac{1}{4}$ foot.

7 P. SIEBE'RI (Spreng. pug. 1. no. 29. Rœm. et Schultes, syst. 5. p. 80.) radical leaves petiolate, ovate-roundish, subcordate, crenated: lower cauline leaves petiolate, lanceolate, coarsely toothed: superior ones stem-clasping, acutely toothed; bracteas ovate, acuminated, pilose, coarsely and acutely toothed. ♃. H. Native of the Apennines, Carniola, and Tyrol, on the alps. Rchb. icon. bot. t. 214. P. Charmèlii, Sieb. P. orbiculàre, var. Schrad. P. intermèdium, Jan. in herb. Sering. Stem glabrous or pilose. Heads of flowers spherical. Corollas deep blue.

Sieber's Rampion. Fl. May, July. Clt. 1826. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

8 P. ORBICULA'RE (Lin. spec. 1. p. 242.) radical leaves petiolate, lanceolate, subcordate, crenated: cauline leaves sessile, linear-lanceolate; bracteas ovate, acute, entire. ♃. H. Native of the alps of Europe, from Abruzzo to Arragon, and the Pyrenees; also of Galicia, Saxony, Transylvania, Switzerland, and on the Carpathian mountains. In England, in pastures and by road sides, on a chalky soil, but rare on the downs of Sussex and Hampshire, in many places; in several parts of Surrey and Kent; plentiful near Leatherhead. Jacq. fl. austr. t. 437. Smith, engl. bot. t. 142. Lodd. bot. cab. t. 122. Hook. fl. lond. t. 55. P. comòsa, Gouan, fl. monsp. p. 26. Rapúnculus orbiculàris, Scop. fl. carn. 2. ed. 1. p. 150. demonstr. bot. t. 34. P. cordàtum, Vill. dauph. 2. p. 517. t. 11. f. 1. Sims, bot. mag. t. 1466. P. hemisphæ'ricum, Geners. elench. scep. no. 195. P. Scheuchzèri, Lapeyr. abr. p. 109. P. Michèlii, Hegetschw. reis. p. 148. t. 33. but not of others. P. corniculàtum, Riv. mon. irr. t. 109. f. 1. Leaves glabrous or pilose. Heads round. Corollas deep blue.

FIG. 130.

Var. β, lanceolàtum (Alph. D. C. mon. p. 188.) stem larger; leaves long-lanceolate, less cordate. ♃. H. Native throughout France. P. lanceolàtum, Vill. dauph. 2. p. 517. t. 12. f. 1. P. orbiculàre *β*, Lam. et D. C. fl. fr. no. 2861. Pl. 1 ft. high.

Var. γ, gigantèum (Alph. D. C. mon. p. 188.) stem taller; leaves long-lanceolate, less cordate. ♃. H. Native of France. V. ellípticum, Vill. dauph. 2. p. 517. t. 11. f. 2. P. orbiculàre *γ*, Lam. et D. C. fl. fr. no. 2860. Plant 1½ foot high.

Var. δ, comòsum (Alph. D. C. mon. p. 188.) bracteas larger. ♃. H. Native of France. P. comòsum, Vill. dauph. 2. p. 517. Lam. et D. C. fl. fr. no. 2860. Rapúnculus, Lam. fl. fr. 3. p. 331. P. orbiculàre *δ*, D. C. fl. fr. suppl. no. 2861.

Var. ε, Colúmnæ (Alph. D. C. mon. p. 188.) radical leaves small, ovate-cordate: lower cauline leaves lanceolate, serrated.—Column. ecphr. pt. 1. p. 223. t. 224.

Var. η, decípiens (Alph. D. C. mon. p. 188.) humble; radical leaves short, elliptic-linear or linear, obsoletely crenated: cauline leaves sessile, linear, bluntish. ♃. H. Native of Switzerland. P. brevifòlium, Schleich. cat. 1821. p. 25. P. pilòsum, Hegetschw. reis. p. 149. f. 34. P. orbiculàre, Gaud. fl. helv. 2. p. 176.

Orbicular-leaved Rampion. Fl. June, Aug. England. Pl. $\frac{1}{2}$ to $1\frac{1}{2}$ foot.

* * *Bracteas few, unequal, narrow.*

9 P. CHARME'LII (Vill. dauph. 2. p. 516. t. 11. f. 3.) leaves of various forms; radical ones on long petioles, cordate, ovate, acute, coarsely serrate-toothed: lower cauline ones petiolate, lanceolate, irregularly serrate-toothed; heads spherical; bracteas short, linear-lanceolate, spreading. ♃. H. Native of Piedmont, Provence about Colmars, Dauphiny, and the Central Pyrenees. All. auct. fl. pedem. p. 8. Alph. D. C. mon. p. 189. P. orbiculàre *δ*, Willd. spec. 1. p. 922. P. orbiculàre, A. Lam. ill. no. 2586. Poir. dict. 6. p. 73. P. Scheuchzèri, Benth. cat. p. 111.—Column. ecphr. 1. t. 224. obs. t. 525. and t. 526. Plant glabrous. Heads spherical. Corollas blue.

Charmeli's Rampion. Fl. May, Aug. Clt. 1823. Pl. $\frac{1}{2}$ to 1 foot.

10 P. SCHEUCHZE'RI (All. pedem. no. 428. t. 39. f. 2.) radical leaves petiolate, ovate-lanceolate, bluntly serrated: lower cauline ones linear-lanceolate, acutely serrulated: upper ones linear, nearly entire; heads spherical; bracteas very long, reflexed. ♃. H. Native of Vallais, and nearly throughout the whole southern declivities of the alps from Piedmont, through Provence, even to Tyrol. Sims, bot. mag. 1797. Rchb. icon. bot. t. 366. P. ovàtum, Lam. ill. no. 2585. exclusive of the syn. All. t. 7. f. 3. P. corniculàtum, Clairv. man. p. 63. Gaud. fl. helv. 2. p. 177.—Scheuchz. itin. 6. p. 460. Plant glabrous. Corollas deep blue.

Var. β, corniculàtum (Alph. D. C. mon. p. 191.) radical leaves deeply cordate; bracteas longer than the heads or shorter. ♃. H. Native of Vallais and Switzerland. P. Charmèlii, Murr. guid. en. vall. p. 84. Hegetschw. fl. helv. 2. p. 421. Schleich. pl. exsic. P. Colúmnæ, Thom. cat. 1818. P. corniculàtum, 2. Gaud. fl. helv. 2. p. 178. P. Charmelioides, Birol.

Scheuchzer's Rampion. Fl. May, June. Clt. 1813. Pl. 1 foot.

§ 2. *Heads cylindrical, conical, or ovate at the time of flowering, but at length they become more elongated.*

11 P. SCORZONERIFÒLIUM (Vill. dauph. 2. p. 519. t. 12. f. 2.) leaves of various forms; radical ones petiolate, ovate-cordate or ovate: cauline leaves linear-lanceolate; spikes ovate; bracteas reflexed, linear, glabrous. ♃. H. Native of Dauphiny, Vallais, Carniola, Savoy, &c. on the mountains. Rchb. icon. bot. 3. t. 249. Gaud. fl. helv. 2. p. 181. exclusive of the syn. P. scorzonerifòlium, D. C. and persicifòlium, Hoppe. P. Scheuchzèri *β*, Pers. ench. 1. p. 193. P. Scheuchzèri *γ*, Schultes, fl. austr. 2. ed. no. 881. P. betonicæfòlium, Sims, bot. mag. t. 2066. but not of Vill. P. Michèlii, Schmidt, fl. bohem. no. 187. Bert. amœn. ital. p. 342. but not of All. Plant glabrous. Stems simple. Corollas pale blue.

Var. β; flowers deep blue. ♃. H. P. scorzonerifòlium, Sims, bot. mag. t. 2271.

Salsefy-leaved Rampion. Fl. July, Aug. Clt. 1819. Pl. 1 to 2 feet.

12 P. MICHE'LII (All. pedem. 1. p. 115. no. 427. f. 7—3.)

radical leaves linear-lanceolate: cauline leaves linear; spikes ovoid, nearly globose; bracteas reflexed, linear, downy; calyx pilose in the middle; stigmas 2. ♃. H. Native of Mount Cenis. Rchb. icon. bot. t. 348. Alph. D. C. mon. p. 195. but not of Hegetschw. Bertol. Pollin. nor Schmidt.—Till. pis. p. 146. Mich. hort. pis. et flor. p. 80. Bass. comm. acad. bonon. 4. p. 289. t. 1. Leaves glabrous or pilose. Corollas blue.

Micheli's Rampion. Fl. June, July. Clt. 1822. Pl. 1 ft.

13 P. BETONICÆFÒLIUM (Vill. dauph. 2. p. 518. t. 12. f. 3.) lower leaves oblong, acuminated, simply serrulated: superior ones linear-lanceolate, nearly entire; spikes ovoid, almost bractless; stigmas 3. ♃. H. Native of the Pyrenees, Provence, alps of Dauphiny, Savoy, Switzerland, Apennines, Carniola, Bohemia, &c. Rchb. icon. bot. t. 250. but not of Sims, bot. mag. Stems glabrous. Leaves glabrous or pilose. Corollas blue.

Var. β, pubéscens (Alph. D. C. mon. p. 194.) leaves downy, and particularly so on the petioles. ♃. H. Native along with the species. P. cordifòlium, Lapeyr. abr. p. 110. but not of Vill. P. betonicæfòlium, Gaud. fl. helv. 2. p. 181.

Var. γ, sessilifòlium (Alph. D. C. l. c.) radical leaves sessile, crowded, linear-lanceolate, not cordate. ♃. H. Native of Savoy, on the mountain called Cramont, and on St. Bernard.

Betony-leaved Rampion. Fl. June, July. Clt. 1818. Pl. ½ to 1 foot.

14 P. VERONICÆFÒLIUM (Schrad. in litt. ex Alph. D. C. mon. p. 196.) lower leaves on long petioles, cordate, long-lanceolate, simply serrated: superior ones sessile, linear-lanceolate, serrulated; spikes cylindrical, acuminated; bracteas setaceous, glabrous; calyxes glabrous; stigmas 2-3. Native of Salisburgh, in the valley of Cillara. Root turnip-formed. Leaves pilose. Stem downy at the base, simple. Corollas blue.

Speedwell-leaved Rampion. Pl. 2 feet.

15 P. PERSICIFÒLIUM (Hoppe, cent. exsic. ex Alph. D. C. mon. p. 196.) lower leaves petiolate, oblong-lanceolate, simply crenulated: cauline leaves linear-lanceolate, nearly entire; spikes oblong; bracteas linear-lanceolate, glabrous; calyxes glabrous; stigmas 2-3. ♃. H. Native of Carinthia, in alpine meadows; and the province of France called Lozère. P. scorzoneræfòlium. Lam. et D. C. fl. fr. ed. 3d. no. 2866. Plant glabrous. Leaves like those of *Campánula persicifòlia*. Corollas blue.?

Peach-leaved Rampion. Pl. 1 to 2 feet.

16 P. SPICA'TUM (Lin. spec. p. 242.) lower leaves on long petioles, cordate, ovate-acute, biserrated: superior ones ovate-lanceolate; spikes cylindrical, elongated; bracteas linear-subulate, glabrous; calyxes glabrous; stigmas 2. ♃. H. Native of the temperate parts of Europe, in woods even from the Pyrenees, Cevennes, Provence, Piedmont, Apennines, and Carniola, to the north of Germany; also of Galicia, Podolia, Transylvania, and Volhynia. Lam. ill. no. 2589. t. 124. f. 1. Oed. fl. dan. t. 362. Gærtn. fr. 1. p. 149. t. 30. Schkuhr, ench. no. 430. t. 39. Sims, bot. mag. t. 2347. Root fusiform. Plant glabrous. Stems simple. Flowers white, cream-coloured, or blue.

Var. β, bracteàtum (Alph. D. C. mon. p. 198.) plant pilose; cauline leaves large, on long petioles; bracteas long. ♃. H. Native of the Pyrenees. P. Hallèri, D. C. et Dub. bot. gall. p. 312. but not of Lam.

Spiked-flowered Rampion. Fl. July, Aug. Clt. 1597. Pl. 1 to 3 feet.

17 P. HALLE'RI (All. pedem. 1. p. 116.) lower leaves on long petioles, cordate, ovate-acute, doubly and coarsely serrated: superior ones lanceolate, serrated; spikes ovate-oblong; bracteas lanceolate, glabrous; calyxes glabrous; stigmas 2. ♄. H. Native of the lower alps of Provence; alps of Piedmont, throughout Switzerland and Salisburgh; on Mount Cenis; of Carinthia, Bohemia, and Transylvania. Lam. et D. C. fl. fr. ed. 3d. no. 2868. Alph. D. C. mon. p. 199. but not of D.C. and Dub. bot. gall. P. ovàtum, Schmidt, new. abhand. bohem. pt. 1. p. 20. Willd. spec. 1. p. 923. P. urticæfòlium, Clairv. man. miss. p. 63. P. spicàtum, β, cærùleum, Hegetschw. reis. p. 149.—Scheuchz. itin. 7. p. 518.—Hall. helv. no. 683. Stem simple. Leaves glabrous. Corollas deep violet.

Haller's Rampion. Fl. July, Aug. Clt. 1822. Pl. 2 to 3 feet.

18 P. NI'GRUM (Schmidt, fl. bohem. 1. p. 87.) lower leaves petiolate, cordate, ovate-acute, simply crenulated; superior ones sessile, linear-lanceolate, serrulated; spikes ovate; bracteas reflexed, linear-lanceolate, glabrous; calyxes glabrous; stigmas 2. ♃. H. Native of Bohemia. Willd. spec. 1. p. 922. exclusive of the syn. of Vill. Rœm. et Schultes, syst. 5. p. 81. P. spicàtum, var. γ, Pohl, tent. fl. bohem. p. 210. P. Charmèlii, Panz. in herb. D. C. Plant glabrous. Stem simple. Corolla of a very dark violet, almost black.

Black-flowered Rampion. Fl. June, July. Clt. 1820. Pl. 1 to 2 feet.

19 P. BALBÍSII (Alph. D. C. mon. p. 200.) radical leaves petiolate, cordate, ovate-acute: cauline leaves few, nearly sessile, ovate, acuminated; spikes oblong-cylindrical; bracteas few, linear, rather pilose; calycine lobes rather pilose; stigmas 3. ♃. H. Native of Piedmont, in Valley Pesio. P. cordàta, Balb. misc. alt. p. 10. Plant glabrous. Corollas white; anthers yellow.

Var. β, petræ'um (Alph. D. C. mon. p. 200.) leaves entire; superior ones long-lanceolate. ♃. H. Rapúnculus petrèus, Alp. exot. p. 343. and p. 344. with a figure. Moris. oxon. sect. 5. t. 1. f. 12.

Balbis's Rampion. Pl. ½ foot.

SECT. III. PODA'NTHUM (from πους ποδος, *pous podos*, a foot; and ανθος, *anthos*, a flower; in reference to the flowers being pedicellate). Segments of corolla cohering a long time at the apex, but at length free. Filaments expanded at the base. Stigmas 3. Capsule 3-celled.—Flowers on short pedicels, disposed in loose spikes, 2 or 3 rising from the axil of each bractea.

20 P. TENUIFÒLIA (Alph. D. C. mon. p. 201.) stems simple, glabrous at bottom, but rather roughish at top; cauline leaves linear, entire, very narrow; flowers spicate. ♃. H. Native about Constantinople. Spikes 3 inches long, loose at the base, and dense at top. Corolla whitish. Anthers yellow.

Fine-leaved Rampion. Fl. Aug. Pl. 1 ft.

21 P. LIMONIIFÒLIUM (Sibth. et Smith, fl. græc. t. 218.) stem branched; radical leaves on long petioles, quite glabrous, lanceolate, a little toothed; spikes long, interrupted; calyxes glabrous; capsules ovoid, glabrous. ♃. H. Native of the Levant, on the top of Mounts Olympus and Lebanon; and of Caucasus on the Talusch mountains. P. strícta, Sims. bot. mag. 2145. P. virgàta. Lodd. bot. cab. t. 667. P. stylòsum Schrank, pl. rar. mon. fasc. 5. t. 49. Campánula limoniifòlia. Lin. spec. 1. p. 239. Stems twiggy. Plant glabrous. Flowers sessile, blue.

Limonium-leaved Rampion. Fl. June, July. Clt. 1819. Pl. 2 to 3 feet.

22 P. COLLÌNUM (Guss. pl. rar. p. 97. t. 19.) stem nearly simple; radical leaves lanceolate, attenuated at both ends, roughish, repandly denticulated; spikes somewhat interrupted; capsules turbinate, scabrous. ♃. H. Native of Japygia, on arid hills, by the sea side. Campánula virgàta, Ten. fl. neap. 1. p. 66. but not of Labill. Stems downy, simple or a little branched. Leaves glabrous or downy. Corollas blue.

Hill Rampion. Pl. 1 foot.

23 P. LOBELIOÌDES (Willd. phyt. 1. no. 20. t. 4. f. 2.) stem

nearly simple, roughish; leaves scabrous, petiolate, linear-lanceolate, acutely denticulated; flowers scattered, on short pedicels; calyxes scabrous. ♃. H. Native of Armenia.—Tourn. cor. p. 4. Flowers solitary or twin, blue.?

Lobelia-like Rampion. Pl. ½ foot.

24 P. lanceola'tum (Willd. spec. 1. p. 924. Desf. in ann. mus. 11. p. 55. t. 5. or choix, des. pl. p. 34. t. 24.) glabrous; stems branched; radical leaves crowded, on short petioles, lanceolate, serrated; flowers scattered, solitary, on short pedicels. ♃. H. Native of Armenia. Alph. D. C. mon. p. 204.—Tourn. cor. p. 4. Stems 2-3, rising from the middle of the radical leaves, almost naked. Flowers scattered on the tops of the stems. Corollas white, with red nerves.

Lanceolate-leaved Rampion. Fl. June, July. Clt. 1826. Pl. ½ to 1 foot.

25 P. repa'ndum (Sibth. et Smith, prod. fl. græc. 1. p. 143.) stem glabrous; radical leaves crowded, petiolate, elliptic-oblong, repand, glabrous; petioles imbricated at the base; flowers spicate; bracteas fringed. ♃. H. Native of Mount Olympus. Leaves rosulate, very like those of *Globulària acaúlis*. Flowers disposed in a loose spike.

Repand-leaved Rampion. Pl. ¼ to ½ foot.

26 P. rígidum (Willd. spec. 1. p. 925. exclusive of the syn. of Tourn.) stem very simple, glabrous; radical leaves linear-lanceolate, furnished with very minute teeth on the edges; flowers scattered. ♃. H. Native of the Levant. Peduncles branched a little, 3-flowered.

Stiff Rampion. Pl. ½ foot.?

27 P. cane'scens (Waldst. et Kit. pl. hung. 1. p. 12. t. 14.) plant scabrous; stems simple; cauline leaves sessile, ovate-lanceolate, crenulated; flowers disposed in long spikes. ♃. H. Native of Hungary, Transylvania, Galicia, Podolia, Tauria, and Caucasus. Leaves greyish. Flowers 1-3 from the same bractea, sessile. Corolla of a violet blue colour. Plant yielding a yellow viscid juice.

Canescent Rampion. Fl. July, Aug. Clt. 1804. Pl. 1 to 3 feet.

28 P. salicifòlium (Waldst. et Kit. ined. Bess. prim. fl. gal. 1. p. 368. Alph. D. C. mon. p. 205.) stem quite simple, glabrous; lower leaves ovate-lanceolate, serrate-toothed: superior ones sessile, lanceolate, acutely serrated; spikes short; calyxes glabrous. ♃. H. Native of Hungary, on calcareous rocks. Leaves glabrous, except the margins, which are a little hairy. Spike almost an inch long. Flowers solitary, sessile. Corollas blue or violaceous?

Willow-leaved Rampion. Pl. ½ to 1 foot.

29 P. campanuloìdes (Bieb. fl. taur. 1. p. 156.) stem simple, glabrous; lower leaves petiolate, ovate, bluntish, crenated: middle ones broad, sessile, ovate-acute, crenated: superior ones lanceolate, serrated; spikes short, dense; calyxes glabrous. ♃. H. Native of Caucasus, about Nartzana and the sides of Mount Beschtau. Sims, bot. mag. t. 1015. Alph. D. C. mon. p. 206. Campánula alopecuroìdes, Willd. herb. Leaves glabrous, or with the margins and nerves pilose. Flowers disposed in a spike 2-3 inches long, 1-3 together, from the axils of the bracteas. Corolla of a violaceous blue colour.

Var. β, Sibthorpiànum (Alph. D. C. mon. p. 206.) stems and leaves hairy. ♃. H. Native of Mount Olympus. P. ellípticum, Sibth. and Smith, prod. fl. græc. 1. p. 143. fl. græc. t. 217. P. Sibthorpiànum, Rœm. et Schultes, syst. 5. p. 84.

Campanula-like Rampion. Fl. June, Aug. Clt. 1804. Pl. 1 to 2 feet.

30 P. amplexicau'le (Willd. spec. 1. p. 925.) glabrous; stems simple; cauline leaves somewhat stem-clasping, ovate-acute, broad, acutely serrated; spikes dense, fascicled; calycine lobes capillary. ♃. H. Native of Armenia. Sibth. et Smith, fl. græc. t. 219.—Tourn. cor. p. 4. Flowers sessile, 1-3 from the same bractea. Corollas blue.

Stem-clasping-leaved Rampion. Pl. 1 to 1½ foot.

† *Species little known.*

31 P. Sibíricum (Vest, ex Rœm. et Schultes, syst. 5. p. 77.) heads many-flowered; flowers all bracteate; bracteas oblong, stiff, acute; leaves all linear-cuneated, toothed; stem erect, leafy. ♃. H. Native of Siberia. P. pauciflòrum, Johann. herb. ex Rœm. et Schultes. Stem 2 inches high. Leaves 3-4 lines long. Heads of flowers like those of some species of *Scabiòsa* or *Globulària*.

Siberian Rampion. Pl. 2 inches.

32 P. inæqua'tum (Kit. ex Schultes, fl. austr. ed. 2d. no. 883.) heads nearly globose; radical leaves lanceolate, unequal at the base, cordate, serrated: cauline leaves linear: superior leaves sessile, quite entire. ♃. H. Native of Austria. Rœm. et Schultes, syst. 5. p. 80. Very nearly allied to *P. Charmèlii*.

Unequal-leaved Rampion. Pl. ½ to 1 foot.

33 P. fistulòsum (Reich. fl. dresd. fl. bot. zeit. 5. p. 534.) leaves lanceolate, a little toothed, acuminated; stem erect, simple, striated; heads cylindrical. ♃. H. Native of Austria. P. Scheuchzèri, Schmidt, fl. bohem. fic. fl. dresd. ed. 2. P. orbiculàre, Buch. fl. dresd. fic. dresd. ed. 1. P. orbiculàre alpìnum, Jacq. fl. austr. 437. left-hand figure. This plant has a very peculiar habit, but the flowers have not been seen.

Fistular Rampion. Pl. 1 foot.

34 P. stylòsum (Bess. cat. hort. crem. 1816. Rœm. et Schultes, syst. 5. p. 88.). Nothing is known of this plant but the name.

Long-styled Rampion. Pl.

35 P.? minu'tum (Rœm. et Schultes, syst. 5. p. 87.) radical leaves ovate-spatulate, sinuated: cauline leaves spatulate, quite entire, obtuse, all glabrous; flowers axillary, terminal. ♃. H. Native on the top of Serra Texeda. Campánula Aghard, in litt. to Rœm. et Schultes. Radical leaves crowded. Stems ascending or decumbent, simple. Peduncles filiform, length of leaves. Corollas blue.

Minute Rampion. Pl. decumbent.

36 P. supìna (Sieb. in Spreng. syst. 1. p. 810.) stem creeping, diffuse; leaves spatulate, subcrenated; heads terminal; bracteas ovate, crenated, equal in length to the flowers. ♃. H. Native of Asia Minor.

Supine Rampion. Pl. creeping.

Cult. All the species of *Phyteùma* being hardy and ornamental, they are well fitted for decorating flower-borders, or rock-work. They grow in any common garden soil, and are readily increased by division or by seeds.

XIII. PETROMA'RULA (*from* πετρος, *petros*, a rock; and μαρον, *maron*, a bitter herb; *the plant is bitter, and grows on rocks by the sea side*). Bellus. episc. 1. in Clus. hist. pt. 2. p. 299. Alph. D. C. mon. p. 209. Phyteùma species, Lin.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla 5-parted. Stamens 5, alternating with the lobes of the corolla; filaments broad at the base, longer than the anthers; pollen violaceous. Style glabrous; stigma capitate, 3-lobed, rather pilose. Ovarium 3-celled, inferior. Capsule erect, dehiscing laterally by 3 pores in the middle part.—An herb, native of Candia.—First radical leaves petiolate, ovate, acute; those afterwards pinnate, with the petioles marginated and lobed. Flowers pedicellate, disposed in loose racemes.

1 P. pinna'ta (Alph. D. C. mon. p. 209.). ♃. or ♂. H. Native of Candia, on rocks by the sea side. Sweet, fl. gard. n.

s. t. 224. Phyteùma pinnàtum, Lin. spec. 1. p. 242. Lam. ill. no. 2591. Vent. cels. t. 52. Sibth. et Smith, fl. græc. t. 226. Rœm. et Schultes, syst. 5. p. 86. Petromárula Rapúnculum Créticum &c. Barrel. icon. 1154.—Moris. oxon. 2. p. 454. —Park. theatr. 649. f. 5.—Moris. ox. sect. 5. t. 1. f. 8.—Ponæ. bald. p. 38. with a figure.—Bauh. hist. 2. p. 811. Plant glabrous, 3-6 feet. Root fusiform. Leaves large, pinnatifid. Racemes long, forming terminal panicles. Corollas blue or white.

Var. β, pubéscens (D. C. prod. 4. p. 209.) panicle and calyxes downy. ♃. or ♂. H. Native of Candia. Phyteùma pinnàtum. Rchb. hort. bot. t. 137.

Pinnate-leaved Petromarula. Fl. Aug. Clt. 1640. Pl. 3 to 6 feet.

Cult. A light rich soil, and a warm sheltered situation, are the best for this plant. It is increased slowly by division, but plentifully by seed. The plant requires shelter in severe weather in winter.

XIV. MICHAU'XIA (named in honour of Andrew Michaux, botanist to the King of France, who travelled into Syria, Persia, and North America, and discovered this his genus). Lher. diss. Lam. ill. 2. t. 295. Gærtn. fil. suppl. p. 162. t. 211. Alph. D. C. mon. p. 211.—Míndium rhàzes, Adans. fam. 2. p. 134. Juss. gen. p. 164.

Lin. syst. *Octándria, Monogy'nia.* Calyx 8-10-cleft, having the recesses covered by appendages. Corolla 8-10-parted, rotate. Stamens 8-10, free; filaments very broad, membranous, approximate at the base; anthers yellow, cuspidate at the apex. Style covered by hairs, which are disposed in 16 rows; stigmas 8, filiform. Ovarium wholly inferior, 8-celled: cells opposite the calycine lobes. Capsule drooping, 8-10-valved, dehiscing at the base. Seeds numerous, ovate, rusty, inserted in fleshy receptacles, which are situated at the inner angles of the cells.—Handsome biennial herbs, natives of the Levant, with the habit of *Campánula*, but the recesses or sinuses of the calyx are covered, and the leaves are lyrate.

1 M. campanuloìdes (Lher. diss. mon. with a figure) stem pilose; radical leaves lanceolate, irregularly lobed; petioles marginated and lobed; appendages of the sinuses of the calyx shorter than the lobes. ♂. H. Native of the Levant, about Aleppo, and on Mount Lebanon. Lam. ill. 2. t. 295. Curt. bot. mag. 219. Alph. D. C. mon. p. 211. Campánula lyræfòlia, Salisb. prod. p. 127. Michaúxia strigòsa, Pers. syn. 1. p. 418. —Moris. oxon. 2. p. 460. sect. 5. t. 31. Míndium Rhàzes, Adans. fam. 2. p. 134. Mèdium Dioscóridis, or Míndium Rhàzis, Rauw. hodoep. part. 2. chapt. 12. p. 284. and part. 4. t. 35. Root fusiform. Stem branched at top. Leaves strigose as well as the stem, 3-4 inches long. Flowers drooping, scattered along the stem and branches, from the axils of bracteas, on short pedicels, purple or pale red, octandrous. Corolla, calyx, and stigma, 8-parted.

Campanula-like Michauxia. Fl. July, Aug. Clt. 1787. Pl. 6 feet.

2 M. lævigà'ta (Vent. cels. t. 81.) stem glabrous; leaves hispid, doubly toothed; radical ones ovate, on long petioles: cauline ones sessile, oblong, lower ones attenuated at the base, upper ones cordate; appendages of the sinuses of the calyx longer than the lobes. ♂. H. Native of Persia. Gærtn. fruct. suppl. p. 162. t. 211. f. 6. Hook. bot. mag. 3128. M. decándra, Fisch. Root branched. Stem and leaves glaucescent, the latter strigose. Flowers on short pedicels, horizontal, solitary, and scattered along the top of the stem and branches, decandrous, whitish. Calyx, corolla, and stigma, 10-parted.

Smooth-stemmed Michauxia. Fl. Sept. Oct. Clt. 1820. Pl. 8 to 10 feet.

Cult. The seeds only require to be sown in the open ground, and the plants treated like other biennials. They require some protection in severe weather in winter.

XV. CAMPA'NULA (a dim. of *campana*, a bell; referring to the shape of the flowers). Fuchs. hist. p. 43. Tourn. elem. 2. p. 90. t. 37-38. Alph. D. C. mon. p. 213.—Campánula species, Lin. gen. no. 290. Adans. fam. nat. 2. p. 134. Juss. gen. p. 164. Gærtn. fruct. 1. p. 153. t. 31. Neck. elem. 1. p. 234. Schk. ench. no. 117. t. 39. Lam. ill. no. 345. t. 123. Vent. tabl. 2. p. 470. R. Br. prod. p. 560.—Roucèla, Dumóntier, comm. bot. p. 14.—Mèdium, Fisch. mss.—Erìneon, Pliny, 23. ch. 17.—Cervicària species, Cord. Dod. pempt. 164.—Ràpum species, Ruell. p. 458.—Trachèlium, Lob. hist. 176.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft, having the sinuses usually covered by appendages. Corolla 5-lobed or 5-cleft at the apex, usually bell-shaped. Stamens 5, free; filaments broad at the base and membranous. Style covered by fascicles of hairs, except at the base; stigmas 3-5, filiform. Ovarium wholly inferior, 3-5-celled. Capsule 3-5-valved, dehiscing laterally. Seeds usually ovate, flattened, sometimes ovoid, and small.—Herbs usually perennial, rarely annual or biennial. Radical leaves usually different in form from the cauline ones, especially in size. Flowers for the most part pedunculate, usually racemose, rarely spicate or glomerate, blue or white.—All the species are inhabitants of the northern hemisphere.—The names *Trachèlium* and *Cervicària* are the oldest names used for this genus, which were given to it on account of its supposed efficacy in the cure of disorders of the neck and trachea; hence it has the name of *Halskraut* or *Halswort* in German, *Halsurt* in Danish, and *Throatwort* in English; and some European species have the name of *Rapúnculus*, from the resemblance of the root to that of a turnip; hence they have the names *Ràpum*, *Rapúntum*, *Rapúnculus*, &c., from whence spring the French name *Raiponce*, the German *Rapunzel*, the Spanish one of *Rapiunchigo*, and the English one of *Rampion*.

Sect. I. Me'dium (a name employed by Dioscorides for some species of Bell-flower). Alph. D. C. mon. p. 216.—Μηδιον, Diosc.—Mèdium, Fisch. mss. Mariánthemum, Schrank, hort. monac.—Rapúntia, Cheval. fl. par. 2. p. 526. Sinuses of calyx covered by reflexed appendages. Capsule 3-5-celled, dehiscing by valves at the base.

§ 1. *Capsule 5-celled. Stigmas 5.—Stems many-flowered. Radical leaves on long petioles.—Inhabitants of Greece and the adjacent regions.*

* *Lower leaves irregularly lyrate or jagged; petioles marginated and lobed.*

1 C. crìspa (Lam. dict. 1. p. 581.) glabrous; stems simple; leaves smooth, coarsely and crenately toothed: radical ones bidentate, jagged: cauline leaves sessile, ovate, acute; flowers pyramidally racemose; calyx scabrous, with the appendages of the sinuses small and tooth-formed; corolla broad, campanulate, roughish on the outside. ♃. H. Native of Armenia, about the city of Kars and Erzeroum. Alph. D. C. mon. p. 216.—Tourn. cor. 3. voy. 2. p. 370. Flowers disposed as in *C. pyramidàlis*, rising from the lower or middle part of the stem to the apex from the axils of the leaves. Corolla very open, white or blue.

Curled Bell-flower. Pl. 1 to 1½ foot.

2 C. Ce'lsii (Alph. D. C. mon. p. 217.) plant velvety; stem ascending; lower leaves irregularly lobed: terminal lobe crenated, ovate, acute: superior leaves sessile, obovate crenated; flowers disposed in long panicles; appendages of the sinuses of

the calyx small, tooth-formed; corolla tubular, velvety, 4 times longer than the calycine lobes. ♂. H. Native of Greece. C. tomentòsa, Vent. hort. cels. t. 18. Stem branched. Corollas pale violet.

Cels's Bell-flower. Pl. 2 feet.

3 C. rupe'stris (Sibth. et Smith. prod. 1. p. 142. fl. græc. t. 213.) stems ascending, pilose; leaves hoary: radical ones irregularly pinnate, crenulately toothed: terminal lobe roundish; cauline leaves sessile, ovate, a little toothed; flowers disposed in loose racemes; lobes and appendages of calyx triangular; corolla velvety, tubular, twice longer than the calycine lobes. ♂. H. Native of Spain and the Morea, among rocks. C. lanuginòsa, Willd. in hort. berol. 1. p. 213. but not of Lam. Stems branched. Corolla pale blue, with a white throat.

Rock Bell-flower. Pl. ascending.

4 C. tomentòsa (Lam. dict. 1. p. 584. ill. no. 2537.) plant clothed with hoary tomentum; radical leaves petiolate, irregularly lyrate, crenate-toothed: cauline leaves sessile, obovate: upper ones lanceolate; flowers in loose racemes; appendages of the sinuses of the calyx ovate-lanceolate, one-half shorter than the lobes, which are long-acuminated; corolla tubular, silky, hardly twice the length of the calycine lobes. ♃. H. Native of the Levant. C. lanuginòsa, Willd. in hort. berol. 1. t. 213.? but not of Lam. Stem branched. Peduncles 1-3-flowered. Corollas white.?

Var. β, *Ephèsia* (Alph. D. C. mon. p. 218.) radical leaves not lyrate, regularly crenated; calycine lobes shorter. ♃. H. Campánula, calyce duro, *Ephèsia*, Tourn. herb.

Tomentose Bell-flower. Fl. June, Aug. Clt. 1810. Pl. 1 foot.

5 C. lyra'ta (Lam. dict. 1. p. 588.) plant hispid; lower leaves petiolate, cordate, ovate, acute, crenated: superior ones sessile, ovate-lanceolate, serrate-toothed; flowers racemose; appendages of the sinuses of the calyx ovate, obtuse, length of lobes; corolla tubular, with rather pilose nerves, twice longer than the calycine lobes. ♃. H. Native of the Levant, and about Constantinople. Stem branched. Flowers disposed in a long, many-flowered, loose raceme, violaceous.?

Lyrate-leaved Bell-flower. Fl. June, Aug. Clt. 1823. Pl. 2 feet.

6 C. Andre'wsii (Alph. D. C. mon. p. 220.) plant villous; radical leaves lyrately-pinnatifid: lobes cut; lower cauline leaves petiolate, subcordate, roundish, coarsely toothed: upper ones sessile, obcuneiform, toothed; flowers disposed in loose racemes; appendages of the sinuses of the calyx ovate, one-half shorter than the lobes; corolla campanulate, tubular. ♃. H. Native of the Grecian Islands, on shady rocks. C. laciniàta, Andr. bot. rep. 385. Ait. hort. kew. ed. 2. vol. 1. p. 351. Smith, prod. fl. græc. 1. p. 141. but not of Lin. nor Lam. Stem branched. Flowers in loose, elongated, leafy racemes. Corollas glabrous, pale blue, white or yellow at the base.

Andrews's Bell-flower. Fl. May, Aug. Clt. 1790. Pl. 1 to 2 feet.

7 C. lacinia'ta (Lin. spec. 1. p. 237.) stems rather velvety; leaves rather pilose: radical leaves ovate-lanceolate, coarsely jagged; petioles margined and lobed; flowers disposed in loose panicles; appendages of the recesses of the calyx ovate, acute, one-half shorter than the lobes; corolla large, campanulate, 3 times longer than the calycine lobe. ☉. ♂. H. Native of the Archipelago, among rocks in the island of Cardiotissa. Lam. dict. 1. p. 588. Stem branched. Cauline leaves ovate-lanceolate, sessile, smaller and less jagged than the radical ones. Corollas pale blue.

Jagged-leaved Bell-flower. Fl. June, July. Pl. 2 feet.

8 C. anchusæflòra (Sibth. et Smith, prod. 1. p. 141. fl. græc. t. 212.) stems branched, rather velvety; leaves pilose, ovate-lanceolate; radical leaves petiolate, jagged: cauline ones sessile; flowers disposed in loose panicles; calyxes smoothish; appendages of the sinuses of the calyx ovate, acute, one-half shorter than the lobes. ♂. H. Native of Greece, in the island of Polycandro, and among rocks by the sea side in the island of Hydra. Primordial leaves obovate, crenated. Flowers copious, rather nutant, fine blue.

Anchusa-flowered Bell-flower. Pl. 1 foot.

9 C. tubulòsa (Lam. dict. 1. p. 586.) plant pilose; stems terete; petioles of the lower leaves long, shortly lobed: limb ovate, acute, crenately toothed: superior leaves ovate-lanceolate, serrate-toothed; appendages of the sinuses of the calyx obtuse, one-half shorter than the lobes; corolla velvety, tubular, twice the length of the calycine lobes. ♂. H. Native of the Island of Candia. Flowers few, axillary and terminal, of a greyish violet colour.

Var. β; petioles of radical leaves less lobed. ♂. H. Native of Candia. C. tubulòsa, Desf. pl. cor. in ann. mus. 11. p. 142. t. 17.—Tourn. cor. p. 3.

Tubular-flowered Bell-flower. Pl. 1 to 2 feet.

* * *Lower leaves regularly ovate or lanceolate; petioles not margined.*

10 C. betonicæfòlia (Sibth. et Smith, prod. 1. p. 141. fl. græc. t. 210. but not of Bieb.) stem erect; leaves elliptic-oblong or ovate, acute, crenate-toothed: radical leaves on short petioles; calycine lobes ovate-acute, having the sinuses reflexed and length of the lobes; corollas tubular. ♂. H. Native of Mount Olympus, in Bithynia. Plant pilose. Stem branched. Flowers terminal and axillary; the branchlets usually bearing 3 flowers. Corollas purplish-blue, with a pale yellow base.

Betony-leaved Bell-flower. Fl. May, Aug. Clt. 1820. Pl. 1½ foot.

11 C. corymbòsa (Desf. pl. cor. in ann. mus. 11. p. 139. t. 15. choix. p. 40. t. 30.) stem erect; leaves ovate-acute, crenately toothed: radical ones petiolate: cauline ones sessile; lobes of calyx long-acuminated; appendages of the sinuses of the calyx ovate-acute, one-half shorter than the lobes; corolla campanulately tubular. ♂. H. Native of Candia.—Tourn. cor. 3. Plant pilose. Stem branched. Flowers disposed in loose corymbs, 1-3 at the top of each branch. Corolla bluish violet.

Corymbose-flowered Bell-flower. Fl. May, July. Clt. 1820. Pl. 2 feet.

12 C. pelvifórmis (Lam. dict. 1. p. 586. Desf. choix. in ann. mus. 11. p. 141. t. 16.) stems ascending; radical leaves petiolate, ovate, crenately toothed: cauline ones nearly sessile, ovate-acute; calycine lobes ovate-acuminated; appendages of the recesses of the calyx length of lobes, ovate-roundish; corolla large, campanulate. ♂. H. Native of Candia.—Tourn. cor. inst. p. 3. Plant hairy. Flowers 1-4 at the extremity of each branch. Corollas large, of a greyish-blue colour.

Bowel-shaped Bell-flower. Pl. 1 foot, ascending.

13 C. me'dium (Lin. spec. 1. p. 236.) stem erect; leaves sessile, ovate-lanceolate, crenately toothed; calycine lobes ovate-acuminated, with the appendages of the sinuses reflexed and large, but one-half shorter than the lobes; corolla campanulate, inflated. ♂. H. Native of the south and east of Europe, as about Naples, Carniola, about Constantinople, north of Italy, Provence, Dauphiny at a place called Grande-Chartreuse, Bavaria, Thuringia, Austria, Transylvania, &c., on the mountains; and of Caucasus and Tauria, Hill. syst. 8. t. 7. St. Hil. pl. de. fr. t. 72. C. grandiflòra, Lam. fl. fr. 3. p. 334. Μηδιον, Diosc.—Debry, floril. nov. t. 75. Tabern. icon. 315.—Swert, floril. t. 16. f. 6.—Park. parad. 355. f. 3.—Lob. icon. 324.—Besl. hort. eyst. 1. t. 3. f. 2-3.—Mor. oxon. 2. p. 459. sect. 5. t. 3. f. 30.—Garid.

aix. 1. p. 75. t. 18.—Weinm. phyt. t. 289. Plant hairy. Stem branched. Flowers numerous, large, disposed in racemes. Corollas blue, purple, and white, single and double. It is a very handsome and common border biennial.

Var. β, a monstrous polypetalous plant. Alph. D. C. mon. t. 3. f. A.

Medium Bell-flower, or Canterbury Bells. Fl. July, Sept. Clt. 1597. Pl. 1 to 4 feet.

§ 2. *Capsule 3-celled. Stigmas 3.—Flowers solitary, rarely capitate, few or many.*

* *Stems* 1-*flowered. Radical leaves crowded.*

14 C. Ada'mi (Bieb. fl. taur. 1. p. 153.) leaves ciliated a little: radical ones on long petioles, cuneate-spatulate, coarsely toothed at the apex: cauline leaves sessile, obovate or linear, serrate-toothed; calyx rather pilose, with acuminated lobes, which are 3 times shorter than the corolla; appendages of the sinuses of the calyx 3 times shorter than the lobes, ovate, acuminated. ♃. H. Native of the Alps of Caucasus. Bieb. cent. pl. ross. 1. t. 16. Alph. D. C. mon. t. 9. f. 1. Plant tufted. Root woody. Stems simple. Flowers nearly erect, one on the top of each stem. Corolla funnel-shaped, bluish. Radical leaves tufted.

Adam's Bell-flower. Fl. July, Aug. Clt. 1821. Pl. ½ foot.

15 C. Bieberstei'nia'na (Rœm. et Schultes, syst. 5. p. 147. Alph. D. C. mon. p. 227. t. 9. f. 1.) glabrous; leaves soft, ciliated: radical ones spatulate, toothed at the apex: cauline ones sessile, entire, linear; calycine lobes oblong-lanceolate, twice shorter than the corolla: appendages of sinuses ovate, acuminated, 3 times shorter than the lobes. ♃. H. Native of Caucasus, among Alpine rocks. C. tridentàta, Schreb. dec. 3. t. 2. Rœm. et Schultes, syst. 5. p. 147. C. rupéstris, Bieb. fl. taur. 1. p. 154. Stems erect, 1-flowered, slender. Radical leaves rosulate. Flowers nearly erect, blue?

Bieberstein's Bell-flower. Fl. June, July. Clt. 1820. Pl. ¼ to ½ foot.

16 C. pilòsa (Pall. mss. Willd. ex Rœm. et Schultes, syst. 5. p. 148.) leaves ciliated at the base; radical ones oblong-obovate, petiolate, crenulated: cauline ones linear, acuminated, sessile, entire; lobes of calyx ovate, acuminated, ciliated, 3 times shorter than the corolla; corolla funnel-shaped, with a bearded throat. ♃. H. Native of Siberia. Ledeb. fl. ross. alt. ill. t. 209. Stems simple, hairy, 1-flowered. Corolla blue, form of those of *C. saxífraga*, bearded, drooping.

Pilose Bell-flower. Pl. ¼ to ½ foot.

17 C. saxífraga (Bieb. fl. taur. 1. p. 155.) stems smoothish; leaves a little ciliated, pilose: radical ones on long petioles, lanceolate-spatulate, crenulated: cauline leaves sessile, entire, ligulate; lobes of calyx broad, acuminated, glabrous, twice shorter than the corolla; appendages of the sinuses of the calyx ciliated, acuminated, doubly shorter than the lobes. ♃. H. Native of Caucasus, on the upper part of Mount Beschtau, where it forms broad tufts. Alph. D. C. mon. p. 228. t. 10. f. 2. Leaves ciliated, with soft, hardly perspicuous hairs. Stem simple, 1-flowered. Flowers erect, blue.

Saxifrage Bell-flower. Fl. June, July. Pl. ¼ to ½ foot.

18 C. cilia'ta (Stev. mem. soc. mosc. 3. p. 256.) stem rather pilose; leaves ciliated with stiff hairs; radical leaves almost sessile, obovate-lanceolate, crenulated, shining: cauline ones ligulate, ciliated a little at the base: lobes of calyx ciliated, linear-acuminated, one-half shorter than the lobes of corolla; appendages of the sinuses of the calyx ovate-acute, 4 times shorter than the lobes. ♃. H. Native of the higher alps of Caucasus, in stony places. Mèdium Saxífragum. Fisch. in litt. Stem solitary, 1-flowered. Lower leaves rosulate. Flower erect, blue.

Ciliated Bell-flower. Pl. ½ foot.

19 C. Alta'ica (Alph. D. C. mon. p. 229. t. 10. f. 3.) radical leaves petiolate, long-lanceolate, crenated, glabrous; cauline leaves ligulate, a little toothed, smoothish; tube of calyx downy, but with the lobes smoothish and doubly shorter than the corolla, which is funnel-shaped; appendages of the sinuses of the calyx subulate, villous, 3 times shorter than the lobes. ♃. H. Native of the Altain mountains, about Sayen; and of Persia. C. Sayenénsis, Fisch. cat. hort. gorenk. 1808. p. 52. but not of Pall. Mèdium Sayanénse, Fisch. in litt. C. frígida, Pall. in herb. Lamb. Stems slender, 1-flowered, glabrous. Corolla blue, nutant.

Altain Bell flower. Pl. ¼ foot.

20 C. dasya'ntha (Bieb. fl. taur. suppl. p. 147.) radical leaves ovate, acute, petiolate, crenated, smoothish: cauline leaves sessile, lanceolate, entire, downy; calycine lobes ovate-lanceolate, 3 times shorter than the corolla, which is funnel-shaped; appendages of the sinuses small and subulate. ♃. H. Native of the Aleutian Islands; very frequent in the Unalaschka, Behring's Island, and Behring's Straits. Rchb. icon. bot. 1. p. 70. t. 85. f. 178.—Gmel. sib. 3. p. 160. no. 28. Stem 1-flowered, pilose or glabrous, nearly naked. Flowers nearly erect, almost naked. Radical leaves rosulate. Corolla large, blue (*f.* 131).

FIG. 131.

Thick-flowered Bell-flower. Pl. ¼ foot.

21 C. Alliònii (Vill. delph. p. 18. dauph 1. p. 302. and 338. vol. 2. p. 512. t. 10.) stem rather pilose; radical leaves linear-lanceolate, nearly entire, ciliated: lower ones bluntish; lobes of calyx linear-acuminated, rather pilose, one-half shorter than the corolla: appendages of sinuses ovate-acute, 3 times shorter than the lobes. ♃. H. Native of Provence, Dauphiny, Piedmont, Mount Cenis, Switzerland. C. alpéstris, All. ped. 1. p. 113. t. 6. f. 3. C. barbàta, Var. β, Schouw, pl. pfl. geogr. ital. p. 13. Root creeping. Stems 1-flowered. Radical leaves rosulate. Flowers subnutant, large, blue or white.

Var. β, *spatulàta* (Alph. D. C. mon. p. 231.) radical leaves spatulate: cauline ones a little toothed. ♃. H. C. nàna β, Lam. et D. C. fl. fr. ed. 3. no. 2851. C. Alliònii, β, Lam. et D. C. fl. fr. l. c.

Allioni's Bell-flower. Fl. July, Aug. Clt. 1820. Pl. ½ foot.

22 C. Pallasia'na (Rœm. et Schultes, syst. 5. p. 138.) stem 1-flowered, glabrous; leaves glabrous, lanceolate, serrated, petiolate; flower nutant; calycine segments acute. ♃. H. Native of Siberia. Like *C. Alliònii*. Root creeping. Radical leaves an inch long: cauline ones 2 to 3 lines long.

Pallas's Bell-flower. Pl. ½ foot.

* * *Stems few or many-flowered. Flowers pedicellate, not capitate.*

23 C. saxa'tilis (Lin. spec. p. 237.) glabrous; stems erect; leaves crenated: radical ones rosulate, somewhat spatulate: cauline ones ovate, acute; flowers few, racemose; lobes of calyx acuminated, one-half shorter than the corolla, which is tubular;

style exserted. ♃. H. Native of Candia, on rocks by the sea side, on the north side of the island. Ait. hort. kew. ed. 2. vol. 1. p. 350.—Bocc. mus. p. 76. t. 64. Barrel. obs. t. 813. Flowers 3-5, disposed in a loose raceme. Corollas nutant, blue.

Rock Bell-flower. Fl. May, Aug. Clt. 1768. Pl. ½ foot.

24 C. HETEROPHY'LLA (Lin. spec. 1. p. 240.) quite glabrous; stems decumbent, simple; leaves entire: radical ones somewhat spatulate: cauline ones ovate-roundish; lobes of calyx acute; sinuses of calyx toothed a little. ♃. H. Native of the island of Chero. Sibth. et Smith, fl. græc. t. 208. Tourn. cor. 3. itin. p. 243. with a figure. Flowers rising from the axils of the leaves, on the upper part of the stem. Corolla campanulately tubular, pale blue.

Various-leaved Bell-flower. Fl. Sept. Pl. ½ to 1 foot.

25 C. OLIVIE'RI (Alph. D. C. mon. p. 233. t. 9.) plant clothed with cinereous down; stems erect, simple; leaves nearly entire: radical ones spatulate: cauline ones ovate, or ovate-roundish, on short petioles; flowers approximate; calyx with acuminated lobes, and subdentate sinuses. ♃. H. Native of Greece, on the walls of Jupiter's temple, in the island of Deli. Stems numerous. Flowers 3-6, crowded at the top of each stem. Corolla funnel-shaped, blue. ?

Olivier's Bell-flower. Pl. ½ to 1 foot.

26 C. CA'NDIDA (Alph. D. C. mon. p. 234.) plant few-flowered, of a pale hoary hue; stems erect, simple: radical leaves spatulate, nearly entire: cauline leaves ovate, sinuately toothed, on short petioles; calycine lobes acuminated; sinuses of calyx very short, tooth-formed. ♃. H. Native of the Levant, among rocks. Stems many, downy. Leaves downy beneath, and silky above. Flowers few, terminal and axillary. Corolla funnel-shaped.

White Bell-flower. Pl. ¼ to ½ foot.

27 C. CALAMENTHIFÒLIA (Lam. dict. 1. p. 585.) plant clothed with greyish down; stems decumbent, branched; leaves toothed: radical ones rosulate, somewhat spatulate: cauline leaves obovate; lobes of calyx lanceolate, one-half shorter than the corolla; sinuses of calyx short, tooth-formed. ♃. H. Native of the island of Naxia. Desf. cor. in ann. mus. 11. t. 12. Stems numerous. Radical leaves rosulate. Flowers disposed in a loose leafy raceme, erect, pale rose-coloured.

Calamint-leaved Bell-flower. Pl. decumbent.

28 C. EDU'LIS (Forsk. fl. ægypt. arab. p. 106. and 44. Alph. D. C. mon. p. 233.) plant hispid; root thick; stems erect, simple, 1-flowered; leaves ovate-lanceolate, a little crenulated; calycine lobes linear-lanceolate, equal in length to the corolla, which is hispid. ♃. H. Native of Arabia Felix. Root thick, sapid, and is eaten by children like those of many other species under the names of chobs and okab. Corolla tubular, pale blue or white, with violaceous veins.

Edible-rooted Bell-flower. Pl. ½ foot.

29 C. STRIGÒSA (Russ. alepp. ex Rœm. et Schultes, syst. 5. p. 142. Vahl. symb. 3. p. 34. ?) plant beset with strigose hairs; stem erect, with dichotomous branches; leaves lanceolate, entire; calycine lobes subulate, equal in length to the corolla; appendages of the sinuses of the calyx obtuse. ♃. H. Native of the Levant, especially in Syria, about Aleppo. C. Russeliàna, Rœm. et Schultes, syst. 5. p. 142. Stem simple at the base, and branched at the apex. Flowers solitary, drooping, rising from the angles of the forks and tops of the branches. Calyx very hispid.

Strigose Bell-flower. Pl. ¼ to ½ foot.

30 C. DICHÓTOMA (Lin. amœn. acad. 4. p. 306.) plant clothed with stiff hairs; stem erect, with dichotomous branches; cauline leaves ovate, acute, a little crenated; flowers sessile in the forks of the branches; calycine lobes long, subulate, one-half shorter than the corolla; appendages of the sinuses of the calyx subulate, one-half shorter than the lobes. ♃. H. Native in the region of the Mediterranean; near Athens; in the south of Italy, even to lat. 42°; frequent in Sicily; Spain; about Mogodor; Tangiers, &c. Jacq. coll. 5. p. 36. t. 12. Sibth. et Smith. fl. græc. t. 211. Sweet, brit. fl. gard. t. 280. C. móllis. Var. β, Willd. spec, 1. p. 910. C. A'fra. Cav. ann. de cienc. 3. p. 21. Rœm. et Schultes, syst. 5. p. 137. C. decípiens, Rœm. et Schultes, syst. 5. p. 142.—Cupan. pamph. sic. 2. t. 259. Bocc. sic. p. 83. t. 45. f. 1. Moris. oxon. 2. p. 459. sect. 5. t. 3. f. 26. Flowers drooping, terminal, solitary in the forks of the branches and stem, bluish-purple, with a paler tube.

Var. β, *brachiàta* (Alph. D. C. mon. p. 237.) appendages of the sinuses of the calyx obtuse. ♃. H. Native of Mauritania. C. brachiàta Salzm. ined.

Dichotomous Bell-flower. Fl. July, Aug. Clt. 1820. Pl. ½ foot.

31 C. MÓLLIS (Lin. spec. 1. p. 237.) plant velvety from greyish down; stems ascending; leaves nearly entire: radical ones rosulate, spatulate: cauline ones ovate; flowers in loose panicles; calyx velvety, with acuminated lobes, which are twice shorter than the corolla, and with the appendages of the sinuses short and subulate. ♃. H. Native of the region of the Mediterranean; about Tangiers; Candia; near Naples, at a place called St. Roch, and elsewhere in the kingdom of Naples; Spain, &c. Curt. bot. mag. t. 404. C. velutìna, Desf. fl. atl. 1. p. 180. t. 51. Plant tufted. Stem downy, also often villous. Leaves more or less hoary on both surfaces, villous. Flowers 1 to 5 at the top of each stem, axillary and terminal. Corollas campanulate, pale blue.

Var. β, *microphýlla* (Alph. D. C. mon. p. 238.) cauline leaves small, ovate, acute, a little toothed. ♃. H. Native of Spain; in Murcia, about Ellin.

Soft Bell-flower. Fl. May, Aug. Clt. 1788. Pl. ascending.

32 C. STRÍCTA (Lin. spec. p. 238.) stem branched, pilose; leaves ovate-lanceolate, acute, serrated, pilose; flowers almost sessile, few, solitary; lobes of calyx glabrous, lanceolate, 4 times shorter than the corolla, which is tubular; appendages of the sinuses of the calyx ovate, length of lobes, but broader. ♃. ? or ♂. H. Native of Armenia; Syria, about Damascus, at the mountain called Djebel-cher; and of the island of Cois, on the mountains, and elsewhere in Greece. Desf. cor. in ann. mus. 11. t. 13. Flowers spicate. Corollas blue.

Var. β; leaves narrower, and nearly entire. ♃. H. Native of Syria. C. stricta. Labill. pl. syr. dec. 5. t. 4. C. stricta, var. β. Rœm. et Schultes, syst. 5. p. 149.

Straight Bell-flower. Fl. July, Aug. Clt. 1819. Pl. 1 to 2 feet.

33 C. SARMA'TICA (Ker. bot. reg. 237.) stems simple, straight, downy; leaves tomentose: lower leaves petiolate, cordate, rather hastate, crenately-toothed: superior ones sessile, ovate-lanceolate, serrate-toothed; flowers scattered, disposed in racemes; calyx with a densely hairy tube and velvety lobes, which are twice shorter than the corolla, and triangular; appendages of the sinuses of the calyx small and tooth-formed; corolla velvety outside. ♃. H. Native of Caucasus, in stony places. C. betonicæfòlia, Biehler, pl. nov. herb. Spreng. p. 14. no. 26. ex Bieb. fl. taur. 1. p. 153. and suppl. p. 144. but not of Smith, nor Bieb. C. gummífera, Willd. rel. in Rœm. et Schultes, syst. 5. p. 144. Spreng. syst. 1. p. 734. C. commutàta, Rœm. et Schultes, syst. 5. p. 143. Stems simple. Leaves grey, cordate, lanceolate. Flowers nutant, usually secund, terminal and axillary, forming a long, loose, scattered raceme. Corollas pale blue.

Var. β, *glàbra* (Alph. D. C. mon. p. 240.) stem leaves gla-

brous, as also the calyx. ♃. H. C. Sarmática, Sims, bot. mag. t. 2019. Lodd. bot. cab. t. 581.

Sarmatian Bell-flower. Fl. July, Aug. Clt. 1803. Pl. 1 to 2 feet.

34 C. alliariæfòlia (Willd. spec. 1. p. 910. Salisb. par. lond. t. 26.) stems simple, terete, downy; leaves crenulated, hoary beneath: lower ones petiolate, somewhat reniform: upper ones sessile, ovate, acute; flowers spicately racemose; lobes of calyx velvety, hoary inside, lanceolate, acuminated, 4 times shorter than the corolla, which is downy outside; appendages of the sinuses of the calyx ovate, acute, one-half shorter than the lobes. ♃. H. Native of Siberia, Georgia, and Caucasus. Rœm. et Schultes, syst. 5. p. 143. C. lamiifòlia, Bieb. fl. cauc. 1. p. 154. Rœm. et Schultes, syst. 1. p. 734.—Buxb. cent. 5. p. 10. t. 18. Flowers sessile, secund, disposed in a long, racemose, loose spike, with a few short floriferous branches at its base, the lower flowers often 3 from each bractea. Leaves hispid, and green above, but clothed with hoary tomentum beneath. Corollas white or cream-coloured.

Var. β, *macrophýlla* (Alph. D. C. mon. p. 241.) radical leaves hastate. ♃. H. C. macrophýlla, Sims, bot. mag. t. 912.

Alliaria-leaved Bell-flower. Fl. July, Sept. Clt. 1803. Pl. 2 to 3 feet.

35 C. violæfòlia (Lam. dict. 1. p. 587.) plant humble, few-flowered, pilose; radical leaves petiolate, ovate-roundish, cordate, crenated: cauline leaves ovate-oblong, toothed; lobes of calyx lanceolate, ciliated, long-acuminated; appendages of sinuses of the calyx ovate, acute, one-half shorter than the lobes; corolla much longer than the calycine lobes. ♃. H. Native of Siberia. C. víolæ, Pers. ench. 1. p. 192. Leaves rather pilose. Flowers 2-3, large, drooping, white, about the size of those of *C. Mèdium*.

Violet-leaved Bell-flower. Pl. ¼ to ½ foot.

36 C. puncta'ta (Lam. dict. 1. p. 586.) plant pilose; stems simple, few-flowered, terete; leaves ovate, acute: radical ones on long petioles, cordate-ovate, acute, crenated: cauline ones almost sessile, toothed; lobes of calyx ciliated, long-lanceolate, 3 times shorter than the corolla; appendages of the sinuses of the calyx ovate, acute, one-half shorter than the lobes. ♃. H. Native of Siberia, in the provinces called Okotsk and Jakutsk; and of Dahuria, even to the Eastern Ocean; also of Japan. Sims, bot. mag. t. 1723. Schrank, pl. rar. fasc. 9. t. 87. C. Trachèlium, Thunb. fl. jap. p. 88.—Gmel. sib. 3. p. 155. t. 30. no. 23. Stem usually downy, panicled at top. Flowers large, pendulous. Corolla dirty-white, spotted with purple inside.

Dotted-flowered Bell-flower. Fl. May, June. Clt. 1813. Pl. ½ to 1 foot.

37 C. dive'rgens (Willd. enum. 1. p. 212.) plant pilose; stem panicled; radical leaves subspatulate, crenulated, narrowed at the base: cauline ones sessile, lanceolate, acuminated; peduncles many-flowered, diverging; lobes of calyx bristly, long-acuminated, 4 times shorter than the corolla: appendages of the sinuses ovate, obtuse, one-half shorter than the lobes. ♂. H. Native of Siberia, alps of Transylvania, and Hungary. Alph. D. C. mon. p. 243. Sweet, fl. gard. n. s. t. 256. C. spatulàta, Waldst. et Kit. pl. hung. 3. p. 286. t. 258. but not of Smith. C. nùtans, Vahl, ined. Horn. hort. hafn. p. 201. C. cérnua, Hort. ex Horn. Balb. cat. hort. taur. 1813. p. 20. but not of Thunb. Plant bristly rather than pilose. Leaves ciliated. Panicle loose. Peduncles like the stem, usually trichotomous. Flowers rather large, at first erect, but drooping in the expanded state. Corollas glabrous, of a violaceous blue colour.

Diverging Bell-flower. Fl. June, July. Clt. 1814. Pl. 1½ foot.

38 C. Sibírica (Lin. spec. p. 236.) plant beset with bristle-like hairs; stem branched; leaves crenulated: radical ones crowded, petiolate, obovate, obtuse: cauline ones sessile, oblong-lanceolate, undulated, acuminated; panicle many-flowered; lobes of calyx long-acuminated, 3 times shorter than the corolla: appendages of the sinuses form of the lobes, but one-half shorter. ♂. H. Native of the north and middle of Asia; east of Europe, at the foot of the Alps; Siberia, Altaia, Caucasus, Iberia, Podolia, Volhynia, Germany, Galicia, Bohemia, Hungary, Carniola, Vallais, Piedmont, &c. Jacq. fl. austr. 2. p. 60. t. 200. Hill. veg. syst. 8. t. 96. Sims, bot. mag. 659. C. undulàta, Mœnch, suppl. p. 189. C. paniculàta, Pohl, tent. fl. bohem. p. 207. C. racemòsa, Gmel. reis. durch. russ. 1. p. 153.—Gmel. sib. 3. p. 154. no. 2. t. 29. Leaves undulated. Flowers numerous, drooping. Corollas of a bluish violet-colour, rather large.

Var. α, *paniculàta* (Alph. D. C. mon. p. 244.) panicle divaricate. A broad-leaved garden variety, very like *C divérgens*.

Var. γ, *abortìva* (Alph. D. C. l. c.) plant 2 inches high, 3-flowered; leaves linear-subulate; flowers small. ♂. H. Native about Vienna, in very dry places.

Siberian Bell-flower. Fl. July, Sept. Clt. 1783. Pl. 1 to 1½ foot.

39 C. parviflòra (Lam. dict. 1. p. 588. Desf. cor. in ann. mus. 11. t. 14.) stem pilose, branched; branches dichotomous; leaves crenately-toothed: radical ones on long petioles, ovate-oblong, obtuse, unequally cut at the base: cauline leaves nearly sessile, ovate-lanceolate; panicle many-flowered; calyx downy, with ovate, acuminated lobes, which are 3 times shorter than the corolla: appendages of the sinuses ovate, acute, about equal to the lobes. ♃. H. Native of Siberia. Rœm. et Schultes, syst. 5. p. 148. Alph. D. C. mon. p. 245. Stem panicled at top. Leaves glabrous, or rather villous. Corolla blue, 5-6-lines long. Flowers numerous, small, drooping.

Small-flowered Bell-flower. Pl. 1 to 2 feet.

40 C. Cauca'sica (Bieb. casp. p. 140. append. no. 14. fl. taur. 1. p. 155. Stev. mem. soc. mosc. 3. p. 256.) plant humble; stems erect, branched, terete, scabrous, pilose; leaves crenulated, lower ones obovate, obtuse, petiolate: superior ones lanceolate, sessile; peduncles few-flowered, diverging; lobes of calyx acuminated, ciliated by hairs, 4 times shorter than the corolla; appendages of the sinuses of the calyx ovate-acuminated, one-half shorter than the lobes. ♃. H. Native of Caucasus, in sub-alpine stony places. Root creeping. Leaves scabrous. Flowers few, terminal and axillary, drooping. Corollas glabrous outside, but bearded inside, of a violaceous blue colour.

Caucasian Bell-flower. Fl. July, Aug. Clt. 1804. Pl. ½ foot.

41 C. affìnis (Rœm. et Schultes, syst. 5. p. 140.) stems hispid with deflexed bristles; cauline leaves linear-lanceolate, setaceously ciliated, very long. ♃. H. Native of Spain, on Mount Lujo. Root horizontal. Stems numerous, simple. Leaves glabrous, but ciliated with reflexed bristles. Flowers at first erect, but at length drooping. Corolla above an inch long, blue.

Allied Bell-flower. Fl. July, Aug. Clt. 1824. Pl. ½ to 1 foot.

42 C. barba'ta (Lin. spec. 236.) stems nearly simple, terete, pilose; leaves villous, nearly entire: radical leaves crowded, lanceolate: cauline leaves few, ligulate; racemes loose, few-flowered; calyx pilose, with triangular acuminated lobes; appendages of the sinuses of the calyx ovate, one-half shorter than the lobes; corollas bearded in the mouth. ♂. ♃. H. Native of the alps of Dauphiny, Piedmont, Savoy, and even to the alps of Salisburgh and Austria; in the south towards Mount Baldo; as well as of Siberia, Saxony, Transylvania, &c. Jacq. obs. pt. 2. p. 14. t. 37. Krok. sil. t. 38. Sims. bot. mag. t. 1258. ex-

clusive of the synonymes. Lodd. bot. cab. t. 788.—C. Bauh. prod. p. 36. with a figure.—Moris. oxon. 2. p. 460. sect. 5. t. 3. f. 33. and f. 35. Root thick, white. Flowers nutant, disposed in a loose, often secund raceme; pedicels 1-flowered, rising from the axils of the superior leaves. Corolla pale blue or white, glabrous outside, but woolly in the mouth. Pl. $\frac{1}{4}$ foot high.

Var. β, uniflòra (Alph. D. C. mon. p. 247.) plant small. ♃. H. Native of Switzerland, on Mount Rossboden, and on Mount Umbrail.—C. barbàta, var. γ. Rœm. et Schultes, syst. 5. p. 138. Gaud. fl. helv. 2. p. 163. C. Firmiàna, Vand. in Rœm. script. p. 55. Vand. fasc. p. 9.—Pluk. phyt. t. 153. f. 5.

Bearded-flowered Bell-flower. Fl. June, July. Clt. 1752. Pl. $\frac{1}{2}$ to $1\frac{1}{2}$ foot.

43 C. alpìna (Jacq. enum. vind. 210.) humble; stem nearly simple, furrowed; leaves linear-lanceolate, repandly-crenate, woolly: radical ones crowded, narrowed at the base; flowers pyramidally racemose; calycine lobes long-acuminated, woolly: appendages of sinuses ovate-acute, woolly, much shorter than the lobes. ♃. H. Native of Europe, on the alps, especially of Austria, Salisburgh, Germany, Silesia, Transylvania, and the Carpathian mountains. Jacq. fl. austr. 2. t. 118. Sims, bot. mag. t. 957.—Clus. hist. 5. p. 171. Root spongy, fusiform. Stem glabrous or woolly. Flowers few or numerous, scattered in a pyramidal manner along the whole of the stem. Corollas deep blue.

Alpine Bell-flower. Fl. July. Clt. 1779. Pl. $\frac{1}{4}$ to $\frac{3}{4}$ foot.

44 C. speciòsa (Pourr. act. tol. 3. p. 309.) stem simple; leaves sessile, repandly crenated: radical leaves rosulate, linear-lanceolate: cauline leaves linear; flowers pyramidally racemose; lobes of calyx linear-acuminated, ciliated: appendages of the recesses ovate-triangular, ciliated, one-half shorter than the lobes. ♃. H. Native of France, in the olive region, and in central and eastern Pyrenees, and in that part of the Cevennes called Capouladoux. D. C. fl. fr. ed. 3. no. 2854. C. longifòlia, Lapeyr. fig. pyr. t. 6. abr. p. 107. C. thyrsoìdea, Lapeyr. abr. pyr. 106.? C. Allìoni, Lapeyr. l. c. p. 107. C. barbàta, Lapeyr. l. c. p. 107.? C. mèdium, Lapeyr. l. c. 107.? Root simple, tuberculate. Stem glabrous or pilose, furrowed. Flowers pedicellate, disposed in a pyramidal raceme, each pedicel furnished with 2 bracteas. Corolla an inch long, smooth outside, but often villous inside, blue, purple, or white.

Var. β, bicaùlis (Alph. D. C. mon. p. 248.) plant humble, few-flowered; stigmas 2. ♃. H. Native of the Pyrenees. C. bicaùlis, Lapeyr. fig. pyr. p. 13. t. 7. C. longifolià, β, Lapeyr. abr. p. 107.

Showy Bell-flower. Fl. June, Sept. Clt. 1820. Pl. $\frac{1}{2}$ to 1 ft.

* * * *Flowers capitate.*

45 C. cichora'cea (Sibth. et Smith, fl. græc. t. 209.) plant pilose; stem angular, branched; leaves undulately crenated: radical ones obovate, irregularly jagged, petiolate: cauline leaves sessile, linear-oblong, obtuse; bracteas ovate, cordate; calyx pilose, with ovate acute lobes; appendages of sinuses of the calyx obtuse, very like the lobes; corolla tubular, 3 times longer than the calyx. ♂. H. Native of Thessaly. C. capitàta, Sims, bot. mag. t. 811.? Root fusiform. Leaves undulated. Flowers capitate, terminal, and from the axils of the leaves. Corollas purplish blue.

Chicory-like Bell-flower. Fl. June, July. Clt. 1768. Pl. 3 feet.

46 C. lingula'ta (Waldst. et Kit. pl. hung. 1. p. 65. t. 64.) plant hispid; stem nearly simple; leaves sessile, undulately crenated: lower ones lingulately spatulate: superior ones linear-lanceolate; bracteas ovate, acute; calycine lobes oblong, obtuse, setaceously ciliated: appendages of sinuses similar to the lobes; corolla tubular, twice longer than the calyx. ⊙. H. Native of Hungary, Croatia, and Dalmatia, in woods. Alph. D. C. mon. p. 250. Root branched. Stems many from the same root. Flowers in dense terminal heaps, surrounded by setaceously ciliated bracteas.

Tongue-leaved Bell-flower. Fl. July, Aug. Clt. 1804. Pl. 1 ft.

Sect. II. Eucòdon (from *ευ, eu*, well; and *κωδων, kodon*, a bell; this section is considered to contain the true species of *Campánula*). Alph. D. C. mon. p. 251. Campánula Trachèlium, Cervicària, and Rapúnculus of most of the old authors. Trachèlium and Rapúnculus, Lin. gen. no. 290. Sinuses of calyx not covered by appendages. Capsule 3-celled, dehiscing laterally by the valves, sometimes at the base, and sometimes at the apex.

§ 1. *Capsule erect, dehiscing at the base. Flowers sessile, capitate, or spicate.—All the species are inhabitants of Europe.*

* *Style exserted. Stems ascending, simple. Lower leaves petiolate. Flowers glomerate, sub-pedicellate.*

47 C. Jacquìni (Alph. D. C. mon. p. 251.) glabrous; stem firm, glabrous; leaves remotely serrated: lower ones on short petioles, obovate: the rest ovate, bluntish and larger; heads of flowers loose, bractless; calyx velvety, with acuminated lobes much shorter than the corolla. ♃. H. Native of the island of Candia, on walls on the Sphaceotic mountains. Phyteùma, Jacquìni, Sieb. herb. cret. Flowers disposed in a loose, terminal, spherical head, on short pedicels. Corollas blue?

Jacquin's Bell-flower. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

48 C. foliòsa (Tenor. fl. neap. 1. p. 71. t. 18.) rather pilose; stem terete; leaves doubly serrated: radical ones ovate, acute, subcordate: cauline ones acuminated; bracteas ovate, acuminated; calycine lobes long-acuminated, ciliated, denticulated, one-third shorter than the corolla, which is tubular; lobes of corolla velvety inside. ♃. H. Native of the kingdom of Naples, on the Apennines and Abruzzo. Heads of flowers globose, terminal. Corollas blue.

Leafy Bell-flower. Pl. 1 foot.

49 C. petræ'a (Lin. spec. 236.) stem rather woody, hoary; leaves crenulated, hoary beneath: radical leaves petiolate, ovate-lanceolate: cauline ones sessile, linear-lanceolate; heads of flowers dense, surrounded by obtuse bracteas; calyx hoary, with linear obtuse lobes, doubly shorter than the corolla, which is campanulate. ♃. H. Native of Mount Baldo, on rocks, in the wooded region; and of the south of France, at a place called Les Escalles d'Eglon. Poll. elem. bot. 2. p. 150. t. 5. f. 1.—Moris. oxon. 2. p. 462. sect. 5. t. 4. f. 44.—J. Bauh. hist. 2. p. 802. with a good figure.—Barrel. pl. gall. p. 10. t. 890.—Pluk. phyt. t. 152. f. 5. Ponæ, descript. mont. bald. p. 62. with a good figure. Stems ascending, simple. Leaves green, and pilose above. Flowers disposed in a terminal bracteate head. Corollas white.

Rock Bell-flower. Fl. May. Pl. 1 foot, ascending.

50 C. glomera'ta (Lin. spec. 235.) downy; stems terete; leaves serrulated: radical ones ovate, acute; bracteas ovate, acuminated; calycine lobes acuminated, twice shorter than the corolla, which is funnel-shaped. ♃. H. Native nearly throughout the whole of Europe; especially from Arragon, Pyrenees, south of France, Piedmont, northern part of the kingdom of Naples, Greece, even to Scotland, Sweden, &c.; collected also in Caucasus, Persia, Altaian mountains, and almost throughout Siberia, even to Kamtschatka, &c. &c.; in shady rocky places, by river sides, and in dry, open, chalky pastures; plentiful in Britain, in like situations. Smith, engl. bot. t. 90. Gilib. demonstr. bot. t. 30. Oed. fl. dan. t. 1328. Gentiàna collìna, With. 282. t. 11. f. 8. C. barbàta, Spreng. ex Steud.

C. betonicæfòlia, Gilib. Kluk. in Bess. fl. gal. 2. p. 344. C. graminifòlia, Willerm. fl. lor. 1. p. 208. C. congésta, Rœm. et Schultes, syst. 5. p. 125.—Weinm. phyt. t. 290. f. c. and d. Trachèlium mìnus Lob. adv. 139. Cervicària mìnor, Dodon. pempt. 146. &c. Stems simple or branched. Radical leaves more or less cordate. Flowers sessile, disposed in terminal heaps on the branches and stem. Corollas glabrous, except the nerves outside, bluish violet or white.

Var. β, speciòsa (Alph. D. C. mon. p. 254.) flowers glomerate, larger, and showy. ♃. H. Native of Siberia. C. speciòsa, Horn. hort. hafn. 2. p. 957. Sims, bot. mag. 2649. but not of Pourr. C. cephalòtis or cephaláprevious, Fisch. mss. C. glomeràta, var. Spreng. syst. 1. p. 731. var. Dahùrica, Ker. bot. reg. t. 620. Flowers bluish violet.

Var. γ, Nicæénsis (Alph. D. C. mon. p. 254.) leaves approximate, ovate, acute, sessile; flowers disposed in short dense spikes. ♃. H. C. Nicæénsis, Rœm. et Schultes, syst. 5. p. 126. C. glomeràta, Poll. fl. veron. 1. p. 276. C. glomeràta, var. All. pedem. 1. p. 112. t. 39. f. 1. Corollas of bluish-violet colour.

Var. δ, ellíptica (Alph. D. C. mon. p. 255.) leaves on long petioles, elliptic, less cordate; flowers large, capitate; bracteas large, often longer than the flowers. ♃. H. C. ellíptica, Kit. ex Schultes, fl. austr. ed. 2. p. 918. C. glomeràta, Spreng. syst. 1. p. 731. C. glomeràta β, Willd. spec. 1. p. 904.—Bocc. mus. t. 58.

Var. ε, sparsiflòra (Alph. D. C. mon. p. 255.) flowers disposed in sessile, scattered, axillary heaps. ♃. H. C. aggregàta, Willd. enum. suppl. 1. p. 10. Nocc. et Balb. fl. tic. 1. p. 101. t. 5. Lodd. bot. cab. t. 505. C. glomeràta elongàta, Fisch. mss. C. glomeràta β, Lam. dict. 1. p. 508. Lam. et D. C. fl. fr. ed. 3d. no. 2845. Corollas bluish-violet.

Var. ζ, cervicarioìdes (Alph. D. C. mon. p. 255.) stem flexuous, hairy; lower leaves on long petioles; flowers terminal and axillary. ♃. H. C. cervicarioìdes, Rœm. et Schultes, syst. 5. p. 128. C. glomeràta, var. Clusiàna, Re, flor. torin. p. 130. Corollas bluish-violet.

Var. η, farinòsa (Alph. D. C. mon. p. 255.) leaves sessile, hoary beneath; flowers disposed in terminal heads, and smaller axillary ones, all sessile. ♃. H. C. petræ'a, All. pedem. 1. p. 112. Krok. fl. sil. no. 319.? &c. Lam. et D. C. fl. fr. ed. 3. no. 2845. C. glomeràta, Wallr. fl. hal. suppl. 3. p. 34. C. glomeràta affìnis, Bess. cat. hort. crem. 1811. C. glomeràta, β, farinòsa, Rochel, pl. exsic. ex Bess. C. farinòsa, Bess. enum. pl. volh. p. 10. C. glomeràta δ, Moretti, pl. ital. dec. 3. p. 4. Corollas of a bluish violet colour.

Var. θ, pusílla (Alph. D. C. mon. p. 255.) plant 1-2 inches high; leaves round, cordate; flowers few, capitate. ♃. H.

Var. ι, flore pleno; flowers double, blue or white. ♃. H. C. glomeràta δ, Rœm. et Schultes, syst. 5. p. 124.

Glomerate-flowered Bell-flower. Fl. May, Sept. Britain. Pl. 1 to 2 feet.

51 C. Cervica'ria (Lin. spec. 1. p. 235.) plant beset with stiff pili; stems furrowed; leaves crenately serrated; radical ones linear-lanceolate, bluntish, on short petioles: cauline leaves linear, acuminated; bracteas ovate, acute; calycine lobes oblong, obtuse, doubly shorter than the corolla, which is campanulately funnel-shaped. ♂. H. Native of the temperate parts of Europe, as of the Pyrenees, south of France, Piedmont, and as far north as Sweden, but not of Britain; of Russia, about Moscow and Petersburgh; also of Transylvania, Galicia; and Siberia, about the Jaic and Jenessee, and about Barnaoul, and near Riddersk and Alexandrousk. Oed. fl. dan. t. 787. Lodd. bot. cab. 452. C. spicàta, Geners, scep. no. 192.—Gmel. sib. 3. p. 157. t. 31.—Weinm. phyt. t. 288. f. 6.—Mor. oxon. sect. 5. t. 3. f. 34. Stem simple. Upper stem leaves half stem-clasping. Heads of flowers terminal, round, bracteate. Corollas blue, usually pale, pilose outside.

Throat-wort Bell-flower. Fl. July. Clt. 1768. Pl. 1 to 2 ft.

52 C. multiflòra (Waldst. et Kit. pl. hung. 3. p. 292. t. 263.) plant pilose; stem striated; leaves undulately crenated: lower ones ovate-lanceolate: cauline ones acuminated; spikes interrupted from the flowers being in fascicles; calycine lobes obtuse, 3 times shorter than the corolla, which is tubularly funnel-shaped; capsule bluntly triangular. ♂. H. Native of Hungary, on the mountain on which the town of Versitz is built. C. macrostàchya, Willd. enum. 1. p. 213. C. cervicària imbricàta, Rochel, herb. ex Rœm. et Schultes. Stem simple. Corollas glabrous, of a pale bluish-violet colour.

Many-flowered Bell-flower. Fl. July, Aug. Clt. 1814. Pl. 1½ to 3 feet.

53 C. spica'ta (Lin. spec. 1. p. 234.) hairy; stem striated; leaves nearly entire; radical leaves crowded, linear-lanceolate: cauline ones linear-acuminated; spike long, interrupted at the base; calycine lobes ovate, acuminated, 3 times shorter than the corolla, which is funnel-shaped; capsule spheroid. ♂. H. Native of Europe, frequent on the south side of the alps about Nice, Fenestrella, and Turin; and in the region of Mount Baldo; of Italy, Provence, Dauphiny, Vallais, Carniola, Croatia, Portugal, &c. All. pedem. 1. p. 112. t. 46. f. 2.—Pluk. phyt. t. 153. f. 3. Stem simple. Leaves sessile. Flowers sessile, 1-3 from each bractea. Corolla glabrous, blue.

Var. β, ramòsa (Alph. D. C. mon. p. 261.) stem branched. ♂. H. C. spicàta, Schmidt, fl. bohem. no. 182.

Var. γ, spicá interruptá (Alph. D. C. mon. p. 261.) leaves elliptic-lanceolate; spike interrupted. ♂. H. C. spicàta, var. All. fl. pedem. no. 414. t. 47. f. 1. Lam. fl. fr. ed. 3. no. 2855.

Var. δ, Hornschúchii (Alph. D. C. mon. p. 261.) plant small; leaves obovate-lanceolate; corolla ovoid. ♂. H.

Spicate-flowered Bell-flower. Fl. July. Clt. 1786. Pl. 1 to 2 feet.

54 C. thyrsoídea (Lin. spec. 1. p. 235.) plant pilose; stem furrowed; leaves entire, pilose: lower ones lanceolate, obtuse: cauline ones linear-lanceolate, acute; flowers disposed in a dense pyramidal spike; calyx with a glabrous tube, and linear-lanceolate ciliated lobes; corolla oblong, doubly longer than the calycine lobes; style exserted; capsule spherical. ♃. H. Native of the alps of Europe, from Provence, Dauphiny, Savoy, even to Carniola and Lower Austria; frequent on the alps of Jura and Dola. Stem simple, covered with leaves and flowers. Flowers sessile. Bracteas often reddish. Corolla cream-coloured, hairy.

Thyrsoid Bell-flower. Fl. July, Aug. Clt. 1785. Pl. 1 to 1½ ft.

§ 2. *Capsule drooping, dehiscing at the base. Lobes of calyx always entire. Flowers pedicellate.*

* *Flowers on more or less elongated pedicels. Radical leaves usually cordate, petiolate.—Species almost all perennial.*

A. *Stems many-flowered. Corolla always glabrous. Capsule ovoid. Species all natives of Europe.*

55 C. latifòlia (Lin. spec. 233.) stems simple, smooth; leaves large, doubly serrated; radical ones petiolate, cordate, ovate-oblong: cauline ones sessile, ovate-acuminated; flowers disposed in spicate racemes; peduncles erect, 1-flowered; calycine lobes long-acuminated, broad at the base, 3 times shorter than the corolla, which is campanulately funnel-shaped and large. ♃. H. Native of Europe, from the Pyrenees and north of Italy, even to Scotland; of Caucasus, Lapland, Nordland, Carpathian Mountains, Altaian Mountains, and Nipaul, always in moist woods and thickets. Frequent in the alps of France and Switzerland. Not unfrequent in Scotland and the north of England, but

more rare in the south: in moist woods and thickets, by the sides of rivulets. Oed. fl. dan. t. 85. and t. 782. Smith, engl. bot. 302. C. urticæfòlia, All. pedem. 1 p. 110. C. Brunònis, Wall. cat.—Weinm. phyt. t. 287.—Park. par. 355. f. 2.—Lob. icon. 2. t. 278. Stem glabrous, rarely a little hairy. Leaves glabrous, rarely rather scabrous. Flowers solitary, rising from the axils of the superior leaves. Corollas large, blue, but sometimes white, or bluish-white, glabrous outside, but sometimes bearded inside. Lobes of calyx often denticulated.

Var. β, macrántha (Alph. D. C. mon. p. 265.) stem and leaves rather pilose: teeth of leaves more distinct; calyx glabrous; corollas larger. 4. H. C. macrántha, Fisch. ined. V. latifòlia, var. macrántha, Sims, bot. mag. 2553.

Var. β, eriocárpa (Alph. D. C. mon. p. 265.) stem and leaves pilose and pale; leaves less acuminated; tube of calyx very hispid. 4. H. Native of Caucasus. C. eriocárpa, Bieb. fl. taur. 1. p. 149. C. latifòlia, var. macrántha and eriocárpa, Fisch, in litt.

Broad-leaved Bell-flower. Fl. July. Britain. Pl. 2 to 3 ft.

56 C. trachè'lium (Lin. spec. 235.) stems angular, pilose; leaves scabrous, acuminated, coarsely and crenately toothed: radical ones petiolate, cordate; flowers disposed in loose racemes; peduncles 1-3-flowered; calyx rather pilose, with triangularly acuminated erect lobes, 3 times shorter than the corolla, which is campanulate. 4. H. Native of Europe, from Spain. Portugal, Piedmont, Naples, and Greece, even to Scotland, Sweden, Russia, and the Carpathian Mountains; of Caucasus, Tauria, Siberia, and even to Japan, in shady places. In Britain, in groves, thickets, and hedges frequent. Smith, engl. bot. t. 12. Oed. fl. dan. t. 1026. Hook. fl. lond. t. 109. C. gantélée, Jaum. St. Hil. fl. fr. t. 47. C. urticæfòlia or urticifòlia, Schmidt, fl. bohem. no. 173. p. 73. Bieb. fl. cauc. 1. no. 374. Tenor. fl. neap. 1. p. 68.—J. Bauh. hist. 2. p. 805. with a figure. C. Cervicària, Fuchs, hist. p. 431. with a figure.—Moris. oxon. 2. p. 459. sect. 5. t. 3. f. 28. Stem simple or branched, reddish. Leaves often doubly toothed, roughish. Flowers drooping a little, 1-4 together, terminating the branchlets. Corolla bluish violet and white, and all the shades between these two colours, bearded inside. The name *Trachelium* is from τραχηλος, the neck; alluding to the reputed virtues of this plant in disorders of the throat, to which the other appellations of old authors allude. A decoction of the herb, which is bitter and somewhat acrid, was used as a gargle.

Var. β; flower solitary, terminal. Bieb. fl. taur. 1. p. 149.

Var. γ, flore pleno; flowers double, blue and white, and all the shades between these two colours. Theatr. flor. t. 69.

Var. δ, monstròsa (Alph. D. C. mon. p. 267.) flowers abortive, degenerating into leaves. Hall. enum. p. 193.

Great *Throat-wort* or Nettle-leaved Bell-flower. Fl. July, Aug. Britain. Pl. 2 to 3 feet.

57 C. rapunculoìdes (Lin. spec. 234.) stems rather scabrous; leaves scabrous, ovate, acuminated: radical ones petiolate, cordate, crenulated: cauline ones serrulated; flowers disposed in long spicate racemes, solitary; calyx rather scabrous, with linear-lanceolate lobes, which are afterwards reflexed; corolla funnel-shaped, 4 times longer than the calycine lobes. 4. H. Native of Europe, from the Pyrenees, Dauphiny, Piedmont, Transylvania, even to Scotland, Sweden, and Lapland; in the plains about the Carpathian Mountains; Caucasus, even to the banks of the river Oby in Siberia. Frequent in Middle Europe. In Britain, in woods and fields, but rare, in some woods in Oxfordshire, among yew trees. It grows in Scotland, in corn-fields, 2 miles north-west from Kirkaldy. Smith, engl. bot. t. 1369. fl. dan. 1327. Plenck, icon. t. 152. C. nùtans, Lam. fl. fr. 3. p. 336. but not of Waldst. et Kit. C. urticifòlia, Turr. prod. fl. ital. 64. no. 9. Vittm. summ. pl. 1. p. 454. Turr. giorn. de veniz. t. 1. Gmel. syst. 2. p. 350. but not of All. and Willd. C. Trachèlium, Bull. herb. t. 319. C. secúnda, Schmidt, fl. bohem. 2. p. 74. C. morifòlia, Salisb. prod. p. 126. C. rigida, Stokes, mat. med. 3. p. 333. C. glabricárpa, Schleich. pl. exsic. Root creeping. Stems glabrous or scabrous, usually branched in gardens, but simple in the wild state. Flowers drooping, solitary, disposed in spike-formed racemes, secund, but usually hanging on all sides in strong garden specimens. Corollas bluish-violet, and bearded a little inside.

Var. β, cályce glabérrimo (Alph. D. C. mon. p. 268.) calyx quite glabrous; plant more or less glabrous and reddish. 4. H. Native of the Ukraine. C. Ucránica, Bess. C. neglécta, Bess. cat. hort. crem. 1808. p. 28. C. crenàta, Link, enum. 1. p. 214. C. infundibulifòrmis, Sims, bot. mag. t. 2632. Flowers bluish-violet.

Var. γ, macrophýlla (Alph. D. C. mon. p. 268.) stem branched; racemes many-flowered; leaves large. 4. H. A garden plant. Corollas bluish-violet.

Var. δ, Œnipontàna (Alph. D. C. mon. p. 268.) flowers few, disposed in loose racemes; peduncles long, erect, usually 1-flowered; calycine lobes broader. 4. H. C. Œnipontàna, Morett. ined.

Var. ε, trachelioìdes (Alph. D. C. mon. p. 269.) stem and leaves beset with stiff white hairs, but particularly the calyx. 4. H. Native of Caucasus. C. trachelioìdes, Bieb. fl. taur. 1. p. 150. no. 376. Stev. mem. nat. cur. mosc. 3. p. 255. C. Ucránica, Spreng. nov. prov. p. 8. Rœm. et Schultes, syst. 5. p. 121. C. macrostàchya, Panz. herb. C. setòsa, Fisch. mss.

Var. ζ, nàna (Alph. D. C. mon. p. 269.) stem abortive, 1-3-flowered. 4. H.

Rampion-like Bell-flower. Fl. June, July. England. Pl. 2 to 4 feet.

58 C. Bononie'nsis (Lin. spec. 1. p. 234.) scabrous; stems simple; leaves serrulated, ovate, acuminated, dark green above, pale beneath: radical leaves cordate, petiolate: superior leaves stem-clasping; flowers numerous, small, disposed in long racemes; calycine lobes acuminated, 4 times shorter than the corolla, which is funnel-shaped. 4. H. Native of the east of Europe and west of Asia, from lat. 40° to 53°, and long. 15° 10′ west. even to 60°; particularly in the northern elevated valleys in the kingdom of Naples; Upper Italy, Piedmont, Saxony, Prussia, Bohemia, Silesia, Caucasus, the Ukraine, and near the Volga, &c. Bieb. fl. taur. 1. p. 150. Rchb. icon. cent. 2. t. 111. f. 221. C. Thaliàna, Wallr. sched. crit. p. 86. Rchb. icon. cent. 2. t. 112.—Bauh. hist. 2. p. 806.—Moris. oxon. 2. p. 461. sect. 5. t. 4. f. 38. Tube of calyx blackish. Flowers smaller than in any other nearly allied species, numerous, disposed in a simple raceme, or the raceme is branched at the base. Corollas bluish-violet, glabrous. Plant dark green. Leaves pale beneath.

Var. β; radical leaves very long. 4. H. Native of the kingdom of Naples. C. obliquifòlia, Tenore, fl. neap. prod. p. 15. fl. neap. 1. p. 69. t. 17. Flowers bluish-violet.

Var. γ; plant much branched, many-flowered. 4. H. Native of Caucasus. C. Bononiénsis, var. α, Bieb. fl. taur. 1. p. 151. C. multiflòra, Hortul. C. lychnìtis, Horn. hort. hafn. 1. p. 199. Flowers bluish-violet.

Var. δ; leaves broader, tomentose beneath. 4. H. Native of Tauria, Caucasus, and many parts of Russia, and the Levant. C. petræ'a, Habl. taur. p. 157. ex Bieb. C. Bononiénsis, Scop. carn. 1. p. 147. Spreng. syst. 1. p. 730. C. Ruthénica, Bieb. fl. taur. 1. p. 151. Willd. enum. p. 211. Sims, bot. mag. 2653. Flowers bluish-violet.

Var, ε; stems very simple. 4. H. C. Bononiénsis, All. fl. pedem. 1. p. 111. C. símplex, Lam. et D. C. fl. fr. 3. p. 730. Rœm. et Schultes, syst. 5. p. 122. C. Bononiénsis, var. β, Bieb. fl. taur. 1. p. 151. Flowers bluish-violet.

Bononian Bell-flowers. Fl. July, Sept. Clt. 1773. Pl. 2 to 3 feet.

B. *Stems few-flowered or* 1*-flowered. Corollas nearly always glabrous. Capsule ovoid, rarely spheroid.*

59 C. collìna (Bieb. fl. taur. 1. p. 152.) stems simple; lower leaves on long petioles, ovate-oblong, crenulated: middle ones lanceolate: superior ones linear-acuminated; flowers few, secund, disposed in a long raceme; calycine lobes erect, lanceolate, acuminated, doubly shorter than the corolla, which is funnel-shaped. ♃. H. Native of Caucasus and Tauria, on grassy hills. Bieb. pl. rar. ross. 1. t. 42. Stem rather pilose. Leaves smoothish. Flowers distant. Calyx pilose. Corolla deep blue, twice the length of the calycine segments.

Var. α; plant larger; petioles very long; germen hispid. ♃. H. Native of Iberia, on the mountains, and of Tauria. Var. α, Bieb. l. c.

Var. β; plant larger; leaves shorter, and on shorter petioles; calyxes glabrous. ♃. H. Native of Caucasus and Iberia. C. collìna, Sims, bot. mag. 927. Ait. hort. kew. ed. 2d. vol. 1. p. 348. Var. β, Bieb. l. c.

Var. γ, *pùmila;* plant dwarf.—Tourn. cor. p. 4. C. Ibérica, angustifòlia, &c. var. β, Bieb. l. c.

Var. δ; flowers white. ♃. H.—Tourn. cor. p. 4.

Hill Bell-flower. Fl. July, Aug. Clt. 1803. Pl. 1 foot.

60 C. pauciflòra (Desf. choix. du. cor. p. 36. t. 26. ann. mus. 11. p. 57. t. 7.) stems branched; leaves dentately serrated: radical ones ovate-roundish, petiolate: cauline ones ovate, on short petioles; flowers few, terminal; calycine segments subulate, erect; corolla funnel-shaped, twice the length of the calycine segments. ♃. H. Native of Candia, on the mountains, among bushes. Stem slender. Plant glabrous. Flowers hanging one way, solitary, terminating the branches and stem. Corolla campanulate, bluish-violet. The capsule is said to be 5-celled.

Few-flowered Bell-flower. Pl. 1 to 1½ foot.

61 C. nemoròsa (Alph. D. C. mon. p. 274.) stems simple; radical leaves on long petioles, cordate, ovate-oblong, crenated: cauline leaves sessile, long-acuminated, serrated; flowers disposed in loose racemes; calycine segments subulate; corolla funnel-shaped, twice longer than the calycine lobes. ♃. H. Native of Austria and Moravia, in woods. C. elongàta, Portenschl. but not of Willd. nor others. Plant glabrous. Racemes often furnished with few-flowered peduncles at the base. Corollas blue.

Grove Bell-flower. Pl. 1½ foot.

62 C. rhomboida'lis (Lin. spec. p. 233.) stems almost simple; leaves sessile, ovate, acute, serrated; flowers few, disposed in loose racemes, pedunculate; segments of calyx subulate, erect; corolla campanulate, twice longer than the calycine segments; capsule ovoid. ♃. H. Native of the temperate parts of Europe, on the mountains; as of the Pyrenees, mountains of Auvergne, alps of Provence, Dauphiny, Savoy, Switzerland, Germany, Carniola, &c.; and of Russia and Tauria. C. rhomboídea, Lin. spec. 233. Gilib. demonstr. bot. t. 27. Lodd. bot. cab. t. 603. C. azùrea, Sims, bot. mag. t. 551. Ait. hort. kew. ed. 2d. vol. 1. p. 348. C. venòsa, Willd. enum. suppl. p. 10.—Barrel. icon. 78. t. 567.—Bocc. mus. p. 75. t. 61.—J. Bauh. hist. 2. p. 798. with a figure. Stem glabrous, or a little pilose, furnished with flower-bearing branches at top. Flowers usually drooping, but sometimes looking upwards, very like those of *C. rotundifòlia.* Corollas hardly one-half longer than the calycine lobes, blue, glabrous.

Var. β, *lanceolàta* (Alph. D. C. mon. p. 275.) leaves crowded, lanceolate, nearly entire. ♃. H. Native of the Pyrenees. C. lanceolàta, Lapeyr. abr. p. 105. C. rhomboidàlis angustifòlia, Benth. cat. pyr. p. 66. Flowers blue.

Var. γ, *reflèxa* (Alph. D. C. l. c.) leaves broader; calycine lobes reflexed. ♃. H. Flowers blue.

Var. δ, *polypétala* (Alph. D. C. l. c.) leaves long-lanceolate, nearly entire; corollas 5-parted. ♃. H. Flowers blue.

Rhomboidal-leaved Bell-flower. Fl. July, Aug. Clt. 1775. Pl. 1 to 2 feet.

63 C. trichocalycìna (Ten. fl. neap. prod. p. 16. fl. neap. p. 67. t. 16.) stems simple; leaves on short petioles, ovate, acute, coarsely serrated; flowers few, racemose; calycine segments reflexed, long-capillary, nearly equal to the corolla, which is profoundly 5-cleft, and funnel-shaped; capsule ovoid. ♃. H. Native of the kingdom of Naples, on the mountains: of Sicily, on the Nebrodes; and of Candia. C. Albúrnica, Brigant. stirp. rar. in giorn. encycl. sept. 1817. Root simple, fusiform. Stems glabrous, but hairy at the base. Flowers disposed in an almost simple terminal raceme, approximate at the top, 1-3 rising from each axil, at the time of flowering erect, but afterwards drooping. Corolla pale violet.

Hair-calyxed Bell-flower. Fl. July. Clt. 1823. Pl. 1 to 3 feet.

64 C. Ca'rnica (Schiede, mss. ex Alph. D. C. mon. p. 277.) stems ascending, weak, few-flowered; leaves glabrous: lower ones obovate or lanceolate: upper ones linear; calycine segments very long, reflexed; corolla tubular, elongated. ♃.? H. Native of Carniola and Carinthia, on the mountains. Root slender. Plant glabrous. Flowers few, on long peduncles, solitary, inclined. Corolla blue, glabrous.

Carniola Bell-flower. Pl. ½ to ¾ foot.

65 C. Hóstii (Baumg. enum. 3. p. 342.) stems few-flowered; leaves with scabrously ciliated margins: radical ones few, roundish, cordate, broad, toothed: cauline leaves lanceolate and linear; flower-buds drooping; calycine segments subulate, spreading or reflexed; corolla funnel-shaped. ♃. H. Native of Transylvania, Austria, and Carinthia, in pastures, woods, and on the mountains; and on the alps of Jura. Stems glabrous or scabrous, simple or branched at top. Flowers more or less numerous, pedunculate and pedicellate, as in *C. rotundifòlia,* drooping. Corollas blue. Very like *C. rotundifòlia.*

Var. β, *uniflòra* (Alph. D. C. mon. p. 277.) stem 1-flowered, ascending, weak; cauline leaves few, linear-lanceolate, petiolate. ♃. H.

Host's Bell-flower. Pl. 1 foot.

66 C. petiola'ta (Alph. D. C. mon. p. 278.) quite glabrous; stems simple, few-flowered; radical leaves on long petioles, cordate-roundish, toothed; petioles marginated; lower cauline leaves lanceolate, remotely toothed, petiolate: upper cauline leaves linear, entire; calycine lobes erect, subulate; corolla campanulate, twice longer than the calycine lobes. ♃. H. Native of North America, near Slave Lake. Plant with the habit of *C. rotundifòlia.* Root slender. Flowers 3-4, at the top of the stem, erect, but at length becoming recurved. Corollas blue.

Petiolate-leaved Bell-flower. Pl. 1 foot.

67 C. linifòlia (Lam. dict. 1. p. 579.) stems erect; radical leaves few, petiolate, ovate, sinuated: cauline leaves linear, entire; calycine segments long, erect, 2 or 3 times shorter than the corolla, which is large and campanulate. ♃. H. Native of Europe, on the mountains; as of the Pyrenees, Auvergne, Dauphiny, Vallais, Alsatia, alps of Italy, Austria, Transylvania, and the Carpathian Mountains; but wanting in the more northern regions of Europe. Scop. carn. 1. p. 144. C. angustifòlia, Lam. ill. 2499.? C. Schleichèri, Sut. fl. helv. 1. p. 124. C. rotundifòlia linifòlia, β et γ, Lapeyr. abr. p. 104. C. rotundifòlia, β, Wahl. helv. p. 39. but not of his fl. lapp. C. virgàta, Rafin. in Rœm. et Schultes, syst. 5. p. 100.?—J. Bauh. hist. 2. p. 797. with a figure. Root slender, creeping. Plant quite glabrous, rarely a little downy. Flowers few at top of

each stem, but usually only one, drooping. Corollas large, blue, of a form between those of *C. rotundifòlia* and *C. persicæfòlia.*

Var. β, *Valdénsis* (Alph. D. C. mon. p. 279.) plant downy. ♃. H. Common on the alps. C. Valdénsis, All. pedem. no. 400. vol. 1. p. 109. t. 6. f. 1. Lam. et D. C. fl. fr. ed. 3d. no. 2835. C. linifòlia, Hænke, in Jacq. coll. 2. p. 81. Sut. fl. helv. 1. p. 123. C. uniflòra, Vill. dauph. 2. p. 500. t. 10. but not of Lin. C. subuniflòra, Lam. ill. no. 2500. C. rotundifòlia linifòlia α, Lapeyr. abr. p. 104. C. linifòlia β, Schouw. C. Ròhdii, Lois, fl. gall. ed. 2. vol. 1. p. 140. t. 24. Flowers blue.

Var. γ, *Scheuchzèri* (Alph. D. C. l. c.) plant small, glabrous; stems 1-flowered; segments of the calyx long. ♃. H. Common on the alps. C. Scheuchzèri, Vill. dauph. 2. p. 503. t. 10. but not of Lodd. bot. cab. t. 485. C. linifòlia, Willd. spec. 1. p. 893. Rœm. et Schultes, syst. 5. p. 101. Flowers blue.

Var. δ, *Langsdorffiàna* (Alph. D. C. mon. p. 279.) glabrous; stems erect, usually 1-flowered; radical leaves ovate-roundish, entire: lower cauline leaves obovate-lanceolate. ♃. H. Native of Arctic America, from Greenland even to Sledge Island, and of the Aleutian Islands, and Eastern Siberia. C. Langsdorffiàna, Fisch. mss. C. rotundifòlia, var. Horn. in herb. D. C. Perhaps a proper species.

Flax-leaved Bell-flower. Fl. June, Aug. Clt. 1813. Pl. ½ to ¾ foot.

68 C. rotundifòlia (Lin. spec. 232.) radical leaves petiolate, cordate, roundish, crenately toothed: cauline leaves linear or lanceolate; flower-buds erect; calycine segments subulate, short, erect, 3 times shorter than the corolla, which is campanulate. ♃. H. Native throughout Europe, Siberia, and North America; plentiful every where in Britain. Cav. valent. t. 2. All. pedem. 1. p. 108. t. 47. f. 2. Œder. fl. dan. t. 1086. Drev. et Hayne, term. bot. t. 5. f. 9. Smith, engl. bot. 866. Curt. lond. fasc. 4. t. 21. Jaum St. Hil. pl. fr. t. 418. C. uniflòra, Huds. angl. ed. 1st. p. 81. but not of Lin. C. mìnor, Lam. fl. fr. 3. p. 339. C. variifòlia, Salisb. prod. p. 126. C. minùta, Savi, fl. etrusc. p. 554. C. Scheuchzèri, Lodd. bot. cab. t. 485. but not of others. C. heterophýlla, Gray, brit. arr. 2. p. 408. C. allophýlla, Rafin. mss. Root creeping. Stems numerous. Plant glabrous. Flowers drooping, solitary, pedunculate, few on each stem. Corollas deep blue. In France the plant is called *Clochette;* in Germany, *Weisen-Busch, Grass-glas,* or *Milch-Glocken,* and *Kleine wilde Rapunzel;* in Denmark, *Gemeene Smaa Klokkler;* in Sweden, *Angklackor* and *Blakackor;* and in Britain, *Blue-Bells* and *Milkwort.* The juice expressed from the flower makes a very good blue ink, and a good green colour mixed with alum. The roots are eaten by children in many parts.

Var. β, *velutìna* (Alph. D. C. mon. p. 282.) plant small, of a grey colour, downy; stem few-flowered. ♃. H. D. C. fl. fr. suppl. no. 2832. Flowers blue.

Var. γ, *màjor* (Alph. D. C. mon. p. 282.) cauline leaves long-lanceolate; flowers larger. ♃. H. C. rotundifòlia β, Lam. dict. 1. p. 578. Pers. ench. 1. p. 188. Flowers blue.

Var. δ, *tenuifòlia* (Alph. D. C. mon. p. 284.) radical leaves oblong: cauline ones linear; stems elongated, slender. ♃. H. Rapúnculus esculéntus, Oed. fl. dan. t. 855. C. rotundifòlia tenuifòlia, Hoffm. fl. germ. 1800. p. 100. C. rotundifòlia parviflòra, Wahl. fl. ups. p. 78. fl. suec. 1. p. 134. C. anterrhìna, Schleich. Flowers blue.

Var. ε, *albiflòra;* flowers white.

Round-leaved Bell-flower. Fl. June, Aug. Britain. Pl. ½ to 1 foot.

69 C. cæspitòsa (Scop. carn. 1. p. 143. t. 4.) plant humble, few-flowered, glabrous; radical leaves crowded, on short petioles, ovate, glandularly toothed, shining; buds, flowers, and capsules drooping; calycine segments linear, erect, 3 times shorter than the corolla, which is campanulate; pollen violaceous. ♃. H. Native of the temperate parts of Europe, on the mountains; as of the Pyrenees, Dauphiny, Savoy, Switzerland, Mount Baldo, Apennines, Austria, Carinthia, Bohemia, Transylvania, Carpathian Mountains, &c. C. cochlearifòlia, Lam. dict. 1. p. 578. but not of Wahl. C. pusílla, Hænke, in Jacq. coll. 2. p. 79. Sut. fl. helv. 1. p. 123. &c. C. Bellárdi, All. pedem. 1. p. 108. no. 396. t. 85. f. 5. C. rotundifòlia β, Lin. spec. 1. p. 232. β et α. Willd. spec. 1. p. 892. var. 2. Lapeyr. abr. p. 103. var. cæspitòsa, Boissieu, fl. d'eur. t. 135. C. pùmila, Sims, bot. mag. t. 512. Rœm. et Schultes, syst. 5 p. 96. Root fibrous, creeping. Stems numerous, tufted. Flowers terminal, solitary, and sometimes 3-4 at the top of each stem. Corollas deep blue or pure white.

Var. β, *pubéscens* (Alph. D. C. mon. p. 284.) stems elongated, 1-flowered, downy; leaves few, rather hairy; corolla broad. ♃. H. Native of Bohemia. C. pubéscens, Schmidt, fl. bohem. no. 167. Rchb. icon. bot. 1. t. 78. C. cæspitòsa β, Poir. suppl. 2. p. 55. Flowers blue.

Var. γ, *imbricàta* (Alph. D. C. mon. p. 284.) leaves crowded at the base, imbricated, linear-lanceolate; flowers numerous; corollas narrow. ♃. H. Native of Carinthia, and about Vienna. C. Boccòni, Vill. dauph. 2. p. 502. exclusive of the syn. of Gmel. C. imbricàta, Heyne, ined.—Bocc. mus. t. 103. Flowers blue.

Tufted Bell-flower. Fl. May, Aug. Clt. 1813. Pl. ¼ to ½ foot.

70 C. arista'ta (Wall. in Roxb. fl. ind. 2. p. 98.) plant quite glabrous; stems erect, 1-flowered; radical leaves petiolate, lanceolate, acute, undulated: cauline leaves sessile, narrow-linear, glandularly denticulated; calycine segments long-subulate, twice longer than the corolla; capsule very long, obconical. ♃.? H. Native of the north of India, about Laddack. Root thickish, rather fusiform, divided at top. Flowers small, solitary, terminal, drooping. Tube of calyx very much elongated. Corolla funnel-shaped, pale blue.

Awned-calyxed Bell-flower. Pl. 1 foot.

71 C. sylva'tica (Wall. in Roxb. fl. ind. 2. p. 97.) plant scabrous from short stiff hairs; stems erect, straight, few-flowered; cauline leaves linear, narrow, nearly entire; calycine segments erect, subulate; corolla campanulate, downy, twice longer than the calycine segments. ♃.? H. Native of Nipaul, in shady humid places. C. stricta, Wall. asiat. res. 13. p. 374. C. integérrima, D. Don, prod. fl. nep. p. 155. Habit of *C. rotundifòlia,* but probably without any roundish radical leaves. Stems simple or branched. Flowers terminal, on long peduncles, disposed like those of *C. rotundifòlia.* Corollas blue.

Wood Bell-flower. Pl. ½ to 1 foot.

72 C. Ve'sula (All. pedem. 1. p. 108. no. 397. t. 7. f. 1.) stems 1-flowered; leaves glabrous, oval, toothed; stems nearly naked; calyx glabrous. ♃. H. Native of Piedmont, on Mount Vesulus. Leaves many at the roots, petiolate, with a few scattered hairs beneath. Flowers campanulate, spreading.

Vesulus Bell-flower. Pl. ½ foot.

73 C. du'bia (Alph. D. C. mon. p. 286.) glabrous; stems 1-flowered; cauline leaves erect, narrow: lower ones linear-lanceolate, petiolate: superior ones long-acuminated; calycine lobes subulate; corolla tubularly funnel-shaped, twice longer than the calycine lobes. ♃. H. Native of Newfoundland. Flowers erect, terminal, very like those of *C. rotundifòlia.*

Doubtful Bell-flower. Pl. ⅓ to ½ foot.

74 C. prate'nsis (Pyl. ined. ex Alph. D. C. mon. p. 287.) stems humble, 1-flowered, most leafy above; leaves all petiolate, ovate, acute, subcrenated; calycine segments long-acuminated, one-third shorter than the corolla. ♃. H. Native of Newfoundland, by the sea side. Plant glabrous. Corollas funnel-shaped.

Meadow Bell-flower. Pl. ½ foot.

75 C. pu'lla (Lin. spec. p. 231.) stems humble, 1-flowered; leaves glabrous, crenulately toothed: lower ones on short petioles, ovate-roundish: superior ones sessile, ovate, acute; calycine segments long-acuminated, erect, twice shorter than the corolla, which is campanulate. ♃. H. Native of Transylvania, Bohemia, alps of Austria, Syria, Carniola, &c. in shady places. Jacq. obs. bot. 1. p. 30. t. 18. fl. austr. 3. t. 285. Gilib. demonstr. bot. t. 26. Lodd. bot. cab. t. 554. Sims, bot. mag. 2492. Sweet. fl. gard. n. s. t. 80. Plant small. Stems rarely pilose at the base, but usually glabrous. Root slender. Flowers terminal, large for the size of the plant. Corollas of a deed violaceous blue colour.

Var. β, *ramòsa* (Alph. D. C. mon. p. 288.) stems branched a little. ♃. H. C. púlla β, Lin. spec. p. 231.? C. púlla, var. Scop. carn. 1. p. 143.—C. Bauh. prod. t. 35.?

Russet Bell-flower. Fl. June, Aug. Clt. 1779. Pl. ¼ to ½ foot.

76 C. excìsa (Schleich. pl. exsic. Murr. guide en Vall. p. 33. and 35.) plant glabrous, humble; stems slender, 1-flowered; lower leaves linear-acuminated; calycine lobes setaceous, spreading, at length reflexed, 3 times shorter than the corolla, which is funnel-shaped; sinuses of corolla cut; capsule obconical. ♃. H. Native of Switzerland, on the higher alps in the valley of St. Nicholas; at Saas; and about Simplon, &c. Lodd. bot. cab. t. 561. Rchb. icon. cent. 1. t. 78. Re, fl. pedem. alt. p. 193. in mem. acad. turin, t. 31. Gaud. fl. helv. 2. p. 147. t. 2. Stems numerous, erect, slender, simple, naked at top. Leaves entire, or remotely denticulated. Flowers drooping before and at the time of expansion. Corollas blue.

Cut-flowered Bell-flower. Fl. June, July. Clt. 1820. Pl. ¼ to ½ foot.

77 C. Waldsteinia'na (Rœm. et Schultes, syst. 5. p. 99.) glabrous; stems erect, flexuous, stiff, simple, few-flowered; leaves sessile, lanceolate, serrated: lower ones obtuse: superior ones long-acuminated; alabastra erect; calycine lobes subulate, subdenticulated, spreading, 4 times shorter than the corolla, which is campanulate. ♃. H. Native of Croatia, on the mountains, in the fissures of rocks. Rchb. icon. bot. cent. 1. t. 85. C. flexuòsa, Waldst. et Kit. pl. rar. hung. 2. p. 145. t. 136. C. rupéstris, Host, fl. austr. 1. p. 263. Stems numerous from the same root, stiff. Flowers 3-4 at the top of each stem, one of which is terminal, and the others from the axils of the superior leaves, always looking upwards. Corollas of a violaceous blue colour.

Waldstein's Bell-flower. Fl. June, Aug. Clt. 1824. Pl. ½ to ¾ foot.

78 C. aparinòides (Pursh. fl. amer. sept. 1. p. 159.) glabrous; stem weak, ascending, simple, few-flowered, having the angles beset with short retrograde bristles; lower leaves linear-obovate: the rest linear and acuminated: all remotely denticulated, and beset with retrograde short bristles; calycine lobes triangular, twice shorter than the corolla, which is campanulate; capsule spherical. ☉. H. Native of North America, in humid meadows about Elizabeth Town, on the banks of the Hudson, near Boston; Philadelphia, and West Chester in Pennsylvania. C. erinoìdes, Muhl. cat. p. 22. Bigel. fl. bost. p. 54. Nutt. gen. amer. 136. but not of Lin. and Willd. Root slender. Flowers 2-4, terminal, pedunculate, small, erect. Corollas white.

Var. β, *multiflòra* (Alph. D. C. mon. p. 290.) stem erect; panicle divaricate.

Goose-grass-like Bell-flower. Fl. June, Aug. Pl. 1 foot.

79 C. flexuòsa (Michx. fl. bor. amer. 1. p. 109.) glabrous; stem panicled at top, with erectish branches; leaves most frequent in the middle and above, almost sessile, lanceolate, acuminated at both ends, coarsely serrated; calycine lobes capillary, twice shorter than the corolla, which is tubularly campanulate; style a little exserted. ♃. H. Native of Carolina, on high mountains. Stems erect, angular. Leaves very few at the base, but crowded at top. Flowers panicled, terminal and axillary. Corolla blue.

Flexuous Bell-flower. Fl. Aug. Sept. Pl. ¼ to ½ foot.

80 C. divarica'ta (Michx. fl. amer. bor. 1. p. 109.) glabrous; stem panicled at top, with the branches diverging; leaves equally scattered over the stem, nearly sessile, ovate-lanceolate, acuminated at both ends, coarsely serrated, with rather scabrous edges; calycine lobes capillary, twice shorter than the corolla, which is tubularly campanulate; style a little exserted. ♃. H. Native of Carolina and Virginia, on the mountains; and of Kentucky, &c. Stems leafy to the middle, and almost naked in the upper part. Flowers small, drooping, terminating the branches and branchlets. Corolla azure blue.

Divaricate-panicled Bell-flower. Pl. 2 to 4 inches.

c. *Plants few-flowered, pilose. Corolla downy outside. Capsule usually turbinate, and probably always drooping.—All natives of Nipaul.*

81 C. ca'na (Wall. in Roxb. fl. ind. 2. p. 101.) tomentose; stems ascending, branched; leaves sessile, approximate, lanceolate, toothed, hoary beneath; flowers terminal; segments of calyx lanceolate, toothed, twice shorter than the corolla, which is funnel-shaped and pilose; capsule turbinate. ♃. H. Native of Nipaul, on the mountains near Gosaingsthan. Root fibrous. Stems many, ascending, densely covered with white hairs, as well as the upper surfaces of the leaves. Flowers on short peduncles, terminating the stem and branches. Corollas blue.

Hoary Bell-flower. Fl. Oct. Pl. ascending.

82 C. cane'scens (Wall. cat. no. 1289.) plant hispid; stem erect; radical leaves crowded, lanceolate, crenulated: cauline leaves remote, narrower, repandly denticulated; flowers racemose, often approximate, on short pedicels, small; tube of calyx spherical: lobes linear, entire; corolla tubular, pilose. ☉. H. Native of Nipaul; and Hindostan, about Rampore. Alph. D. C. mon. p. 292. C. Benthàmii, Wall. cat. no. 1290. Root slender. Stem branched from the base or simple. Flowers numerous, small, 4-6 at the top of each branchlet, the whole forming a many-flowered loose raceme.

Canescent Bell-flower. Pl. 1 foot.

83 C. colora'ta (Wall. in Roxb. fl. ind. 2. p. 101.) stem branched, downy; leaves scattered, lanceolate, acute, repandly denticulated; peduncles elongated, terminal and axillary; calyx with a very pilose obconical tube, and triangular entire lobes, which are about equal in length to the corolla, which is tubular and velvety; capsule turbinate. ♃. F. Native of Nipaul. Leaves variable in size, acuminated at both ends, sessile, downy. Peduncles nearly naked, or bearing a large bractea each.

Var. β, *Moorcroftiàna* (Alph. D. C. mon. p. 233.) leaves less toothed. ♃. H. Native of the north of India, about Ludack. C. Moorcroftiàna, Wall. herb. no. 1288.

Coloured Bell-flower. Pl. ½ foot.

84 C. pa'llida (Wall. in asiat. res. 13. p. 375.) plant clothed with canescent pili; stem erect, branched; leaves elliptic, sinuately crenated, petiolate: upper ones sessile; calyx bristly, with linear-lanceolate segments, which are about equal in length to the corolla. ♃.? F. Native of Nipaul, in sterile places. Wall. in Roxb. fl. ind. 2. p. 100. D. Don, prod. fl. nep. p. 156. Branches slender, simple, subfastigiate. Flowers solitary, terminating the stem and branchlets, white, forming a terminal fastigiate panicle. Corolla pilose.

Pale Bell-flower. Pl. 1 to 2 feet.

85 C. ramulòsa (Wall. in Roxb. fl. ind. 2. p. 100.) stem erect, pilose, branched; leaves lanceolate, sessile, crenately

toothed, with the nerves rather prominent beneath; flowers pedicellate, terminal and axillary; calyx pilose, with broad, acute, subdentate lobes, twice or thrice shorter than the corolla, which is cylindrical and velvety; capsule turbinate. ♃. H. Native of Nipaul. Root short, slender, simple or branched. Flowers inclinate, pedicellate. Leaves pilose. Corolla of a violaceous blue colour.

Branched Bell-flower. Pl. 1 to 2 feet.

86 C. Alphónsii (Wall. cat. no. 1296. Alph. D. C. mon. p. 294.) stems humble, simple, 1-flowered, downy; cauline leaves sessile, lanceolate, acute, toothed a little, rather pilose above, and hoary beneath; calyx downy, with acute segments, twice shorter than the corolla, which is campanulate and downy. ♃. H. Native of the south of India, on the Nellighery Mountains. Stems very leafy at top. Flowers drooping, terminal, large for the size of the plant.

Alphonse De Candolle's Bell-flower. Pl. 2 to 3 inches.

** *Flowers on very short pedicels, opposite the leaves. Capsule turbinate. Branches more or less dichotomous. Leaves small, sessile, oblong.—All annual humble herbs, inhabitants of the region of the Mediterranean.*

87 C. erìnus (Lin. spec. 240.) plant hispid; leaves obovate or ovate, toothed; flowers sessile; calycine lobes triangular, acuminated, erect, at length spreading, about equal in length to the corolla, which is small and tubular. ♃. H. Native about the Mediterranean Sea; very plentiful throughout the whole Spanish Peninsula, south of France, Provence, Sardinia, throughout the whole of Italy, Sicily, Dalmatia, Grecian Islands, Teneriffe, &c. on walls and rocky places. Sibth. et Smith, fl. græc. t. 214. Cav. valenc. t. 2. Roucèla erìnus, Dumont, comm. bot. p. 14. —J. Bauh. hist. 2. p. 799. with a good figure.—Mor. oxon. sect. 5. t. 3. f. 25.—Column. phyt. t. 28. pl. nov. hist. p. 29. t. 31. Stem much branched. Flowers terminal and axillary, and situated in the angles of the forks of the branches. Corollas tubular, of a pale bluish rose-colour or white, pilose at the base.

Erinus-like Bell-flower. Fl. May, Aug. Clt. 1768. Pl. $\frac{1}{3}$ to $\frac{3}{4}$ foot.

88 C. drabæfòlia (Sibth. et Smith, fl. græc. 3. p. 11. t. 215.) plant hispid; leaves elliptic-oblong, toothed; flowers pedicellate; segments of the calyx always erect; corolla inflated, much longer than the calyx. ⊙. H. Native of the Island of Samos, and near Athens, in cotton plantations and vineyards. Habit of *C. erìnus*. Stem many times forked, erectish. Corolla with a white tube, and a violaceous blue limb.

Draba-leaved Bell-flower. Fl. July, Aug. Clt. 1823. Pl. $\frac{1}{4}$ foot.

89 C. Rhode'nsis (Alph. D. C. mon. p. 297.) plant pilose; leaves entire, ovate; flowers terminal; calycine lobes triangular, erect, at length spreading; corollas large, campanulate. ⊙. H. Native of the Island of Rhodes. Root simple. Stems many from each root, reddish. Flowers numerous, erect, terminating the branches. Corollas elegant.

Rhodes' Bell-flower. Pl. $1\frac{1}{2}$ to 3 inches.

§ 3. *Capsule erect; valves dehiscing at the base.—Flowers pedicellate. Radical leaves petiolate, usually cordate, having the base of the petioles usually expanded and permanent.*

* *Corolla downy or velvety, tubular, 5-lobed at the apex. Radical leaves crowded. Stems few-flowered.—Species all natives of the Levant.*

90 C. Damasce'na (Labill. pl. syr. dec. 5. p. 7. t. 5.) downy; radical leaves ovate-obovate, acute, nearly entire, hoary: cauline ones few, ovate, acute; calyx velvety, with subulate lobes, twice shorter than the corolla; capsule ovoid. ♃. F. Native of the Levant, near Damascus, on the mountain called Dgebel-cher. Root woody. Stems slender, 1 or few-flowered. Flowers erect, pedicellate. Corollas cylindrical.

Damascus Bell-flower. Pl. ascending.

91 C. arge'ntea (Lam. dict. 1. p. 584.) humble; radical leaves linear-obovate, clothed with silvery tomentum, nearly entire: upper leaves few, oblong; calyx silvery, with triangular lobes, 3 times shorter than the corolla; capsule turbinate. ♃. F. Native of Armenia.—Tourn. cor. 3. Root hard, blackish. Stems erect, velvety, with short branches. Flowers 1 or few on the top of each branch, erect. Corollas velvety.

Silvery Bell-flower. Pl. $\frac{1}{4}$ foot.

92 C. Syri'aca (Rœm. et Schultes, syst. 5. p. 133.) radical leaves oblong-spatulate: cauline leaves oval, sessile, somewhat sinuated; stem simple, few-flowered at top. ⊙.? H. Native of Syria. There is nothing said of the flower and capsule by the authors.

Syrian Bell-flower. Pl. $\frac{1}{4}$ foot.?

** *Corollas rotate, deeply 5-lobed, usually downy outside. Style exserted.—All natives of Italy.*

93 C. Garga'nica (Ten. fl. neap. prod. 1827.) radical leaves reniform, on long petioles: cauline ones cordate, all crenately toothed, downy; flowers axillary, in fascicles; corollas 5-parted. ♃. H. Native of Apulia, on Mount St. Angelo. Sweet, fl. gard. n. s. t. 252. C. elátines, Pentagn. inst. bot. 2. p. 367. Plant pale green. Corollas blue. Habit of *C. Carpática*.

Garganus Bell-flower. Fl. May, Sept. Clt. 1832. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

94 C. elatinoìdes (Morett. pl. ital. dec. 3. p. 5.) plant tomentose; leaves acutely toothed, petiolate: lower ones oblong: superior ones ovate-acute; flowers disposed in dense racemes; tube of calyx ovoid: lobes subulate, spreading, about equal in length to the corolla. ♃. H. Native of Italy, on the mountains about Pisa, among stones and on rocks. C. elátines, Poll. fl. veron. 1. p. 278. no. 404. C. petræ'a, Zantedesch. fl. brix. ined. but not of Lin. nor others.—Gerard. emac. p. 455. f. 2.—Clus. cur. post. p. 67. t. 68. Root nodose. Stem erect, simple, thick for the size of the plant. Leaves canescent. Peduncles many-flowered. Corollas blue, downy outside.

Elatine-like Bell-flower. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

95 C. Ela'tines (Lin. spec. 1. p. 240.) stem ascending; leaves cordate, coarsely and acutely toothed, ovate-acute: lower ones roundish; flowers in loose racemes; tube of calyx spherical; lobes of calyx spreading, linear-lanceolate, twice shorter than the corolla. ♃. H. Native of the alps of Piedmont, Liguria, Naples, &c. in shady, rocky places. All. pedem. no. 422. t. 7. f. 2. Plant downy. Stem branched. Flowers scattered over the upper part of the plant, sometimes racemose, and sometimes panicled. Corollas bluish-purple, hardly one-half longer than the calycine lobes.

Var. β, glabérrima (Alph. D. C. mon. p. 301.) plant quite glabrous.

Elatine Bell-flower. Fl. June, Aug. Clt. 1823. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

*** *Corolla campanulate, funnel-shaped, or tubular, 5-lobed at the apex, glabrous.—Roots for the most part thick. All natives of Italy.*

96 C. macrorhìza (Gay, ined. ex Alph. D. C. mon. p. 302.) root thick; stems ascending; radical leaves petiolate, small, roundish-cordate, toothed: lower cauline leaves on short petioles, ovate, acute, toothed: superior ones sessile, linear-acuminated; flowers terminal and axillary; alabastra erect; calycine lobes acuminated, spreading or reflexed, twice shorter than the corolla, which is campanulate. ♃. H. Native of Nice, on dry rocks; Provence, on the mountain called Cousson; and near

San Marco, in Calabria. C. Nicæénsis and C. rupéstris, Risso, in herb. D. C. Root thick, marked by the vestiges of the fallen leaves, creeping among rocks. Stem simple or branched, glabrous. Leaves glabrous. Flowers more or less numerous, solitary, pedunculate and pedicellate, as in *C. rotundifòlia*, looking upwards. Corolla broader than those of *C. rotundifòlia*.

Var. β, pubéscens (Alph. D. C. mon. p. 502.) stems and leaves downy; calycine lobes always erect. ♃. H. In the alpine regions above Tende. C. pusílla β, D. C. fl. fr. suppl. no. 2833.

Long-rooted Bell-flower. Pl. ½ to 1 foot.

97 C. Portenschlagia'na (Rœm. et Schultes, syst. 5. p. 93. Vis. stirp. dalm. pp. 29-54. exclusive of the syn. C. isophýlla, Morett. Alph. D. C. mon. p. 303. t. 13. f. a.) stems erectish; leaves about equal in size, petiolate, roundish-cordate, acutely and angularly toothed; flowers racemose; calycine lobes subulate, thrice shorter than the corolla, which is funnel-shaped. ♃. H. Native of Dalmatia, on walls. C. muràlis, Portenschlag. herb. Flowers erect, lilac. Habit of *C. Carpática*. Plant quite glabrous.

Var. β, velutìna (Alph. D. C. mon. p. 303.) plant velvety.

Portenschlag's Bell-flower. Pl. ½ foot.

98 C. Billardie'rii (Alph. D. C. mon. p. 303.) glabrous; stems ascending; radical leaves on long petioles, small, cordate, 3-5-cleft: lobes toothed; flowers few, in loose racemes; calycine segments filiform, rather unequal, twice shorter than the corolla, which is tubular. ♃. H. Native of Syria. Flowers few, secund, drooping. Corollas small, blue. Radical leaves numerous; cauline ones few. Habit of *Wahlenbérgia hederàcea*.

La Billardiere's Bell-flower. Pl. ⅓ foot.

99 C. Morettia'num (Rchb. icon. rar. cent. iv. p. 18. t. 320.) plant pilose, humble; stems 1-flowered; leaves crenately toothed, small; radical leaves petiolate, cordate, roundish: cauline leaves smaller, ovate, acute; calycine lobes lanceolate, 4 times shorter than the corolla, which is funnel-shaped. ♃. H. Native of Dalmatia, on Mount Bioccovo; and of Tyrol, on Mount Vodai, above Vigo, in the valley of Foscia. C. púlla, Parol. hort. sic. ined. but not of Lin. nor Jacq. C. filifórmis, Morett. pl. ital. dec. p. 8. giorn. di. fisic. &c. di. Pav. 1826. vol. 9. p. 155. bot. ital. no. 11. p. 21. no. 4. Flowers erect, blue.

Moretti's Bell-flower. Pl. 1 to 3 inches.

100 C. Raine'ri (Perpenti, in bibl. ital. 1817. 5. p. 134. with a figure) stems erect, firm, branched: branches 1-flowered; leaves almost sessile, ovate, remotely serrated: lower ones the smallest, obovate; calycine lobes long-acuminated, erect, twice shorter than the corolla, which is funnel-shaped; capsule obovate. ♃. H. Native of Italy, on the alps in the province of Brixo, and on the mountains surrounding Lake Cosmo; on the alps of Biandino and Tremare, above Mandello and Resegone, from the termination of the Beech Woods, even to the elevation of 6000 feet and upwards. C. Perpéntiæ, Morett. in herb. D. C. Plant tufted. Caudex creeping. Stems leafy, rather pilose. Leaves glabrous or downy. Flowers erect, blue.

Rainer's Bell-flower. Fl. June, July. Clt. 1826. Pl. ½ ft.

* * * * *Corollas large, campanulately rotate, somewhat 5-cleft, glabrous. Roots usually thick.*

101 C. isophy'lla (Moretti, append. to Schouw, prospett. fl. ital. p. 22. Rchb. icon. pl. cent. 3. t. 202. f. 344.) stems erectish, firm; leaves all about the same size, petiolate, roundish, crenately toothed; flowers corymbose; calycine lobes acuminated, broad, twice shorter than the corolla; style exserted; capsule ovoid. ♃. H. Native of Liguria, at Cape Nauli and Caprazoppa. C. floribúnda, Viv. fl. lyb. append. fl. ital. p. 67. Caudex woody. Plant glabrous or velvety. Flowers numerous, erect, disposed in a corymb. Corollas blue, rotate.

Equal-leaved Bell-flower. Pl. ¼ to ½ foot.

102 C. fra'gilis (Cyril. pl. fasc. 1. p. 32. t. 11. f. 2.) stems ascending, diffuse, branched; radical leaves on long petioles, roundish-cordate, bluntly crenate-lobed: cauline leaves smaller, ovate and lanceolate; flowers panicled; calycine lobes linear-lanceolate, erect, about equal to the corolla; style exserted; capsule ovoid. ♃. H. Native of the south of Italy, in the valley of Anania; near Naples, in Goat's Island, about Cava; on Mount Pollino and elsewhere in Calabria; and probably of Sicily. C. diffùsa, Vahl, symb. p. 18. C. cochlearifòlia, Vahl, symb. p. 18. C. crassifòlia, Nees, syll. ratisb. 1. p. 6. and amœn. bot. fasc. 2. p. 9. t. 4.—Barrel. icon. rar. p. 54. t. 27. Root thick. Plant glabrous. Flowers numerous, racemosely panicled, terminating the branchlets, erect, pedicellate. Corollas large, pale blue.

Var. β, hirsùta (Alph. D. C. mon. p. 307.) plant hispid, and as if it was covered with wool. ♃. H. C. frágilis lanuginòsa, Ten. fl. neap. prod. p. 15. C. frágilis β, Rœm. et Schultes, syst. 5. p. 92.—Barrel. obs. p. 10. t. 453.

Brittle Bell-flower. Fl. July, Aug. Clt. 1826. Pl. ¼ to ½ foot.

103 C. Barrelie'ri (Presl, symb. bot. p. 30. t. 19. ex Linnæa. 7. p. 7.) villous; stems diffuse, procumbent, very simple, 1-flowered; leaves roundish-cordate, crenated; flowers terminal; segments of the calyx lanceolate, acute, longer than the tube, which is glabrous. ♃. H. Native of Naples, on rocks by the sea side. C. diffùsa, var. Rœm. et Schultes, syst. 5. p. 92. Corollas blue.

Barrelier's Bell-flower. Pl. procumbent.

104 C. versícolor (Sibth. et Smith, prod. fl. græc. 1. p. 138. fl. græc. t. 207.) glabrous; stem ascending; leaves serrated; radical leaves petiolate, ovate, acute, rather cordate: cauline leaves on short petioles, ovate-lanceolate, acuminated; flowers disposed in long spicate racemes; calycine segments acuminated, spreading, at length reflexed, twice shorter than the corolla, which is variegated; style exserted; capsule spheroid. ♃. H. Native of Greece. C. planiflòra, Willd. enum. 1. p. 210. but not of Lam. C. Willdenowiàna, Rœm. et Schultes, syst. 5. p. 107. Root tuberous, thick, white, subdivided at top. Stems erect. Corollas campanulately rotate, of a deep violaceous colour at bottom, pale in the middle, and the lobes pale violet. Flowers disposed in long spikes, like those of *C. pyramidàlis*, of which this species has the habit.

Var. β, multiflòra (Alph. D. C. mon. p. 308.) leaves irregularly serrated, undulated; flowers more numerous. ♃. H. C. versícolor, Andr. bot. rep. 396.

Party-coloured Bell-flower. Fl. July, Sept. Clt. 1788. Pl. 2 to 4 feet.

105 C. Tenòrii (Morett. prospett. descript. geogr. de Schouw, p. 19. in a note. p. 15. Alph. D. C. mon. p. 309.) stem ascending; leaves coriaceous: radical ones ovate-oblong, acutely serrulated, on long petioles: cauline leaves on short petioles, ovate, acute, coarsely serrated; flowers racemose; calycine lobes linear, spreading, twice shorter than the corolla; capsule spherical. ♃. H. Native of the kingdom of Naples. C. corymbòsa, Ten. prod. fl. neap. p. 15. C. Rosàni, Ten. in herb. Moricand. C. Thomàsii, Tenore, in litt. C. versícolor, Guss. pl. rar. p. 92. exclusive of the syn. of Sibth. et Smith. Plant glabrous. Stem simple. Radical leaves subcordate; petioles of cauline leaves ciliated at the base. Flowers approximate; peduncles 1-5-flowered, as in *C. versícolor*. Corolla with a white base and blue lobes.

Tenore's Bell-flower. Pl. ½ to 1 foot.

106 C. pyramida'lis (Cam. hort. med. p. 33. Lin. spec. 1. p.

233.) glabrous; leaves glandularly toothed: lower ones petiolate, ovate-oblong, somewhat cordate: cauline leaves sessile, ovate-lanceolate; flowers numerous, pyramidally racemose; calycine lobes acuminated, spreading; capsule spheroid, deeply furrowed. 4. H. Native on rocks and on walls in Carinthia, Carniola; of Dalmatia, in the island of Viego; on the walls of Venice and Verona. The plant has been cultivated a long time in gardens, and consequently has become, as it were, indigenous in many parts of the south of Europe. Jaum St. Hil. pl. fr. t. 416.—Weinm. phyt. t. 289. f. b.—Moris. oxon. 2. p. 452. sect. 5. t. 1. f. 1.—Besl. hort. eyst. 1. t. 7. f. 1.—Tab. icon. 317.—Swert, floril. t. 16. f. 2.—Lob. hist. p. 177. icon. 327.—Dod. pempt. 166. with a figure. Root large, turnip-formed, oblong, usually divided into fusiform branches. Stem nearly simple, but furnished with floriferous branchlets. Flowers very numerous, pedicellate, usually 3 together from the same bractea, the whole disposed in a large pyramidal raceme, which is loose at the base. Corolla pale blue, with a dark base. There is also a white-flowered variety of this.

Var. β, calycìna (Alph. D. C. mon. p. 510.) plant monstrous, 1-flowered, dwarf; leaves all petiolate; calycine segments changed into large leaves. 4. H.—Weinm. phyt. icon. t. 294.

Pyramidal Bell-flower. Fl. July, Sept. Clt. 1596. Pl. 4 to 5 feet.

107 C. lactiflòra (Bieb. fl. taur. 1. p. 153. cent. pl. ross. 1. t. 10.) stem branched; leaves sessile, ovate-lanceolate, acutely serrated; flowers in loose panicles; calycine lobes very broad, serrulated, acute, twice shorter than the corolla; capsule ovoid. 4. H. Native of Caucasus and Siberia, in grassy places. Ker. bot. reg. 241. Sims, bot. mag. 1973. Alph. D. C. mon. t. 7. C. híspida, Fisch. hort. gorenk. ex herb. Willd. C. volùbilis, Willd. herb. Stems simple or branched, glabrous or pilose. Leaves pale beneath, glabrous or pilose. Corollas erect, milk-coloured, tinged with blue. Peduncles short, erect, usually 3-flowered.

Milk-flowered Bell-flower. Fl. July, Sept. Clt. 1814. Pl. 2 to 6 feet.

§ 4. *Capsule dehiscing laterally by the valves towards the apex, erect. Lobes of calyx usually denticulated.—Radical leaves usually obovate, on short petioles, but never cordate. Flowers pedicellate.*

* *Valves situated between the middle and upper part of the capsule.—Branches not dichotomous.*

108 C. Scoule'ri (Alph. D. C. mon. p. 312.) stem simple, few-flowered; leaves ciliated, sharply serrated: lower leaves ovate, acute, petiolate: middle ones ovate-lanceolate, sessile: superior ones linear-lanceolate; flowers racemose; calyx glabrous, with capillary erect lobes, which are 3 times shorter than the 5-cleft, funnel-shaped corolla; style exserted; capsule ovoid. 4. H. Native of North-west America, about Fort Van Couver, on the banks of the Columbia river. Stems ascending at the base, glabrous or a little hairy, simple at bottom, and furnished with floriferous peduncles at top. Flowers 4 to 10 on each stem, terminal and axillary, loosely racemose. Habit of a species of *Adenóphora*.

Scouler's Bell-flower. Pl. ½ foot.

* * *Valves situated near the top of the capsule. Flowers usually on long peduncles, terminal or axillary. Branches not dichotomous.*

109 C. planiflòra (Lam. dict. 1. p. 580. ill. 2509.) quite glabrous: stems simple; leaves sessile, coriaceous, shining; radical ones crowded, ovate or obovate, obtuse, crenulated: cauline ones linear-lanceolate, acute, nearly entire; flowers disposed in spicate racemes; calycine lobes ovate, acute, broad, erect, 3 times shorter than the corolla, which is campanulately rotate. 4. H. Native of North America, probably towards Hudson's Bay. C. nítida, Ait. hort. kew. ed. 1. vol. 1. p. 346. Nutt. gen. amer. 1. p. 136. C. Americàna, Mill. dict. no. 13. but not of Lin.—Tourn. inst. 1. p. 111. Munting, phyt. cur. t. 123.—Dodart, mem. ed. de mal. p. 621. t. 33. ed. fol. p. 119. t. v. Flowers terminal and axillary, on short pedicels, approximate, disposed in a kind of spicate raceme. Corolla pale blue; there is also a variety with white flowers.

Flat-flowered Bell-flower. Fl. July, Sept. Clt. 1731. Pl. ½ to 1 foot.

110 C. America'na (Lin. spec. 233.? Ait. hort. kew. 1. p. 220.) stem simple; radical leaves ovate, acute, a little cordate, petiolate, serrated: cauline leaves ovate-lanceolate, acuminated at both ends, serrulated; flowers disposed in long spikes; calycine lobes long-acuminated, spreading, rather shorter than the corolla, which is rotately campanulate; capsule cylindrical, furrowed. 4. H. Native of North America, in South Carolina, Georgia, Virginia, and Pennsylvania, on the mountains. Pursh. fl. sept. amer. 1. p. 159. Phyteùma Americàna, Hill, in hort. kew. p. 128. C. asteroìdes, Lam. ill. 2515. C. oblìqua, Jacq. hort. schoenbr. 3. t. 336. Willd. enum. 1. p. 210. C. declinàta, Mœnch. suppl. meth. p. 187. C. acuminàta, Michx. fl. bor. amer. 1. p. 108. Pursh. fl. sept. amer. 1. p. 159. exclusive of the syn. of Ait. and Dod. Nutt. gen. amer. 1. p. 136. Stems erect, simple, firm, glabrous or pilose on the angles. Radical leaves rosulate, rather pilose. Corollas blue, a little longer than the calycine lobes. Flowers erect, 1-3 from the axil of each bractea.

Var. β, subulàta (Alph. D. C. mon. p. 314.) plant humble, few-flowered; leaves petiolate. 4. H. C. subulàta, Beauv. ined.

American Bell-flower. Fl. July, Aug. Clt. 1763. Pl. 2 feet.

111 C. fu'lgens (Wall. in. Roxb. fl. ind. 2. p. 99.) stem simple, erect, pilose; leaves lanceolate, acuminated at both ends, on short petioles, serrated; flowers almost sessile, disposed in a raceme, crowded at top; calycine segments linear-subulate, erect, entire, rather longer than the corolla, which is funnel-shaped; capsule ovoid, 10-nerved. 4. F. Native of Upper Nipaul, on the more elevated mountains. Root simple, glabrous. Stem usually undivided, but sometimes furnished with a few simple branches, angular, Leaves hispid. Petioles pilose. Flowers small, blue, in fascicles, from the axils of the upper leaves, the whole forming an oblong terminal raceme.

Fulgent Bell-flower. Pl. 1 foot.

112 C. peregrìna (Lin. syst. p. 301.) plant hispid; stem simple, many-flowered, angular; leaves crenated: lower ones obovate: superior ones ovate, acute; flowers disposed in a spicate raceme; calycine lobes acuminated, nearly entire, rather shorter than the corolla, which is spreading; capsule ovoid. 4. H. Native of Mount Lebanon, and near Aleppo. Jacq. hort. schoenbr. 3. p. 337. Sims, bot. mag. t. 1257. Hoffm. and Link. fl. port. 2. p. 15. t. 83. C. lanuginòsa, Lam. dict. 1. p. 584. but not of Willd. C. hirsutíssima, Guss. ined. Flowers sessile, solitary, disposed in a long dense spike. Corollas funnel-shaped, hardly one-half longer than the calycine lobes, of a dark violet colour at the base, of a less deep colour in the middle, and paler towards the margins.

Foreign Bell-flower. Fl. July. Aug. Clt. 1794. Pl. 2 ft.

113 C. primulæfòlia (Brot. fl. lus. 1. p. 288. phyt. lus. 1. t. 20.) stem hispid, many-flowered, simple; leaves unequally and doubly crenated: radical ones lanceolate, bluntish: cauline

leaves ovate-oblong, acute; flowers disposed in a spicate raceme; calycine lobes acuminated, broad at the base, denticulated; corolla campanulately rotate, twice longer than the calycine segments; capsule long, obconical. ♃. H. Native of Portugal, in shady, humid places of the Algarves and Beira, and near Coimbra; above Punhete, and about Monchica. C. Trachèlium, Brot. fl. lus. 1. p. 287. Root oblique, branched, thickened into tubers at top. Leaves hispid on the ribs and veins. Flowers erect. Corollas nearly glabrous, blue, rarely purple, with a whitish downy bottom.

Primrose-leaved Bell-flower. Pl. 1 to 2 feet.

114 C. ala'ta (Desf. fl. atl. 1. p. 178. t. 50.) stem few-flowered, simple, glabrous; leaves irregularly toothed, glabrous: lower ones ovate, acute; cauline leaves lanceolate; flowers few, disposed in racemose heads; calyx with a hispid tube, and linear-lanceolate, acute, rather ciliated segments; corolla broadly campanulate, twice longer than the calycine segments; capsule spherical. ♃. H. Native of the north of Africa, near Maiaral. Stem angular. Flowers sessile on the top of the stem. Corolla blue, size of that of *C. pyramidàlis*.

Winged Bell-flower. Pl. 2 to 3 feet.

115 C. ptarmicæfòlia (Lam. dict. 1. p. 579.) stems simple, many-flowered; radical leaves crowded, linear-lanceolate, serrulated; flowers sessile, disposed in a loose spike; calyx with a spherical tube and triangular lobes, which are thrice shorter than the tubularly-campanulate corolla. ♃. H. Native of Armenia. Desf. choix. cor. p. 35. t. 25. or in ann. mus. 11. p. 56. t. 6. Radical leaves rosulate. Plant glabrous. Flowers erect, violaceous.

Sneezewort-leaved Bell-flower. Pl. ½ to ¾ foot.

116 C. Carpa'tica (Jacq. hort. vind. 1. p. 22. t. 57.) plant glabrous, branched; lower leaves on long petioles, ovate-roundish, cordate, toothed: superior ones on short petioles, ovate, acute; flowers disposed in loose panicles, on long peduncles; calycine lobes erectish, triangular, acuminated, thrice shorter than the corolla, which is broadly campanulate; capsule ovoid-cylindrical. ♃. H. Native of Transylvania, and at the sides and bottoms of the mountains of Liptovia, to the south of the Carpathian mountains; among calcareous alpine rocks. Curt. bot. mag. t. 117. Root fibrous. Stems leafy. Branches or peduncles elongated, naked, each terminated by an erect flower. Corollas blue, about the size of those of *C. persicæfòlia*.

Carpathian Bell-flower. Fl. June, Aug. Clt. 1774. Pl. ½ foot.

117 C. silenifòlia (Fisch. mss. ex Alph. D. C. mon. p. 320.) stem simple, few-flowered; leaves ciliated: radical ones lanceolate, on long petioles, entire: cauline ones narrower, acuminated; calycine lobes erect, acuminated, ciliated, thrice shorter than the corolla, which is funnel-shaped; capsule long, obovoid. ♃. H. Native of Dahuria; and at the river Lena, in Siberia. C. Baicalénsis, Pall. mss. in herb. Lamb. C. ciliàta, Patrin, herb. Gmel. sib. 3. p. 159. t. 32. exclusive of the syn. of Tourn. Root slender, creeping transversely below the earth, and emitting slender fascicles of fibres. Stem glabrous. Flowers 1-3 on each stem, terminal and axillary, pedicellate. Corollas large, blue, with glabrous or ciliated lobes.

Catchfly-leaved Bell-flower. Pl. ½ foot.

118 C. Steve'nii (Bieb. fl. taur. suppl. p. 138.) stem quite simple, 1-flowered; radical leaves obovate, petiolate, crenulated: cauline leaves sessile, nearly entire: lower ones ovate-lanceolate: superior ones acuminated; calyx glabrous, with acuminated erect lobes, which are one-half shorter than the funnel-shaped corolla. ♃. H. Native of Eastern Caucasus, in subalpine places; and of Iberia, Armenia, and the Ukraine. C. Steveniàna, Rœm. et Schultes, syst. 5. p. 91. C. lanceolàta, Pall. in herb. Lamb. C. Vittinghoffiàna, Rœm. et Schultes, syst. 5. p. 102. C. infundíbulum, Vest, in Rœm. et Schultes, syst. 5. p. 106.? C. seminùda, Vest, in Rœm. et Schultes, syst. 5. p. 91. C. símplex, Stev. mem. soc. des. natur. mosc. 3. p. 255. but not of D. C. fl. fr. Root slender. Stem sometimes velvety at the base. Flower erect, terminal. Corolla blue.

Var. β, Sibírica (Alph. D. C. mon. p. 321.) stem few-flowered; corolla 5-cleft even to the middle, with ample lobes. ♃. H. Native of Siberia. C. Steveniàna, Fisch. mss.

Steven's Bell-flower. Fl. July, Aug. Clt. 1825. Pl. ½ to 2 feet.

119 C. persicæfòlia (Lin. spec. ed. 1. p. 164.) stems nearly simple; leaves glabrous, stiff, crenulated: radical leaves lanceolate-obovate: cauline leaves linear-lanceolate; flowers racemose; calycine lobes acuminated, broad at the base, entire, twice shorter than the corolla, which is broadly campanulate; capsule ovoid, trisulcate, dehiscing by broad pores. ♃. H. Native of the south and temperate parts of Europe; from Spain, Italy, Greece, even to Scotland; south of Sweden; about Petersburgh and Moscow, and throughout Siberia, especially towards the east, and the Altaian mountains; about Constantinople; delighting in subalpine shady places, and woods; in Scotland, in woods near Cullen. Bull. herb. t. 367. Oed. fl. dan. t. 1087. Sibth. et Smith, fl. græc. t. 205. C. decúrrens, Lin. spec. ed. 2. p. 232. C. speciòsa, Gilib. pl. lith. p. 10. but not of Horn. C. amydalifòlia, Salisb. prod. p. 126.—Weinm. phyt. icon. t. 291. f. and b. and t. 290. f. c. and d.—Swert, floril. pt. 2. t. 16.—Besl. hort. eyst. 1. t. 8. f. 2. and 3.—Tab. icon. t. 317.—Lob. icon. t. 327.—Moris. oxon. 2. p. 452. sect. 5. t. 1. f. 2. Plant glabrous. Flowers terminal and axillary, pedunculate, solitary, inclined, the whole forming a raceme. Corollas large, broad, campanulate, blue, and all the intermediate shades to white.

Var. β, angustifòlia (Alph. D. C. mon. p. 322.) leaves narrow-linear. ♃. H. C. persicæfòlia, β, Lin. spec. ed. 1. p. 164. C. decúrrens, β, Lin. spec. ed. 2. p. 232. but not of ed. 1.—Tabern. icon. t. 411. and t. 412.

Var. γ, macrántha (Alph. D. C. mon. p. 323.) flowers very large, of a lilac colour. ♃. H. C. persicæfòlia, var. máxima, Curt. bot. mag. t. 397.

Var. δ, calỳce pilòso (Alph. D. C. mon. p. 325.) tube of calyx beset with strigose pili: lobes glabrous; leaves narrow-linear. ♃. H. Native of France and Carniola. C. persicæfòlia, Scop. carn. no. 228. D. C. fl. fr. no. 2838, var. γ.

Var. ε, dasycárpa (Alph. D. C. mon. p. 323.) stems 1-flowered; radical leaves ovate and obovate; cauline leaves oblong-lanceolate; calyx scabrous from pili. ♃. H. C. dasycárpa, Kit. in Schultes, fl. austr. 2. no. 900. Rœm. et Schultes, syst. 5. p. 93. C. persicæfòlia, β, Wahl. carp. p. 60.

Var. ξ, híspida (Alph. D. C. mon. p. 323.) plant hispid from pili. ♃. H. C. persicæfòlia, Rœm. et Schultes, 5. p. 106.

Var. η, pùmila (Alph. D. C. mon. p. 323.) glabrous; stems 1-flowered; leaves approximating, firm; corolla narrow at the base. ♃. H. Native of Bohemia. C. persicæfòlia, var. β, Pohl, fl. bohem. p. 202. C. pùmila, Schmidt, fl. bohem. no. 171. Flowers blue.

Var. δ, calycìna (Alph. D. C. mon. p. 323.) plant monstrous; stems 1-flowered; calycine lobes large, ovate-lanceolate; corolla narrowed at the base. ♃. H. C. persicæfòlia calycìna, Rchb. icon. cent. 1. t. 67.

Var. ι, flòre plèno (Alph. D. C. mon. p. 323.) flowers double, blue or white. ♃. H. Tourn. inst. 1. p. 111. C. decúrrens, var. Mill. dict. no. 2.

Peach-leaved Bell-flower. Fl. July, Sept. Britain. Pl. 1 to 3 feet.

120 C. Pyrena'ica (Alph. D. C. mon. p. 324.) stems simple, 1-flowered, beset with soft hairs; leaves rather pilose: radi-

cal leaves roundish, a little crenated, on short petioles: cauline leaves sessile, lanceolate, nearly entire, acute at both ends; calyx glabrous: with subulate, spreading, entire lobes, which are rather shorter than the corolla. ♃. H. Native of the Pyrenees, and of the Balearic Islands. Flowers terminal, erect. Corolla blue?

Pyrenean Bell-flower. Pl. 1 to 1½ foot.

121 C. Rapúnculus (Lin. spec. p. 232.) stem almost simple; lower leaves obovate, on short petioles, nearly entire: cauline leaves sessile, linear-lanceolate, entire; flowers spicately racemose, solitary; calycine lobes erect, long-subulate, very slender, rather shorter than the corolla, which is funnel-shaped; capsule obconical, trisulcate. ♂. H. Native of Morocco and Barbary; as also of the south of Europe, and extending as far north as the county of Norfolk, in England; as well as of Transylvania and Caucasus. In Britain, on banks and about the borders of fields; not common. About old Buckingham Castle, Norfolk. In many parts of Kent and Surry, as well as in other places on a gravelly soil; having formerly perhaps escaped from gardens. Smith, engl. bot. t. 283. Schrank, ench. no. 406. t. 39. Oed. fl. dan. t. 1326. Svenk, bot. t. 629. C. fastigiàta, Gmel. reis. 1. p. 153. t. 33. but not of Dufour. C. coarctàta, Gilib. pl. lith. p. 8. C. esculénta, Salisb. prod. p. 126. C. elàtior, Link, et Hoffm. fl. port. 2. p. 11. t. 80. C. glandulòsa, Banks, herb. Tourn. inst. 111. Morand. hist. p. 69. t. 39. f. 3.—Moris. oxon. sect. 5. t. 2. f. 20. and f. 1. Column. phyt. 102. with a figure. Lob. icon. t. 328. Root fusiform, thick, white. Stem simple, but sometimes furnished with a few branches towards the top, furrowed, glabrous, but pilose at the base. Leaves usually glabrous, but sometimes hairy. Flowers nearly sessile, or pedicellate, erect, forming a long raceme, which is branched at the base. Corollas blue or white. This plant varies in the stem being glabrous or pilose, in the length of the pedicels, in the tube of the calyx being glabrous or strigose, in the calycine teeth being entire or a little denticulated at the base. The root is milky, thick, and edible, and, with the leaves, is mixed in salads; and, therefore, it was formerly cultivated for that purpose. In France and Italy the roots are boiled and eaten hot with sauce, or cold with vinegar and pepper. The seed is sown in the spring on deep light soils, in drills, and the plants are ready for use in the autumn of the same year. It is called *Raperonzola* in Italy; *Rapuncio*, in Portugal; *Raiponce*, *petite Raiponce*, in France; *Rampion*, and *Small Rampion*, in England; *Rapunzel*, *Ruben*, or *Blau Bluhende Wurzel*, *Rapunzel*, *Purwitzlein*, in Germany; *Rzepeka*, in Bohemia; and *Akla Rapunzel*, in Sweden.

Var. β, calỳce strigòso (Alph. D. C. mon. p. 326.) calyx beset with strigose pili. ♂. H. Native of the Ukraine, Tauria, and Iberia. ♂. H. C. Rapúnculus, δ, Rœm. et Schultes, syst. 5. p. 105. C. verruculòsa Link et Hoffm. fl. portug. 2. p. 12. t. 81.

Var. γ, calycìna (Alph. D. C. mon. p. 326.) calycine segments subulate, length of corolla serrated from the base even to the middle: teeth acuminated. ♂. H. C. calycìna, Bœb. in Rœm. et Schultes, syst. 5. p. 104. C. Rapúnculus, Bieb. fl. taur. suppl. p. 138.

Rampion Bell-flower. Fl. July, Aug. Britain. Pl. 2 to 3 feet.

122 C. Lambertia'na (Alph. D. C. mon. p. 327.) stem simple, many-flowered, pilose; cauline leaves sessile, oblong-acuminate, irregularly denticulated, rather pilose; flowers disposed in a spicate raceme; calyx glabrous, with acuminated, spreading, coarsely, and acutely-toothed lobes, rather shorter than the corolla, which is obconical. ♂.? H. Native of Persia, in the province of Ghilan. Flowers disposed in a spike-formed raceme, furnished with a few branches at its base, as in *C. Rapúnculus*. Corollas white.?

Lambert's Bell-flower. Pl. 1½ to 2 feet.

123 C. virga'ta (Labill. pl. syr. dec. 2. p. 11. t. 6.) stem simple, many-flowered; radical leaves lanceolate, crenulated, petiolate: cauline ones sessile, linear-lanceolate; flowers spicate, usually twin or tern; calyx with a scabrous tube, and erect subulate lobes, which are twice or thrice shorter than the funnel-shaped corolla; capsules obconical. ♂. H. Native of Mount Lebanon. Root thick. Stem hardly leafy, rather scabrous below, but smooth at top. Leaves scabrous. Flowers sessile, erect, 1-3 from each axil, forming a long interrupted spike. Corollas blue.?

Twiggy Bell-flower. Pl. 1½ to 2 feet.

124 C. Hermìnii (Hoffm. et Link, fl. port. 2. p. 9. t. 79. Rœm. et Schultes, syst. 5. p. 328.) glabrous; stem ascending, simple; leaves nearly entire: radical ones lanceolate: cauline ones linear-lanceolate; petioles ciliated at the base; calycine lobes long, capillary, reflexed, rather shorter than the corolla, which is funnel-shaped. ⊙. H. Native of Portugal, on the high mountains called Serra d'Estrella. Root rather thick, creeping. Stem panicled at the top, as in *C. rhomboidàlis*. Pedicels 1-flowered. Corollas pale blue.

Hermin's Bell-flower. Fl. July, Aug. Clt. 1823. Pl. ½ to 1 foot. Ascending.

125 C. pa'tula (Lin. spec. ed. 1. p. 163.) stem branched; branches diverging; radical leaves crowded, obovate, crenated; cauline leaves linear-lanceolate, sessile, nearly entire; calycine lobes long-acuminated, spreading, serrated at the base, twice shorter than the corolla, which is funnel-shaped; capsule ovate-cylindrical. ♂. H. Native of the south and temperate parts of Europe; as of the Pyrenees, Spain, throughout Italy, the Morea, and also in the region of Tunis; Levant, to the Carpathian Mountains, but not below them; Transylvania; about Petersburgh and Moscow, but is never to be found in Europe beyond lat. 61. In England, in pastures, borders of fields and hedges; rare in several parts in Kent; in many places about Alcester; in Worcestershire, and Staffordshire, &c. Oed. fl. dan. t. 373. Smith's engl. bot. t. 42. Hook. fl. lond. t. 51. C. bellidifòlia, Lapeyr. abr. p. 36. C. decúrrens, Lin. spec. ed. 1. p. 164. Diffuse Bell-flower, Hill. veg. syst. 8. t. 1. —Weinm. phyt. icon. t. 290. f. a. Dill. hort. elth. t. 58. f. 68. Besl. eyst. ord. 1. t. 5. f. 3. Root small, slender, branched. Stems glabrous, or scabrous from pili on the angles. Branches divaricate, nearly naked. Leaves glabrous. Flowers panicled, terminal, and axillary, on long pedicels, large, erect. Corollas blue or white. This is a very polymorphous plant.

Var. β, calỳce pilòso strigòso (Alph. D. C. mon. p. 329.) calyx beset with strigose hairs.

Var. γ, latifòlia (Alph. D. C. l. c.) stem branched, glabrous, scabrous on the angles; cauline leaves lanceolate, broad, serrulated; calycine segments very long, rather longer than the corolla.

Var. δ, pauciflòra (Alph. D. C. l. c.) stem humble, branched a little, almost naked; flowers terminal, and axillary, few, large; corolla campanulate, one half longer than the calycine segments. Column. ecphr. p. 24. with a figure. Tourn. inst. 111.

Var. ε, neglécta (Alph. D. C. l. c.) calycine lobes reflexed, serrulated, toothed at the base, acuminated, a half or a third the length of the corolla. C. neglécta, Rœm. et Schultes, syst. 5. p. 104.

Spreading Bell-flower. Fl. July, Aug. Britain. Pl. 1½ to 2 feet.

126 C. erinoîdes (Lin. mant. p. 64.? Cav. ann. cienc. 3. p. 20.) stem humble, few-flowered, with scabrous angles; leaves small, linear-lanceolate, glabrous, crenulated: lower ones obtuse: superior ones acuminated; calycine lobes long, subulate,

entire, rather shorter than the corolla, which is funnel-shaped; capsule long-obconical, nearly terete. ♂. H. Native of Spain, about Madrid and elsewhere; and of Gibraltar and Tangiers. Root slender, filiform. Stem simple, but furnished at top with 1-flowered peduncles, which diverge more or less. Flowers erect, blue.

Erinus-like Bell-flower. Fl. July, Aug. Clt. 1823. Pl. ½ foot.

127 C. Matrite'nsis (Alph. D. C. mon. p. 532.) stem humble, few-flowered; leaves linear-lanceolate, nearly entire: lower ones obtuse: superior ones acute; calycine lobes long-subulate, erect, entire, rather shorter than the corolla, which is narrow-funnel-shaped; capsule obconical, elongated, having the nerves rather prominent. ⊙. H. Native of Spain, about Madrid. Root filiform. Stem simple, but furnished with 1-flowered peduncles at the top, glabrous or pilose, hardly scabrous on the angles. Leaves glabrous or pilose. Corollas violaceous.

Madrid Bell-flower. Pl. ¼ to ½ foot.

128 C. ramosíssima (Sibth. et Smith, fl. græc. t. 204.) stem branched, many-flowered, pilose; leaves ovate-lanceolate, crenated: lower leaves obtuse: upper ones acute; calyx with a pilose tube, and acuminated entire lobes, which are pilose outside, and rather shorter than the spreading corolla; capsule obconical, pilose, having the nerves rather prominent. ⊙. H. Native of Mount Olympus, in Bithynia, and in the island of Zante, &c. Root slender, fibrous. Stem angular. Leaves equally scattered over the stem, smoothish. Branches nearly naked, divaricate, each terminating in a single flower. Corolla bluish-violet, having the nerves more intensely coloured.

Much-branched Bell-flower. Fl. July, Aug. Clt. 1820. Pl. ¼ to ½ foot.

129 C. Lore'yi (Alph. D. C. mon. p. 333.) stem branched, few-flowered; leaves sessile, glabrous: lower ones obovate, crenated: middle ones ovate-lanceolate: superior ones linear, entire; calyx with a hispid tube, and long-acuminated glabrous spreading lobes, which are denticulated at the base, length of corolla, which is somewhat rotate; capsule spheroid, deeply furrowed, and beset with strigose pili. ⊙. H. Native of the province of Verona, near Vallegio, where it was first collected by Lory; and on Mount Baldo, by Rainer. C. Loreiàna, Lorèii, or Lorèi, Poll. elem. bot. t. 2. p. 148. ultimate table, f. 1. Poll. fl. ver. 1. p. 271. t. 2. f. 4. Sims, bot. mag. t. 2581. C. Baldénsis, Balb. cat. hort. taur. 1813. p. 20. C. ramosíssima, Host, fl. austr. 1. p. 264. but not of Sibth. et Smith. Root slender, fibrous. Stem glabrous or hispid. Peduncles long, naked, glabrous, bearing each an erect flower at the apex; but the alabastrum is drooping before expansion. Corolla with a white base, middle part or base of the lobes pale blue, and the lobes bluish-violet.

Lorey's Bell-flower. Fl. June, July. Clt. 1824. Pl. ½ to 1 foot.

130 C. decu'mbens (Alph. D. C. mon. p. 334. t. 12. f. A.) stem decumbent, nearly simple, few-flowered; radical leaves roundish-spatulate, sinuated: cauline leaves obovate, crenately-toothed: superior ones linear-lanceolate; calyx with a pilose tube; corolla funnel-shaped, twice longer than the calycine lobes; capsule spheroid. ⊙. H. Native of Spain, near Aranjuez. Root slender, fibrous. Stem glabrous or slightly pilose. Radical leaves with rather scabrous white subrevolute edges; middle ones quite glabrous. Flowers terminal, and axillary, on long peduncles, solitary, drooping before expansion, but afterwards erect. Corollas blue. ?

Decumbent Bell-flower. Pl. decumbent.

131 C. Loeflíngii (Brot. phyt. fasc. 1. no. 10. fl. lus. 1. p. 237.) stem much branched, many-flowered, rather scabrous on the angles; leaves crenulated: lower ones ovate-reniform, or roundish-cordate: superior ones ovate, stem-clasping; calyx glabrous, with an obconical tube, and long-acuminated spreading lobes, which are rather shorter than the corolla; capsule obconical, with prominent nerves. ⊙. H. Native throughout Portugal, *in* sandy places; of Spain, about Madrid; and of the territory of Mogodor. Brot. phyt. lus. sel. p. 41. t. 18. Hoffm. et Link, fl. port. 2. p. 14. t. 82. C. Broussonnetiàna, Rœm. et Schultes, syst. 5. p. 104. Root slender, fibrous. Leaves glabrous. Flowers solitary, terminating the naked branchlets, loosely panicled, drooping. Corolla funnel-shaped, blue, or violaceous, with a deeper coloured zone beneath the middle, white at the base, both inside and outside. In one variety, the calyx is downy.

Loefling's Bell-flower. Fl. July, Aug. Clt. 1818. Pl. ½ to 1½ foot.

132 C. retrórsa (Labill. pl. syr. dec. 5. t. 3.) stem few-flowered, angular, scabrous from retrograde prickles or bristles on the angles; lower leaves roundish-obovate, petiolate, somewhat sinuated, glabrous: superior leaves ovate-lanceolate, entire, with scabrous edges; calycine lobes long-acuminated, spreading, scabrous from serrulations, longer than the corolla, which is funnel-shaped; capsule obconically elongated. ⊙. H. Native on Mount Lebanon. Root slender, fibrous. Branches elongated, naked, each terminated by an erect flower. Flowers drooping before expansion. Corolla mixed with white and violet.

Retrograde-bristled Bell-flower. Pl. ½ to 1½ foot.

133 C. Zòysii (Wulf. in Jacq. coll. 2. p. 122.) plant tufted; stems erect, few-flowered; leaves entire: radical ones crowded, petiolate, ovately-obovate, obtuse; cauline leaves obovate-lanceolate, and linear; calycine lobes subulate; corolla long, cylindrically ventricose; capsule ovoid-spherical. ♃. H. Native of the Upper Alps of Styria, Carniola, Carinthia, &c. Jacq. icon. rar. 2. t. 334. Plant small, glabrous, tufted. Root creeping, throwing out many small stems, which bear from 1 to 3 flowers each. Leaves crowded at the base. Flowers pedicellate, drooping. Corolla cylindrical, elongated, pale blue, with 5 deeper coloured lines; rarely white.

Zoysi's Bell-flower. Fl. June, Aug. Clt. 1813. Pl. ¼ foot.

134 C. Cenísia (Lin. spec. suppl. p. 1669.) plant tufted; stems ascending, 1-flowered; leaves entire: radical ones rosulate, obovate, obtuse: cauline leaves ovate-oblong; calyx hairy, with linear-lanceolate lobes; corolla 5-cleft, hardly twice the length of the calycine lobes; capsule ovoid. ♃. H. Native of the Higher Alps of Provence, Piedmont, Dauphiny, Savoy, Vallais; on Mount Cenis; and of Switzerland, on the mountains called Diablerets, &c. All. pedem. no. 395. t. 6. f. 2. Rchb. icon. bot. cent. 1. p. 85. All. rar. stirp. spec. 35. t. 5. f. 1. Root creeping, blackish. Stems numerous, glabrous, or slightly pilose. Flowers solitary, terminal, erect. Corolla deep blue, hardly one half longer than the calycine lobes.

Var. β, angustifòlia (Schrad. prim. salisb. p. 70.) leaves narrow. ♃. H. Native of the Alps of Salizburgh.

Mount Cenis Bell-flower. Fl. June, July. Clt. 1775. Pl. ¼ foot.

135 C. spatula'ta (Sibth. et Smith, prod. fl. græc. 1. p. 137. fl. græc. t. 203.) stem ascending, 1-flowered, pilose; lower leaves petiolate, obovate, crenated: superior ones lanceolate; calyx with an obconical tube, and linear-acuminated toothed lobes; corolla subcampanulate, hardly longer than the calycine lobes; capsule spheroid. ♂. H. Native on Mounts Olympus and Parnassus. Root slender, twisted. Stem solitary, angular. Leaves rather pilose, but becoming more smooth and entire as they ascend the stem. Flower terminal, erect, blue.

Spatulate-leaved Bell-flower. Fl. July, Aug. Clt. 1817. Pl. ½ foot.

136 C. a'lgida (Fisch. mss. ex Alph. D. C. mon. p. 338.) plant humble; stems nearly naked, 1-flowered; radical leaves crowded, obovate-lanceolate, setaceously denticulated; petioles ciliated; calyx with a villous tube, and denticulated acuminated lobes; corolla campanulately funnel-shaped, twice longer than the calycine lobes; capsule somewhat cylindrical. ♃. H. Native of Kamtschatka, Unalaschka, Kotzebue's Sound, Cadiak, and Sledge Island, as well as of the Rocky Mountains in America. C. lasiocárpa, Cham. in Linnæa. 4. p. 39. exclusive of the syn. Camp. Sayenénsis, Fisch. Root slender, white. Stem glabrous, or slightly pilose. Flower terminal, erect. Corolla large for the size of the plant, blue.?

Algid Bell-flower. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

137 C. uniflòra (Lin. spec. p. 231. but not of Vill.) stems 1-flowered; leaves nearly entire: lower ones obovate, petiolate: middle ones obovate-lanceolate: upper ones few, linear-lanceolate; calyx rather villous, with linear acuminated lobes, about equal in length to the corolla, which is funnel-shaped; capsule cylindrical. ♃. H. Native of the polar region of America, as in the Island Unalaschka; north side of the Rocky Mountains; between Point Lake and the Arctic Sea; Kotzebue's Sound, Melville Island, Greenland; and of the north of Europe, as in Lapland, Sweden, Norway, &c. Svenk, bot. t. 526. Rottb. pl. greenl. in act. hafn. x. p. 52. t. 6. f. 19. Oed. fl. dan. t. 1512. —Lin. fl. lap. no. 85. t. 9. f. 5-6. Root simple, blackish. Stems simple, glabrous. Leaves glabrous. Flower drooping; deep azure blue.

Var. β, *Gieseckiàna* (Alph. D. C. mon. p. 339.) corolla 4 times longer than the calyx. ♃. H. Native of Greenland and Lapland. C. uniflòra, Gieseck, herb. Wahl. fl. suec. 1. p. 134. C. Gieseckiàna, Vest, in Rœm. et Schultes, syst. 5. p. 89.

One-flowered Bell-flower. Fl. June, July. Clt. 1815. Pl. $\frac{1}{4}$ foot.

* * * *Valves situated near the apex of the capsule. Flowers on short pedicels. Leaves opposite. Branches usually more or less dichotomous.*

138 C. fastigia'ta (Dufr. in herb. D. C. ex Alph. D. C. mon. p. 340. t. 12. f. B.) plant scabrous, humble; lower leaves obovate, nearly entire: middle ones obovate-lanceolate, coarsely 3-5-toothed: superior ones linear-lanceolate; corolla one half shorter than the calycine segments, which are linear-lanceolate; capsule obconical. ☉. H. Native of Spain, in Arragon and about Aranjuez. Plant of a greyish colour. Stem branched, erect; branches diverging. Leaves rather downy or glabrous. Flowers sessile, erect, terminal, rising from the axils or above the axils of the branches, always opposite the leaves, particularly terminating the stem and branches. The flowers situated in the lower axils expand before the rest. Corollas small, blue.

Fastigiate Bell-flower. Pl. $\frac{1}{4}$ foot.

† *Species not sufficiently known.*

139 C. ligula'ris (Lam. dict. 1. p. 585. ill. no. 2547.) leaves numerous, alternate, oblong, narrow, obtuse, entire, and ciliated; flower erect, terminal, middle-sized; calyx hispid, with nearly linear segments and covered sinuses; corolla tubularly campanulate, bearded a little; stem leafy, nearly glabrous, 1-flowered. —Native of the Alps of Europe.

Ligular-leaved Bell-flower. Pl. $\frac{1}{4}$ foot.

140 C. aspe'rrima (Zuccagni in Rœm. coll. p. 128.) leaves hastate, tomentose, spiny-toothed; flowers axillary; corolla tomentose and hispid outside.—Native country unknown. Stem solitary, erect, tomentose. Cauline leaves imbricate, hastately cordate, reticulated and tomentose, especially beneath. Flowers axillary, sessile, solitary. Calyx spiny, shorter than the corolla. Corolla tubularly campanulate, violaceous.

Very rough Bell-flower. Pl. $\frac{1}{2}$ foot.

141 C. decu'rrens (Zuccagni in Rœm. misc. p. 128.) stem winged; leaves decurrent, toothed, hispid; corolla tomentose and hispid on the outside.—Native country unknown. Stem flexuous, winged from the leaves being decurrent. Leaves spatulate, reticulated and tomentose, especially beneath. Flowers axillary, crowded, seated on a common peduncle. Bracteas cordate. Calyx hispid.

Decurrent-leaved Bell-flower. Pl. 2 feet.

142 C. a'spera (Mœnch. suppl. p. 188.) stem terete, straight, quite simple; leaves oblong, sessile, crenated; peduncles 3-flowered. ♂. H. Native country unknown. Plant hispid from pili. Leaves obtuse, stiff; radical ones petiolate; cauline ones sessile, remote. Racemes loose, terminal. Flowers axillary; intermediate one pedunculate, lateral 2 adnate to the common peduncle. Corolla blue. Stigma trifid. Capsule 3-celled.

Rough Bell-flower. Pl. 3 feet.

143 C. cymbala'ria (Sibth. et Smith, prod. fl. græc. 1. p. 139.) leaves reniform, cut, quite glabrous, shining; stems diffuse. ♃. H. Native of Mount Olympus, in Bithynia. Camp. foliis cymbalariæ crispis montis Olympi Bithyni, Tour. cor. Perhaps this is either *C. frágilis*, or *C. Bellardièri*.

Cymbalaria-leaved Bell-flower. Fl. diffuse.

144 C. Wanne'ri (Roch. pl. banat. var. t. 5. f. 12.) C. heterophýlla, Baumg. fl. trans. suppl. ex Feruss. bull. sc. febr. 1829. Nothing is known of this species.

Wanner's Bell-flower. Pl.

145 C. lanceolata (Presl. ex Wanderoth, beitr. zu. fl. Von Hessen. p. 37. but not of Lapeyr). Nothing more is known of this plant.

Lanceolate-leaved Bell-flower. Pl.

146 C. monta'na (Delarb. fl. auvergn. p. 40.). Native of Auvergne. Nothing is known of this plant but the name.

Mountain Bell-flower. Pl.

147 C. rige'scens (Pall. ex Rœm. et Schultes, syst. 5. p. 102.) leaves lanceolate: radical ones attenuated into the petioles, crenated: cauline ones sessile; stem straight, simple, downy; flowers terminal, racemose; calyxes ciliated. Native of Siberia, about Lake Baical, in frigid places. Corolla $1\frac{1}{2}$ inches long, twice the length of the calyx, with the segments ciliated a little. Style a little longer than the calyx. Stem a span high, few-flowered.

Stiffish Bell-flower. Fl. June, Aug. Clt. 1820. Pl. $\frac{1}{2}$ foot.

148 C. adsce'ndens (Vest, in Rœm. et Schultes, syst. 5. p. 90.) leaves scattered: lower ones on short petioles, ovate, toothed: superior ones oblong, quite entire, glabrous as well as the stem, which is ascendent; flowers solitary, drooping: calycine leaflets subulate, a little shorter than the corolla. Native of Siberia. C. rotundifolia, Pall. ex herb. Lamb. Very nearly allied to *C. uniflòra*.

Ascending Bell-flower. Pl. ascending, $\frac{1}{2}$ foot.

149 C. heterodóxa (Vest, in Rœm. et Schultes, syst. 5. p. 98.) leaves oblong, glabrous; flowers axillary, pedunculate, spreading; calyx short, with lanceolate-subulate segments, which are a little shorter than the corolla. ♃. H. Native of Siberia. C. rotundifolia, Pall. herb. Peduncles axillary, capillary, 1-flowered, roughish, furnished with bracteoles.

Heterodox Bell-flower. Pl. $\frac{1}{2}$ to 1 foot.

150 C. lunariæfòlia (Willd. rel. ex Rœm. et Schultes, syst. 5. p. 92.) leaves ovate, deeply cordate, petiolate, doubly serrated; flowers secund. ♃. H. Native of Caucasus.

Lunaria-leaved Bell-flower. Pl. 1 foot.?

151 C. Kitaibelia'na (Rœm. et Schultes, syst. 5. p. 90.) lower leaves obovate-cuneiform, crenated: superior one linear, quite entire; stem quite simple, 1-flowered. ♃. H. Native of Austria. C. microphýlla, Kit. in Schultes, fl. austr. 2. ed. no. 400.

Kitaibel's Bell-flower. Fl. June, July. Clt. 1820. Pl. $\frac{1}{4}$ foot.

152 C. e'legans (Rœm. et Schultes, syst. 5. p. 105.) leaves linear-lanceolate, quite entire: lower ones the broadest, smooth, and tapering into the petioles; stem downy; flowers axillary, at length spicate; calycine segments setaceous, divaricate, rather pungent, length of corolla. 2. H. Native of Siberia. C. speciòsa, Willd. rel. ex Rœm. et Schultes, l. c. Stem simple, terete, weak. Flowers terminal, and rising from the axillæ of the superior leaves, forming an interrupted spike, hardly pedunculate.

Elegant Bell-flower. Fl. July, Aug. Clt. 1821. Pl. 1 foot.

153 C. Camtscha'tica (Rœm. et Schultes, syst. 5. p. 343.) radical leaves cordate, toothed: cauline ones oblong-lanceolate, quite entire; stem weak, usually 1-flowered. 2. H. Native of Kamtschatka. Radical leaves on long petioles, angularly toothed, membranous, glabrous: cauline leaves tapering into the petioles. Root capillary, much branched. Calycine segments unequal, subulate, reflexed.

Kamtschatka Bell-flower. Pl. $\frac{1}{2}$ foot.?

Cult. All the species are elegant and handsome when in blossom, and are well adapted for decorating flower borders. They in general thrive well in common garden earth. The seeds of the biennial and annual kinds should be sown in the open border in spring. The perennial species may either be propagated by division or by seed. Some of the perennial and biennial species, natives of the warmer latitudes, require a little protection in winter, when the weather is severe. Some of the smaller perennial kinds answer well for decorating rockwork, or to be grown in pots, among other alpine plants.

XVI. SPECULA'RIA (so called from the ancient name of one of the species, *Speculum Veneris*, or Venus's Looking-glass). Heister, syst. pl. gen. ex fruct. &c. p. 8. in 1748. Alph. D. C. mon. p. 344.—Legoúzia, Durand, fl. bourg. 2. p. 26. (1782.). Delarb. fl. auvergn. 1. p. 45. Gray, nat. arrang. brit. pl. 2. p. 410.—Spéculum Véneris, Gerard, herb. 356. Rai. hist. 1. p. 742.—Pentagònion, Tabern. icon. 316.—Elátine, Cæsalp. l. 9. cap. 32.—Aviculària, Gessn. tab. phyt. 9. f. 76. J. Bauh. hist. 2. p. 800.—Campánula species, Dodon. pempt. p. 168.—Tourn. inst. 1. p. 112. Lin. gen. no. 290. Willd. spec. 1. p. 912. Rœm. et Schultes, syst. 5. p. 153.—Prismatocárpus species, Lher. sert. angl. p. 2. Mœnch, meth. p. 496. Batsch, anal. flor. 11. p. 32. t. 13. Lam. et D. C. fl. fr. ed. 3d. vol. 3. p. 708.—Apènula, Neck. elem. 1. p. 234.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-lobed, with an elongated, prismatic, or long-obconical tube. Corolla rotate, 5-lobed. Stamens 5, free, one-half shorter than the corolla; anthers longer than the filaments, which are short, membranous, and pilose. Style inclosed, pilose: hairs secund, disposed in 10 rows; stigmas 3, filiform. Capsule long, prismatic, 3-celled, dehiscing by 3 valves at the apex, or a little above the middle part. Seeds ovoid or lenticular, rather compressed, shining.—Dwarf annual herbs, natives of the region of the Mediterranean, and the temperate parts of Europe; one species alone a native of America. Leaves alternate, equally scattered over the stem, small; lower ones unlike the rest. Flowers terminal and axillary, erect, always sessile. Corollas blue, rose-coloured, white, grey, or variegated, shining in the sun; hence the generic name.

* *Tube of calyx very long, prismatic, and angular. Capsule dehiscing towards the top, near the lobes of the calyx. Seeds ovoid. Leaves ovate-oblong or lanceolate, nearly entire, not stem-clasping.*

1 S. pentagònia (Alph. D. C. mon. p. 344.) stem branched, larger; flowers terminal, solitary; calyx beset with a few stiff hairs, having a long prismatic tube, and long linear-lanceolate, spreading lobes; corolla the length of the calycine lobes. ⊙. H. Native of the Levant, about Aleppo; in Caramania, Candia, Thrace, &c. Campánula pentagònia, Lin. spec. 1. p. 239. Desf. choix. cor. p. 44. t. 33. or ann. mus. 11. p. 143. t. 18. Ker. bot. reg. t. 56. Prismatocárpus pentagònius, Lher. sert. angl. p. 2. Stem glabrous or pilose on the angles. Leaves glabrous, nearly entire or crenulated, with revolute edges; lower leaves obovate; middle cauline ones lanceolate-obovate; upper cauline ones linear-lanceolate. The corolla before expansion is blunt and pentagonal, but when expanded large, white at the base, blue to the middle part, and violaceous at the extremity of the lobes.

Pentagonal-flowered Venus's Looking-glass. Fl. May, Aug. Clt. 1686. Pl. $\frac{1}{2}$ to 1 foot.

2 S. falca'ta (Alph. D. C. mon. p. 345.) stem nearly simple; flowers disposed in long spikes, or approximate at the tops of the branches; calyx glabrous or scabrous on the margins, with a prismatic tube, and very long lanceolate acuminated lobes, which are reflexed at the apex, and are twice the length of the corolla. ⊙. H. Native of the region of the Mediterranean; as of the Island of Chalcis or Eubæa; of Dalmatia; about Rome and Naples; and of Sicily, Corsica, and Sardinia; among corn, and on dry hills. Campánula falcàta, Rœm. et Schultes, syst. 5. p. 154. Guss. pl. rar. p. 96. Prismatocárpus falcàtus, Tenore, prod. p. 16. fl. neap. 1. p. 77. t. 20. Sebas et Maur. fl. rom. prod. 1. p. 102.—Buxb. cent. 4. p. 24. t. 38.—Cupan. panph. 2. t. 20. Stem glabrous or a little scabrous on the angles. Leaves glabrous, rarely pilose, with rather revolute edges, crenulated. Flowers sessile, solitary, axillary, the whole forming a leafy spike. Corolla rose-coloured. Lobes of calyx falcate.

Falcate-calyxed Venus's Looking-glass. Fl. May, Aug. Clt. 1820. Pl. $\frac{1}{2}$ to 1 foot.

3 S. spe'culum (Alph. D. C. mon. p. 346.) stem branched; branches 3-flowered; calyx glabrous or downy, with a prismatic tube, which is narrow at the apex, and linear-lanceolate spreading lobes, which are at length reflexed; corolla length of the lobes of the calyx. ⊙. H. Native of the temperate parts of Europe, and throughout the region of the Mediterranean Sea, in corn-fields; in Germany, Transylvania, Pyrenees, Spain, Italy, Greece, Syria, Barbary, &c. Campánula spéculum, Lin. spec. p. 238. Curt. bot. mag. t. 102. Smith, fl. græc. t. 216. Lagoúzia arvénsis, Durand. fl. bourg. 1. p. 37. Prismatocárpus spéculum, Lher. sert. angl. p. 2. Raf. t. 100. f. 2.—Mor. oxon. 2. p. 457. sect. 5. t. 2. f. 22. Stem more or less scabrous from pili on the angles. Leaves crenated, more or less pilose; lower ones obovate; middle ones ovate, acutish; superior ones smaller and ovate-lanceolate. Flowers 3-6, crowded towards the top of the stem, sessile, rising from the axils of the upper leaves and top of the stem. Corollas rose-coloured, or of a bluish rose-colour.

Hybrid Venus's Looking-glass. Fl. May, Aug. England. Pl. $\frac{1}{2}$ foot.

5 S. Còa (Alph. D. C. mon. p. 350.) stem humble, nearly simple; flowers few, approximate towards the top of the stem; calyx downy, with prismatic tube, and erect lanceolate-subulate lobes; corolla twice longer than the calycine lobes. ⊙. H. Native of the Island of Cois, in the sand by the sea side. Campánula spéculum, var. D'Urv. enum. pl. arch. in mem. Lin. par. 1. p. 280. Prismatocárpus hírtus? or a new species? D'Urv. in herb. D. C. Stem pilose, downy at top. Leaves pilose, greyish; lower ones obovate; middle ones sessile, ovate-acute; superior ones narrower and lanceolate. Flowers 3-6 towards the top of the stem, sessile, axillary, and terminal. Corolla blue or white.

Cois Venus's Looking-glass. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

6 S. Ghilane'nsis (Alph. D. C. mon. p. 350.) stem simple or a little branched; leaves lanceolate, acuminated, serrated; flowers subracemose; segments of the calyx acuminated, serrated, longer than the corolla. ⊙. H. Native of Persia, in the province of Ghilan. Campánula Ghilanénsis, Pall. ined. ex Rœm. et Schultes, syst. 5. p. 154. Very like *S. spéculum*, but differs in the stem being simple and much higher, in the calycine segments being serrated, and ending each in a long setaceous twisted mucrone.

Ghilan Venus's Looking-glass. Pl. 1 foot.

** *Tube of calyx long, obconical, smooth. Capsule dehiscing towards the middle part. Seeds rather lenticular. Leaves ovate-roundish, clasping the stem.*

7 S. perfolia'ta (Alph. D. C. mon. p. 351.) stem erect, simple, or branched at the base; flowers disposed in long leafy spikes; calyx glabrous, with an obconical tube, and erect lanceolate lobes; corolla longer than the calycine lobes. ⊙. H. Native of North America, from New York, and beyond the Alleghany Mountains, about West-Chester, and on the north-west Coast; of Mexico, about Vera Cruz, Xalapa, and La Pileta; of Jamaica; and of Peru. Campánula perfoliàta, Michx. fl. bor. amer. 1. p. 108. Nutt. gen. amer. 1. p. 136. Campánula biflòra, Ruiz et Pav. fl. per. 2. p. 55. t. 200. f. b. Camp. flagellàris, H. B. et Kunth, nov. gen. amer. 3. p. 301. t. 265. Camp. angulàta, Rafin. fl. lud. p. 55.?—Barr. obs. t. 1133. Mor. oxon. 2. p. 457. sect. 5. t. 2. f. 23. Stem pilose, particularly on the angles, but sometimes glabrous. Leaves distant, crenately toothed, rather pilose. Flowers sessile, rising from the axils of the leaves, solitary or 2-3 together, and longer than them. Corolla blue, always longer than the calycine lobes.

Perfoliate-leaved Venus's Looking-glass. Fl. May, Aug. Clt. 1680. Pl. $\frac{1}{2}$ to $1\frac{1}{2}$ foot.

Cult. All the species are showy border annuals, and are therefore worth cultivating in every garden. The seeds only require to be sown in the open ground, where the plants are intended to remain. By sowing the seeds in the autumn, the plants will blossom early in summer, and by successive sowings in spring, at intervals of a fortnight or three weeks, a succession of blossoming plants may be kept up.

XVII. TRACHE'LIUM (from τράχηλος, *trachelos*, the neck; from its supposed efficacy in diseases of the trachea; hence also it is called *Throat-wort* in England, *Halskraut* in Germany, and *Hermorilla*, in Spain, &c.). Lin. gen. 293. Adans. fam. nat. 2. p. 134. Gærtn. fruct. 1. p. 155. t. 31. f. 4. Juss. gen. 165. Lam. ill. no. 2599. t. 126. Schkuhr, handb. 1. t. 40. Gessn. phyt. p. 105. t. 13. f. 204. Vent. tabl. regn. veg. 2. p. 470. Alph. D. C. mon. p. 352.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-cleft. Corolla 5-lobed at the apex, with a very long tube. Stamens 5, free; filaments very long, filiform, glabrous, much longer than the anthers. Style twice longer than the corolla, glabrous, pilose only at the apex about the stigmas; stigmas 2-3, small, obtuse. Capsule 2-3-celled, wholly inferior, spheroid, dehiscing at the base by lateral pores. Seeds ovoid, small, bay-coloured, shining.—Herbs with erect, glabrous stems, alternate leaves, and corymbose erect small flowers.—Inhabitants of the north of Africa.

1 T. cœru'leum (Lin. hort. ups. 41. spec. 243.) leaves ovate, acute, coarsely serrated, on short petioles; corolla violaceous, salver-shaped, with a very long narrow tube; stigma trifid. ♃. H. Native of the region of the Mediterranean, among rocks; in Spain, Mogodor, Sicily, Calabria, Italy, but not farther north than lat. 42°, as about Rome. Hill. veg. syst. 8. t. 16. Boissieu, fl. europ. t. 137. Ker. bot. reg. t. 72.—Barrel. icon. 683.—Mor. oxon. sect. 5. t. 5. f. 12. Stem glabrous. Leaves glabrous or ciliated. Flowers very numerous on the tops of the stem and peduncles, forming a wide-spreading corymb. Corollas violaceous.

Blue Throat-wort. Fl. July, Sept. Clt. 1640. Pl. 1 to 3 feet.

2 T. angustifòlium (Schousb. beob. morocc. p. 72.) leaves narrow-linear, quite entire, obtuse, sessile; corolla whitish, funnel-shaped, with an elongated tube; stigma bifid. ♃. H. Native of the kingdom of Morocco, in arid mountainous places. Stem simple, glabrous. Leaves glabrous. Corymbs like those of *T. cærùleum*, but smaller. Corollas whitish.

Narrow-leaved Throat-wort. Pl. 1 foot.

Cult. The species are very showy when in blossom. They grow best in a light soil, against a south wall, or in front of a hot-house; and they may either be increased by seed or by cuttings, planted under a hand-glass in spring.

XVIII. ADENO'PHORA (from ἀδήν, *aden*, a gland, and φορέω, *phoreo*, to bear; in reference to the cylindrical nectary which girds the base of the style). Fisch. ined. ann. 1816. Led. cat. hort. dorp. ann. 1822. Fisch. diss. Reichb. hort. bot. t. 23. and 45. but not of Lamour.—Campánula species, Gmel. sib. 3. p. 148. Lin. gen. no. 290.—Flóerkia, Spreng. ann. 1818. but not of his syst. Campánula, sect. Floerkiàna, Spreng. syst. 1. p. 735.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft. Corolla campanulate or funnel-shaped, 5-lobed at the apex. Stamens 5, free; filaments erect, membranous, long, very much ciliated, conniving so closely as to appear coherent. Nectary cylindrical, girding the base of the style. Style usually exserted, pilose while in the bud, the hairs disposed in 10 rows, but afterwards it becomes glabrous; stigmas 3. Capsule 3-celled, dehiscing laterally at the base by 3 valves. Seeds ovate, more or less flat. —Perennial, rarely biennial herbs, with usually edible roots (ex Fisch.). Stems erect. Leaves alternate, very rarely subverticillate; radical ones roundish, petiolate; cauline ones usually sessile, becoming narrower and shorter to the top of the stem. Flowers racemose or panicled, terminal and axillary, pedicellate, drooping; clavate while in bud.—Natives of Siberia, China, and Japan, and one of the east of Europe.

* *Leaves broader, ovate-lanceolate, more or less coarsely serrated.*

1 A. Sinénsis (Alph. D. C. mon. p. 354.) leaves alternate, ovate-lanceolate, glabrous, acutely serrated; flowers disposed in spicate racemes; calycine lobes linear-lanceolate, entire, glabrous; corolla funnel-shaped; style a little exserted. ♃. H. Native of China. Stem branched, glabrous or velvety. Leaves glabrous, deep green above. Flowers disposed in a loose few-flowered raceme, which is furnished with branchlets at the base. Corolla blue, glabrous.

Var. α, glàbra (Alph. D. C. mon. p. 354.) tube of calyx glabrous.

Var. β, pilòsa (Alph. D. C. l. c.) tube of calyx hairy.

China Adenophora. Pl. 1 foot.

2 A. tricuspida'ta (Fisch. mss. ex Rœm. et Schultes, syst. 5. p. 158.) leaves alternate, serrated, smoothish; radical ones petiolate, rounded: cauline ones sessile, ovate-lanceolate; flowers racemose; calycine lobes triangular, toothed; corolla campanulate; style length of corolla. ♃. H. Native of Dahuria. A. denticulàta, Ledeb. suppl. hort. dorp. 1823. Fisch. mss. Rchb. hort. bot. t. 2. Sweet. fl. gard. 115. Campánula denticulàta, Spreng. syst. 1. p. 735. Stem simple. Flowers numerous, on short pedicels, disposed in a more or less loose elongated raceme. Corollas small, blue.

Tricuspidate Adenophora. Fl. July, Aug. Clt. 1817. Pl. 1½ foot.

3 A. verticilla'ta (Fisch. adumb. gen. aden. p. 5. Alph. D. C. mon. p. 356.) leaves subverticillate, serrately toothed; radical ones petiolate, roundish: cauline ones ovate-lanceolate; flowers usually verticillate, small; calycine lobes erect, subulate; corolla campanulate; style much exserted. ♃. H. Native of Dahuria and Japan. Sweet, fl. gard. n. s. t. 160. Campánula verticillàta, Pall. voy. 3. p. 719. t. 9. f. 1. ed. gall. append. 8. p. 263. t. 75. f. 1. Camp. tetraphýlla, Thunb. fl. jap. p. 87.—Amm. ruth. p. 12. no. 18. Plant glabrous. Leaves 3-6 in a whorl. Flowers small, irregularly disposed at the tops of the stems, which are simple; lower whorles many-flowered, remote. Peduncles 1-3-flowered. Corollas pale blue.

Whorled Adenophora. Fl. June, July. Clt. 1783. Pl. 2 to 3 feet.

4 A. latifòlia (Fisch. adumbr. gen. aden. p. 6. Alph. D. C. mon. p. 356.) leaves subverticillate; cauline ones ovate-oblong, acuminated, coarsely serrated, roughly ciliated; flowers scattered or subverticillate; calycine lobes spreading, lanceolate, with scabrous margins; corolla campanulately funnel-shaped; style a little exserted. ♃. H. Native of Dahuria. Campánula pereskiæfòlia, Rœm. et Schultes, syst. 5. p. 116. Camp. perescifòlia, Spreng. syst. 1. p. 735. Camp. Peréskia, Fisch. mss. Stem simple, glabrous. Leaves 3-5 in a whorl, glabrous, except the margins; radical ones not seen. Flowers rather numerous, scattered over the upper part of the stems, rarely subverticillate; peduncles 2-3-flowered, sometimes only 1-flowered. Corollas blue.

Broad-leaved Adenophora. Fl. July, Sept. Clt. 1821. Pl. 1½ foot.

5 A. Lama'rkii (Fisch. adumb. gen. aden. p. 6. Alph. D. C. mon. p. 357.) leaves alternate, ovate-lanceolate, acutely serrated, ciliated; flowers racemose; calycine lobes erect, lanceolate, entire, glabrous; corolla funnel-shaped; style length of corolla. ♃. H. Native of Altaia, about Barnaoul. Campánula liliifòlia, Lam. dict. 1. p. 581.—Gmel. sib. 3. p. 148. t. 26.? Stem glabrous, simple at the base, but furnished with short floriferous branches at the apex. Leaves glabrous, except on the margins. Flowers disposed in an elongated many-flowered raceme, which is compound at the base. Corollas blue.

Var. β, angustifòlia (Alph. D. C. mon. p. 357.) cauline leaves lanceolate, narrow, long-acuminated, petiolate; style exserted. ♃. H. A. Lamárkii, Fisch. ined. in herb. Prescott.

Lamark's Adenophora. Fl. June, Aug. Clt. 1824. Pl. 1 to 2 feet.

6 A. liliifòlia (Ledeb. cat. hort. dorp. 1822. Alph. D. C. mon. 358. t. 1. f. B.) leaves alternate; radical ones petiolate, ovate-roundish, cordate, crenately toothed: cauline ones sessile, ovate-lanceolate, coarsely serrated; flowers numerous, panicled; calycine lobes erectish, triangular, a little toothed; corolla campanulate; style exserted. ♃. H. Native throughout Siberia, south of Tauria; east of Europe, especially in Lithuania, about Grodno; also in Volhynia, Galicia, Podolia, and Bohemia; about Vienna; in Hungary, France, Candia, &c. A. commùnis, Fisch. adumbr. gen. aden. p. 6. A. stylòsa, Rchb. hort. bot. t. 45. but not of Lam. nor Fisch. Campánula Fischèri, Rœm. et Schultes, syst. 5. p. 116. Camp. umbròsa, Dietr. lex. 1. p. 672. Camp. rhomboídea β, Willd. spec. 1. p. 899. Poll. fl. veron. 1. p. 274. Camp. alpìna, Lin. spec. append. p. 1669. Lam. dict. 1. p. 581. Camp. liliifòlia, Lin. spec. 1. p. 233. Jacq. hort. schoenbr. 3. p. 46. t. 335. Ker. bot. reg. t. 236. Root thick, fusiform, esculent, sometimes simple, and sometimes divided into many turnip-formed tubers. Stem glabrous. Leaves glabrous, or rather pilose. Flowers numerous, sweet-scented, disposed in a more or less compound, elongated, and loose pyramidal panicle. Corollas blue, or whitish blue.

Var. β, infundibulifórmis (Alph. D. C. mon. p. 359.) corollas funnel-shaped. ♃. H. Native of Hungary. Campánula liliifòlia, Waldst. et Kit. pl. rar. hung. 3. p. 274. t. 247. Camp. suavèolens, Willd. enum. p. 10. Camp. liliifòlia β, Rœm. et Schultes, 5. p. 110. Adenóphora suavèolens, Rchb. hort. bot. t. 32.

Var. γ, sprèta (Alph. D. C. mon. p. 359.) stem downy towards the apex; leaves rather hairy on both surfaces. ♃. H. Native of Siberia. Campánula sprèta, Rœm. et Schultes, syst. 5. p. 123.

Lily-leaved Adenophora. Fl. Aug. Sept. Clt. 1784. Pl. 1 to 1½ foot.

7 A. stylòsa (Fisch. adumbr. gen. aden. p. 6. Alph. D. C. mon. 360. but not of Rchb. hort. bot. t. 45.) leaves alternate, petiolate: lower ones obovate, sinuated: upper ones ovate, acuminated; flowers few, racemose; calycine lobes triangular, erect, entire; corolla funnel-shaped; style usually exserted. ♃. H. Native of Siberia and Tartary. Campánula stylòsa, Lam. dict. 1. p. 580. Rœm. et Schultes, syst. 5. p. 110. but not of Besser, cat. hort. crem. 1816. p. 27.—Gmel. sib. 3. p. 152. t. 27. Stems ascending, glabrous. Leaves firm, glabrous. Flowers disposed in a loose, naked, few-flowered raceme. Corollas small, pale blue.

Long-styled Adenophora. Fl. May, July. Clt. 1820. Pl. 1 to 1½ foot.

8 A. INTERME'DIA (Sweet, fl. gard. n. s. t. 108.) radical leaves petiolate, cordate, toothed: cauline leaves lanceolate, attenuated at the base, serrated, crowded: lower ones on short petioles, elliptic-lanceolate, remotely serrated; style very long. ♃. H. Native of Siberia. Campánula stylòsa affînis, Fisch. cat. hort. Gorenk. 1808. p. 52. Camp. intermèdia, Rœm. et Schultes, syst. 5. p. 110. but not of Led. Flowers small, pale blue.

Intermediate Adenophora. Fl. May, June. Clt. 1820. Pl. 3 feet.

9 A. PERIPLOCÆFÒLIA (Alph. D. C. mon. p. 361.) leaves alternate, petiolate, ovate, acute, somewhat cordate, crenately serrated; flowers few; calycine lobes triangular, acute, a little toothed; corolla campanulate, truncate at the apex; style exserted. ♃. H. Native of Siberia. Campánula periplocifòlia, Lam. dict. 1. p. 580. Stem ascending, glabrous. Leaves glabrous. Flowers few at the top of the stem, sometimes only one. Corolla pale blue.

Periploca-leaved Adenophora. Fl. June, July. Clt. 1824. Pl. ¼ foot.

10 A. CORONOPIFÒLIA (Fisch. adumbr. gen. aden. p. 5. Rchb. hort. bot. t. 23.) leaves alternate: radical ones petiolate, ovate-roundish, cordate, crenately toothed: cauline leaves sessile, linear-lanceolate, nearly entire, quite glabrous, smooth; flowers few, racemose; calycine lobes spreading, lanceolate, entire; corolla campanulate; style length of corolla. ♃. H. Native of Dahuria and Altaia. Sweet, fl. gard. 104. Campánula coronopifòlia, Rœm. et Schultes, syst. 5. p. 157. Camp. salicifòlia, Juss. herb.? ex Fisch. Camp. Fischeriàna, Spreng. cur. post. p. 77. Aden. Lamárkii angustifòlia, Fisch. ined. Root nearly simple. Stems simple, glabrous. Leaves glabrous. Flowers 3-10, disposed in a simple raceme at the top of the stem, on short pedicels. Corollas large, blue.

Var. β, latifòlia (Alph. D. C. mon. p. 362.) leaves broader, and sharply toothed. ♃. H. A. coronopifòlia latifòlia, Fisch. adumbr. gen. aden. p. 5.

Var. γ, angustifòlia (Alph. D. C. l. c.) leaves very narrow, almost entire. ♃. H. Aden. coronopifòlia angustifòlia, Fisch. ined. Camp. erysimoìdes, Rœm. et Schultes, syst. 5. p. 102.

Buck-horn-leaved Adenophora. Fl. June, July. Clt. 1822. Pl. 1 to 2 feet.

* * *Leaves narrower, linear, entire or nearly so.*

11 A. GMELÌNI (Fisch. adumbr. gen. aden. p. 5. Alph. D. C. mon. p. 362.) cauline leaves alternate, erect, linear, very narrow, entire, glabrous, smooth; flowers few, secund; calycine lobes erect, lanceolate, entire; corolla campanulately funnel-shaped; style inclosed. ♃. H. Native of Dahuria, in dry stony places. Campánula Rabelaisiàna, Rœm. et Schultes, syst. 5. p. 158. Camp. pomponiifòlia, Fisch. mss.—Gmel. sib. 3. p. 162. t. 33. Stem quite simple, glabrous. Flowers secund, 3-10, on the top of each stem, rising from the axils of the upper leaves, disposed in a long raceme. Corollas blue.

Var. β, stylòsa (Alph. D. C. mon. p. 365.) style exserted. ♃. H. Campánula Gmelìni, Spreng. mant. 1. p. 56. but not of Rœm. et Schultes.

Gmelin's Adenophora. Fl. July, Aug. Clt. 1820. Pl. 1 to 2 feet.

12 A. CORONA'TA (Alph. D. C. mon. p. 365.) radical leaves petiolate, ovate-roundish, cordate, crenately toothed: cauline ones alternate, erect, linear-lanceolate, remotely subserrated, rather scabrous; flowers panicled; calycine lobes linear, entire; corolla campanulate; style exserted. ♃. H. Native of Dahuria, on the mountains about Sajan. A. marsupiflòra, Fisch. adumbr. gen. aden. p. 5. Rchb. hort. bot. t. 15. A. intermèdia, Ledeb. cat. hort. dorp. suppl. 2. 1824. but not of Fisch. in Rœm. et Schultes, syst. Campánula coronàta, Ker. bot. reg. t. 146. exclusive of the syn. of Gmel. sib. t. 33. Camp. linophýlla, Pall. in herb. Banks. Cam. syngenesiflòra, Pall. herb. ex Fisch. Camp. monadélpha, Pall. ex Fisch. Camp. Sajanénsis, Pall. in herb. Kunth. Rœm. et Schultes, syst. 5. p. 102. Camp. marsupiiflòra, Rœm. et Schultes, syst. 5. p. 116. Link. enum. 1. p. 213. Camp. Gmelìni, Rœm. et Schultes, syst. 5. p. 103. but not of Spreng. nor Fisch. Camp. stenanthìna, Ledeb. ex Fisch. adumbr. Flóerkia marsupiiflòra, Spreng. anliet. 2. p. 523. Root fusiform. Stem simple, or furnished with a few floriferous branches at top, rather scabrous. Leaves rather scabrous. Flowers scentless, disposed in a loose elongated panicle, terminal and axillary. Peduncles slender, 1-5-flowered. Corollas bluish-violet.

Crowned Adenophora. Fl. July, Aug. Clt. 1818. Pl. 1 to 3 feet.

† *A species hardly known.*

13 A.? TRIPHY'LLA (Alph. D. C. mon. p. 365.) leaves 3 in a whorl, linear; flowers 3 in a whorl. ♃. H. Native of Japan, where it is called *Todoki Nisjin*, ex Thunb. Campánula triphýlla, Thunb. fl. jap. p. 87. Root fusiform. Plant glabrous. Leaves sessile, with reflexed edges. Peduncles capillary, 1-flowered, axillary, rarely divided, thrice longer than the leaves.

Three-leaved Adenophora. Pl. 1 to 2 feet.

Cult. All the species are elegant border-flowers, and are therefore worth cultivating in every garden. They grow in common garden soil, and are to be increased by seeds, as dividing at the root is almost sure to kill the plants.

XIX. SYMPHYA'NDRA (from *συμφύω, symphyo*, to combine, and *ἀνὴρ, aner*, a male; in reference to the anthers being combined into a tube). Alph. D. C. mon. p. 365.—Campánula species, Bieb. fl. taur. 1. p. 154. &c.

LIN. SYST. *Monadélphia, Pentándria.* Calyx 5-cleft. Corolla 5-lobed at the apex, usually velvety, and cream-coloured. Stamens 5; filaments free, membranous, ciliated; anthers combined into a long tube, which is 5-lobed at top. Style cylindrical, pilose; stigmas 3, filiform. Capsule 3-celled, dehiscing by 3 valves at the base. Seeds ovate, more or less flattened, shining.—Herbaceous perennial or woody plants. Leaves alternate, petiolate, cordate; lower ones larger and on longer petioles. Flowers terminal and axillary, pedicellate, usually racemose, rather large.—Three of the species inhabit the region of Caucasus, and one the Island of Candia.

SECT. I. *Sinuses of calyx not covered by the appendages.*

1 S. CRE'TICA (Alph. D. C. mon. p. 366. t. 8.) quite glabrous; stems erect, herbaceous; leaves ovate, acute, irregularly serrated; flowers drooping, racemose; calycine lobes long-acuminated; corolla campanulately funnel-shaped. ♃. H. Native of Candia, on the Spaceotic Mountains near Aradena. Campánula nùtans, Sieb. herb. cret. but not of Lam. Flowers disposed in a loose raceme at the top of the stem. Peduncles thick, 1-3-flowered. Corollas 15 lines long, white.?

Cretan Symphyandra. Pl. 1½ foot.

SECT. II. *Sinuses of calyx covered by the appendages.*

2 S. PE'NDULA (Alph. D. C. mon. p. 366.) stems branched, pendulous, very firm, pilose; leaves ovate, acute, crenately toothed, velvety; flowers panicled; calycine lobes lanceolate; sinuses of calyx reflexed, ovate, acute; corollas funnel-shaped, velvety. ♃. H. Native of Caucasus, among rocks. Sweet, fl. gard. n. s. t. 66. Campánula péndula, Bieb. fl. taur. 1. p. 154. no. 384. Bess. cat. hort. crem. 1811. Rœm. et Schultes, syst. 5. p. 144.

Camp. Vandèsii, G. Don, in Loud. hort. brit. p. 77. Roots rather creeping, throwing out many stems. Flowers drooping, showy, cream-coloured, disposed in a loose panicle, intermixed with the leaves; peduncles 1-3-flowered.

Pendulous-branched Symphyandra. Fl. July, Aug. Clt. 1817. Pl. 1 foot.

3 S. Arme'na (Alph. D. C. mon. p. 367.) stem erect, twiggy, stiff, pilose; leaves ovate, acute, coarsely serrated, clothed with hoary velvety down; flowers terminal, solitary; calyx hoary, with triangular entire segments; sinuses of calyx reflexed, small, acute; corolla tubular, velvety. 4. H. Native of Caucasus, in the fissures of rocks, about Gandsha. Campánula Armèna, Stev. mem. soc. mosc. 3. p. 256. Bieb. fl. taur. suppl. p. 145. Root oblong, fixed to rocks. Stem branched, rather woody, purplish, downy. Leaves tomentose beneath; lower ones cordate, similar to those of *Alliària officinàlis*. Flowers solitary, drooping, terminating the branches. Corolla blue.

Armenian Symphyandra. Fl. July, Aug. Clt. 1825. Pl. 1 foot.

4 S.? Osse'tica (Alph. D. C. mon. p. 368.) stem humble, simple; leaves petiolate, cordate, doubly serrated; calyxes glabrous, with the segments long and denticulated, much shorter than the sinuses, which are reflexed; corolla somewhat 5-cleft, having the segments pilose inside. 4. H. Native of Iberia, in Ossetia, on Mount Kaischaur. Campánula Ossética, Bieb. fl. taur. suppl. p. 145. Habit of *S. péndula*, but is destitute of branches, and is wholly glabrous. Flowers solitary, axillary, erect, disposed in a crowded simple raceme from the middle of the stem to its top. Corollas blue.

Ossetian Symphyandra. Pl. ½ to 1 foot.

Cult. These plants have much the habit of the large bell-flowered species of *Campánula*, as *C. punctàta* and *C. mèdium*. They are of easy culture, and are increased by dividing at the root, or by seed; and being showy, are worth cultivating as border-flowers.

XX. MU'SSCHIA (so named by Alphonse de Candolle, in honour of J. M. Mussche, director of the botanic garden at Gaud.). Alph. D. C. mon. p. 368. t. 6. f. A.—Campánula species of Lin. and others.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-cleft. Corolla deeply 5-cleft, of a golden yellow colour. Stamens 5, cuspidate at the apex, free; filaments broadest at the base, glabrous. Stigmas 5. Capsule 5-celled, 10-nerved, dehiscing by numerous transverse lateral fissures between the nerves; cells alternating with the calycine lobes and stamens. Seeds numerous, small, ovoid, shining.—A small glabrous shrub, native of Madeira and Teneriffe, altogether different in habit to any other campanulaceous plant. Stem thick. Leaves alternate, large, serrated. Flowers numerous, pyramidally racemose, yellow.

1 M. au'rea (Dumortier, comm. bot. ann. 1823. p. 28. Alph. D. C. mon. p. 368.). ♄. G. Native of Madeira and Teneriffe, among rocks. Campánula aúrea, Lin. suppl. p. 141. Lam. dict. 1. p. 590. Ait. hort. kew. 1. p. 223. Vent. malm. t. 116. Duham. arbr. 3. p. 169. with a good figure. Ker. bot. reg. t. 57. Plant suffruticose, evergreen, milky, quite glabrous. Stem simple, rather fleshy, marked by the cicatrices occasioned by the falling of the leaves, but furnished with a crown of leaves at top: and annual floriferous branches, which are disposed in a leafy pyramidal panicle. Leaves 3-6 inches long, pale green, shining. Peduncles 1-3-flowered. Flowers erect.

Var. β, angustifòlia (Alph. D. C. mon. p. 369.) leaves very narrow. ♄. G. Native along the coast of Madeira, on rocks. Campánula aúrea, Jacq. hort. schoenbr. 4. t. 472.

Golden-flowered Musschia. Fl. July, Sept. Clt. 1777. Shrub 1 to 2 feet.

Cult. This remarkable shrub thrives very well in a mixture of loam and peat; but is only to be increased by seed, of which abundance is produced in the gardens.

† *A genus not sufficiently known, and it is not quite certain whether it belongs to Campanulàceæ.*

XXI. MERCIE'RA (named by Alphonse De Candolle, in honour of his friend, Philip Mercier, who has written a monograph on the order *Polemoniàceæ*). Alph. D. C. mon. p. 370.—Trachèlium species, Thunb. prod. p. 38. Lin. suppl. p. 143.—Roélla species, Banks, herb.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx 5-cleft, with an ovoid tube. Corolla 5-lobed, caducous, with a very narrow tube. Stamens 5, free; filaments very slender at the base, much longer than the anthers. Style filiform, usually exserted, glabrous; stigmas 2, very short. Ovarium inferior, 1-celled, probably always. Ovula usually 4, placed in the bottom of the ovarium. Capsule indehiscent.?—Small Cape shrubs, with the habit of *Roélla*. Stems erect, branched; branches very leafy, downy, rather woody, reddish. Leaves sessile, alternate, crowded, linear-subulate, more or less ciliated, stiff, and very similar to those of *Roélla*. Flowers sessile, solitary, spicate, always axillary. Inflorescence centripetal. Calyx with a very hispid tube, and lanceolate acute smoothish segments. Corolla like that of *Trachèlium*, long, tubular, and narrow. The character of the capsule still remains unknown; this is, however, without doubt inferior, and probably 1-celled, and contains 4 ovula in the bottom. The capsule is without any indication of dehiscence in the specimen examined by Alph. D. C.

1 M. tenuifòlia (Alph. D. C. mon. p. 370. t. 5.) leaves much ciliated; corolla blue, longer than the leaves, 5-lobed at the very apex: lobes lanceolate, spreading, pilose on the back; style a little exserted. ♄. G. Native of the Cape of Good Hope. Trachèlium tenuifòlium, Thunb. prod. fl. cap. p. 38. Lin. suppl. p. 143. Roélla compácta, R. pinifòlia, and Trachèlium tenuifòlium, Thunb. in herb. Banks. Habit of *Roélla ciliàta*. Stem erect, branched. Flowers very numerous, always lateral, solitary and sessile in the axils of the leaves.

Fine-leaved Merciera. Shrub 1 foot.

2 M. brevifòlia (Alph. D. C. p. 371.) leaves ciliated a little; corolla white, length of leaves, 5-lobed at the apex: lobes lanceolate, spreading, glabrous; style doubly longer than the corolla. ♄. G. Native of the Cape of Good Hope. Roélla lateriflòra, Banks, herb. Very like the preceding. Flowers numerous, lateral, solitary, in the axils of the leaves.

Short-leaved Merciera. Shrub 1 foot.

3 M. leptóloba (Alph. D. C. mon. p. 371.) leaves ciliated; corolla rather shorter than the leaves, white, 5-cleft: lobes linear, erectish, glabrous; style length of corolla. ♄. G. Native of the Cape of Good Hope. Habit of the preceding species. Flowers sessile, solitary, among the leaves.

Slender-lobed-flowered Merciera. Shrub 1 foot.

Cult. A mixture of peat and sand is a good soil for the species of *Mercièra*; and they may be increased either by cuttings under a hand-glass, or by seed.

† *Plants referred to the genus Campánula, but it is doubtful to what genera they belong.*

1 Campa'nula stella'ta (Thunb. phyt. bl. p. 20. mem. acad. petersb. 4. p. 373. with a figure) leaves 3 in a whorl, linear, entire; flowers axillary, pedunculate; stem frutescent, terete, glabrous, branched, erectish, a hand high; branches alternate, simple, a little curved; leaves sessile, acute, imbricated, unguicular; flowers solitary, at the tops of the branches; peduncles

capillary, flexuous, an inch long. ♄. G. Native of the Cape of Good Hope. This is certainly not a species of *Campánula*, but it may be a species of *Lightfoòtia*, *Roélla*, or *Prismatocárpus*.

Stellate Bell-flower. Shrub ½ to 1 foot.

2 CAMPA'NULA LANCEOLA'TA (Roxb. fl. ind. 2. p. 96.) branched, glabrous; leaves alternate or nearly opposite, on short petioles, lanceolate, serrated, acuminated; flowers terminal; calycine segments lanceolate and jagged; capsule obovate, 5-celled. ⊙. H. Native of Chittagong, in humid valleys. Plant delicate, 1½ foot high, simple or branched at the top, sending out 2 or 3 1-flowered peduncles. Flowers inclined, size and form of *C. rotundifòlia*. Radical leaves not seen. Perhaps this plant is allied to *Platycòdon*.

Lanceolate-leaved Bell-flower. Pl. 1 to 1½ foot.

3 CAMPA'NULA PHYTEUMOÌDES (Zuccagni, cent. 1. obs. bot. in Rœm. et Schultes, syst. 1. p. 84.) plant small; radical leaves numerous, lanceolate, obtuse, running down the petioles, undulated; cauline leaves few, remote, sessile, stem-clasping, mucronate; flowers sessile, crowded into a short spike or in a head; calyx with a tetragonal base, and erect, lanceolate, smooth segments; corolla campanulate, violaceous, larger than the calyx; style elevated, exserted; capsule tetragonal.—Native of Mount Olympus, in Bithynia. Perhaps a species of *Phyteùma*.

Phyteuma-like Bell-flower. Pl. small.

4 CAMPA'NULA GLAU'CA (Thunb. fl. jap. p. 88.) leaves sessile, ovate, serrated, glaucous beneath; stem angular, panicled; peduncles 1-flowered.—Native of Japan, near Nagasaki; also cultivated. Kekko Kæmpf. amœn. v. p. 822. Stem suffruticose, angular, glabrous, paniculately branched at top. Leaves green above, with rather reflexed edges. Flowers axillary, and on the tops of the branches solitary. Peduncles bracteate. Corollas large, blue. The roots are esculent, like those of *Rampion*. It is, perhaps, a species of *Campánula*, but more probably of *Platycòdon* or *Adenóphora*.

Glaucous Bell-flower. Pl 2 feet.

5 CAMPA'NULA MONTEVIDEE'NSIS (Spreng. syst. 1. p. 788.) stem erect, downy, branched at the base; leaves obsoletely crenated: lower ones spatulate: superior ones cordate, stem-clasping; flowers solitary, sessile; calycine segments ovate, cuspidate.—Native of Monte Video, where it was collected by Sello.

Monte-Video Bell-flower. Pl. erect.

6 CAMPA'NULA CARNÒSA (Wall. in Roxb. fl. ind. 2. p. 102.) plant smooth, fleshy, procumbent; leaves ovate, cuspidately serrated, petiolate; flowers axillary, on capillary peduncles, which are about equal in length to the leaves; filaments linear, not dilated at the base. ♃. H. Native of Nipaul on Mount Sheopore, towards the middle, on rocks near rivulets. Stems creeping, obscurely 3-cornered. Flowers very small, of a pale blue. Calycine segments entire, erect. Corolla funnel-shaped, more than twice the length of the calyx, with a quinquefid sub-bilabiate limb; segments oblong, acute, equal; the two uppermost ones more parallel and erect; the rest spreading. Stamens distinct, distant, a little shorter than the corolla; filaments flat, not valvate at the base, inserted together with the corolla on the disc of the ovarium; anthers erect, linear. Ovarium oblong, obscurely triangular, 3-celled, many-seeded; its vertex not elongated, as is usual in the genus, but covered by a fleshy yellowish disc. Style filiform; stigmas 3, linear. Capsule club-shaped, prismatic, bursting towards the base by 3 round valves. This is certainly not a species of *Campánula*, but from the characters given, it appears to be a new genus, connecting *Campanulàceæ* with *Lobeliàceæ*.

Fleshy Bell-flower. Pl. creeping.

ORDER CXXXVIII. EPACRI'DEÆ (this order contains plants agreeing with *Epàcris* in important characters). R. Br. prod. p. 535.

Calyx 5-parted, (rarely 4-parted), usually coloured, permanent. Corolla hypogynous, monopetalous, with the tube sometimes divisible into 5 parts; limb 5-cleft, rarely 4-cleft, equal, and sometimes bursting transversely from the segments, cohering, valvate or imbricate in æstivation, deciduous or marcescent. Stamens equal in number to the segments of the corolla, and alternating with them, rarely fewer; filaments epipetalous or hypogynous; anthers simple, with a single polliniferous receptacle, constituting a complete, rarely a marginate dissepiment, undivided, dehiscing longitudinally. Pollen subglobose, rather angular, or composed of 3 combined globules. Ovarium sessile, usually girded by 5 distinct or combined scales, many-celled, rarely 1-celled. Seeds solitary or indefinite. Style 1; stigma 1, sometimes toothed. Fruit drupaceous, baccate, or capsular. Seeds albuminous. Embryo straight, slender, longer than the half of the albumen.—Shrubs or small trees. Leaves alternate, very rarely opposite, entire, rarely serrated, usually petiolate, or with a simple base; having the bases broader, imbricated, cucullate, and sheathing a little. Flower spicate or racemose, terminal: or solitary and axillary. Calyxes or pedicels furnished with 2 or more bracteas, which are of the same texture as the calyx. Flowers white or purple, rarely blue. This order is chiefly distinguished from *Ericàceæ* in the anthers being awnless and 1-celled. The shrubs are all elegant, of a dry prickly habit, with tubular or campanulate flowers.

Synopsis of the genera.

TRIBE I.

STYPHYLIE'Æ. *Cells of ovarium* 1-*seeded*. *Pericarps closed, rarely capsular*.

1 STYPHE'LIA. Calyx with 4 or more bracteas. Corolla long, tubular; tube furnished on the inside near the base with 5 fascicles of villi: segments of the limb revolute, bearded. Filaments exserted.

2 ASTROLÒMA. Calyx imbricated by 4 or more bracteas. Corolla with a ventricose tube (f. 132. *b*.), furnished with 5 fascicles of villi near the base, inside; limb short, spreading, bearded (f. 132. *c*.). Filaments inclosed.

3 STENANTHE'RA. Calyx many-bracteate. Corolla tubular, ventricose, without any fascicles of hairs inside; limb short, spreading, bearded a little. Filaments inclosed.

4 MELÌCHRUS. Calyx many-bracteate. Corolla rotate or urceolate, furnished with 5 fascicles of glands near the base inside; segments half bearded.

5 CYATHÒDES. Calyx many-bracteate. Corolla funnel-shaped, without any fascicles of villi or glands inside; limb spreading, a little bearded. Filaments inclosed. Drupe baccate.

6 LISSA'NTHE. Calyx bibracteate or bractless. Corolla funnel-shaped: limb beardless. Drupe baccate.

7 Leucopògon. Calyx bibracteate. Corolla funnel-shaped: limb spreading, bearded lengthwise. Filaments inclosed. Drupe baccate or dry.

8 Monotòca. Calyx bibracteate. Corolla funnel-shaped; limb and throat beardless. Ovarium 1-seeded. Drupe baccate.

9 Acrotríche. Calyx bibracteate. Corolla funnel-shaped: segments of the limb furnished with a reflexed beard at the apex. Drupe rather baccate.

10 Trochoca'rpa. Calyx bibracteate. Corolla campanulate: limb spreading, bearded. Stamens exserted. Ovarium 10-celled. Drupe baccate.

11 Deca'spora. Calyx bibracteate. Corolla campanulate: limb loosely bearded. Stamens exserted. Ovarium 10-celled.

12 Pentachóndra. Calyx with 4 or more bracteas. Corolla funnel-shaped; limb spreading, longitudinally and densely bearded.

13 Needha'mia. Calyx bibracteate. Corolla salver-shaped: limb 5-cleft, beardless, with elevated sinuses, plicate in æstivation. Stamens inclosed. Ovarium 2-celled.

14 Oligarrhe'na. Calyx 4-parted, bibracteate. Corolla 4-cleft, permanent, valvate in æstivation. Stamens 2, inclosed. Ovarium 2-celled.

Tribe II.

Epacrie'æ. *Cells of ovarium many-seeded. Pericarp capsular.*

15 Epa'cris. Calyx coloured, many-bracteate (f. 133. *a.*); bracteas texture of calyx. Corolla tubular (f. 133. *c.*), with a beardless limb. Stamens epipetalous (f. 133. *b.*). Anthers peltate above the middle. Hypogynous scales 5. Placentas adnate to the central column.

16 Lysine'ma. Calyx coloured, many-bracteate; bracteas texture of the calyx. Corolla salver-shaped: with the tube sometimes divided into 5 parts to the base; segments of the limb beardless, bent to the right. Stamens hypogynous. Anthers peltate above the middle. Hypogynous scales 5. Placentas adnate to the central column.

17 Prionòtes. Calyx bractless. Corolla tubular, with an open throat, and a beardless limb. Stamens hypogynous; filaments half adhering to the tube. Anthers with a complete dissepiment. Hypogynous scales 5.

18 Cosme'lia. Calyx foliaceous. Corolla tubular. Stamens epipetalous. Anthers adnate to the ciliated tops of the filaments. Hypogynous scales 5. Placentas adnate to the central column.

19 Andersònia. Calyx coloured, imbricated by 2 or more foliaceous bracteas. Corolla length of calyx; segments of the limb bearded at the base. Stamens hypogynous. Anthers fixed beneath their middle. Hypogynous scales 5. Placentas adnate to the central column.

20 Poncele'tia. Calyx foliaceous. Corolla short, campanulate, 5-cleft, beardless. Stamens hypogynous; anthers peltate beneath the middle, with a marginate dissepiment. Hypogynous scales wanting. Placentas adnate to the central column.

21 Sprenge'lia. Calyx a little coloured. Corolla 5-parted, rotate, beardless. Stamens hypogynous. Anthers connate or free, with an immarginate dissepiment. Hypogynous scales wanting. Placentas adnate to the central column.

22 Cysta'nthe. Calyx foliaceous. Corolla closed, calyptriform, dehiscing transversely, with a truncate permanent base. Stamens hypogynous, permanent. Hypogynous scales wanting. Placentas hanging from the top of the central column.

23 Ríchea. Calyx membranous, bractless. Corolla closed, calyptriform, dehiscing transversely, with a truncate permanent base. Stamens hypogynous, permanent. Hypogynous scales 5. Placentas hanging from the top of the central column.

24 Dracophy'llum. Calyx bractless. Corolla funnel-shaped, with a rather ventricose tube, and a 5-parted spreading acutish beardless limb. Stamens hypogynous. Hypogynous scales 5. Placentas hanging from the top of the central column.

25 Spenótoma. Calyx bibracteate. Corolla salver-shaped, with a slender tube, a coarctate throat, and a blunt beardless limb. Stamens epipetalous. Hypogynous scales 5. Placentas hanging from the top of the central column.

Tribe I.

STYPHELIE'Æ. Cells of ovarium 1-seeded. Pericarp closed, rarely capsular.

I. STYPHE'LIA (from στυφελὸς, *styphelos*, rough or harsh; from the stiff, compact, harsh habit of the shrubs). R. Br. prod. p. 537. Styphèlia species, Smith.

Lin. syst. *Pentándria, Monogýnia.* Calyx girded by 4 or more bracteas. Corolla elongated, tubular; tube furnished with 5 fascicles of villi near the base inside: segments of the limb revolute, bearded. Filaments exserted. Ovarium 5-celled. Drupe nearly dry, containing a solid bony putamen.—Erect or ascending, branched, smoothish, shrubs. Leaves scattered, on short petioles, mucronate. Flowers axillary, drooping, or divaricate, showy. Peduncles 1-flowered, rarely 2-3-flowered. Hypogynous scales 5, distinct, rarely combined.

1 S. longifòlia (R. Br. prod. p. 537.) leaves long-lanceolate, attenuated at the apex, rather concave above, with smooth margins; branchlets downy. ♄. G. Native of New South Wales, about Port Jackson. Ker. bot. reg. 24. Flowers green.

Long-leaved Styphelia. Fl. April, June. Clt. 1807. Shrub 3 to 4 feet.

2 S. læ'ta (R. Br. prod. p. 537.) leaves elliptic, or oblong-lanceolate, flat, glaucous, imbricated, with scabrous denticulated edges; branchlets downy; stem erect. ♄. G. Native of New South Wales, about Port Jackson. Flowers red.

Fruitful Styphelia. Fl.? Clt. 1822. Shrub 3 to 4 feet.

3 S. adsce'ndens (R. Br. prod. p. 537.) leaves lanceolate, flat, with scabrous dentately ciliated margins, glaucous beneath and manifestly striated; stems diffuse, with ascending branches. ♄. G. Native of Van Diemen's Land. Flowers scarlet.

Ascending Styphelia. Fl.? Clt. 1822. Shrub 2 to 3 feet.

4 S. latifòlia (R. Br. prod. p. 537.) leaves broadly ovate, acute, imbricated, rather concave above, with scabrous edges; flowers erectish. ♄. G. Native of New South Wales, about Port Jackson. Flowers pink.

Broad-leaved Styphelia. Fl. April, July. Clt. 1823. Shrub 4 to 6 feet.

5 S. viridiflòra (R. Br. prod. p. 537.) leaves obovate-

oblong, obtuse, mucronulate, flat, smooth above, with the margins rather scabrous, and are, as well as the flowers, divaricate. ♄. G. Native of New South Wales, about Port Jackson. Andr. bot. rep. 312. Flowers green, with brown anthers.

Green-flowered Styphelia. Fl. April, July. Clt. 1791. Shrub 3 to 4 feet.

6 S. triflòra (Andr. bot. rep. 72.) leaves elliptic or oblong-lanceolate, flat, glaucous, smooth every where, as well as on the margins; branchlets glabrous; flowers corymbosely approximate; peduncles 1-3-flowered. ♄. G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 537. Sims, bot. mag. 1297. Flowers pink, with a cream-coloured limb.

Three-flowered Styphelia. Fl. May, Aug. Clt. 1796. Shrub 6 feet.

7 S. tubiflòra (Smith, new holl. 45. t. 14.) leaves linear, obovate, mucronate, rather scabrous above, with revolute edges; flowers drooping. ♄. G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 537. Lodd. bot. cab. 1938. Flowers scarlet.

Tube-flowered Styphelia. Fl. May, Aug. Clt. 1802.

8 S. glauce'scens (Sieb. pl. nov. holl. ex Spreng. syst. add. p. 67.) leaves lanceolate, mucronate, quite entire, smooth, finely striated, glaucous; peduncles short, 1-flowered. ♄. G. Native of New Holland.

Glaucescent Styphelia. Shrub.

Cult. This is a very handsome genus of shrubs. A mixture of one-third sandy loam, and two-thirds sandy peat, answers the species best; and young cuttings, planted in sand under a bell-glass, will strike root.

II. ASTROLO'MA (*ἄστρον*, *astron*, a star, and *λῶμα*, *loma*, a fringe; in reference to the bearded limb of the corolla. R. Br. prod. 538.). Ventenàtia species, Cav. Styphèlia, Spreng. syst. 1. pp. 657, 658.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx imbricated by 4 or more bracteas (f. 132. *a*.). Corolla with a ventricose tube (f. 132. *b*.), which is doubly longer than the calyx, and furnished with 5 fascicles of hairs near the base inside; limb short, spreading, bearded (f. 132. *c*.). Filaments linear, inclosed. Ovarium 5-celled. Drupe nearly dry; containing a solid bony putamen. —Humble, usually diffuse shrubs. Leaves scattered, usually ciliated. Flowers axillary, erect. Hypogynous disk cup-shaped, almost entire.

1 A. humifu'sum (R. Br. prod. p. 538.) shrub prostrate, much branched; leaves lanceolate-linear, rather convex above, with ciliated edges. ♄. G. Native of New South Wales, Van Diemen's Land, and the south coast of New Holland. Sims, bot. mag. 1439. Ventenàtia humifûsa, Cav. icon. 4. p. 28. t. 348. Flowers scarlet.

Trailing Astroloma. Fl. May, Oct. Clt. 1807. Shrub prostrate.

FIG. 132.

2 A. prostra'tum (R. Br. prod. p. 538.) shrub prostrate, much branched; leaves lanceolate-linear, ciliated, flat above, and rather convex beneath. ♄. G. Native of New Holland, on the south coast. Flowers red.?

Prostrate Astroloma. Shrub prostrate.

3 A. denticula'tum (R. Br. prod. p. 538.) shrub usually procumbent, but sometimes erectish; leaves lanceolate, flat, ciliated: the ciliæ dilated at the base. ♄. G. Native of New Holland, on the south coast. Flowers pale red.

Denticulated-leaved Astroloma. Fl. May, Aug. Clt. 1824. Shrub procumbent.

4 A. pa'llidum (R. Br. l. c.) shrub diffuse; branches ascending; leaves lanceolate, sessile, ciliated, imbricated, rather concave above. ♄. G. Native of New Holland, on the south coast. Flowers pale red.?

Pale Astroloma. Shrub diffuse.

5 A. compa'ctum (R. Br. l. c.) shrub diffuse; branchlets ascending, very short; leaves obovate-lanceolate, ciliated, tapering into the petioles, rather concave above. ♄. G. Native of New Holland, on the south coast.

Compact Astroloma. Shrub diffuse.

6 A. te'ctum (R. Br. l. c.) erect, a little branched; leaves lanceolate-oblong, flat, imbricated, with scabrous edges: denticulations very short, obtuse. ♄. G. Native of New Holland, on the south coast.

Covered Astroloma. Shrub erect.

Cult. This genus contains dwarf glaucous shrubs, bearing large scarlet or red flowers. They are, therefore, desirable plants for all collections. They thrive best in an equal mixture of sand, loam, and peat; and cuttings from young wood root readily, if planted in a pot of sand under a bell-glass.

III. STENANTHE'RA (*στενὸς*, *stenos*, narrow; and *ἀνθηρὰ*, *anthera*, an anther; the filaments are broader than the anthers, which makes them appear narrow). R. Br. prod. p. 538.

Lin. syst. *Pentandria Monogy'nia*. Calyx girded by many bracteas. Corolla tubular; tube twice longer than the calyx, ventricose, without any fascicles of villi in the throat: limb short, spreading, half bearded. Filaments inclosed, fleshy, broader than the anthers. Ovarium 5-celled. Drupe nearly dry, containing a solid bony putamen.—An erect shrub. Leaves much crowded, acerose. Flowers axillary, erect, with a scarlet tube, and a greenish-yellow limb. Hypogynous disk cup-shaped, entire.

1 S. pinifòlia (R. Br. prod. p. 538). ♄. G. Native of New South Wales. Ker. bot. reg. 218. Styphèlia pinifòlia, Spreng. syst. 1. p. 659.

Pine-leaved Stenanthera. Fl. May, July. Clt. 1811. Shrub 4 to 6 feet.

Cult. This is a beautiful shrub when in blossom. A soil composed of one-third very sandy loam, and two-thirds sandy peat, suits it best. The pot in which it is grown should be well drained with sherds, or the mould is apt to get soddened from too much wet. It should not be too much exposed to the sun in summer. Cuttings from the young shoots root readily in sand, under a bell-glass.

IV. MELI'CHRUS (from *μελιχρος*, *melichros*, honey-coloured; in reference to the colour of the glands of the flowers). R. Br. prod. p. 539.

Lin. syst. *Pentándria Monogy'nia*. Calyx with many bracteas. Corolla rotate or urceolate, furnished near the base with 5 fascicles or glands; segments bearded. Ovarium 5-celled. Drupe nearly dry, containing a solid bony putamen. —Procumbent or erectish shrubs. Leaves lanceolate. Flowers erect. Hypogynous disk cup-shaped, nearly entire.

1 M. rota'tus (R. Br. prod. p. 539.) corollas rotate; calyx villous; leaves lanceolate-linear, pilose on both sides and on the margins. ♄. G. Native of New South Wales, and of tropical New Holland. Ventenàtia procúmbens. Cav. icon. 4. p. 28. t. 349. f. 1. Flowers scarlet.

Rotate-flowered Melichrus. Fl. April, August. Clt. 1824. Shrub procumbent.

2 M. urceola'tus (R. Br. l. c.) corollas urceolate: calyxes glabrous; leaves lanceolate, attenuated at the apex, with shortly denticulated edges. ♄. G. Native of New South Wales. Flowers scarlet. ?

Urceolate-flowered Melichrus. Shrub erect.

3 M. me'dius (Cunningh. in Fields, New South Wales, p. 314.) erect; corolla urceolate; calyxes pilose; leaves lanceolate, attenuated, very acute, mucronate, concave, many-nerved, with membranous denticulated edges. ♄. G. Native of New South Wales, on the plains of Bathurst. Intermediate between the two preceding species.

Intermediate Melichrus. Fl. April, May. Clt. 1824. Shrub.

Cult. For culture and propagation see *Astrolòma*, p. 775. Fine shrubs, bearing elegant flowers.

V. CYATHO'DES (from *κύαθος*, *kyathos*, a cup; and *ὀδοὺς*, *odous*, a tooth; in reference to the disk, which is cup-shaped and 5-toothed). R. Br. prod. p. 539.—Cyathòdes species, Labill.—Styphèlia species, Labill. Solander, and Spreng.

Lin. syst. *Pentándria Monogy'nia.* Calyx with many bracteas. Corolla funnel-shaped; tube hardly exceeding the calyx, without any fascicles of villi or glands; limb spreading, with or without any beard. Filaments inclosed. Ovarium 5-10-celled. Drupe baccate.—Erect branched shrubs, with the habit of small trees. Leaves striated on the under sides. Flowers axillary, erect, or drooping a little, small. Hypogynous disk cup-shaped, 5-toothed.

§ 1. *Segments of the corolla bearded; axis simple inside.*

1 C. glau'ca (Labill. nov. holl. 1. p. 57. t. 81.) drupe 8-10-celled; leaves crowded at intervals, somewhat verticillate, spreading or divaricate, linear-lanceolate. ♄. G. Native of Van Diemen's Land. R. Br. prod. p. 539. Trochocárpa glaúca, Spreng. syst. 1. p. 660.

Glaucous Cyathodes. Fl. April, June. Clt. 1818. Tree 25 feet.

2 C. stramínea (R. Br. prod. p. 539.) drupe 5-celled; leaves crowded at intervals, somewhat verticillate, oval, obtuse, awnless, spreading, many-nerved beneath; stem erect. ♄. G. Native of Van Diemen's Land.

Strawy Cyathodes. Shrub.

3 C. dealba'ta (R. Br. prod. p. 539.) drupe 2-5-celled; leaves linear, erectly spreading, margined with very short ciliæ, 5-nerved beneath: nerves all simple. ♄. G. Native of Van Diemen's Land.

Whitened Cyathodes. Shrub procumbent.

4 C. Tameia'miæ (Cham. et Schlecht. in Linnæa, 1. p. 539.) drupe 5-8-celled; leaves narrow, cuneate-obovate, petiolate, mucronate, many-nerved beneath. ♄. G. Native of the Sandwich Islands. Habit of Leucopògon obovàtus, Labill. Cy. Banksii, Gaud. in Freyc. voy. pt. bot. p. 365. is perhaps the same as this. Dr. R. Brown speaks of 2 other species from the Sandwich Islands, having the segments of the corolla naked, while this is bearded.

Tameiamea's Cyathodes. Shrub or small tree.

§ 2 *Segments of corolla beardless; axis usually elevated inside.* Lissánthe, Spreng. syst. 1. p. 660.

5 C. parvifòlia (R. Br. prod. 540.) leaves linear-lanceolate, not half an inch long, spreading, margined with very short ciliæ, 5-nerved beneath: nerves all simple. ♄. G. Native of Van Diemen's land.

Small-leaved Cyathodes. Shrub or small tree.

6 C. oxyce'drus (R. Br. l. c.) leaves linear, more than half an inch long, spreading, with naked margins, 3-5-nerved beneath: nerves all simple. ♄. G. Native of Van Diemen's land. Styphèlia Oxycèdrus, Labill. nov. holl. 1. p. 49. t. 69. Flowers white. ?

Red Cedar-like Cyathodes. Fl. April, June. Clt. 1822. Shrub 6 feet.

7 C. abietìna (R. Br. l. c.) leaves linear-lanceolate, flat, much crowded, imbricated. ♄. G. Native of Van Diemen's land. Styphèlia abietìna, Labill. nov. holl. 1. p. 48. t. 68.

Fir-like Cyathodes. Shrub or small tree.

8 C. aceròsa (R. Br. prod. p. 539. and 540.) leaves linear-spreading, with naked margins, 3-5-nerved beneath: outer nerves pectinately branched. ♄. G. Native of Van Diemen's Land. ? Styphèlia aceròsa, Banks and Soland. mss. Ardìsia aceròsa, Gærtn.

Chaffy Cyathodes. Fl. April, May. Clt. 1823. Shrub.

Cult. See *Styphèlia*, p. 775. for culture and propagation.

VI. LISSA'NTHE (from *λισσὸς*, *lissos*, smooth, and *ἄνθος*, *anthos*, a flower). R. Br. prod. p. 540.

Lin. syst. *Pentándria, Monogýnia.* Calyx bibracteate or bractless. Corolla funnel-shaped; limb beardless. Ovarium 5-celled. Drupe baccate, containing a solid bony putamen.—Small erect shrubs. Leaves scattered, lined beneath. Flower small, white. Hypogynous disk cup-shaped, 5-lobed.

§ 1. *Calyx bractless. Racemes axillary, few-flowered; pedicels bibracteate at the base. Tube of corolla villous inside.*

1 L. sa'pida (R. Br. prod. p. 540.) racemes 2-3-flowered, recurved; leaves oblong-linear, mucronate, with revolute margins, whitened and striated beneath. ♄. G. Native of New South Wales. Lindl. bot. reg. 1275. Hook. bot. mag. t. 3147. Flowers white, tipped with green. The berries are red and acid, and are made into tarts in New South Wales, under the name of cranberries.

Sapid Lissanthe. Fl. May. Clt. 1823. Shrub.

2 L. subula'ta (R. Br. l. c.) racemes 4-5-flowered, erect; leaves linear-subulate, half an inch long; branchlets glabrous; drupe 10-striped. ♄. G. Native of New South Wales.

Subulate-leaved Lissanthe. Fl. April, July. Clt. 1823. Shrub.

3 L. strigòsa (R. Br. l. c.) racemes subspicate, erect, few-flowered; leaves linear-subulate; branches downy, drupes hardly furrowed. ♄. G. Native of New South Wales and Van Diemen's Land. Styphèlia strigòsa. Smith, new holl. p. 48.

Strigose Lissanthe. Fl. May, July. Clt. 1824. Shrub.

§ 2. *Calyx bibracteate. Corolla urceolate, having the tube and throat naked. Spikes axillary, few-flowered.*

4 L. monta'na (R. Br. l. c.) leaves oblong-linear, obtuse, mutic, glaucous beneath. ♄. G. Native of Van Diemen's Land.

Mountain Lissanthe. Shrub.

§ 3. *Calyx bibracteate. Corolla funnel-shaped, having the throat closed by deflexed villi. Flowers axillary, solitary.*

5 L. daphnòides (R. Br. prod, p. 541.) leaves elliptic-lanceolate, rather concave, ending each in a very short callous mucrone, with roughish naked margins; segments of corolla quite glabrous. ♄. G. Native of Van Diemen's Land and tropical New Holland. Lodd. bot. cab. 466. Styphèlia daphnòides, Smith, new holl. 48.

Daphne-like Lissanthe. Fl. June, July. Clt. 1818. Shrub.

6 L. CILIA'TA (R. Br. l. c.) leaves elliptic-lanceolate, flat, with serrulately ciliated margins, ending each in a pellucid mucrone; limb of corolla roughish. ♄. G. Native of Van Diemen's Land.

Ciliated-leaved Lissanthe. Fl. May, July. Clt. 1825. Shrub.

Cult. For culture and propagation see *Styphèlia*, p. 775.

VII. LEUCOPO'GON (from λευκὸς, *leucos*, white; and πὼγων, *pogon*, a beard; the limb of the corolla is bearded with white hairs). R. Br. prod. p. 541. Styphèlia, Spreng. syst. 1. p. 656, 657, 658, and 659.

Lin. syst. *Pentándria Monogýnia.* Calyx bibracteate. Corolla funnel-shaped; limb spreading, bearded lengthwise. Filaments inclosed. Ovarium 2-5-celled. Drupe baccate or dry, sometimes crustaceous.—Usually dwarf Shrubs. Leaves scattered and sometimes crowded at intervals. Flowers spicate, axillary or terminal. Hypogynous disk cup-shaped, lobed a little, rarely wanting.

§ 1. *Spikes axillary, many-flowered. Drupe baccate.*

1 L. LANCEOLA'TUS (R. Br. prod. p. 541.) spikes nodding, aggregate; ovaries 2-celled; drupes oval; leaves lanceolate, flat, 3-nerved; branchlets glabrous. ♄. G. Native of New South Wales, on mountains. Sweet, fl. austr. t. 47. Styphèlia lanceolàta, Smith, new holl. p. 49. exclusive of the synonymes. Styphèlia parviflòra, Andr. bot. rep. 287. Flowers white.

Lanceolate-leaved Leucopogon. Fl. May, Aug. Clt. 1790. Shrub 6 to 12 feet.

2 L. MALAYA'NUS (Jack, mal. misc. vol. 1. Wall. in Roxb. fl. ind. 2. p. 301.) spikes axillary, many-flowered, erect, short; drupes globular, 5-celled; leaves lanceolate, mucronate, nearly veinless, glaucous beneath. ♄. S. Native of the plains of Singapore, abundant; where it is called by the Malays *Mentada*. A small, branching, dry shrub, exhibiting the peculiar habit of the family. Corollas funnel-shaped, downy, having the segments bearded above beyond the base. The discovery of this species is remarkable as forming an exception to the general geographical distribution of the order *Epacrideæ*, a family almost exclusively confined to Australia, or at least to the southern hemisphere. Singapore, situated at the extremity of the Malay peninsula, and forming as it were the connecting link between continental or Western India and the plains of the great Eastern Archipelago, partakes of this character in its Flora, which exhibits many remarkable points of coincidence with the Flora of both regions. A resemblance has been observed between its productions and those of the northern frontier of Bengal, on the one hand, and of the Moluccas on the other, while the present plant connects it with the still more distant range of New Holland.

Malay Leucopogon. Shrub 3 feet.

3 L. AUSTRA'LIS (R. Br. l. c.) spikes erect; drupes depressed, globose, 5-celled; leaves linear-lanceolate, more than an inch long, 3-5-nerved, with recurved smooth margins. ♄. G. Native of the south coast of New Holland and Van Diemen's Land. Flowers white.

Southern Leucopogon. Shrub.

4 L. RÍCHEI (R. Br. l. c.) spikes erect, many-flowered, a little shorter than the leaves; drupes ovate, 5-celled; leaves glabrous, oblong-lanceolate, hardly an inch long, broadest beyond the middle, 3-5-nerved, convex above, with subrecurved margins. ♄. G. Native of New South Wales, the south coast of New Holland, and Van Diemen's Land. L. polystàchyus, Lodd. fl. cab. t. 1436. L. apiculàtus, Smith in Rees, cycl. L. parviflòrus, Lindl. bot. reg. 1560. Styphèlia Ríchei, Labill. nov. holl. 1. p. 44. t. 60. Styphèlia parviflòra, Andr. bot. rep. 287. Styphèlia Gnídium Vent. malm. t. 23. Flowers white.

Riche's Leucopogon. Fl. May, Aug. Clt. 1822. Shrub 4 to 5 feet.

5 L. AFFÍNIS (R. Br. l. c.) spikes erect; drupes oval, 2-3-celled; leaves long-lanceolate, more than an inch long, flat. ♄. G. Native of Van Diemen's Land. Flowers white.

Allied Leucopogon. Shrub.

6 L. INTERRU'PTUS (R. Br. l. c.) spikes nearly terminal; leaves elliptic, spreading, many-nerved, 1½ inch long, crowded in whorles. ♄. G. Native of the south coast of New Holland. Lodd. bot. cab. 1451. Flowers white.

Interrupted-leaved Leucopogon. Fl. May, July. Clt. 1826. Shrub.

7 L. CYMBU'LÆ (Labill. sert. caled. p. 36. t. 39.) spikes axillary, erect; segments of the corolla bearded with rufous hairs; leaves an inch long, oblong-lanceolate, rufous, concave. ♄. G. Native of New Caledonia. Flowers furnished each with an orbicular, lacerately ciliated scale, besides 2 opposite boat-shaped ones above it.

Boat-leaved Leucopogon. Shrub 1 to 2 feet.

8 L. VERTICILLA'TUS (R. Br. l. c.) spikes nearly terminal, aggregate, nodding while bearing the fruit; drupes 5-celled; putamen pentagonal; leaves oblong-lanceolate, attenuated at the apex, disposed in interrupted whorles, 2 to 4 inches long. ♄. G. Native of the south coast of New Holland. Flowers white.

Whorled-leaved Leucopogon. Shrub.

§ 2. *Spikes axillary, but sometimes terminal. Flowers three or more together. Calyx and bracteas coloured. Drupe nearly dry. Leaves never cordate.*

9 L. APICULA'TUS (R. Br. prod. p. 542.) spikes terminal, rather aggregate, 5-7-flowered; bracteas lanceolate; leaves lanceolate-oblong, erect, rather concave, with smooth margins, ending each in a callous point; drupe crustaceous, depressedly turbinate, shorter than the calyx. ♄. G. Native of the south coast of New Holland. Flowers white.

Var. α, branchlets and leaves glabrous.

Var. β, branchlets and leaves pubescent. Perhaps a distinct species.

Apiculate-leaved Leucopogon. Shrub.

10 L. POLYSTA'CHYUS (R. Br. l. c.) spikes axillary or terminal, aggregate, 7-10-flowered; leaves linear-lanceolate, mutic, convexly concave; branchlets glabrous, twiggy; drupes dry, oval, depressed at the apex. ♄. G. Native of the south coast of New Holland. Flowers white.

Many-spiked Leucopogon. Fl. May, Aug. Clt. 1826. Shrub 2 to 3 feet.

11 L. MULTIFLÒRUS (R. Br. l. c.) spikes axillary, shorter than the leaves; leaves lanceolate, a little acuminated, mucronate, imbricated, rather convex beneath, with smooth edges; calyx and bracteas with woolly margins. ♄. G. Native of the south coast of New Holland. Flowers white.

Many-flowered Leucopogon. Shrub.

12 L. RUBRICAU'LIS (R. Br. l. c.) spikes nearly terminal, aggregate, 4-5-flowered; calyxes and bracteas smoothish; leaves linear-oblong, obtuse, mutic, smooth, rather convex above, with somewhat recurved denticulated edges; branchlets glabrous; drupes oblong. ♄. G. Native of the south coast of New Holland. Flowers white.

Red-stemmed Leucopogon. Shrub.

13 L. villòsus (R. Br. l. c.) spikes nearly terminal, aggregate; leaves linear-oblong, bluntish, mutic, erectly spreading, villous on both surfaces as well as on the branches, with denticulated subrecurved margins. ♄. G. Native of the south coast of New Holland. Flowers white. Very nearly allied to *L. rubricaúlis*.

Villous Leucopogon. Shrub.

14 L. obova'tus (R. Br. l. c.) spikes terminal, nearly simple; leaves obovate-oblong, obtuse, mucronulate, with subrecurved margins; drupes nearly globose, 5-celled. ♄. G. Native of New Holland, on the south coast. Styphèlia obovàta, Labill. nov. holl. 1. p. 48. t. 67. Flowers white.

Obovate-leaved Leucopogon. Fl. May, Aug. Clt. 1824. Shrub 1 foot.

15 L. revolu'tus (R. Br. l. c.) spikes nearly terminal, aggregate, 4-5-flowered; calyxes and bracteas clothed with fine down; leaves moderately spreading, linear-oblong, obtuse, mutic, tipped by a callous obtuse point, convex and scabrous above, lined and glabrous beneath, with recurved naked margins; branchlets clothed with minute down; drupes dry, 5-celled, obovate. ♄. G. Native of the south coast of New Holland. Flowers white.

Revolute-leaved Leucopogon. Shrub.

16 L. margaròdes (R. Br. l. c.) spikes axillary, usually 3-flowered; leaves moderately spreading, linear-oblong, obtuse, mutic, with recurved smooth margins; drupes 2-celled, dry and compressed above. ♄. G. Native of New Holland, within the tropic. Flowers white.

Pearl-toothed Leucopogon. Shrub.

17 L. mu'ticus (R. Br. prod. p. 543.) spikes axillary, erect, 3-6-flowered; leaves linear-oblong, obtuse, rather mutic, erectly spreading, with smooth rather recurved margins; drupes 5-celled, angular, glabrous. ♄. G. Native of New South Wales, in rocky situations. Flowers white. Very nearly allied to the following.

Awnless-leaved Leucopogon. Shrub.

18 L. trichoca'rpus (R. Br. l. c.) spikes axillary, nodding a little, 3-flowered; leaves linear-oblong, obtuse, mucronulate; drupes 5-celled, angular, pilose. ♄. G. Native of Van Diemen's Land. Styphèlia trichocárpa, Labill. nov. holl. 1. p. 47. t. 66. Flowers white.

Hair-fruited Leucopogon. Shrub 3 feet.

19 L. ericoìdes (R. Br. l. c.) spikes axillary, approximate, 3-4-flowered; leaves oblong-linear, moderately spreading, mucronate, with recurved margins, rather scabrous above; bracteas mutic; calyxes membranous; drupes dry, angular. ♄. G. Native of New South Wales and Van Diemen's Land. Styphèlia ericoìdes, Smith, nov. holl. p. 48. E'pacris spùria, Cav. icon. 4. p. 27. t. 347. f. 1. Flowers reddish.

Heath-like Leucopogon. Fl.? Clt. 1815. Shrub 4 to 6 feet.

20 L. propi'nquus (R. Br. l. c.) spikes axillary, usually 3-flowered, pedunculate; leaves lanceolate-linear, setaceously mucronate, smooth above, with revolute margins, which are denticulated from without; bracteas cuspidate. ♄. G. Native of the south coast of New Holland

Allied Leucopogon. Shrub.

21 L. attenua'tus (Cunningh. in Field's New South Wales, p. 341.) peduncles very short, erect, usually 1-flowered; leaves ovate-lanceolate, moderately spreading, rather convex, striated, setaceously mucronate, when young imbricated and ciliately denticulated. ♄. G. Native of New South Wales, on hills at Cox's River.

Attenuated-leaved Leucopogon. Shrub.

22 L. virga'tus (R. Br. l. c.) spikes terminal and axillary, almost aggregate, few-flowered; calyxes and bracteas rather membranous; leaves linear-lanceolate, attenuated at the apex, very acute, convexly concave, imbricated and spreading, with ciliated margins; branchlets glabrous. ♄. G. Native of New South Wales, south coast of New Holland, and Van Diemen's Land. Styphèlia virgàta, Labill. nov. holl. 1. p. 46. t. 64. Flowers white.

Twiggy Leucopogon. Fl. May, July. Clt. 1824. Shrub 2 feet.

23 L. collìnus (R. Br. l. c.) spikes terminating the short lateral branches; lower bracteas sheathed a little, foliaceous, equalling the calyx in length; leaves oblong-linear, acutish, mutic, erect, smooth and rather convex above, with recurved denticulated edges. ♄. G. Native of Van Diemen's Land. Styphèlia collìna, Labill. nov. holl. 1. p. 47. t. 65. Flowers white.

Hill Leucopogon. Fl. May, June. Clt. 1824. Shrub 1 foot.

24 L. fasciula'tum; arboreous; leaves crowded, linear, acuminated; racemes spicate, lateral, drooping. ♄. G. Native of New Zealand. E'pacris fasciculàta, Forst. ins. austr. p. 13.

Fascicled-flowered Leucopogon. Shrub.

§ 3. *Spikes axillary and terminal. Leaves cordate. Calyxes and bracteas membranous and foliaceous.*

25 L. amplexicau'lis (R. Br. l. c.) spikes axillary and terminal, spreading, pedunculate, exceeding the leaves; leaves cordate, stem-clasping, mutic, clothed with minute down beneath: with recurved margins, which are as well as the branches villous; drupes lenticular, 2-celled. ♄. G. Native of New South Wales. Styphèlia amplexicaúlis, Rudge, in Lin. trans. 8. p. 292. t. 8. good. Flowers white.

Stem-clasping-leaved Leucopogon. Clt. 1815. Shrub.

26 L. alternifòlius (R. Br. l. c.) spikes axillary and terminal, few-flowered; leaves alternate, reniform, stem-clasping, acute, mutic, a line and a half long, and are as well as the branchlets glabrous; drupes crustaceous, lenticular, 2-celled. ♄. G. Native of the south coast of New Holland. Flowers white.

Alternate-leaved Leucopogon. Shrub.

27 L. dìstans (R. Br. prod. p. 544.) spikes terminal, aggregate, flexuous; flowers distant; leaves ovate, subcordate, divaricate, mutic, one line long, convex above and downy beneath; drupes crustaceous, 5-celled, obovate, depressed. ♄. G. Native of the south coast of New Holland. Flowers white.

Distant-flowered Leucopogon. Shrub.

28 L. refle'xus (R. Br. prod. p. 544.) spikes terminal, crowded, few-flowered; flowers imbricated; leaves ovate, almost cordate, divaricate, mutic, a line long, convex above, and concave beneath, pilose, lined; drupes crustaceous, 5-celled. ♄. G. Native of the south coast of New Holland. Flowers white.

Reflexed-leaved Leucopogon. Shrub.

29 L. glabe'llus (R. Br. prod. p. 544.) spikes terminal, almost solitary; bracteas foliaceous, and are as well as the calyxes glabrous; leaves alternate, broadly cordate, acute, mutic, divaricate, flattish, and are, as well as the branchlets, glabrous. ♄. G. Native of the south coast of New Holland. Flowers white.

Smooth Leucopogon. Shrub.

§ 4. *Spikes terminal. Calyx and bracteas somewhat foliaceous. Drupe dry. Leaves not cordate.*—Perojòa, Cav.

30 L. microphy'llus (R. Br. l. c.) spikes crowded, few-flowered; leaflets of calyx acuminated, semi-foliaceous; bracteas foliaceous, nerved; leaves oval, obtuse, mutic, flat, of the same colour on both surfaces; drupes crustaceous, 1-2-celled.

ħ. G. Native of New South Wales. Perojòa microphýlla, Cav. icon. 4. p. 29. t. 349. f. 2. Flowers white.

Small-leaved Leucopogon. Fl. May, July. Clt. 1818. Shrub 2 feet.

31 L. tamarísCINUS (R. Br. l. c.) spikes aggregate or solitary, many-flowered; calyxes and bracteas foliaceous, glabrous; leaves imbricated, adpressed, ovate, mutic, concave-convex, lined beneath, and are as well as the branchlets glabrous. ħ. G. Native of the south coast of New Holland. Flowers white.

Tamarisk-like Leucopogon. Shrub.

32 L. gra'cilis (R. Br. l. c.) spikes crowded, 4-6-flowered; calyxes and bracteas subfoliaceous, glabrous; leaves lanceolate-linear, erect, concave-convex, mutic, nerved and 3-lined beneath; branchlets glabrous, filiform. ħ. G. Native of the south coast of New Holland. Flowers white.

Slender Leucopogon. Shrub.

33 L. denuda'tus (Sieb. pl. nov. holl. ex Spreng. syst. add. p. 67.) leaves linear acute, erect, glabrous, quite entire; flowers terminal, aggregate. ħ. G. Native of New Holland. Styphèlia denudàta, Spreng. l. c.

Naked Leucopogon. Shrub.

34 L. stria'tus (R. Br. l. c.) spikes aggregate; bracteas and calyxes subfoliaceous, with naked margins; leaves elliptic, mutic, erect, rather convex beneath and nerved, and somewhat concave above; branchlets glabrous; drupes crustaceous, 2-celled. ħ. G. Native of the south coast of New Holland. Flowers white.

Striated-leaved Leucopogon. Fl. May, Aug. Clt. 1820. Shrub 2 to 3 feet.

35 L. nervòsus (R. Br. l. c.) spikes crowded, few-flowered; bracteas and calyxes foliaceous and quite glabrous; leaves elliptic, imbricated, on short petioles, mutic, flat above, and rather convex beneath, with elevated nerves; branchlets downy. ħ. G. Native of the south coast of New Holland. Flowers white. Nearly allied to the preceding.

Nerved-leaved Leucopogon. Shrub.

36 L. carina'tus (R. Br. prod. p. 545.) spikes solitary or aggregate; bracteas and calyxes foliaceous, quite glabrous; leaves lanceolate, mutic, imbricated, flat above, and keeled beneath, with the lateral nerves obsolete, and the margins denticulated; branchlets downy. ħ. G. Native of the south coast of New Holland. Flowers white.

Keeled-leaved Leucopogon. Shrub.

37 L. assi'milis (R. Br. prod. p. 545.) spikes aggregate; leaves lanceolate-linear, imbricated, adpressed, mutic, convex and striated beneath, of the same colour on both surfaces, with denticulated margins; ovarium 5-celled. ħ. G. Native of New Holland, on the south coast. Flowers white.

Similar Leucopogon. Shrub.

38 L. cuculla'tus (R. Br. l. c.) spikes aggregate, 4-6-flowered; bracteas foliaceous; leaves ovate, obtuse, mutic, cucullate, imbricated, sessile, lined, with naked margins; drupes 5-celled. ħ. G. Native of the south coast of New Holland. Flowers white.

Cucullate-leaved Leucopogon. Shrub.

§ 5. *Peduncles axillary, 2-flowered, or 1-flowered every where from abortion: when this is the case, the calyx is many-bracteate. Drupe dry.*

39 L. pe'ndulus (R. Br. prod. p. 545.) peduncles usually 2-flowered, recurved; tube of corolla exceeding the calyx; leaves oblong-linear, erectly spreading, ending in an innocuous point, with recurved smooth margins; drupes clavate, ventricose, smooth, glabrous. ħ. G. Native of the south coast of New Holland. Flowers white.

Pendulous-flowered Leucopogon. Shrub.

40 L. biflòrus (R. Br. l. c.) peduncles 2-flowered, recurved; tube of corolla equal in length to the calyx; leaves spreading, linear-lanceolate, flat, 3 lines long, each ending in a pungent point, with smooth margins. ħ. G. Native of New South Wales. Flowers white.

Two-flowered Leucopogon. Shrub.

41 L. setíger (R. Br. l. c.) peduncles 2-flowered, recurved, longer than the calyx; leaves spreading, lanceolate-linear, acuminated, half an inch long, ending in a setaceous pungent mucrone, with recurved obsoletely denticulated margins. ħ. G. Native of New South Wales. Flowers white.

Bristle-bearing Leucopogon. Fl.? Clt. 1824. Shrub 2 to 3 feet.?

42 L. acumina'tus (R. Br. l. c.) peduncles very short, erect, usually 2-flowered; leaves erectish, linear-lanceolate, very acute, flat, ending in a setaceous mucrone, with scabrous denticulated margins. ħ. G. Native of New Holland, within the tropic. Flowers white.

Acuminated-leaved Leucopogon. Shrub.

43 L. cuspida'tus (R. Br. l. c.) peduncles very short, erect, 1-2-flowered; leaves moderately spreading, obovate-oblong, acutish, cuspidate, flat, with scabrous denticulated edges. ħ. G. Native of New Holland, within the tropic.

Cuspidate-leaved Leucopogon. Shrub.

44 L. imbrica'tus (R. Br. l. c.) peduncles very short, erect, 1-2-flowered; leaves imbricate, oval, obtuse, cuspidate, rather concave, with smooth toothless edges. ħ. G. Native of New Holland, within the tropic. Flowers white.

Imbricated-leaved Leucopogon. Shrub.

45 L. ruscifòlius (R. Br. l. c.) peduncles very short, erect, usually 2-flowered; leaves erectly spreading, obovate-elliptic, acutish, rather concave, mucronate, with smooth obsoletely denticulated edges. ħ. G. Native of New Holland, within the tropic. Flowers white.

Ruscus-leaved Leucopogon. Shrub.

46 L. pauciflòrus (R. Br. prod. p. 546.) peduncles very short, erect, usually 2-flowered; leaves narrow-lanceolate, moderately spreading, flat, ending each in a very short callous mucrone, with smooth margins; stem arborescent. ħ. G. Native of New Holland, within the tropic. Flowers white.

Few-flowered Leucopogon. Shrub.

47 L. leptospermoìdes (R. Br. prod. p. 546.) peduncles very short, erect, usually 2-flowered; leaves linear-lanceolate, moderately spreading, flattish, very acute, with minutely denticulated scabrous edges, ending each in a stiff mucrone. ħ. G. Native of New Holland, within the tropic. Flowers white.

Leptospermum-like Leucopogon. Shrub.

48 L. rotundifòlius (R. Br. l. c.) peduncles very short, erect, 1-2-flowered; leaves roundish or obovate, petiolate, spreading moderately, flat, mucronulate, with pellucid finely ciliated edges. ħ. G. Native of the south coast of New Holland. Flowers white.

Round-leaved Leucopogon. Shrub.

49 L. adpre'ssus (R. Br. l. c.) peduncles very short, erect, 1-3-flowered; leaves imbricated, adpressed, lanceolate, subacuminated, mucronate, concave, with denticulated margins. ħ. G. Native of New South Wales. Flowers white.

Adpressed-leaved Leucopogon. Fl. May, Aug. Clt. 1820. Shrub 2 to 3 feet.

50 L. fastigia'tus (Sieb. l. c.) leaves lanceolate, cuspidate, serrulated at the apex, striated; calyx glabrous; flowers axillary, almost solitary. ħ. G. Native of New Holland. Styphèlia fastigiàta, Spreng. l. c.

Fastigiate Leucopogon. Shrub.

51 L. junipe'rinus (R. Br. l. c.) flowers almost sessile, solitary or twin; leaves divaricate, lanceolate-linear, ending in a setaceous mucrone, with recurved slightly denticulated margins; bracteas 3-5, and are as well as the calyxes mucronate. ♄. G. Native of New South Wales. Lodd. bot. cab. 447. Flowers white.

Juniper-like Leucopogon. Fl. April, June. Clt. 1804. Shrub 3 to 4 feet.

52 L. defórmis (R. Br. l. c.) flowers almost sessile, solitary, many-bracteate; leaves erectly spreading, lanceolate-linear, rather concave, mucronate, with obsoletely denticulated edges; ovarium 3-celled. ♄. G. Native of New South Wales. Flowers white.

Deformed Leucopogon. Shrub.

53 L. esquama'tus (R. Br. l. c.) peduncles very short, erect, 1-2-flowered; leaves scattered, erectly spreading, lanceolate, subacuminated, mucronate, flat, turned, with scabrous margins; ovarium 2-celled; hypogynous disk wanting. ♄. G. Native of New South Wales. Flowers white.

Scaleless-flowered Leucopogon. Shrub.

54 L. flexifòlius (R. Br. l. c.) flowers almost sessile, solitary; leaves much crowded, imbricated, linear, mucronate, twisted, with scabrous denticulated edges; ovarium 5-celled. ♄. G. Native of New Holland, within the tropic.

Bent-leaved Leucopogon. Shrub.

55 L. Forste'ri; arboreous; leaves scattered, linear, cuspidate, serrulated; flowers sessile, solitary, terminal. ♄. G. Native of New Zealand. E'pacris junipérina, Forst. char. gen. 10. no. 2. ins. austr. p. 13.

Forster's Leucopogon.

Cult. The species of this genus are very pretty when in blossom; they grow best in an equal mixture of sandy loam and peat; and the tops of the very young shoots taken off and planted in sand, with a bell-glass over them, strike root readily.

VIII. MONO'TOCA (from *μόνος, monos*, alone, and *τόκος, tokos*, a birth; in reference to the fruit being one-seeded). R. Br. prod. p. 546.

Lin. syst. *Pentándria, Monogýnia.* Calyx bibracteate. Corolla funnel-shaped; limb and throat beardless. Ovarium 1-seeded. Drupe baccate.—Shrubs or small trees. Leaves scattered. Spikes axillary, rarely terminal, few-flowered. Flowers small, white, usually dioecious from the defect of the organs. Hypogynous disk cup-shaped, lobed.

§ 1. *Bracteas extending, caducous. Small dioecious trees.*

1 M. ellíptica (R. Br. prod. p. 546.) spikes erect, nearly terminal and aggregate, or axillary and solitary; leaves elliptic, oblong, 4 times longer than broad. ♄. G. Native of New South Wales. Styphèlia ellíptica, Smith, new holl. 49.

Elliptic-leaved Monotoca. Fl. May, Aug. Clt. 1802. Tree small.

2 M. a'lbens (R. Br. prod. p. 547.) spikes erect, solitary, terminal and axillary; leaves oblong-linear, acute, mucronate, white beneath, 5 times longer than broad. ♄. G. Native of New South Wales.

White-leaved Monotoca. Fl. May, Aug. Clt. 1824. Shrub 6 feet.

3 M. linea'ta (R. Br. l. c.) spikes axillary, few-flowered, nodding, pedunculate; leaves oblong, and often obovate, acute, flattish, mucronate. ♄. G. Native of Van Diemen's Land. Styphèlia glaúca, Labill. nov. holl. 1. p. 45. t. 61. where the plant is represented as having erect spikes, and a 5-celled ovarium.

Lined-leaved Monotoca. Fl. May, Aug. Clt. 1804. Shrub.

§ 2. *Bracteas extending, permanent. Shrubs with hermaphrodite flowers.*

4 M. scopa'ria (R. Br. l. c.) spikes axillary, few-flowered, nearly sessile, nodding; leaves oblong-linear, with revolute edges; stem erect. ♄. G. Native of New South Wales. Styphèlia scopària, Smith, new holl. p. 48.

Broom Monotoca. Fl. May, Aug. Clt. 1825. Shrub.

5 M. empetrifòlia (R. Br. l. c.) spikes axillary, nodding, 2-3-flowered; leaves oblong-oval, mucronate, divaricate, convex above, white and striated beneath; stem prostrate. ♄. G. Native of Van Diemen's Land.

Empetrum-leaved Monotoca. Shrub.

Cult. For culture and propagation see *Leucopògon*, above. The pots in which the species are grown require to be well drained with sherds.

IX. ACRO'TRICHE (from *ἄκρος, akros*, the uttermost, and *θρὶξ τριχὸς, thrix trichos*, a hair; the tips of the corolline segments are bearded). R. Br. prod. p. 547. Styphèlia species, Spreng.

Lin. syst. *Pentándria, Monogýnia.* Calyx bibracteate. Corolla funnel-shaped; segments of the limb furnished with a deflexed beard at the apex. Drupe nearly baccate, containing a 5-celled cellular putamen.—Humble much branched shrubs; branches usually divaricate. Leaves scattered. Spikes lateral or axillary, short. Flowers small, white. Hypogynous disk cup-shaped, a little lobed. Drupe small, depressedly globose, of a dry substance.

1 A. divarica'ta (R. Br. prod. p. 547.) leaves lanceolate, mucronate, divaricate, flat, green on both surfaces; spikes axillary. ♄. G. Native of New South Wales.

Divaricate-leaved Acrotriche. Fl. May. Clt. 1824. Shrub ½ to 1 foot.

2 A. aggrega'ta (R. Br. l. c.) leaves oblong-lanceolate, rather concave, glaucous beneath, with smooth margins. ♄. G. Native of New Holland, within the tropic.

Aggregate Acrotriche. Shrub 1 foot.

3 A. ramiflòra (R. Br. l. c.) leaves linear-lanceolate, mucronate, divaricate, of a different colour beneath, nerved, with recurved margins; spikes on the branches. ♄. G. Native of New Holland, on the south coast.

Branch-flowered Acrotriche. Shrub 1 foot.

4 A. serrula'ta (R. Br. l. c.) leaves linear-lanceolate, cuspidate, spreading, pilose or smoothish, with serrulately ciliated edges; spikes axillary. ♄. G. Native of the south coast of New Holland, and Van Diemen's Land.

Serrulated-leaved Acrotriche. Shrub 1 foot.

5 A. pa'tula (R. Br. l. c.) leaves ovate-lanceolate, acuminated, mucronate, flattish, and are as well as the branches divaricate; spikes axillary. ♄. G. Native of New Holland, on the south coast.

Spreading Acrotriche. Shrub.

6 A. ovalifòlia (R. Br. prod. p. 548.) leaves ovate and oval, obtuse, awnless, flat, with smooth margins; spikes axillary; drupes somewhat cellular. ♄. G. Native of New Holland, on the south coast. Hook. bot. mag. t. 3171. Lodd. bot. cab. 1930. Corolla greenish-yellow. Drupes white.

Oval-leaved Acrotriche. Fl. March. Clt. 1824. Shrub ½ to 1 foot.

7 A. corda'ta (R. Br. l. c.) leaves cordate, flat, striated below; flowers axillary, twin or solitary. ♄. G. Native of New Holland, on the south coast. Styphèlia cordàta, Labill. nov. holl. 1. p. 46. t. 63. Perhaps belonging to a different genus.

Cordate-leaved Acrotriche. Fl. April, July. Clt. 1823. Shrub 1 foot.?

8 A. depre'ssa (R. Br. l. c.) leaves ovate, rather cordate, mucronate, divaricate, convex above, and veiny beneath; stem depressed; spikes on the branches. ♄. G. Native of New Holland, on the south coast.

Depressed Acrotriche. Shrub depressed.

Cult. For culture and propagation see *Leucopògon*, p. 780.

X. TROCHOCA'RPA (from τροχὸς, *trochos*, a wheel, and καρπὸς, *karpos*, a fruit; in reference to the putamen of the fruit, which is wheel-shaped and 10-lobed). R. Br. prod. p. 548.

Lin. syst. *Pentándria, Monogy'nia.* Calyx bibracteate. Corolla funnel-shaped: limb spreading, bearded. Ovarium 10-celled. Drupe baccate, containing a wheel-shaped, 10-lobed putamen, which is at length divisible into as many parts.—A small glabrous tree, with very hard wood. Leaves scattered, petiolate, nerved, very like those of a species of *Laúrus*. Spikes slender, terminal and axillary, solitary or aggregate. Flowers small, white. Hypogynous disk cup-shaped, 5-lobed. Drupe depressedly globose, smaller than a pea. The genus approaches *Decáspora* in character and habit.

1 T. lau'rina (R. Br. prod. p. 548.). ♄. G. Native of New South Wales. Hook. bot. mag. t. 3324. Styphèlia cornifòlia, Rudge, in Lin. trans. 8. t. 9. good. Cyathòdes laúrina, herb. Banks. Flowers small, white.

Laurel-like Trochocarpa. Fl. April, May. Clt. 1823. Tree 10 to 25 feet.

Cult. See *Leucopògon*, p. 780. for culture and propagation.

XI. DECA'SPORA (from δέκα, *deca*, ten, and σπορὰ, *spora*, a seed; the fruit contains 10 pyrenæ or seeds). R. Br. prod. p. 548.

Lin. syst. *Pentándria, Monogy'nia.* Calyx bibracteate. Corolla campanulate; limb loosely bearded. Stamens exserted. Ovarium 10-celled. Berry containing 10 pyrenæ.—Beautiful shrubs. Leaves scattered, petiolate. Spikes terminal, nodding. Flowers red. Hypogynous scales 5, connate at the base. Berries violaceous.

1 D. dísticha (R. Br. prod. p. 548.) leaves lanceolate, very acute, flat, nerved beneath, 8 times longer than the petioles; branchlets glabrous. ♄. G. Native of Van Diemen's Land. Cyathòdes dísticha, Labill. nov. holl. 1. p. 58. t. 82.

Distich-leaved Decaspora. Shrub 4 to 6 feet.

2 D. thymifòlia (R. Br. prod. p. 548.) leaves ovate, acutish, mutic, hardly 4 times longer than the petioles, obsoletely 3-nerved beneath; branchlets downy. ♄. G. Native of Van Diemen's Land.

Thyme-leaved Decaspora. Shrub.

Cult. For culture and propagation see *Leucopògon*, p. 780.

XII. PENTACHO'NDRA (from πέντε, *pente*, five, and χόνδρος, *chondros*, a grain; in reference to the berry containing 5 pyrenæ or seeds). R. Br. prod. p. 549.

Lin. syst. *Pentándria, Monogy'nia.* Calyx with 4 or more bracteas. Corolla funnel-shaped; limb spreading, longitudinally and densely bearded. Ovarium 5-celled. Berry containing 5 pyrenæ.—Small mountain shrubs. Leaves scattered, petiolate. Flowers solitary, terminal, erect, white. Hypogynous scales 5.

1 P. involucra'ta (R. Br. prod. p. 549.) filaments exserted; calyxes ciliated, furnished with 8 bracteas; leaves elliptic-lanceolate, flattish, many-nerved; branchlets downy; stem erect. ♄. G. Native of Van Diemen's Land. Styphèlia involucràta, Spreng. syst. 1. p. 655.

Involucrated-flowered Pentachondra. Shrub.

2 P. pu'mila (R. Br. l. c.) stamens inclosed; calyx furnished with 4 bracteas; leaves nearly elliptic, 3-nerved, with naked margins; branchlets glabrous; stem prostrate, much branched. ♄. G. Native of Van Diemen's Land. E'pacris pùmila, Forst. prod. no. 70. Styphèlia pùmila, Spreng. syst. 1. p. 656.

Dwarf Pentachondra. Shrub prostrate.

Cult. For culture and propagation see *Leucopògon*, p. 780.

XIII. NEEDHA'MIA (in honour of the celebrated micrographist, Turberville Needham, author of Observations on the Shape and Œconomy of the Pollen of Anthers). R. Br. prod. p. 549.

Lin. syst. *Pentándria, Monogy'nia.* Calyx bibracteate. Corolla salver-shaped: limb 5-cleft, beardless, having the sinuses elevated, plicate in æstivation. Stamens 5, inclosed. Ovarium 2-celled. Drupe dry. Leaves opposite.—A small erect shrub. Leaves minute, adpressed. Spikes terminal, erect, solitary; bracteas extending, foliaceous. Flowers white. Hypogynous disk saucer-shaped.

1 N. pumílio (R. Br. l. c.). ♄. G. Native of New Holland, on the south coast. Monótoca pumílio, Spreng. syst. 1. p. 654.

Dwarf Needhamia. Shrub.

Cult. For culture and propagation see *Astrolòma*, p. 775.

XIV. OLIGARRHE'NA (from ὀλίγος, *oligos*, few, and ἄρρην, *arrhen*, a male; in reference to the few stamens). R. Br. prod. p. 549.

Lin. syst. *Diándria, Monogy'nia.* Calyx 4-parted, bibracteate. Corolla 4-cleft, permanent, valvate in æstivation. Stamens 2, inclosed. Ovarium 2-celled. Capsule 2-celled.—An erect much-branched shrub. Leaves scattered, imbricate, small. Spikes terminal, erect. Flowers small, white. Hypogynous scales 4. This is a very paradoxical genus; it agrees in the artificial character with the order *Olèinæ*, but the habit is wholly distinct.

1 O. micra'ntha (R. Br. prod. p. 549.). ♄. G. Native of New Holland, on the south coast.

Small-flowered Oligarrhena. Shrub.

Cult. See *Astrolòma*, p. 775. for culture and propagation.

Tribe II.

EPACRIE'Æ (the genera contained in this tribe agree with *E'pacris* in many particulars). Cells of ovarium many-seeded. Fruit capsular.

XV. E'PACRIS (from ἐπὶ, *epi*, upon, and ἄκρος, *akros*, the uttermost; in allusion to the habitation of the species on the tops of hills). Smith, exot. bot. p. 77. t. 40. Labill. nov. holl. 1. p. 41. t. 55. Cav. icon. 4. p. 25. t. 344. R. Br. prod. p. 550.

Lin. syst. *Pentándria, Monogy'nia.* Calyx coloured, many-bracteate; bracteas of the same texture as the calyx. Corolla tubular; limb beardless. Stamens epipetalous. Anthers peltate above the middle. Hypogynous scales 5. Capsule having the placentas adnate to the central column.—Small branched, usually glabrous shrubs. Leaves scattered, petiolate or simple at the base. Flowers axillary, white or purplish, usually disposed in leafy spikes.

* *Leaves cordate.*

1 E. purpura'scens (R. Br. prod. p. 550.) segments of calyx acuminated, about equal in length to the tube of the corolla; leaves cucullate, nearly sessile, ending each in a recurved mucrone, which exceeds the base of the leaf; floral leaves equalling the corollas in length. ♄. G. Native of New South Wales. E. púngens, Sims, bot. mag. t. 844. E'pacris attenuàtum, Link. Lodd. bot. cab. t. 38. Corollas purplish.

Var. β, rùbra (Lodd. bot. cab. 876.) flowers red.

Purpurescent-flowered Epacris. Fl. Jan. March. Clt. 1803. Shrub 2 to 3 feet.

2 E. pulche'lla (Cav. icon. 4. p. 26. t. 345. Sims, bot. mag. 1170. R. Br. prod. p. 550.) segments of the calyx acuminated, equalling the tube of the corolla; leaves rather concave, ending each in a spreading point, which is not so long as the base of the leaf; floral leaves shorter than the corollas. ♄. G. Native of New South Wales. Lodd. bot. cab. 194. Flowers pale red or pink.

Neat Epacris. Fl. April, June. Clt. 1804. Shrub 1 to 3 feet.

3 E. microphy'lla (R. Br. prod. p. 550.) segments of calyx bluntish, equalling the tube of the corolla; leaves cucullate, acute, spreading; spike terminal. ♄. G. Native of New South Wales. Flowers almost white.

Small-leaved Epacris. Fl. April, June. Clt. 1822. Shrub 1 to 2 feet.

4 E. ripa'ria (R. Br. l. c.) segments of calyx setaceously acuminated, about equal in length to the tube of the corolla; leaves flat, acuminated, spreading. ♄. G. Native of New South Wales.

River-side Epacris. Shrub.

5 E. grandiflòra (Smith, exot. bot. 75. t. 39. Sims, bot. mag. t. 982.) corollas cylindrical, 4 times longer than the calyx; flowers pendulous; leaves flat, acuminated. ♄. G. Native of New South Wales. Lodd. bot. cab. 21. E'pacris longiflòra, Cav. icon. 4. p. 25. t. 344. Flowers scarlet and white.

Great-flowered Epacris. Fl. Jan. June. Clt. 1803. Shrub 2 to 6 feet.

6 E. campanula'ta (Lodd. bot. cab. 1925.) leaves ovate, reflexed; flowers axillary, the whole forming a spike; corolla twice or thrice longer than the calyx, campanulate. ♄. G. Native of Van Diemen's Land. Corollas red.

Var. β, álba (Lodd. bot. cab. 1931). Flowers white.

Campanulate-flowered Epàcris. Fl. March. Clt. 1830. Shrub 1 to 2 feet.

7 E. apicula'ta (Cunningh. in Field's New South Wales, p. 340.) calycine segments lanceolate, acuminated, about equal in length to the tube of the corolla; leaves cucullate, hairy, sessile, auricled at the base: superior leaves imbricated, ending each in a callous obtuse point; branchlets downy. ♄. G. Native of New South Wales, on boggy moist declivities, in the ravines of King's Table Land.

Apiculated-leaved Epacris. Fl. April, July. Clt. 1823. Shrub.

** *Leaves simple at the base, not cordate.*

8 E. ruscifòlia (R. Br. prod. p. 550.) flowers scattered, pendulous; leaves elliptic-lanceolate, petiolate, acuminated; corollas cylindrical, having the tube twice longer than the calyx. ♄. G. Native of Van Diemen's Land.

Ruscus-leaved Epacris. Fl. April, June. Clt. 1824. Shrub.

9 E. rivula'ris (Sieb. pl. nov. holl. ex Spreng. syst. add. p. 64.) leaves almost sessile, ovate, acuminated, reflexedly spreading; calyxes acute, about equal in length to the corolla. ♄. G. Native of New Holland.

Rivulet Epacris. Shrub.

FIG. 133.

10 E. impre'ssa (Labill. nov. holl. 1. p. 43. t. 58.) flowers pendulous, spicate, leaning all one way; leaves lanceolate, nearly sessile, attenuated at the apex, mucronate, with scabrous edges; peduncles 3 times shorter than the calyx; corollas cylindrical; tube of corolla prismatic, twice longer than the acute ciliated calyx. ♄. G. Native of the south coast of New Holland, and Van Diemen's Land. R. Br. prod. p. 551. Sweet, fl. austr. t. 4. Lodd. bot. cab. 1691. Flowers beautiful crimson.

Impressed Epacris. Fl. April, July. Clt. 1824. Shrub 1 to 3 feet.

11 E. varia'bilis (Lodd. bot. cab. 1818.) leaves ovate, sessile, tapering to the apex; corolla tubular, 3 or 4 times longer than the calyx. ♄. G. Native of Van Diemen's Land. Flowers drooping, pale red or blush, spicate. Like *E. imprèssa.*

Variable Epàcris. Fl. Jan. Feb. 1829. Shrub 2 feet.

12 E. niva'lis (Lodd. bot. cab. 1821. Lindl. bot. reg. 1531. Graham, in bot. mag. 3253.) leaves ovate-lanceolate, spreading much, nakedish, nerved beneath, attenuated at the apex, mucronate, with scabrous margins; flowers axillary, solitary, secund, disposed in a leafy raceme or spike; tube of corolla campanulate, much longer than the segments of the calyx, which are ciliated, as well as the bracteas. ♄. G. Native of New Holland. Flowers white.

Snowy Epacris. Fl. April, May. Clt. 1829. Shrub 2 to 3 feet.

13 E. cerafòlia (Graham, in bot. mag. t. 3243.) leaves lanceolate, spreading much, nakedish, attenuately mucronate at the apex, with scabrous edges; flowers spreading, axillary, solitary, secund; tube of corolla ovate, exceeding the acute ciliated segments of the calyx. ♄. G. Native of Van Diemen's Land. Flowers white, collected near the extremities of the branches, much shorter than those of *E. nivàlis.*

Wax-leaved Epacris. Fl. April, May. Clt. 1831. Shrub 1 to 3 feet.

14 E. spa'rsa (R. Br. prod. p. 551.) flowers unknown; peduncles scattered, about equal in length to the acute calyx; leaves oblong-lanceolate, petiolate, mucronate, veinless. ♄. G. Native of New South Wales. Flowers white. ?

Scattered-flowered Epacris. Shrub.

15 E. rígida (Sieb. l. c.) leaves ovate-oblong, bluntish, nearly sessile, cartilaginous, spreading, keeled; calyxes obtuse, about equal in length to the tube of the corolla. ♄. G. Native of New Holland.

Stiff Epacris. Shrub.

16 E. obtusifòlia (Smith, exot. bot. p. 77. t. 40.) flowers nodding; leaves lanceolate, erect, a little imbricated, ending in a bluntish callous point; segments of the calyx obtuse, length of the tube of the corolla; stamens inclosed. ♄. G. Native of New South Wales, south coast of New Holland, and Van Diemen's Land. R. Br. prod. p. 551. Lodd. bot. cab. 293. Flowers white.

Blunt-leaved Epacris. Fl. April, June. Clt. 1804. Shrub 2 to 3 feet.

17 E. heterone'ma (Labill. nov. holl. 1. p. 42. t. 56.) leaves elliptic-lanceolate, acuminated, rather concave, striated beneath; segments of calyx very acute, naked, length of tube of the

corolla; stamens inclosed; style glabrous; branches hairy. ♄. G. Native of Van Diemen's Land, and of New Holland, on the Blue Mountains. R. Br. prod. p. 551. Hook. bot. mag. t. 3257. Flowers white.

Variable-stamened Epacris. Fl. May, June. Clt. 1823. Shrub 2 to 4 feet.

18 E. paludòsa (R. Br. prod. p. 551.) leaves narrow-lanceolate, acuminated, flat, striated beneath, with scabrous margins; calycine segments very acute, naked, length of tube of the corolla; stamens inclosed; style glabrous. ♄. G. Native of New South Wales. Lodd. bot. cab. 1226. Flowers pale red.?

Marsh Epacris. Fl. April, July. Clt. 1825. Shrub 2 to 3 feet.

19 E. lanuginòsa (Labill. nov. holl. 1. p. 42. t. 57.) leaves lanceolate, acuminated, with scabrous margins; calycine segments very acute, length of tube of the corolla, with the margins woolly; stamens inclosed; style hairy. ♄. G. Native of Van Diemen's Land. R. Br. prod. p. 551.

Woolly Epacris. Shrub 2 feet.

20 E. onosmæflòra (Cunningh. in Field's New South Wales, p. 340.) leaves elliptic-lanceolate, acuminated, cucullately concave, 5-nerved, mucronate, petiolate, with ciliated margins; branchlets hoary; corollas cylindrically ventricose, with the tube exceeding the calyx, which is very acute. ♄. G. Native of New South Wales, in boggy moist declivities on the King's Table Land. Nearly allied to *E. lanuginòsa*, Labill.

Onosma-flowered Epacris. Fl. May. Clt. 1823. Shrub.

21 E. myrtifòlia (Labill. nov. holl. 1. p. 41. t. 55.) leaves ovate, acute, mucronulate, flat, thick: floral ones about equal in length to the corolla; calycine segments acutish, naked, length of tube of the corolla; bracteas bluntish; stamens inclosed. ♄. G. Native of Van Diemen's Land. R. Br. prod. 551.

Myrtle-leaved Epacris. Shrub.

22 E. sespyllifòlia (R. Br. prod. 551.) leaves ovate, acute; floral leaves one-half shorter than the corolla; calycine segments acutish, naked, length of tube of corolla; stamens inclosed. ♄. G. Native of Van Diemen's Land.

Wild-Thyme-leaved Epacris. Shrub.

23 E. exse'rta (R. Br. prod. 551.) leaves lanceolate, acute, erect, flat above, and rather convex beneath; calycine segments bluntish, equalling the tube in length; anthers clearly exserted. ♄. G. Native of Van Diemen's Land. Flowers white.

Exserted-stamened Epacris. Fl. April, July. Clt. 1812. Shrub 1 to 3 feet.

24 E. crassifòlia (R. Br. l. c.) leaves oval or obovate, obtuse, mutic, flat, cartilaginous, acute at the base; calyxes pedunculate, with woolly margins; stem procumbent, with ascending branches. ♄. G. Native of New South Wales.

Thick-leaved Epacris. Shrub procumbent.

25 E. mucronula'ta (R. Br. prod. p. 552.) leaves lanceolate, very acute, erectly spreading, ending each in a pungent pellucid mucrone; calycine segments acute, with naked margins. ♄. G. Native of Van Diemen's Land. Flowers red.?

Mucronulate-leaved Epacris. Fl. April, July. Clt. 1824. Shrub 2 to 3 feet.

Cult. All the species of this genus are delicate and handsome small shrubs; and many of them, on that account, are cultivated by nurserymen and florists. A sandy peat soil suits them best, and the rougher and more turfy it is, the better the plants will thrive. They should be always shifted into fresh pots and mould just before they are placed out of doors for the summer from the green-house, as the roots become matted, and being so very fine, the hot sun against the pots is apt to destroy the points, and thus often kills the plants altogether. Cuttings taken from the tips of young shoots, and planted in pots filled with sand, with a bell-glass placed over them, either in autumn, winter, or spring, will readily strike root; but they will not strike so freely in summer. When the cuttings are rooted, they should be potted singly in small pots, and set in a close frame for some time, and hardened to the air only by degrees.

XVI. LYSINE'MA (from λυσις, *lysis*, a freeing, and νῆμα, *nema*, a filament; in reference to the stamens being hypogynous, and therefore free from the corolla, not as in *Epacris* epipetalous). R. Br. prod. p. 552.

Lin. syst. *Pentándria, Monogy'nia*. Calyx coloured, with many bracteas; bracteas texture of calyx. Corolla salver-shaped, with the tube sometimes divisible into 5 parts; segments of the limb beardless, bent to the right. Stamens hypogynous. Anthers peltate above the middle. Hypogynous scales 5. Placentas of capsule adnate to the central column.—Shrubs with the habit of *E'pacris*.

1 L. petape'talum (R. Br. prod. p. 552.) corollas pentapetalous, having the claws distinct the whole length, and longer than the calyx, glabrous outside. ♄. G. Native of New Holland, on the south coast. Flowers pink. Leaves trigonal.

Five-petalled Lysinema. Fl. Feb. March. Clt. 1823. Shrub 2 to 3 feet.

2 L. cilia'tum (R. Br. l. c.) corollas pentapetalous: having the claws cohering at the apex, length of calyx, glabrous outside. ♄. G. Native of New Holland, on the south coast.

Ciliated-leaved Lysinema. Shrub.

3 L. lasia'nthum (R. Br. l. c.) corollas pentapetalous: having the claws woolly outside, and 4-5 times longer than the limb. ♄. G. Native of New Holland, on the south coast.

Hairy-flowered Lysinema. Fl. Feb. May. Clt. 1820. Shrub 2 to 3 feet.

4 L. conspi'cuum (R. Br. l. c.) corolla monopetalous: having the tube 5-cleft, and exceeding the calyx; leaves lanceolate-subulate, adpressed. ♄. G. Native of New Holland, on the south coast.

Conspicuous Lysinema. Fl. Feb. May. Clt. 1824. Shrub 2 to 3 feet.

5 L. ruscifòlium (Sieb. ex Spreng. syst. add. p. 64.) leaves half stem-clasping, ovate-oblong, cuspidate, ciliated, smooth; segments of calyx subulate, about equal in length to the tube of the corolla. ♄. G. Native of New Holland.

Ruscus-leaved Lysinema. Shrub.

6 L. pu'ngens (R. Br. prod. p. 552.) corollas monopetalous, having the tube entire, and equal in length to the calyx; leaves ovate, acuminated, spreading. ♄. G. Native of New South Wales. E'pacris púngens, Cav. icon. 4. p. 26. t. 346. Flowers white. Shrub pale green. This species is intermediate between *Lysinèma* and *E'pacris*. Leaves stem-clasping.

Var. β, *rùbrum* (Sims, bot. mag. 1199.) shrub dark or brownish green; flowers red. ♄. G. Native of New South Wales. E'pacris ròsea, Lodd. bot. cab. t. 863.

Pungent-leaved Lysinema. Fl. Feb. April. Clt. 1804. Shrub 2 to 3 feet.

Cult. See *E'pacris* above for culture and propagation. Elegant and delicate shrubs, having the habit of *E'pacris*.

XVII. PRIONO'TES (from πρίων, *prion*, a saw, and οὖς ὠτὸς, *ous otos*, an ear; in reference to the serrated leaves). R. Br. prod. p. 552.

Lin. syst. *Pentándria, Monogy'nia*. Calyx bractless. Corolla tubular, with an open throat; the limb beardless. Stamens hypogynous. Filaments half adhering to the tube. Anthers with a complete dissepiment. Hypogynous scales 5. Placentas unknown.—A glabrous much branched shrub. Leaves scattered, petiolate, serrated. Peduncles axillary, 1-flowered, recurved,

minutely bracteate at the base, and naked above. Flowers showy, pendulous. The placentas of the capsules are loose and pendulous, and the leaves sheathing, according to Labillardiere.

1 P. cerinthoìdes (R. Br. prod. p. 553.). ♄. G. Native of Van Diemen's Land. E'pacris cerinthoìdes, Labill. nov. holl. 1. p. 43. t. 59.

Cerinthe-like Prionotes. Shrub 4 to 5 feet.

Cult. This is an elegant and delicate shrub, bearing showy pendulous flowers. For culture and propagation, see *E'pacris*, p. 783.

XVIII. COSME'LIA (from *κοσμὲω*, *kosmeo*, to adorn; beauty of flowers.) R. Br. prod. p. 553.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx foliaceous. Corolla tubular. Stamens epipetalous. Anthers adnate to the filaments, which are ciliated at top. Hypogynous scales 5. Placentas of capsule adnate to the central column.—An erect much branched shrub, but the branches while naked are not marked by cicatrices. Bases of leaves cucullate, half sheathing. Flowers solitary, drooping, terminating the short lateral branches. Calyx imbricated by smaller leaves. Corollas deep red. Stamens inclosed. Anthers loosened at the base. Placentas free at both extremities.

1 C. ru'bra (R. Br. prod. p. 553.). ♄. G. Native of the south coast of New Holland. E'pacris rùbra, Spreng. syst. 1. p. 629.

Red-flowered Cosmelia. Fl.? Clt. 1826. Shrub 1 to 2 feet.

Cult. See *E'pacris*, p. 783. for culture and propagation.

XIX. ANDERSO'NIA (named in memory of William Anderson, a surgeon of the Royal Navy, who accompanied Captain Cook; he paid great attention to botany. Descriptions of the genera of Van Diemen's Land plants, written by him, are still in the Banksian Library. The genus is also intended to commemorate the late Alexander Anderson, formerly Director of the Botanic Garden at St. Vincent; and William Anderson, the present Curator of the Apothecaries' Botanic Garden at Chelsea.) R. Br. prod. p. 553.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx coloured, imbricated by 2 or more foliaceous bracteas. Corolla length of calyx; segments of the limb bearded at the base. Stamens hypogynous: anthers fixed beneath the middle. Hypogynous scales 5, sometimes connate. Capsule with the placentas adnate to the central column.—Small squarrose shrubs, having the branches not annulated while naked. Bases of leaves cucullate, half sheathing. Flowers terminal, spicate, or solitary, erect. Placentas short, rising from the bottom of the capsule. Seeds few when mature, erect.

* *Flowers bibracteate, spicate.*

1 A. sprengelioìdes (R. Br. prod. p. 554.) leaves spreading, ending each in a flat point. ♄. G. Native of New Holland, on the south coast. Sims, bot. mag. 1645. Lodd. bot. cab. 263. Flowers pink.

Sprengelia-like Andersonia. Fl. March, July. Clt. 1803. Shrub 1 to 3 feet.

2 A. parvifòlia (R. Br. l. c.) leaves adpressed, ending in a triquetrous point each. ♄. G. Native of the south coast of New Holland.

Small-leaved Andersonia. Shrub.

** *Flowers many-bracteate; terminating the short branchlets.*

3 A. cæru'lea (R. Br. l. c.) leaves moderately spreading; young leaves and outside of calyxes downy. ♄. G. Native of New Holland, on the south coast. Flowers blue.

Blue-flowered Andersonia. Shrub.

4 A. squarròsa (R. Br. prod. p. 554.) leaves squarrose, divaricate or recurved, glabrous, with naked margins; calyxes and styles glabrous; stem erect. ♄. G. Native of New Holland, on the south coast.

Squarrose-leaved Andersonia. Shrub.

5 A. depre'ssa (R. Br. l. c.) leaves squarrose, divaricate or recurved, downy, with ciliated margins; calyxes glabrous; style pilose in the middle; stem depressed. ♄. G. Native of New Holland, on the south coast.

Depressed Andersonia. Shrub depressed.

6 A. micra'ntha (R. Br. l. c.) leaves adpressed; style downy beneath the middle. ♄. G. Native of New Holland, on the south coast.

Small-flowered Andersonia. Shrub.

Cult. The species of this genus are very elegant and delicate plants. They grow freely in a sandy peat soil, having the pots well drained with sherds. Care should be taken not to give them too much water, as when the mould gets soddened, the plants are almost sure to die. They are increased by cuttings in the same way as *E'pacris*, which see, p. 783.

XX. PONCELE'TIA (to the memory of Mr. Poncelet, author of treatise on Triticum or Wheat.) R. Br. prod. p. 554.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx foliaceous. Corolla short, campanulate, 5-cleft, beardless. Stamens hypogynous. Anthers peltate beneath the middle, with a marginate dissepiment. Hypogynous scales wanting. Capsule having the placentas adnate to the central column.—A small, erect, twiggy, marsh shrub, having the branches not annulated while naked: floriferous branches brittle. Bases of leaves cucullate, half sheathing. Flowers solitary, erect, terminating the branchlets. Calyx imbricated by smaller leaves. Anthers free, beardless.

1 P. Sprengelioìdes (R. Br. prod. p. 554.). ♄. G. Native of New South Wales. A suffruticose dense habited plant, adhering to rocks perpetually damp.

Sprengelia-like Ponceletia. Fl. May, June. Clt. 1826. Shrub 1 to 2 feet.

Cult. For culture and propagation, see *E'pacris*, p. 783.

XXI. SPRENGE'LIA (named after Christian Conrad Sprengel, master of the grammar-school at Spandow, in Brandenburgh, who published at Berlin, in 1793, a most ingenious work on the manner in which insects promote the impregnation of plants). Smith, in act. stockh. 1794. p. 260. t. 8. tracts, p. 267. t. 2. R. Br. prod. p. 555.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx coloured a little. Corolla 5-parted, rotate, beardless. Stamens hypogynous. Anthers connate or free, with an immarginate dissepiment. Hypogynous scales wanting. Capsule having the placentas adnate to the central column.—Small, erect, branched shrubs; branches hardly annulated while naked. Bases of leaves cucullate, half sheathing. Flowers terminating the short lateral branchlets. Corolla purplish, length of calyx: with the tube very short, and at length cleft into 5 to the base.

1 S. incarna'ta (R. Br. prod. p. 55.) anthers connate, bearded; calyxes coloured; leaves long-acuminated. ♄. G. Native of New South Wales, south coast of New Holland, and Van Diemen's Land. Andr. bot. rep. t. 2. Sims, bot. mag. 1719. Lodd. bot. cab. 262. Flowers flame coloured.

Flesh-colour-flowered Sprengelia. Fl. April, June. Clt. 1793. Shrub 1 to 2 feet.

2 S. monta'na (R. Br. l. c.) anthers free, beardless; calyx half coloured; leaves short-acuminated. ♄. G. Native of Van Diemen's Land. Flowers purplish.

Mountain Sprengelia. Shrub 1 foot.

Cult. These are elegant and delicate shrubs, with much the habit of *Andersònia*, which see, p. 784, for culture and propagation.

XXII. CYSTA'NTHE (from *κυστη, kiste*, a box or coffer, and *ανθος, anthos*, a flower; in reference to the closed hood-formed flowers.) R. Br. prod. p. 555.

Lin. syst. *Pentándria, Monogýnia.* Calyx foliaceous. Corolla closed, calyptræform, dehiscing transversely: with a truncate permanent base. Stamens hypogynous, permanent. Hypogynous scales wanting. Capsule having the placentas loose, and hanging from the top of the central column.—A shrub with the habit of *Sprengèlia, Cosmèlia*, and *Poncelètia*: unless that the branches are annulated while naked.

1 C. Sprengelioìdes (R. Br. prod. p. 555.). ♄. G. Native of Van Diemen's Land. Flowers pale red.

Var. α, leaves elongated, spreadingly recurved. Growing on the shady sides of mountains.

Var. β, leaves much shorter. Growing on the tops of mountains.

Sprengelia-like Cystanthe. Shrub 1 to 2 feet.

Cult. For culture and propagation, see *Andersònia*, p. 784. It is an elegant and delicate shrub.

XXIII. RI'CHEA (named in memory of M. Riche, one of the naturalists who accompanied the expedition in search of La Perouse). R. Br. prod. p. 555. but not of Labill.

Lin. syst. *Pentándria, Monogýnia.* Calyx membranous, bractless. Corolla closed, calyptræform, dehiscing transversely: with a truncate permanent base. Stamens hypogynous, permanent. Hypogynous scales 5. Capsule having the placentas loose and hanging from the top of the central column.—A shrub with the habit almost of *Dracophýllum montànum*, Labill., but differing in the singular economy of the flower. It comes nearest to *Cystánthe*, in the corolla being calyptræform; but that genus differs in the inflorescence, foliaceous calyx, and want of hypogynous scales. Richea of Labill. voy. 1. p. 187. t. 16. in Craspèdia, Forst. prod. no. 306. and Willd. spec. 3. p. 2393.

1 R. dracophy'lla (R. Br. prod. p. 555.). ♄. G. Native of Van Diemen's Land. This shrub differs much in stature according to stations of its natural growth; for on the tops of mountains it is an humble shrub, $1\frac{1}{2}$ foot high; but on the sides of the mountains it grows to 10 feet high.

Draco-leaved Richea. Shrub 1 to 10 feet.

Cult. For culture and propagation, see *Andersònia*, p. 784.

XXIV. DRACOPHY'LLUM (from *δρακων, drakon*, a dragon; and *φυλλον, phyllon*, a leaf: so named because the leaves have some resemblance to those of *Dracæ'na Dràco*, or Dragon's Blood Tree.) Labill. itin. 2. t. 40. R. Br. prod. p. 555. Rchb. hort. 2. t. 108.

Lin. syst. *Pentándria, Monogýnia.* Calyx bractless. Corolla tubularly funnel-shaped; with a 5-parted acutish spreading beardless limb, a somewhat ventricose tube, and a hardly contracted throat. Stamens 5, hypogynous. Hypogynous scales 5. Capsule having the placentas loosened, and hanging from the top of the central column.—Shrubs or small trees having the branches annulated while naked. Leaves imbricate, cucullate at the base, and half sheathing. Spikes or racemes terminal, simple, or compound. Bracteas subtending the pedicels, caducous.

1 D. secu'ndum (R. Br. prod. p. 556.) racemes secund; lower peduncles divided. ♄. G. Native of New South Wales. Hook. bot. mag. 3264. Flowers white.

Secund-flowered Dracophyllum. Fl. April, Aug. Clt. 1823. Shrub 1 to 2 feet.

2 D. longifòlium (R. Br. prod. p. 556.) arboreous; leaves linear-lanceolate, sheathing at the base; racemes erect, articulated, lateral. ♄. G. Native of New Zealand. E'pacris longifòlia, Forst. char. gen. 10. no. 1. ins. austr. p. 13.

Long-leaved Dracophyllum. Shrub.

3 D. rosmarinifòlium (R. Br. l. c.) shrubby; leaves linear, obtuse, stiff, sheathing; flowers almost solitary, sessile. ♄. G. Native of New Zealand. E'pacris rosmarinifòlia, Forst. ins. austr. p. 13. icon. t. 24.

Rosemary-leaved Dracophyllum. Shrub.

Cult. See *Andersònia*, p. 784. for culture and propagation.

XXV. SPHENO'TOMA (from *σφηνοω, sphenoo*, to cleave, and *τομη, tome*, a section; in reference to the deep divided limb of the corolla). Sweet, fl. austr. t. 44. Dracophýllum, sect. Sphenótoma, R. Br. prod. p. 555.).

Lin. syst. *Pentándria, Monogýnia.* Corolla salver-shaped, with a slender tube, a coarctate throat, and an obtuse beardless limb (f. 134. *e*.) Stamens epipetalous. Hypogynous scales 5. Capsule having the placentas loose, and hanging from the top of the central column.—Shrubs having the branches annulated when naked. Leaves imbricate, cucullate and half sheathing at the base. Spikes simple, terminal. Bracteas stretched out, permanent.

1 S. squarròsa; floriferous branches hardly the length of the spikes; leaves squarrose, ensiform, lanceolate. ♄. G. Native of New Holland, on the south coast. Dracophýllum squarròsum, R. Br. prod. p. 556.

Squarrose Sphenotoma. Shrub.

2 S. capita'ta; floriferous branches much longer than the spikes, which are ovate; cauline leaves lanceolate-ensiform, erectish: of the branches adpressed. ♄. G. Native of New Holland, on the south coast. Dracophýllum capitàtum, R. Br. prod. p. 556.

Capitate-flowered Sphenotoma. Shrub.

3 S. gra'cilis (Sweet, fl. austr. t. 44.) floriferous branches much longer than the spikes, which are ovate; cauline leaves lanceolate-subulate, spreading, or recurved: of the branches adpressed. ♄. G. Native of New Holland, on the south coast. Dracophýllum grácilis, R. Br. prod. p. 556. Flowers white. Leaves fringed with long hairs. (f. 134.).

FIG. 134.

Slender Sphenotoma. Fl. April, May. Clt. 1823. Shrub 1 to 2 feet.

Cult. For culture and propagation, see *E'pacris*, p. 783. or *Andersònia*, p. 784.

Order CXXXIX. ERICA'CEÆ (this order contains plants agreeing with the genus *Erìca*, or Heath, in important characters). D. Don, in edinb. phil. journ. 17. p. 152. Eríceæ, R. Br. prod. p. 557. Ericàceæ, part., Cham. et Schlect. in Linnæa. vol. 1. Eríceæ, part., Juss. gen.

Flowers hermaphrodite, subsymmetrical, regular. Calyx 4-5-cleft. Corolla 4-parted, rarely 5-parted. Stamens 4-5-8-10,

alternating with the segments of the corolla: their insertion various. Style and stigma undivided. Capsule free, or adhering to the fleshy calyx, therefore baccate; cells for the most part many-seeded. Albumen fleshy. Embryo erect, slender. Shrubs variable in habit, scattered over the surface of the earth in every direction.

Among the numerous families which compose the vegetable kingdom, few surpass the *Ericàceæ* in the diversity of their forms, beauty of their flowers, or in the extent of their geographical distribution, which verges upon the ultimate limits of vegetation in both hemispheres. The direction of mountain chains, more especially of particular strata, such, for example, as siliceous and micaceous deposits, appears to exercise an equally important influence on the distribution of this family, with the circumstances of latitude and elevation. Species of the groups of *Andromèdeæ* and *Vaccinièæ* traverse the Andes from one extremity to the other; and in Asia they extend from the Frozen Ocean to within the tropics, colonies of them being found in almost every branch of the Indian Alps. The similarity of the vegetation of North America and Central Asia is strikingly exemplified in the groups of this family, which are peculiar to both regions, such as *Rhodòreæ*, *Monotròpeæ*, *Pyròleæ*, *Vaccinièæ*, and the aberrant *Eríceæ*. Some species are common to both continents, such as *Pýrola pícta*, *Monótropa Morisoniàna*, *Bryánthus Stellèri*, *Cassiópe tetragòna*, and *Andrómeda polifòlia*: the two last forming likewise part of the European Flora. Europe and Africa alone contain the normal *Eríceæ*, well characterized by their permanent corolla, the maximum of which is at the Cape of Good Hope, a spot where so many families of plants are found huddled together in strange confusion, as if nature had at length deprived herself of sufficient space for their equal distribution. The most easterly point to which this last group extends is the Mauritius, where the various species of *Saláxis* are found. The maximum of *Rhodòreæ*, *Vaccinièæ*, *Pyròléæ*, and *Monotròpeæ*, and the aberrant *Eríceæ*, is found in North America; these tribes are also common to Asia. Van Diemen's Land may be regarded as comprehending the majority of the *Epacrídeæ*. Of all the genera of *Ericàceæ*, that of *Gaulthèria* is, however, the most extensively diffused, being met with in almost every region of America, in New Zealand, Van Diemen's Land, and other places of the South Pacific, and in the East Indies. The greater development of the calyx in this genus, and its more or less adherence to the ovarium, considerably lessens the importance of the discriminating character of the *Vaccinièæ*, and most satisfactorily shows that they constitute but a group of *Ericàceæ*, rather than a distinct order. As happens in other very natural families, the characters of the general groups of *Ericàceæ* are not so strongly marked as in those that are less so; but we are not on that account to give up the idea of dividing them, and to retain four or five hundred species in one genus, as has been done in the case of *Erìca*, which we have here attempted to subdivide into a number of minor groups; and, whatever opinion may be formed of their title to rank as separate genera, the arrangement of the species will we trust be found more natural than any hitherto proposed.

Synopsis of the genera.

TRIBE I.

ERÍCEÆ. *Anthers 2-celled. Ovarium free. Hypogynous disk nectariferous, sometimes, though rarely, ornamented with scales. Buds naked. Leaves usually with revolute margins.*

SUBTRIBE I. ERÍCEÆ NORMA'LES. *Normal Ericeæ. Corollas permanent.*

1 ERÌCA. Calyx 4-parted, naked at the base. Corolla globose or urceolate, with a 4-lobed limb. Stamens inclosed; with capillary filaments and bifid anthers; cells of anthers short, opening by an oblong hole, awned or crested at the base, rarely mutic. Stigma peltate.—Leaves acerose. Pedicels scaly.

2 GYPSOCA'LLIS. Calyx 4-parted, glumaceous, naked at the base. Corolla campanulate, or short-tubular, with a dilated 4-lobed mouth. Stamens exserted, with flattened filaments and bipartite anthers; cells of anthers mutic at the base, distinct, substipitate, opening by an oblique hole. Stigma simple.—Leaves acerose.

3 BLÆ'RIA. Calyx 4-parted. Corolla short, tubular, with a 4-cleft limb. Stamens 4-6, with linear flattened glabrous filaments, and bipartite anthers; cells of anthers attenuated at the base, mutic, dehiscing by an oblong foramen at the apex. Stigma obtuse.—Leaves whorled. Flowers terminal, glomerate.

4 SYMPIE'ZA. Calyx turbinate, compressed, bifid. Corolla tubular, with a 2-parted limb, longer than the calyx. Stamens 4, epipetalous. Anthers bifid, mutic, exserted. Stigma simple.—Leaves linear, trigonal, 3 in a whorl. Flowers glomerate.

5 PACHY'SA. Calyx deeply 4-parted, coriaceous. Corolla nearly globose, coriaceous, with a contracted 4-lobed mouth. Stamens inclosed, with dilated filaments, and bifid anthers; cells of anthers short, crested at the base, opening by an oblique foramen. Stigma obtuse.—Leaves loosely imbricated, compressed. Pedicels bracteolate.

6 CERA'MIA. Calyx 4-parted, glumaceous. Corolla urceolate, with a 4-lobed limb. Stamens inclosed, with dilated flat filaments and bifid anthers: cells of anthers short, horned at the base. Stigma capitate.—Leaves scattered, bluntish, flat.

7 DE'SMIA. Calyx 4-lobed. Corolla globose, with a contracted 4-toothed mouth. Stamens exserted, with flat filaments; cells of anthers short, opening by an oblong hole, simple at the base, and confluent in the filament. Stigma capitate.—Leaves scattered, subulate.

8 EURYLE'PIS. Calyx 4-parted, coriaceous, bibracteolate at the base. Corolla tubular, coriaceous, ventricose at the base, with an erect 4-parted limb. Stamens inclosed, with dilated channelled filaments, and bipartite anthers; cells of anthers coriaceous, opening by an oblong hole, auricled at the base. Stigma clavate.—Leaves scattered. Flowers terminal, solitary.

9 EURYSTE'GIA. Calyx 4-parted, large, glumaceous. Corolla

urceolate, with a contracted 4-toothed mouth. Stamens inclosed, with dilated flat filaments and bipartite anthers; cells of anthers opening by an oblong foramen, biappendiculate at the base; appendages flat, crested, crenated. Stigma capitate.—Leaves subulate. Flowers subsolitary, pendulous.

10 Lopha'ndra. Calyx 4-parted, furnished with 4 bracteas at the base: segments scarious, rounded, ventricose outside. Corolla campanulate, 4-lobed. Stamens inclosed, with dilated flat filaments and bifid anthers; cells of anthers beaked at the apex, winged, crested, and crenulated at the sides, dehiscing by an oblong hole in the middle. Stigma truncate.—Leaves short, obtuse, glaucous. Flowers terminal.

11 Lampròtis. Calyx 4-parted, large, glumaceous, coloured, bibracteate at the base. Corolla urceolate, with a small 4-lobed limb. Stamens inclosed, with capillary filaments; cells of anthers short, dehiscing lengthwise, mutic, or crested at the base. Stigma capitate.—Leaves adpressed, opposite, or 3 in a whorl. Flowers terminal.

12 Callísta. Calyx 4-parted, foliaceous. Corolla salver-shaped, with a cylindrical or ventricose tube, and a dilated, spreading, 4-cleft limb. Stamens inclosed, with capillary filaments; cells of anthers short, dehiscing lengthwise, mutic at the base. Stigma capitate.—Leaves acerose. Flowers terminal.

13 Eurylòma. Calyx 4-parted, foliaceous. Corolla salver-shaped, with an elongated, filiform or ventricose tube, and a 4-parted dilated limb. Stamens inclosed, with dilated, membranous, channelled filaments, and bipartite anthers; cells of anthers membranous, dehiscing lengthwise, drawn out at the base into a short tumid spur. Stigma with an elevated 4-lobed disk.—Leaves adpressed, denticulated. Flowers terminal.

14 Chòna. Calyx 4-parted, foliaceous. Corolla funnel-shaped, with a revolute 4-lobed limb. Stamens exserted, with capillary filaments, and truncate anthers; cells of anthers elongated, parallel, awned at the base. Stigma simple, obtuse.—Leaves 3 in a whorl, linear, awned. Flowers terminal.

15 Syringòdea. Calyx 4-leaved, glumaceous. Corolla long-tubular, with a short 4-lobed limb. Stamens usually inclosed, with capillary filaments, and bipartite anthers; cells of anthers short, obtuse, mutic or awned at the base, dehiscing by an oblong foramen. Stigma simple or capitate, in some annulated by an elevated disk.—Leaves loose, acerose. Flowers crowded at the tops of the branches.

16 Dasya'nthes. Calyx 4-parted, bibracteate at the base. Corolla tubular, hispid, with a 4-lobed erect limb. Stamens inclosed, with capillary filaments, and bipartite anthers; cells of anthers mutic at the base, dehiscing lengthwise. Stigma large, peltate.—Leaves loosely imbricated, hispid. Flowers in terminal fascicles.

17 Ecta'sis. Calyx 4-leaved, glumaceous. Corolla tubular, a little ventricose at the base, with a 4-toothed limb. Stamens much exserted, with dilated filaments and bipartite anthers; cells of anthers elongated, tubular, dehiscing by a longitudinal fissure, having the base continuous in the filament, and mutic. Stigma clavate, truncate.—Leaves loosely imbricated. Flowers terminal or lateral.

18 Eriode'smia. Calyx large, 4-parted, bibracteate at the base. Corolla campanulate, with a 4-lobed revolute limb. Stamens exserted, with dilated filaments, and bifid obtuse scabrous anthers; cells of anthers dehiscing by an oblong pore, continuous in the filament at the base.—Leaves 3 in a whorl, obtuse, hairy. Flowers terminal.

19 Octope'ra. Calyx 4-parted, reflexed, naked at the base. Corolla globose, with a contracted bluntly 4-lobed mouth. Stamens inclosed, with flattened filaments; cells of anthers very short, dehiscing by an ample hole, and furnished at the base by a solitary lanceolate acuminated appendage.—A downy procumbent shrub. Leaves verticillate. Flowers terminal, subumbellate. Pedicels scaly.

20 Ere'mia. Calyx 4-parted, with imbricated bracteas at the base; segments orbicular, coriaceous, ciliated. Corolla urceolate, with a small 4-lobed limb. Stamens inclosed, with capillary filaments, and bipartite anthers; cells short, mutic at the base, dehiscing by an oblong hole. Stigma capitate. Cells of capsule 1-seeded.—Leaves spreading, bristly. Flowers glomerate.

21 Sala'xis. Calyx 4-leaved, irregular. Corolla campanulate, 4-cleft. Stigma peltate. Capsule drupaceous, 3-celled, 3-seeded.—Leaves 3-6 in a whorl. Flowers subracemose at the tops of the branches.

22 Callu'na. Calyx 4-parted, membranous, coloured, furnished with 4 bracteas at the base. Corolla shorter than the calyx, campanulate, 4-lobed. Stamens inclosed, with dilated filaments, and bipartite anthers, which are biappendiculate at the base; cells mucronulate, dehiscing lengthwise. Stigma capitate.—Leaves short, imbricated, in 4 rows. Flowers terminal, spicately racemose.

Subtribe II. Androme'deæ. *Corolla deciduous.*

23 Andrómeda. Calyx 5-cleft; segments acute, simple at the base. Corolla globose, with a contracted 5-toothed mouth. Stamens 10, inclosed, with bearded filaments; cells of anthers short, one-awned. Stigma truncate. Capsule with a loculicidal dehiscence; placenta 5-lobed.

24 Cassiópe. Calyx 5-leaved; segments imbricate at the base. Corolla campanulate, 5-cleft. Stamens 10, inclosed, with glabrous filaments; cells of anthers short, tumid, one-awned. Style dilated at the base; stigma obtuse. Capsule with a loculicidal dehiscence; valves bifid at the apex; placenta 5-lobed.

25 Cassa'ndra. Calyx 5-leaved, bibracteate at the base; segments imbricate at the base. Corolla oblong, with a contracted 5-toothed mouth. Stamens 10, inclosed, with glabrous filaments; cells of anthers elongated at the apex, tubular, mutic. Stigma annulated. Capsule with a loculicidal dehiscence; placenta 5-lobed.

26 Zenòbia. Calyx 5-toothed. Corolla campanulate, with a revolute 5-lobed limb. Stamens 10, with very short glabrous filaments; cells of anthers elongated, tubular, biaristate at the apex. Stigma truncate. Capsule with a loculicidal dehiscence; placenta 5-lobed.

27 Lyònia. Calyx 5-parted. Corolla ovate or tubular, with a contracted 5-toothed mouth. Stamens inclosed, with short, flattened, downy filaments; cells of anthers membranous, dehiscing lengthwise, mutic. Style pentagonal; stigma obtuse. Capsule pentagonal, with a loculicidal dehiscence.

28 Leucothòe. Calyx 5-leaved; segments imbricated at the base. Corolla tubular, toothed. Stamens inclosed, with flattened downy filaments; cells of anthers short, truncate, mutic. Stigma large, capitate. Capsule with a loculicidal dehiscence.

29 Pie`ris. Calyx 5-parted. Corolla tubular or ovate, with a contracted, 5-toothed, revolute mouth. Stamens 10, inclosed, with dilated filaments, which are bisetose at the apex; cells of anthers short, incumbent, dehiscing lengthwise. Style pentagonal; stigma truncate. Capsule with a loculicidal dehiscence.

30 Phyllódoce. Calyx 5-parted. Corolla globose, with a contracted 5-toothed mouth. Stamens 10, inclosed, with slender glabrous filaments; cells of anthers short, truncate, mutic. Stigma peltate, with 5 tubercles. Capsule with a septicidal dehiscence.

31 Brya'nthus. Calyx 5-leaved, imbricated. Corolla deeply 5-parted, spreading. Stamens 10, shorter than the corolla, with flattened glabrous filaments; cells of anthers short, mutic, or awned behind, dehiscing by a terminal foramen. Stigma obtuse. Capsule with a septicidal dehiscence.

32 Dabœ`cia. Calyx 4-parted. Corolla oval, ventricose, with a 4-toothed mouth. Stamens 8, inclosed, with dilated glabrous filaments, and linear anthers, which are sagittate at the base; cells of anthers parallel, loosened at the apex, dehiscing lengthwise. Stigma truncate. Capsule 4-celled, with a septicidal dehiscence.

33 Enkia'nthus. Calyx small, 5-parted. Corolla campanulate, with a 5-parted limb, and 5 nectarial pits at the base. Stamens inclosed; anthers 2-horned. Berry 5-celled, many-seeded.

34 A'rbutus. Calyx small, 5-parted. Corolla globose or ovate, with a small, contracted, 5-cleft, reflexed border. Stamens 10, inclosed, with flattened filaments; anthers compressed at the sides, dehiscing at the apex by 2 pores, fixed by the back beneath the apex, and there furnished with 2 reflexed awns. Stigma obtuse. Berry globose, granular.

35 Arctosta'phylos. All as in *Arbutus*, except that the fruit is 5-celled, and the cells 1-seeded, and not granular on the outside.

36 Perne'ttya. Calyx 5-parted. Corolla globose, with a contracted 5-parted revolute limb. Stamens 10, inclosed, having the filaments thickened at the base; anthers 2-celled, 2-lobed at the apex; lobes bifid. Hypogynous scales 10, 3-lobed, surrounding the ovarium. Stigma convex. Berries globose, 5-celled, many-seeded.

37 Agarísta. Calyx 5-lobed. Corolla ovate, with a contracted 5-toothed mouth. Stamens 10, inclosed, with flattened villous filaments, and bipartite anthers; cells of anthers short, mutic at the base, diverging at the apex, and dehiscing by a terminal pore. Capsule globose, 5-celled, with a loculicidal dehiscence; placenta thick, oblong.

38 Dyplecòsia. Calyx girded by a calyculus, which is composed of 2 combined bracteas, 5-cleft. Corolla campanulate, with a 5-cleft reflexed limb. Stamens 10, inclosed, inserted in the disk of the calyx. Anthers bifid at the apex. Stigma truncate. Capsule nearly globose, depressed, inclosed in the baccate calyx, 5-celled, many-seeded.

39 Gaulthe`ria. Calyx 5-cleft or 5-toothed, bibracteate at the base. Corolla ovate, ventricose, with a 5-cleft revolute border, diaphanous at the base. Stamens 10, inclosed, with flat filaments; anthers bifid at the apex; lobes biaristate. Hypogynous scales 10, usually united at the base. Ovarium half inferior. Capsule 5-celled, with a loculicidal dehiscence.

40 Epigæ`a. Calyx large, 5-parted, furnished with 3 bracteas at the base. Corolla salver-shaped, with a 5-parted spreading border, and with the tube villous inside. Stamens 10. Capsule 5-celled; placenta 5-parted.

41 Phalleroca'rpus. Calyx 4-cleft, bibracteate at the base. Corolla campanulate, 4-cleft. Stamens 8, hairy.? Hypogynous disk 8-lobed. Anthers semibifid.

42 Cle`thra. Calyx 5-parted. Corolla so deeply 5-parted as to appear 5-petalled. Stamens 10, with membranous filaments; anthers at length inflexedly pendulous, obverse, and cordate at the base, and mucronate at the apex, but mutic. Stigma trifid. Capsule 3-celled, many-seeded, with a loculicidal dehiscence.

Tribe II.

Rhodòreæ. *Anthers 2-celled. Ovarium free. Hypogynous disk nectariferous. Buds strobile-formed, scaly. Leaves flat, callous at the extremity of the mid-rib.*

43 Rhodode'ndron. Calyx 5-parted. Corolla somewhat funnel-shaped, 5-cleft. Stamens 5-10, declinate; anthers opening by 2 terminal pores. Capsule 5-celled, 5-valved, dehiscing at the summit.

44 Vire`ya. Calyx obsoletely 5-toothed. Corolla subcampanulate, or funnel-shaped, regularly 5-lobed, adnate to the disk of the calyx. Stamens 10, inserted in the calycine disk; anthers dehiscing by terminal pores, mutic. Stigma capitate, 5-furrowed. Capsule silique-formed, 5-angled, 5-celled, 5-valved. Placenta 5-lobed. Seeds numerous, expanded at both ends into a bristle-formed awn.

45 Beja`ria. Calyx 7-cleft. Corolla 7-petalled. Stamens 14, hypogynous. Anthers obverse and pendulous, mutic. Stigma capitate. Capsule depressedly globose, 7-celled, 7-valved, with a septicidal dehiscence.

46 Hymena'nthes. Calyx small, obsoletely denticulated.

Corolla subcampanulate, with a short compressed tube, and a 7-parted limb. Stamens 14, hypogynous; anthers mutic, opening by two terminal pores. Stigma obtuse, with 7 crenatures. Capsule oblong, 7-valved, 7-celled, many-seeded.

47 Ka'lmia. Calyx 5-parted. Corolla salver-shaped; border producing 10 protuberances on the under side, and a corresponding number of cavities on the upper side, in which the anthers are concealed. Capsule 5-celled; dissepiments marginal.

48 Menzie'sia. Calyx 4-cleft. Corolla globose, 4-cleft. Stamens 8, hypogynous. Capsule 4-celled, 4-valved, having the dissepiments formed from the inflexed margins of the valves.

49 Aza'lea. Calyx 5-parted. Corolla short, campanulate, 5-cleft. Stamens 5, equal, inclosed; cells of anthers bursting longitudinally. Style inclosed. Capsule 5-celled, 5-valved, dehiscing at top.

50 Leiophy'llum. Calyx deeply 5-parted, permanent. Corolla 5-petalled. Stamens 10, exserted; anthers lateral, dehiscing lengthwise inside. Capsule roundish, 5-celled, 5-valved, dehiscing at the apex.

51 Le'dum. Calyx minute, 4-toothed. Corolla 5-petalled, spreading. Stamens 5-10, exserted; anthers opening by 2 pores at the apex. Capsule subovate, 5-celled, 5-valved, pedicellate, dehiscing at the base. Seeds ending in a wing at both ends.

Tribe III.

Vaccinie'æ. *Anthers 2-celled. Ovarium adhering. Disk perigynous, nectariferous. Fruit baccate. Buds naked.? scaly.?*

52 Vaccínium. Limb of calyx 4-5-toothed. Corolla urceolate or campanulate, 4-5-cleft. Stamens 8-10, hypogynous. Berry globose, 4-5-celled, many-seeded.

53 Oxycóccus. Calyx 4-cleft. Corolla 4-parted, with the segments somewhat linear and revolute. Stamens 8; filaments conniving; anthers tubular, bipartite. Berry 4-celled, many-seeded.

54 Gaylussa'cia. Limb of calyx 5-cleft. Corolla tubular, with a ventricose base and a 5-cleft limb. Stamens 10, inserted in the limb of the calyx; anthers mutic, drawn out into 2 little tubes from the top. Stigma capitate. Berry nearly globose, 10-celled; cells 1-seeded.

55 Thibau'dia. Calyx urceolar, 5-lobed. Corolla tubular, with a contracted 5-toothed mouth. Stamens 10, inserted in the calyx, inclosed; anthers elongated, mutic, drawn out into 2 little tubes at the apex. Berry 5-celled, many-seeded.

56 Agape'tes. Limb of calyx 5-cleft. Corolla tubular, with a 5-cleft limb. Stamens 10, with very short flattened filaments; anthers mutic, very long, auricled at the base, exserted, narrow, emarginate at the apex, with the cells confluent. Stigma clavate. Berry 5-celled, many-seeded.

57 Ceratoste'mma. Limb of calyx large, 5-parted, foliaceous. Corolla tubular, contracted and 5-lobed at the apex. Stamens 12, with very short, flattened, hairy filaments; anthers bluntly spurred at the base, having the cells elongated at the apex and filiform, dehiscing by a terminal pore. Stigma simple. Berry 5-celled, many-seeded.

Tribe IV.

Pyròliæ. *Anthers 2-celled. Ovarium free. Disk hypogynous, naked. Seeds peltate, samaroid. Embryo dicotyledonous.—Perennial herbaceous plants.*

58 Pyróla. Calyx 5-cleft or 5-parted. Petals 5. Stamens 10, slightly united at the base. Style exserted. Stigma 5-lobed. Capsule 5-celled, dehiscing at the angles near the base, having the margins of the valves connected by intricate tomentum.

59 Chima'phila. Calyx 5-toothed. Petals 5. Stamens 10. Style short, immersed in the germ. Stigma auriculate, orbicular, with a 5-lobed disk. Filaments stipitate; stipe discoid, ciliated. Capsule 5-celled, opening from the summit, with unconnected margins.

60 Mone'ses. Calyx 5-parted. Corolla deeply 5-lobed. Stamens recurved. Stigma radiate. Anthers 2-horned at the base, becoming reversed, and opening at the bottom of each horn. Capsule 5-celled, 5-valved, opening from the summit with unconnected margins.

61 Cladotha'mnus. Calyx 5-parted. Petals 5. Anthers adnate. Stamens 10. Stigma 5-lobed. Capsule 5-6-valved, 5-6-celled; margins of valves septiferous. Seeds small, involved in a membranous aril.

Tribe V.

Monotròpeæ. *Anthers 1-celled. Ovarium free. Disk hypogynous, naked. Seeds peltate. Embryo undivided.—Leafless parasitical herbs.*

62 Hypópitys. Calyx 3-5-parted. Corolla 4-5-petalled; petals or segments each with a cucullate nectariferous base. Anthers small, horizontal, at length opening flat. Stigma orbicular, with a bearded margin. Capsule 5-celled, 5-valved, many-seeded.

63 Monótropa. Calyx none. Corolla 5-petalled; petals or segments each with a cucullate nectariferous base; anthers reniform, horizontal. Stigma orbicular, naked. Capsule 5-celled, 5-valved, many-seeded.

64 Pteróspora. Calyx 5-parted. Corolla ovate, with a reflexed 5-toothed border. Anthers peltate, adnate to the filaments by the margin, bisetose. Capsule 5-celled; placenta 5-lobed. Seeds terminated each by a wing.

65 Schweinítzia. Calyx 5-cleft; segments concave, equal with the corolla. Corolla campanulate, with a 5-cleft border. Hypogynous disk 5-cleft. Anthers adnate to the filaments, opening from the inverted base by two naked pores. Stigma subglobose, internally 5-cleft. Capsule 5-celled.? Seeds unknown.

I. ERI'CA (Erìca of Pliny is altered from ερεικη of Theophrastus, which is derived from *ἐρίκω, erico*, or *ἐρέικω, ereico*, to break; from the supposed quality of some species in breaking the stone in the bladder). D. Don. in edinb. phil. journ. 17. p. 152.—Erìca species of Lin. and other authors.

Lin. syst. *Octándria, Monogýnia.* Calyx 4-parted, with a naked base. Corolla globose or urceolate, with a 4-lobed limb. Stamens inclosed; filaments capillary; anthers bifid; cells of anthers opening by an oblong hole, awned or crested at the base, or mutic. Stigma peltate. Capsule 4-celled, many-seeded.—Shrubs, natives of Europe and Africa. Leaves scattered or verticillate, acerose. Flowers terminal, fascicled or racemose. Pedicels scaly.

§ 1. *Anthers awned at the base. Normal species.*

* *Leaves 3 in a whorl. Corollas campanulate.*

1 E. læ'vis (Andr. heath. 3. t. 6.) leaves glabrous, 3-4 in a whorl, spreading; branches slender; flowers terminal by threes, drooping; corollas small, bell-shaped; awns of anthers falcate. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1393. E. cyathifórmis, Sal. in Lin. trans. 6. p. 376. Flowers white. Plant glabrous. Anthers black. Perhaps only a variety of *E. persolùta.*

Smooth Heath. Fl. March, July. Clt. 1801. Shrub 1 to 2 feet.

2 E. callòsa (Wendl. eric. ex Spreng. syst. 2. p. 194.) leaves 3 in a whorl, linear-oblong, with revolute edges, spreading, white beneath; flowers terminal, usually by threes, erectish; calyx coloured, viscid; corollas campanulate; awns of anthers short. ♄. G. Native of the Cape of Good Hope. E. canaliculàta mìnor, Andr. heath. 3. t. 39. Corollas red.

Callous Heath. Fl. June, July. Clt. 1822. Shrub 1 foot.

3 E. depre'ssa (Thunb. diss. no. 50. with a figure); leaves glabrous, 3 in a whorl, linear, revolute; flowers terminal; corolla bell-shaped; spurs of anthers long, subulate and hairy; bracteas remote from the calyx. ♄. G. Native of the Cape of Good Hope. E. rupéstris, Andr. heath. 2. t. 9. E. hùmilis, Salisb. in Lin. trans. 6. p. 329. Branches decumbent. Flowers small, white.

Depressed Heath. Fl. July, Nov. Clt. 1789. Shrub depressed.

4 E. nolæflòra (Bedf. eric. wob. p. 16. but not of Sal.) leaves 3 in a whorl, slightly hispid; flowers subaxillary; bracteas remote from the calyx; corolla campanulate, with deep segments; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca glomeràta, Hort. Flowers white.

Bell-flowered Heath. Fl. Ju. July. Clt. 1818. Shrub.

5 E. sicæfòlia (Sal. in Lin. trans. 6. p. 326.) leaves 3 in a whorl, mucronate; corolla $1\frac{2}{3}$ lines long, hairy outside, with a cup-shaped tube; flowers terminal; spurs of anthers linear; fruit glabrous. ♄. G. Native of the Cape of Good Hope.

Dagger-leaved Heath. Fl. Feb. May. Clt.? Shrub.

6 E. monta'na (Bedf. eric. wob. p. 15.) leaves 3 in a whorl; flowers axillary, by threes; bracteas broad, approximating the calyx, loose, angular; corolla bell-shaped; anthers awned; style inclosed. ♄. G. Native of the Cape of Good Hope. E. confertifòlia, Wendl.? Flowers purplish-red.

Mountain Heath. Fl. Oct. Clt. 1818. Shrub.

7 E. villosiu'scula (Lodd. bot. cab. 1844.) hairy; leaves acicular, ciliated with long hairs; flowers disposed in racemose terminal fascicles; corollas campanulate. ♄. G. Native of the Cape of Good Hope. Flowers small, pale red. Anthers unknown.

Rather-villous Heath. Fl.? Clt.? Shrub.

8 E. amœ'na (Sal. in Lin. trans. 6. p. 329.) leaves lanceolate, 3 in a whorl; flowers terminal; corolla bell-shaped; bracteas remote from the calyx; anthers awned, glabrous. ♄. G. Native of the Cape of Good Hope. Erìca incarnàta, Thunb. diss. 84. Flowers small, reddish-purple. Corolla 4-5 lines long.

Pleasant Heath. Fl. April, July. Clt.? Shrub.

9 E. assu'rgens (Hortul. Bedf. hort. eric. wob. p. 2.) leaves 3-4 in a whorl, villous; flowers terminal; corolla bell-shaped; bracteas approximating the calyx; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers white. Branches villous. Style inclosed.

Aspiring-branched Heath. Fl. March, Sept. Clt. 1821. Shrub 1 foot.

10 defle'xa (Bedf. hort. eric. wob. p. 8.) leaves 3 in a whorl, rough; flowers terminal, umbellate; corolla deflexed, open-bell-shaped; bracteas minute, remote from the calyx; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers white. Style exserted.

Deflexed-flowered Heath. Fl. July. Clt. 1810. Shrub 1 to 2 feet.

11 E. obtu'sa (Lodd. bot. cab. 1027.) glabrous; leaves 3 in a whorl, obtuse; flowers terminal, by threes; corollas campanulate; genitals inclosed. ♄. G. Native of the Cape of Good Hope. Corolla red.

Blunt-leaved Heath. Fl. May, June. Clt. 1810. Shrub.

12 E. glomera'ta (Lodd. ex Bedf. eric. wob. p. 11.) leaves 3 in a whorl; flowers terminal, capitate; corolla small, bell-shaped; bracteas approximating the calyx; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style exserted.

Glomerated-flowered Heath. Fl. Spring. Clt. 1780. Shrub 1 to 2 feet.

13 E. verna'lis (Lodd. bot. cab. 1608.) glabrous; leaves 3 in a whorl; flowers terminal; corollas campanulate; style exserted. ♄. G. Native of the Cape of Good Hope. Flowers purplish-red. Anthers unknown.

Vernal Heath. Fl. March, April. Clt. 1827. Shrub 2 to 3 feet.

14 E. parviflòra (Bedf. hort. eric. wob. p. 17.) leaves 3 in a whorl; flowers terminal, almost sessile; corolla campanulate; bracteas remote from the calyx; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers small, reddish-purple. Style inclosed.

Small-flowered Heath. Fl. April, June. Clt. 1814. Shrub 1 foot.

15 E. te'nuis (Sal. in Lin. trans. 6. p. 329.) leaves 3 in a whorl, linear, glabrous; flowers terminal, subsolitary; bracteas remote from the calyx; corolla bell-shaped; anthers awned; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca divaricàta, Hort. Bedf. eric. wob. p. 8. Flowers white. Awns of anthers linear, attenuated; filaments very short.

Slender Heath. Fl. June, July. Clt. 1800. Shrub 1 ft.

16 E. Schollia'na (Lodd. bot. cab. 538.) leaves alternate, scattered; flowers subterminal and axillary; corolla campanulate; bracteas remote from the calyx, anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers purple, drooping, and are as well as the calyxes coloured. Style inclosed.

Scholl's Heath. Fl. May, June. Clt. 1812. Shrub 1 to 2 feet.

17 E. actæ'a (Bedf. hort. eric. wob. p. 1.) leaves 3 in a whorl, glabrous; flowers terminal; bracteas remote from the calyx; corolla oblong-bell-shaped; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca Láchnèa, Hort. but not of Andr. Corollas white. Style exserted.

Actea-flowered Heath. Fl. April. June. Clt.? Shrub.

* * *Leaves 3 in a whorl. Corollas urceolate.*

18 E. pube'scens (Lin. spec. 506.) leaves linear, 3 in a whorl, downy; flowers terminal; pedicels hardly the length of the flowers; corolla 2 lines long, urceolate, downy both inside and outside; spurs of anthers short. ♄. G. Native of the Cape of Good Hope. E. pubéscens, var. pilòsa, Thunb. eric. no. 61. E. pállida, Sal. in Lin. trans. 6. p. 326. Sides of calyx reduplicate. Flowers pale red. Style inclosed.

Downy Heath. Fl. Year. Cult. 1790. Shrub 1 foot.

19 E. hírta (Thunb. eric. no. 56. t. 2.) leaves 3 in a whorl, linear, bristly; flowers terminal; pedicels more than twice the length of the flowers; corolla 3 lines long, downy outside, with an urceolar tube; spurs of anthers linear attenuated. ♄. G. Native of the Cape of Good Hope. E. dùra, Hort. E. urceolàris, Sal. in Lin. trans. p. 326. Corolla pale green, with greenish yellow apex. Style inclosed.

Hairy Heath. Fl. April, July. Clt. 1795. Shrub 1 to 2 feet.

20 E. suave'olens (Lodd. bot. cab. t. 24.) leaves 3 in a whorl, oblong-lanceolate, ciliated; flowers terminal; bracteas remote from the calyx; corolla urceolate; anthers a little exserted, black; style much exserted. ♄. G. Native of the Cape of Good Hope. Flowers pale red.

Sweet-scented Heath. Fl. Aug. Clt. 1800. Shrub.

21 E. grandinòsa (Lodd. bot. cab. 627.) glabrous; leaves linear, 3 in a whorl; flowers terminal, drooping, by threes; corolla irregularly ovate, inflated, small; anthers awned; calyx reflexed. ♄. G. Native of the Cape of Good Hope. Bedf. hort. eric. wob. p. 11. Flowers small, white. Style inclosed.

Hail-stone-flowered Heath. Fl. April, May. Clt. 1810. Shrub $\frac{1}{2}$ to 1 foot.

22 E. incu'rva (Andr. heath. 3. t. 1.) leaves linear, 3 in a whorl, rather falcate, with revolute ciliated edges; flowers terminal by threes; calyx ciliated; corolla globose; anthers awned. ♄. G. Native of the Cape of Good Hope. E. campylophýlla, Spreng. syst. 2. p. 190. Plant downy. Flowers small, red. Style exserted.

Incurved-leaved Heath. Fl. March, May. Clt. 1802. Shrub 1 foot.

23 E. globòsa (Andr. heath. 3. t. 24.) leaves linear-lanceolate, oblong, 3-4 in a whorl, ciliated, recurved; flowers terminal, aggregate, drooping; corollas globose; calyx coloured, beset with glandular hairs; awns of anthers small. ♄. G. Native of the Cape of Good Hope. Flowers small, pink.

Globose-flowered Heath. Fl. May, Oct. Clt. 1789. Shrub.

24 E. tubiu'scula (Bedf. hort. eric. wob. p. 26.) downy; leaves 3 in a whorl; flowers terminal; corollas tubular, very small; anthers awned; bracteas remote from the flower. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1157. E. pubéscens mínima, Andr. heath. 2. t. 8. Flowers small, purplish red. E. pubéscens, Wendl. eric. p. 8. no. 7. Style inclosed.

Small tubular-flowered Heath. Fl. Feb. April. Clt. 1800. Shrub 1 foot.

25 E. articula'ris (Thunb. diss. no. 58. but not of Lin.) leaves 3 in a whorl, cuneate or ovate, glabrous; flowers spicate; corolla globose; spurs rising from the middle of the filaments, not from the anthers. ♄. G. Native of the Cape of Good Hope. Sims, bot. mag. 423. E. retrofléxa, Wendl. eric. 8. p. 7. with a figure. Ait. hort. kew. 2. p. 401. E. pulchélla, Andr. heath. 1. t. 2. Lodd. bot. cab. 307. but not of Thunb. E. caduceífera, Sal. in Lin. trans. 6. p. 370. Flowers small, purplish red.

Jointed Heath. Fl. Aug. Feb. Clt. 1792. Shrub 1 foot.

26 E. pygmæ'a (Andr. heaths. vol. 4. icon.) leaves 3 in a whorl, subulate, glabrous, squarrose; branches decumbent; flowers terminal, generally by fours, downy; calyxes short, adpressed; corolla globose; anthers awned. ♄. G. Native of the Cape of Good Hope. E. sanguinolénta, Ker. in bot. mag. 2263. Lodd. bot. cab. 468. Flowers small, blood-red or purple. Bracteas remote from the calyx. Style inclosed.

Dwarf Heath. Fl. July, Oct. Clt. 1806. Shrub procumbent.

27 E. urceola'ris (Berg. pl. cap. p. 107. Ait. hort. kew. pl. 16. Wendl. eric. no. 9. p. 11.) downy; leaves 3 in a whorl, linear-lanceolate, spreading; flowers terminal; bracteas remote from the calyx; awns of anthers glabrous; corolla ovate, downy outside. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1894. E. pentaphýlla, Lin. spec. ed. 2. p. 506. E. Cáffra, Lin. spec. ed. 1st. and 2d. E. lamellàris, Sal. in Lin. trans. 6. p. 327. Corolla white, 3 lines long, with a pyramidal tube. Style inclosed.

Urceolar-flowered Heath. Fl.

28 E. tomentòsa (Sal. in Lin. trans. 6. p. 327.) clothed with hoary tomentum; leaves 3 in a whorl, narrow-linear, ciliated, imbricated; flowers terminal by threes; calyx flattish, fringed; corolla $1\frac{1}{2}$ line long, tomentose both inside and outside; spurs of anthers long, recurved. ♄. G. Native of the Cape of Good Hope. Bracteas situated at the base of the pedicels, and are, as well as the calyxes and corollas, purple.

Tomentose Heath. Fl. June, July. Clt. 1798. Shrub.

29 E. alopecuroìdes (Wendl. eric. no. 20. p. 119.) leaves linear, 3 in a whorl; flowers terminal; corollas ovate; bracteas remote from the calyx; anthers awned. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. p. 874. Flowers small, purplish red. Plant downy. Calyx coloured, ciliated. Style inclosed.

Fox-tail Heath. Fl. Sept. Oct. Clt. 1810. Shrub 1 foot.

30 E. adenóphora (Spreng. syst. 2. p. 188.) leaves 3 in a whorl, glandularly hispid, spreading, remotish; flowers terminal, aggregate, glabrous; calyxes viscid, coloured, adpressed. ♄. G. Native of the Cape of Good Hope. Anthers awned. Corollas urceolate.

Gland-bearing Heath. Shrub.

31 E. lachneæfòlia (Salisb. in Lin. trans. 6. p. 335. Ait. hort. kew. 2. p. 387.) leaves 3 in a whorl, ovate, obtuse, imbricated, downy; flowers terminal, sub-capitate,; corolla ovate, 2 lines long, with a recurved limb; spurs of anthers long and narrow-cuneated, smooth. ♄. G. Native of the Cape of Good Hope. E. láchneæ, Andr. heaths. 3. t. 2. Flowers middle-sized, white. Style exserted.

Lachnæa-leaved Heath. Fl. May, July. Clt. 1793. Shrub 1 foot.

32 E. Pezìza (Lodd. bot. cab. t. 265.) glabrous; leaves 3 in a whorl; flowers terminal; corolla globosely campanulate; bracteas remote from the calyx; anthers awned. ♄. G. Native of the Cape of Good Hope. Bedf. eric. wob. p. 3. f. 1. E. nivàlis, Andr. heath. vol. 4. Flowers small, white, downy. Genitals inclosed.

Peziza-flowered Heath. Fl. April, May. Clt. 1812. Shrub 1 foot.

33 E. pulverule'nta (Bedf. eric. wob. 20.) clothed with powdery down; leaves 3 in a whorl; flowers terminal; corollas ovate; bracteas imbricate; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers purplish-red. Style inclosed.

Powdery Heath. Fl. June, Aug. Clt.? Shrub.

34 E. puria'lis (Bedf. l.c.) leaves 3 in a whorl; flowers terminal; corolla globose; anthers awned, a little exserted. ♄. H.

Native of the Cape of Good Hope. Flowers reddish-purple, small. Style exserted.

Fiery Heath. Fl. Sept. Oct. Clt. 1810. Shrub 1 foot.

35 E. rege'rminans (Lin. syst. 364. Thunb. 35. no. 54.) leaves linear, recurved, 3 in a whorl; flowers pedicellate, drooping, semi-lateral: bracteas remote; corollas ovate-globular; anthers awned. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1728. Erìca uncifòlia, Sal. in Lin. trans. 6. p. 369. Flowers small, pale red. Spurs of anthers very long.

Regerminating Heath. Fl. May, Aug. Clt. 1791. Shrub $1\frac{1}{2}$ foot.

36 E. rube'lla (Lodd. bot. cab. 658. Sims, bot. mag. 2165.) leaves 3 in a whorl; flowers terminal, capitate; corolla ovate, ventricose, length of calyx; bracteas approximating the calyx. ♄. G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style inclosed.

Reddish-flowered Heath. Fl. Summer. Clt. 1814. Shrub.

37 E. scabiu'scula (Link. enum. 1. p. 372. Lodd. bot. cab. t. 517.) leaves 3-4 in a whorl, obtuse, beset with glandular hairs; flowers terminal; corollas ovate; bracteas approximate to the calyx; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers small, silky white or red, sessile. Style inclosed.

Roughish Heath. Fl. April. Clt. 1810. Shrub 1 foot.

* * * *Leaves 4 in a whorl. Corollas campanulate.*

38 E. persolu'ta (Lin. mant. 230. diss. no. 16. with a figure,) leaves 4 in a whorl, short, linear, glabrous; corolla campanulate, with deep acute segments; flowers terminal; branches downy or hairy; spurs of anthers straight; fruit hairy. ♄. G. Native of the Cape of Good Hope. Curt. bot. mag. 324. E. subdivaricàta, Berg. fl. cap. p. 114. E. prolífera, Sal. in Lin. trans. 6. p. 376. E. Cáffra, Andr. heath. 1. t. 4. E. strigòsa, Wendl. eric. fasc. 2. p. 25. with a figure. Willd. spec. 2. p. 365. Corollas small, bell-shaped, white, $1\frac{1}{2}$ line long. Style inclosed.

Var. β, rúbra (Hort.); flowers red. ♄. G. E. persolùta, Curt. bot. mag. 324. Pedicels bibracteate in the middle.

Var. γ, spìcata (Hort.); flowers spicate, white.

Accomplished Heath. Fl. April, May. Clt. 1774. Shrub 1 ft.

39 E. strigòsa (Sol. in Ait. hort. kew. 2. p. 404.) leaves 4 in a whorl, linear, bluntish, downy, ciliated; branches villous; flowers axillary, aggregate; calycine segments villous, adpressed; corolla campanulate; spurs of anthers subulate, hairy. ♄. G. Native of the Cape of Good Hope. E. axillàris, Sal. in Lin. trans. 6. p. 325. E. arbòrea, Thunb. diss. no. 63. Bracteas 2, minute. Corolla $1\frac{1}{2}$ lines long, smooth. There are white and purple flowered varieties of this species. Corolla campanulate. Style exserted.

Strigose Heath. Fl. March, April. Clt. 1775. Shrub 1 to 2 feet.

40 E. negle'cta; glabrous; leaves linear, 4 in a whorl, adpressed; corolla campanulate; anthers awned. ♄. G. Native of the Cape of Good Hope. E. grácilis, Ait. hort. kew. 2. p. 404. Willd. spec. 2. p. 363. Wendl. eric. 8. p. 9. with a figure. Flowers small, red.

Neglected Heath. Fl. year. Clt. 1794. Shrub 1 foot.

41 E. lasiophy'lla (Spreng. syst. 2. p. 195.) leaves 4 in a whorl, linear, scabrous, glandularly ciliated, spreading, aristate at the apex; flowers racemose, drooping; calyx adpressed; corolla campanulate; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers reddish-purple. Style inclosed.

Woolly-leaved Heath. Fl. May, Aug. Clt. 1816. Shrub 1 to 2 feet.

42 E. floribu'nda (Lodd. bot. cab. 176.) glabrous; leaves 4 in a whorl; flowers terminal; corolla bell-shaped, open; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers small, axillary and terminal, pale red. Style exserted.

Bundle-flowered Heath. Fl. April, May. Shrub.

43 E. pelvifórmis (Sal. in Lin. trans. 6. p. 376.) leaves 4 in a whorl; flowers terminal; pedicels hardly pubescent; corolla $1\frac{1}{2}$ line long, with a bowl-formed tube, and with the interstices of the limb oval at the base; spurs of anthers falcate. ♄. G. Native of the Cape of Good Hope. Erìca persolùta, Thunb. diss. no. 62. Curt. bot. mag. no. 342. E. viridipurpùrea, Lin. diss. no. 9. with a flower. E. Mauritánica, Lin. syst. nat. ed. 10. p. 1002. There are varieties of this with either white or purple flowers.

Bowl-formed-flowered Heath. Fl. May, Aug. Clt. 1800. Shrub.

44 E. quadræflòra (Sal. in Lin. trans. 6. p. 375.) stem glabrous; leaves 4 in a whorl; flowers terminal, by fours; corolla $1\frac{1}{4}$ line long, with a cup-shaped tube, and an erect limb; spurs of anthers lanceolate-cuneated. ♄. G. Native of the Cape of Good Hope. E. quadrangulàris, Sal. prod. p. 297.

Four-flowered Heath. Fl. March, Aug. Clt. 1800. Shrub.

45 E. leuca'ntha; leaves 4 in a whorl; flowers terminal, umbellate; bracteas remote from the calyx; corolla bell-shaped; anthers awned. ♄. G. Native of the Cape of Good Hope. E. regérminans, Andr. heath. vol. 4. but not of Lin. Flowers small, white. Style a little exserted.

White-flowered Heath. Fl. Dec. Jan. Clt. 1810. Shrub 1 foot.

* * * * *Leaves 4 in a whorl. Corollas urceolate.*

46 E. te'tralix (Lin. spec. ed. 2d. p. 507.) leaves ciliated, 4 in a whorl; calyx adpressed; flowers capitate, terminal; corolla ovate-globose, downy at top, outside; spurs of anthers lanceolate. ♄. H. Native of the north of Europe, in boggy or moorish ground; plentiful in Britain. Curt. fl. lond. fasc. 1. t. 21. Smith, engl. bot. 1314. Fl. dan. 81. E. botulifórmis, Sal. in Lin. trans. 4. p. 369. E. Barbárica, Rai. syn. 471. E. pùmila, Park. theatr. 1483. no. 5. E. tétralix rùbra, Bedf. hort. eric. wob. p. 25. Corollas 3 lines long, pale red.—Plant of greyish hue.

Var. β, álba (Bedf. hort. eric. wob. p. 25.) flowers white. Ait. hort. kew. 2. p. 393.

Besom Heath. Fl. July, Sept. Britain. Shrub $\frac{1}{2}$ to 1 foot.

47 E. Blandfordia'na (Ait. hort. kew. 2. p. 392.) leaves linear, 4 in a whorl, spreading; flowers terminal, almost solitary; corolla ovate-globose, or urceolar; anthers awned. ♄. G. Native of the Cape of Good Hope. Curt. bot. mag. 1793. Lodd. bot. cab. 115. E. Blandfórdia, Andr. heath. 3. t. 8. Corollas yellow, small. In the hortus eric. wob. the anthers are said to be mutic; this must be wrong.

Blandford's Heath. Fl. March, June. Clt. 1803. Shrub 1 foot.

48 E. hirtiflòra (Sims, bot. mag. 481. Lodd. bot. cab. 1812.) leaves linear, hairy, 4 in a whorl; flowers terminal, umbellate, downy; corolla ovate-globose, with an erect limb; anthers awned; fruit glabrous. ♄. G. Native of the Cape of Good Hope. E. mitræfórmis, Salisb. in Lin. trans. 6. p. 372. E. pubéscens, Andr. heath. 1. t. 5. E. pubéscens, var. híspida, Thunb. eric. no. 61. Corollas purple, small.

Hairy-flowered Heath. Fl. Aug. Feb. Clt. 1790. Shrub $1\frac{1}{2}$ foot.

49 E. tardiflòra (Sal. in Lin. trans. 6. p. 373.) leaves 4 in

a whorl, linear, revolute, downy; flowers terminal, umbellate; corollas urceolate, downy, with a short recurved limb; anthers awned; fruit hairy. ♄. G. Native of the Cape of Good Hope. E. pubéscens, Curt. bot. mag. 480. E. hirtiflòra, *β*, Ait. hort. kew. 2. p. 406. Calyxes adpressed, narrow, ovate, cuneated. Corollas red. Style inclosed.

Late-flowered Heath. Fl. year. Clt. 1800. Shrub 1 to 2 feet.

50 E. cane'scens (Wendl. eric. ex Spreng. syst. 2. p. 195.) leaves 4 in a whorl, linear, canescent, erect; flowers terminal, sessile; corolla urceolately-campanulate; calyxes foliaceous, ovate, acuminated, adpressed; awns of anthers linear. ♄. G. Native of the Cape of Good Hope. E. pubéscens mìnor, Andr. heath. 2. t. 7. E. exígua, Sal. in Lin. trans. 6. p. 373. E. pubéscens parviflòra, Thunb. diss. no. 61. Corolla with an oval tube, and a short limb. Flowers small, pale purple.

Canescent Heath. Fl. Oct. March. Clt. 1790. Shrub 1 foot.

51 E. pusílla (Salisb. in Lin. trans. 6. p. 374.) downy; leaves 4 in a whorl; calyxes adpressed, broad, ovate-cuneated; corollas very small, downy, with a cup-shaped tube, and the limb the length of the tube; anthers awned; fruit glabrous. ♄. G. Native of the Cape of Good Hope, in Baay Fals. Flowers terminal.

Least Heath. Shrub.

52 E. cónica (Lodd. bot. cab. 1179.) leaves 4 in a whorl, linear, glabrous; flowers axillary, racemose; genitals inclosed. ♄. G. Native of the Cape of Good Hope. Flowers purplish-red.

Conical-flowered Heath. Fl. May, Aug. Clt. 1822. Shrub.

53 E. pubígera (Sal. in. Lin. trans. 6. p. 372.) downy; leaves 4 in a whorl; flowers terminal; calyxes spreading, ovate-acuminated; corolla $1\frac{1}{2}$ line long, downy, with a longish recurved obtuse limb; anthers awned; fruit hairy. ♄. G. Native of the Cape of Good Hope, on Mount Taffelberg.

Down-bearing Heath. Shrub.

54 E. catervæflòra (Sal. l. c.) hairy; leaves 4 in a whorl; stem angular; flowers terminal; corolla 2 lines long, downy, with a narrow obovate tube; anthers awned, dehiscing by long holes. ♄. G. Native of the Cape of Good Hope, on the summit of Mount Taffelberg. E. pubéscens villòsa, Thunb. diss. no. 61.

Company-flowered Heath. Shrub.

55 E. turbiniflòra (Sal. in Lin. trans. 6. p. 377.) stem glabrous; leaves 4 in a whorl; flowers terminal; corolla $1\frac{1}{2}$ line long, smooth, with a turbinate 8-angled tube, and an incurved limb; spurs of anthers glabrous. ♄. G. Native of the Cape of Good Hope. Flowers pale purple.

Top-flowered Heath. Fl. Feb. Oct. Clt. 1793. Shrub.

56 E. tragulífera (Sal. in Lin. trans. 6. p. 374.) leaves 4 in a whorl; flowers terminal; calyx imbricate; corolla $2\frac{1}{3}$ lines long, with an urceolar tube, and a recurved limb: anthers hairy, broadly foraminose; spurs hairy. ♄. G. Native of the Cape of Good Hope.

Beard-bearing Heath. Fl. May, Aug. Clt. 1800. Shrub.

57 E. plumòsa (Andr. heath. 2. t. 6.) leaves 4 in a whorl, linear, hairy, erect, imbricated; flowers disposed in axillary whorls; corolla ovate-globose; calyxes hairy; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca amœ'na, Wendl. eric. 17. p. 73. Corollas purplish-red. Branches erect. Style exserted.

Feathered Heath. Fl. March, July. Clt. 1795. Shrub 1 foot.

58 E. tenuíssima (Wendl. eric. fasc. 6. p. 9. with a figure) leaves 4 in a whorl, linear-filiform, glabrous, erect, somewhat imbricated; flowers terminal, aggregate; calyx short, naked; corolla urceolate, with an erectish limb; anthers appendiculate. ♄. G. Native of the Cape of Good Hope. Flowers red.

Slenderest Heath. Fl. Feb. Aug. Clt. 1803. Shrub 1 ft.

59 E. curviróstris (Sal. in Lin. trans. 6. p. 375.) leaves 4 in a whorl, linear; flowers terminal; calyxes adpressed; corolla $1\frac{1}{2}$ line long, with a spherical tube; spurs of anthers downy; style curved. ♄. G. Native of the Cape of Good Hope.

Curved-beaked Heath. Shrub.

60 E. pilulífera (Lin. spec. ed. 2. p. 507.) leaves 4 in a whorl, linear, glabrous, ciliated; flowers terminal; corollas globose, $2\frac{1}{2}$ lines long, having the tube length of the calyx; calycine segments ovate, acuminated, deeper coloured at the apex; spurs of anthers linear-attenuated; fruit glabrous. ♄. G. Native of the Cape of Good Hope. E. nudicaúlis, Berg. pl. cap. p. 113. E. pilulifórmis, Sal. in Lin. trans. 6. p. 370. Flowers red. Style exserted.

Pill-bearing Heath. Fl. April, May. Clt. 1789. Shrub 1 foot.

61 E. imbecílla (Hort. Loud. hort. brit. no. 9716. p. 150.) leaves 4 in a whorl; bracteas remote from the calyx; calyx minute; flowers terminal; corolla with an oval tube and a recurved limb; spurs of anthers linear-attenuated, hairy. ♄. G. Native of the Cape of Good Hope. E. grácilis, Salisb. in Lin. trans. 6. p. 375. Flowers small, red or purple.

Weak Heath. Fl. June, July. Clt. 1793. Shrub 1 foot.

62 E. intervalla'ris (Sal. in Lin. trans. 6. p. 375.) stem slender; leaves 4 in a whorl, remote; flowers terminal; corolla $1\frac{1}{2}$ to 2 lines long, with an ovate-cylindrical tube, and a broad mouth; anthers awned; pericarp hairy. ♄. G. Native of the Cape of Good Hope. Erìca elongàta, Roxb. mss. Flowers small, red, drooping.—A very pretty species.

Distant-leaved Heath. Fl. May, Nov. Clt. 1800. Shrub.

63 E. mucòsa (And. heath. 1. t. 6.) leaves 4 in a whorl, glabrous; flowers terminal; corollas globose, viscid, having the interstices of the limb rather tumid; calycine segments ovate, obtuse, coloured, tipped with green; anthers awned. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 35. Icon. pl. kew. t. 15. Flowers pale purplish-red. Corolla with the tube more or less obovate. Style inclosed.

Mucous-flowered Heath. Fl. March, July. Clt. 1787. Shrub $1\frac{1}{2}$ foot.

64 E. mucosioìdes (Bedf. hort. eric. wob. p. 15.) leaves short, 4 in a whorl; flowers terminal; corollas globose; calycine segments coloured, tipped with green; anthers awned. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab 1202. Flowers small, purplish red. Style inclosed.

Mucosa-like Heath. Fl. Oct. Nov. Clt. ? Shrub.

65 E. latera'lis (Willd. spec. 2. p. 380. but not of Andr.) leaves 4 in a whorl, linear-attenuated, glabrous; flowers terminal; bracteas remote from the calyx; calycine segments ciliated; corolla conical, having the segments anointed with drops of waxy matter at top; crests of anthers downy. ♄. G. Native of the Cape of Good Hope. E. gullæflòra, Sal. in Lin. trans. 6. p. 374. Corollas small, red. Style exserted.

Var. α; stem fastigiate; corolla 1 or $1\frac{1}{2}$ line long, with a hemispherical tube; stigma much exserted. ♄. G. E. lateralis, Willd. l. c.

Var. β; stem low; corolla 2 lines long, with an ovate tube; stigma hardly exserted. ♄. G. E. incarnàta, Andr. heath. 1. t. 19. Lodd. bot. cab. 1655.

Var. γ; stem dwarf; corolla $2\frac{1}{2}$ lines long, with an ovate tube; stigma a little exserted. ♄. G. E. rùbens hùmilis, Wendl. eric. fasc. 3. p. 13. with a figure.

Lateral Heath. Fl. March, July. Clt. 1791. Shrub $1\frac{1}{2}$ to 2 feet.

66 E. fe'sta (Sal. in Lin. trans. 6. p. 371.) leaves 4 in a

whorl; stem angular; flowers axillary at the tops of the branches; corolla viscid, $2\frac{1}{2}$ lines long, with a narrow urceolate tube; filaments mutic; anthers appendiculate. ♄. G. Native of New Holland. Flowers fulvous.

Joyful Heath. Fl. June, July. Clt. 1812. Shrub.

67 E. cantharæfòrmis (Lodd. bot. cab. 1961.) leaves obtuse; flowers terminal; pedicels about 3 together; calyx reflexed; corolla ovate, ventricose. ♄. G. Native of the Cape of Good Hope. Flowers white. Anthers unknown. Nearly allied to *E. refléxa*.

Tankard-formed-flowered Heath. Fl. May, June. Clt.? Shrub 1 to 2 feet.

68 E. Bonplandia'na (Sims, bot. mag. t. 2126.) leaves 4 in a whorl, imbricate, acerose; flowers terminating the small branches, solitary or by threes, sessile; bracteas close to the calyx; corolla large, with an urceolar tube, and an acute spreading limb; genitals inclosed. ♄. G. Native of the Cape of Good Hope. Flowers white. Perhaps a species of *Callista*.

Var. β, fusca; flowers buff-coloured.

Var. γ, aurántia; corolla orange-coloured, with an ovate-globose tube; anthers a little exserted. ♄. G. Erìca Bonplándia, Lodd. bot. cab. 345. Bedf. eric. wob. p. 4.

Bonpland's Heath. Fl. March, Sept. Clt. 1812. Shrub.

69 E. cupressìna (Hort. Bedf. hort. eric. wob. p. 6. pl. 3. f. 10.) leaves 4 in a whorl, slightly ciliated; flowers terminal; corolla ovate-globose; bracteas remote from the calyx; calyx recurved; anthers awned. ♄. G. Native of the Cape of Good Hope. E. turrígera, Sal. in Lin. trans. 6. p. 377. E. procúmbens, Hort. Flowers middle-sized, pale purplish-red. Corolla 2 lines long, with a hemispherical tube, and with the segments imbricate at the base.

Cypress-like Heath. Fl. May, June. Clt. 1800. Shrub.

70 E. mode'sta (Bedf. eric. wob. p. 15. but not of Salisb.) leaves 4 in a whorl; flowers terminal; corolla globose; bracteas approximating the calyx; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style inclosed.

Modest Heath. Fl. April, May. Shrub.

71 E. móllis (Bedf. eric. wob. p. 15.) downy; leaves 4 in a whorl; flowers terminal; bracteas remote from the calyx; corollas globose; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers purplish-red. Style inclosed.

Soft Heath. Fl. May. Clt. 1790. Shrub 1 to 2 feet.

72 E. ol'ula (And. heath. vol. 4.) leaves 4 in a whorl, sessile, crowded, linear, glabrous; flowers terminal, umbellate; corollas ovate-globose; awns of anthers recurved. ♄. G. Native of the Cape of Good Hope. Flowers reddish-purple. Style inclosed.

Pipkin-flowered Heath. Fl. Autumn. Clt. 1802. Shrub 2 feet.

73 E. subula'ta (Wendl. eric. ex Spreng. syst. 2. p. 190.) leaves 4 in a whorl, linear-subulate, a little incurved, elongated; branches rather hairy; flowers terminal, crowded; corolla urceolate; calyxes subulate, adpressed; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers purple. Style exserted.

Subulate-leaved Heath. Fl. July, Oct. Clt. 1817. Shrub.

74 E. flórida (Thunb. diss. 64. t. 6.) leaves 4 in a whorl, linear, pilose; flowers terminal, umbellate, glabrous; calyxes villous, reflexed; corollas 2 lines long, urceolate; awns of anthers lanceolate. ♄. G. Native of the Cape of Good Hope. Corolla red, with a globose tube, and the segments imbricate at the base. Bracteas very minute. Style inclosed.

Florid Heath. Fl. May, Aug. Clt. 1803. Shrub 1 foot.

75 E. Smithia'na (Lodd. bot. cab. 1614. Bedf. eric. wob. p. 23.) leaves 4 in a whorl; flowers subterminal, axillary, drooping; corolla globosely bell-shaped; bracteas remote from the calyx; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers purplish-red.

Smith's Heath. Fl. April, May. Clt. 1791. Shrub 1 to 2 feet.

76 E. corifòlia (Bedf. hort. eric. wob. p. 29. but not of Ait. hort. kew.) leaves 4 in a whorl; flowers terminal; corolla ovate; bracteas remote from the calyx; anthers awned; style inclosed. ♄. G. Native of the Cape of Good Hope. Flowers white. Style inclosed.

Coris-leaved Heath. Fl. Autumn. Clt.? Shrub.

77 E. pectinifòlia (Sal. in Lin. trans. 6. p. 367.) leaves 4 in a whorl, narrow, ovate-cuneated, pectinated; flowers terminal; calycine segments spatulate; corolla 5-7 lines long, woolly inside; anthers inclosed, appendiculate. ♄. G. Native of the Cape of Good Hope. Erìca cerinthoìdes *β*, Thunb. diss. no. 33.

Pectinate-leaved Heath. Fl. June, Nov. Clt. 1800. Shrub.

§ 2. *Anthers crested.*

* *Leaves 3 in a whorl. Corollas campanulate.*

78 E. nívea (Bedf. hort. eric. wob. p. 16.) leaves 3 in a whorl, glabrous; flowers terminal; corolla bell-shaped; bracteas remote from and approximating the calyx, large, loose; calyx large; anthers crested. ♄. G. Native of the Cape of Good Hope. Flowers pure white. Style subexserted.

Snowy-flowered Heath. Fl. Summer. Clt. 1816. Shrub 1 to 2 feet.

79 E. leucanthe'ra (Lin. suppl. p. 223. Andr. heath. 3. t. 15.) glabrous; leaves 3 in a whorl, erect; branches twiggy: flowers terminal, drooping; peduncles glabrous; bracteas remote from and approximating the calyx; corolla oblong-bell-shaped, having the limb as long as the tube; anthers crested. ♄. G. Native of the Cape of Good Hope. E. spirææfòlia, Sal. in Lin. trans. 6. p. 350. Corollas $1\frac{1}{2}$ line long, white as well as the anthers. There is a variety of this, which is rather downy, and larger in the flowers. Style inclosed.

White-anthered Heath. Fl. Jan. March. Clt. 1803. Shrub 1 foot.

80 E. arbòrea (Lin. spec. ed. 2. p. 502.) leaves 3-4 in a whorl, linear, glabrous; branches tomentose; bracteas remote from the calyx; flowers axillary, racemose, glabrous; corolla bell-shaped; anthers crested. ♄. H. Native of the south of Europe. Ait. hort. kew. ed. p. 402. Smith, et Sibth. fl. græc. t. 351. E. scopària, Thunb. diss. no. 80. E. Cáffra, Lin. diss. no. 22. with a figure. E. triflòra, Berg. pl. cap. p. 118. E. scopària, Lin. spec. ed. 2. p. 353. exclusive of the synonymes. E. procèra, Salisb. in Lin. trans. 328. Flowers white, small. Corolla 2 lines long. Style exserted.

Var. β, stylòsa; style very long.

Var. γ, squarròsa (Hort.) leaves squarrose.

Var. δ, mínima (Hortul.) plants small.

Tree Heath. Fl. Feb. May. Clt. 1658. Tree 10 to 20 feet.

81 E. polytrichifòlia (Sal. in Lin. trans. 6. p. 329.) leaves 3-5 in a whorl; stem tomentose; flowers terminal; bracteas remote from the calyx; calyxes gradually narrowed at the base; corolla 1-2 lines long; spurs of anthers cuneated. ♄. G. Native of Portugal, about Lisbon. Fruit pear-shaped. Perhaps only a variety of *E. arbòrea*.

Polytrichum-leaved Heath. Shrub.

82 E. lu'cida (Andr. heaths. 2. t. 16.) leaves 3 in a whorl, filiform; branches spreading; flowers terminal, by threes; co-

rollas short, bell-shaped, subglobose; calyx coloured, bracteate, serrulated; bracteas imbricate, sessile. ♄. G. Native of the Cape of Good Hope. Flowers small, reddish purple. Awns of anthers a little crested. Style exserted.

Shining Heath. Fl. May, June. Clt. 1800. Shrub 1½ ft.

*** Leaves 3 in a whorl. Corollas urceolate.*

83 E. NÍTIDA (Andr. heath. 3. t. 18.) leaves 3 in a whorl, scabrous, spreading; flowers terminal, drooping; pedicels downy; bracteas sessile, close to the calyx; corollas urceolately globose; anthers crested. ♄. G. Native of the Cape of Good Hope. Lodd. bot. bot. cab. 1131. E. refléxa rùbra, Hort. Flowers white, tinged with red. Style exserted.

Nitid Heath. Fl. July, Oct. Clt. 1800. Shrub 2 feet.

84 E. PEDUNCULA'RIS (Sal. in Lin. trans. 6. p. 329.) leaves 3 in a whorl, linear, hispid; flowers terminal; corolla 3 lines long, with a globose tube; anthers woolly, dehiscing by long chinks, crested. ♄. G. Native of the Cape of Good Hope. E. rùbens, Thunb. diss. no. 83. but not of Andr. Pedicels an inch long. Flowers purplish red.

Peduncular-flowered Heath. Shrub.

85 E. FAU'STA (Sal. in Lin. trans. 6. p. 326.) leaves 3 in a whorl, bristly; flowers terminal; corolla 2⅓ lines long, downy outside, with an urceolate tube; spurs of anthers serrated, attenuated, crested. ♄. G. Native of the Cape of Good Hope. Very like *E. hírta*, Thunb. Flowers pale purple.

Fortunate Heath. Fl. April, July. Clt. 1795. Shrub 1 to 2 feet.

86 E. INCA'NA (Wendl. eric. fasc. 18. p. 89. with a figure.) leaves 3 in a whorl, linear-oblong, obtuse, hairy, white beneath; bracteas remote from the calyx; flowers terminal, downy; corolla urceolate; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers white. There is also a red-flowered variety of this species. Style exserted.

Hoary Heath. Fl. Aug. Clt. 1810. Shrub 1½ foot.

87 E. OVA'TA (Lodd. bot. cab. 417.) downy; leaves 3 in a whorl; flowers terminal; bracteas remote from the calyx; corollas ovate; awns of anthers crested a little. ♄. G. Native of the Cape of Good Hope. Flowers purplish red. Style inclosed.

Ovate-flowered Heath. Fl. May, June. Clt. 1811. Shrub 1 foot.

88 E. REFLE'XA (Link, enum. 1 p. 371. Lodd. bot. cab. 1787.) leaves 3 in a whorl, glabrous, lanceolate, obtuse; flowers terminal, usually 3 in a fascicle; calyx, bracteas, and pedicels coloured; corolla ovate, ventricose at the base, clammy; crests of anthers plumose. ♄. G. Native of the Cape of Good Hope. Calyx spreading. Corollas white, waxy, middle sized. Anthers black. Very nearly allied to *E. nítida*, and probably only a variety of it. The young leaves are said by Link to be glandularly ciliated. Style inclosed.

Reflexed-calyxed Heath. Fl. Spring and Autumn. Clt. 1820. Shrub 1 foot.

89 E. CINE'REA (Lin. spec. ed. 2. p. 501.) leaves 3 in a whorl; corolla ovate-urceolate; flowers verticillate, on the naked stems; crests of anthers ear-formed. ♄. H. Native of Europe, but not in the south, nor in the extreme north; plentiful in Britain. Curt. fl. lond. fasc. 1. t. 25. Loefl. res. p. 137. Smith, engl. bot. t. 1015. Ait. hort. kew. 2. p. 392. Fl. dan. 38. E. mutábilis, Salisb. in Lin. trans. 4. p. 369. E. hùmilis, Neck. gall. 182. E. tenuifòlia, Ger. 1198. emac. 1382. E. cinèrea rùbra, Bedf. hort. eric. woburn. p. 5. Corolla 3 lines long, purple, changing to blue as they fade. This is easily distinguished from *E. tétralix*, in the glabrous deep green hue, and deep purple flowers.

Var. β, atropurpùrea (Lodd. bot. cab. 1409.) plant dwarf; flowers deeper purple.

Var. γ, álba (Bedf. l. c.) flowers white.

Var. δ, pállida (Lodd. bot. cab. 1507.) flowers pale purple.

Grey Heath. Fl. Aug. Sept. Britain. Shrub ½ to 1 foot.

90 E. VERNICÍFLUA (Sal. in Lin. trans. 6. p. 335.) leaves 3 in a whorl, viscid; corolla 2½ lines long, with a recurved limb; flowers terminal; spurs of anthers ear-formed and cuneated, hairy; fruit smooth. ♄. G. Native of the Cape of Good Hope. E. glutinòsa, Roxb. mss. The leaves are bluntly acuminated, densely clothed with glands in the reduplicate part; hence they appear shining and clammy.

Varnish-flowing Heath. Shrub.

91 E. EMBOTHRIIFÒLIA (Sal. in Lin. trans. 6. p. 379.) leaves 3 in a whorl, linear-lanceolate; spikes of flowers coarctate; corolla 4 lines long, having the tube ventricose at top; anthers exserted, crested. ♄. G. Native of the Cape of Good Hope.

Embothrium-leaved Heath. Fl. Feb. May. Clt. 1798. Shb.

**** Leaves 4 in a whorl. Corollas campanulate.*

92 E. AUSTRA'LIS (Lin. mant. p. 231.) leaves 4 in a whorl, scabrous, spreading, mucronate; flowers terminal; corolla 3 lines long, with a curved funnel-shaped tube, and a recurved limb; pedicels beset with gemmaceous bracteas; anthers crested. ♄. H. Native of Spain and Portugal. Andr. heaths. 3. t. 21. Ait. hort. kew. 2. p. 396. Lodd. bot. cab. 1472. Wendl. eric. 9. p. 13. with a figure. E. pistilàris, Sal. in Lin. trans. 6. p. 368. Flowers small, purplish red. Style exserted.

Southern Heath. Fl. March, July. Clt. 1769. Shrub 3 to 6 feet.

93 E. DECLINA'TA (Bedf. hort. eric. wob. p. 7.) leaves 4 in a whorl; flowers axillary, subspicate: corolla bell-shaped; bracteas remote from the calyx; anthers crested. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1662. Flowers white, tinged with red. Style a little exserted.

Delicate Heath. Fl. Sept. Oct. Clt. 1820. Shrub 1 ft.

***** Leaves 4 in a whorl. Corollas urceolate.*

94 E. MARGARITA'CEA (Sol. in Ait. hort. kew. 2. p. 401.) glabrous; leaves 4 in a whorl; flowers terminal; bracteas remote from the calyx; anthers crested; corolla with a spherical tube. ♄. G. Native of the Cape of Good Hope. Andr. heath. 1. t. 17. Wendl. eric. 8. p. 11. with a figure. E. obèsa, Sal. in Lin. trans. 6. p. 375. Calyx incurvedly spreading. Corollas nearly 2 lines long, white. Crests of anthers glabrous. Style exserted.

Pearl-flowered Heath. Fl. June, Sept. Clt. 1775. Shrub 1½ foot.

95 E. LACHNÆOÌDES. This species is very distinct from *Erìca lachnæ'a*, Andr.; but we have not means of giving any description of it. Anthers crested. ♄. G. Native of the Cape of Good Hope. E. lachnæ'a purpùrea, Andr. heaths. 3. t. 3. Flowers red.

Lachnæa-like Heath. Fl. May, July. Clt. 1793. Shrub.

96 E. RACEMÍFERA (Andr. heath. 3. t. 12.) leaves 4 in a whorl, and are as well as the calyxes glabrous; flowers axillary, verticillate; corollas ovate-globose; anthers crested. ♄. G. Native of the Cape of Good Hope. Flowers small, red. Style inclosed.

Raceme-bearing Heath. Fl. April, July. Clt. 1803. Shrub 1½ foot.

97 E. SOLA'NDRI (Andr. heath. 2. t. 17. Ait. hort. kew. 2. p. 399.) leaves 4 in a whorl, hispid; branches decumbent; flowers terminal, capitate, or umbellate; bracteas sessile, linear, ciliated, near the calyx; corollas globosely bell-shaped; anthers crested.

ħ. G. Native of the Cape of Good Hope. Flowers reddish-purple. Style inclosed.

Solander's Heath. Fl. March, Nov. Clt. 1800. Shrub.

98 E. acu'ta (Andr. heath. 2. t. 19. Ait. hort. kew. 2. p. 399.) leaves 4 in a whorl, stiff, glabrous, spreading; flowers terminal, usually by threes, drooping; bracteas approximating the calyx; corolla ovate-globose; anthers crested. ħ. G. Native of the Cape of Good Hope. Flowers small, deep purplish-red. Calyx ciliated. Style inclosed.

Acute-flowered Heath. Fl. May, Aug. Clt. 1799. Shrub ½ to 1 foot.

99 E. ru'bens (Andr. heath. 2. p. 21.) leaves 4 in a whorl, hispid, spreading; flowers terminal; bracteas remote from and approximating the calyx; anthers crested or awned; corolla ovate-globose. ħ. G. Native of the Cape of Good Hope. Lodd. bot. cab. 557. Flowers small, purplish-red. Style exserted.

Red-flowered Heath. Fl. Spring and Winter. Clt. 1798. Shrub 1 foot.

100 E. strícta (Donn, hort. cantab. ed. 3d. p. 69. Willd. spec. 2. p. 366.) leaves 4 in a whorl, obtuse, glabrous, bisulcate beneath; flowers terminal, umbellate; corolla 3 lines long, with an ovate urceolar tube, and reflexed segments; bracteas approximating the calyx, sessile; anthers crested. ħ. H. Native of Corsica and Italy. Andr. heath. 2. t. 22. Ait. hort. kew. 2. p. 393. E. multicaúlis, Sal. in Lin. trans. 6. p. 369. E. Córsica, D. C. fl. fr. E. ramulòsa, Viv. Calyx spreading. Corollas purplish red. Stem diffuse. Style subexserted.

Straight Heath. Fl. Aug. Nov. Clt. 1765. Shrub 2 to 3 feet.

101 E. barba'ta (Andr. heath. 2. t. 23.) leaves 4 in a whorl, ciliated; flowers terminal, umbellate, drooping; corolla short, urceolate; bracteas remote from the calyx; calycine segments spatulate, ciliated; anthers crested. ħ. G. Native of the Cape of Good Hope. Lodd. bot. cab. 124. Erìca barbàta màjor, Andr. heath. 2. t. 23. Flowers pale yellow, with brown anthers. Style exserted.

Var. β, mìnor (Andr. heath. 2. t. 24.) flowers white, with black anthers; but according to the hort. eric. wob. they are red, flowering Feb. Aug.

Bearded Heath. Fl. May, Aug. Clt. 1799. Shrub 1 ft.

102 E. ramenta'cea (Lin. mant. p. 65. Andr. heath. 1. t. 16.) leaves 4 in a whorl, glabrous; branches clammy; flowers terminal, umbellate; bracteas remote from and approximating the calyx; corolla with a spherical 8-angled tube, and a recurved erect limb; anthers crested; fruit hairy. ħ. G. Native of the Cape of Good Hope. Ait. hort. kew. 2. p. 405. Lodd. bot. cab. 446. E. bullulàris, Sal. in Lin. trans. 6. p. 377. E. granulàta, Lin. mant. 234. E. multiumbellífera, Berg. pl. cap. p. 110. E. pilulífera, Berg. pl. cap. p. 111. Calycine segments subulate, coloured. Flowers purplish-red. Style subexserted.

Ramentaceous Heath. Fl. July. Dec. Clt. 1786. Shrub 1½ foot.

103 E. ce'rnua (Lin. suppl. p. 222.) leaves 4 in a whorl, hoary, villous or ciliated, aristate: those of the branches ovate; flowers terminal, drooping, umbellate; bracteas decurrent; calyx much fringed; corolla ovate-globose; anthers crested. ħ. G. Native of the Cape of Good Hope. Montin, in act. ups. 2. p. 291. t. 9. f. 3. Flowers purplish-red or pink. Corolla 2½ lines long.

Drooping-flowered Heath. Fl. Aug. Dec. Clt. 1791. Shrub 1 foot.

104 E. verecu'nda (Sal. in Lin. trans. 6. p. 379.) leaves 4 in a whorl, linear, incurvedly spreading, glabrous; branches hairy; spikes coarctate; flowers drooping; bracteas and calyxes fringed; corolla 2½ lines long, with an amphori-formed tube, and crenulated limb; anthers hairy; spurs cuneated, hairy. ħ. G. Native of the Cape of Good Hope. Erìca cérnua, Andr. heath. 1. t. 20. Lodd. bot. cab. 822. but not of Lin. Flowers flesh-coloured. Style inclosed.

Reddish-flowered Heath. Fl. April, Sept. Clt. 1793. Shrub.

105 E. pe'ndula (Wendl. eric. 10. p. 13. with a figure) leaves 4 in a whorl, glabrous; flowers terminal, drooping; bracteas remote from the calyx; calycine segments lanceolate, adpressed; corollas ovate, angular; anthers crested. ħ. G. Native of the Cape of Good Hope. Ait. hort. kew. 2. p. 400. E. arbúscula, Lodd. bot. cab. 843. Flowers purple: in hort. kew. there are said to be 3 bracteas on each pedicel; 2 near the calyx, and the third remote from it. Style inclosed.

Pendulous-flowered Heath. Fl. July, Aug. Clt. 1791. Shrub 1½ foot.

106 E. nu'tans; leaves 4 in a whorl; flowers terminal, drooping; bracteas remote from the flower; calyx ribbed, green; corolla ovate-globose; anthers crested. ħ. G. Native of the Cape of Good Hope. E. péndula, Hort. Bedf. eric. wob. p. 18. but not of Wendl. Flowers reddish-purple. Style a little exserted.

Nodding-flowered Heath. Fl. Spring and Summer. Clt.? Shrub.

107 E. fìbula (Link. enum. 1. p. 368.) leaves 4 in a whorl, finely ciliated; flowers terminal; bracteas remote from the calyx; corolla oblong-globose; anthers crested. ħ. G. Native of the Cape of Good Hope. Flowers purple-red. Style exserted.

Button-flowered Heath. Fl. July, Oct. Clt. 1823. Shrub 1 to 2 feet.

108 E. lactiflòra (Lodd. bot. cab. t. 901.) leaves 4 in a whorl, and are as well as the branches scabrous; flowers terminal, erectish; corolla ovate; bracteas remote from the calyx; anthers crested. ħ. G. Native of the Cape of Good Hope. E. lactícolor, Roll. cat. E. trícolor, Spreng. syst. 2. p. 193. Limb of corolla connivent and drawn out. Flowers white. Style inclosed.

White-flowered Heath. Fl. June, Sept. Clt. 1820. Shrub 1 to 2 feet.

109 E. u'nica (Spreng. syst. 2. p. 188.) leaves 4 in a whorl, crowded, ciliated, erect; flowers terminal, umbellate, drooping; bracteas remote from the calyx; calyx minute, coloured, ciliated; corolla urceolate or globosely bell-shaped; anthers crested. ħ. G. Native of the Cape of Good Hope. E. pedunculàta, Andr. heath. 4. icon. but not of Wendl. E. ciliàta, Hort. Flowers purplish-red. Style inclosed.

Unique Heath. Fl. Oct. Nov. Clt. 1800. Shrub 1 to 2 feet.

110 E. parviflòra (Lin. spec. ed. 2. p. 506. Salisb. in Lin. trans. p. 373.) leaves revolute, 4 in a whorl, downy; flowers terminal; corolla downy, urceolate; spurs of anthers crested or ear-formed; fruit glabrous. ħ. G. Native of the Cape of Good Hope. E. pubéscens, Lin. diss. no. 19. with a figure. Berg. fl. cap. 121. Corolla purple. Style inclosed.

Small-flowered Heath. Fl. March, Sept. Clt. 1790. Shrub 1 foot.

* * * * * *Leaves 5-6 or more in a whorl. Corollas campanulate.*

111 E. empetrifòlia (Lin. mant. p. 375.) leaves 6-7 in a whorl, oblong-linear, ciliated, erect; flowers disposed in glomerate racemose whorles; bracteas and calyxes lanceolate; corolla 2 lines long, hairy, with an urceolar tube, and a recurvedly spreading limb; anthers awned or crested; stigma exserted. ħ. G. Native of the Cape of Good Hope. Lin. diss. no. 15. with a figure. Thunb. diss. no. 70. Curt. bot. mag. 447. Lodd. bot. cab. 1875. Calyx 4-lobed. Style exserted Flowers purplish-red.

Empetrum-leaved Heath. Fl. May, June. Clt. 1774. Shb.

112 E. NOLÆFLÒRA (Sal. in Lin. trans. 6. p. 371.) leaves 6 in a whorl; flowers axillary at the tops of the branches; corolla 2 lines long, smooth, with a cup-shaped tube, and a recurvedly spreading limb; stigma inclosed. ♄. G. Native of the Cape of Good Hope. E. glomeràta, Hortul. Pedicels much longer than in any of the allied species. Anthers appendiculate. Corollas white.

Bell-flowered Heath. Shrub.

* * * * * *Leaves 5-6 in a whorl. Corollas urceolate.*

113 E. EMPETROÌDES (Andr. heath. 2. t. 25. Ait. hort. kew. 2. p. 299.) leaves 6 in a whorl, glaucescent, ciliated, spreading, soft; flowers terminal, subspicate, close; bracteas hairy, approximating the calyx; corollas ovate; calyx green, rough, large; auricles of anthers broad. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1758. E. pyxidifòlia, Sal. in Lin. trans. 6. p. 371. E. empetrifòlia glaúca, Wendl. eric. 11. p. 11. with a figure. Flowers pale purplish-red. Calyx 4-cleft. Corolla smooth, 2 lines long, with an obovate tube, and an incurvedly spreading limb. Pericarp globose, glabrous. Style exserted.

Empetrum-like Heath. Fl. April, May. Clt. 1788. Shrub $1\frac{1}{2}$ foot.

114 E. MALLEOLA'RIS (Sal. in Lin. trans. 6. p. 370.) leaves 6 in a whorl; flowers axillary at the tops of the branches; calyx quadrifid; corolla $1\frac{2}{3}$ line long, smooth, with an urceolar tube, and a recurvedly spreading limb; pericarp glabrous. ♄. G. Native of the Cape of Good Hope. Erìca empetrifòlia, Schnev. pl. no. 17. with a figure. Houtt. pfl. syst. 4. p. 517. t. 23. f. 2. Berg. pl. cap. p. 120.

Branched Heath. Fl. April. Oct. Clt. 103. Shrub.

115 E. GLUTINÒSA (Berg. fl. cap. p. 98. Thunb. diss. no. 48.) leaves alternate or opposite, beset with glandular hairs; spikes of flowers coarctate; flowers drooping; bracteas remote from the calyx; corollas viscid, with an ovate pyramidal tube and a spreading limb; anthers crested. ♄. G. Native of the Cape of Good Hope. Icon. pl. kew. t. 17. E. droseroìdes, Andr. heath. 1. t. 13. Lodd. bot. cab. 1685. Andrómeda droseroìdes, Lin. mant. 239. Corollas deep red, form of those of a species of *Callista*, 3 to 5 lines long.

Clammy Heath. Fl. May, June. Clt. 1787. Shrub 1 ft.

116 E. FA'LLAX (Sal. in Lin. trans. 6. p. 371.) leaves 6 in a whorl; flowers axillary at the tops of the branches; corolla 2 lines long, viscid, with the tube urceolar and a little ribbed; filaments length of tube, spurred; pericarp viscid. ♄. G. Native of the Cape of Good Hope. Anthers bipartite.

False Heath. Fl. May, Nov. Clt. 1800. Shrub.

117 E. PA'RILIS (Sal. in Lin. trans. 6. p. 371.) leaves 6 in a whorl; flowers axillary at the tops of the branches; corolla 3 lines long, viscid, with an urceolar, rather ribbed tube; filaments hardly the length of the tube, minutely spurred. ♄. G. Native of the Cape of Good Hope.

Equal Heath. Fl. May, Aug. Clt. 1789. Shrub.

118 E. CARDUIFÒLIA (Sal. in Lin. trans. 6. p. 330.) leaves 6 in a whorl, bristly; flowers terminal; pedicels long; corolla $2\frac{1}{2}$ lines long, smooth, with a glabrous tube; filaments very short; anthers awned. ♄. G. Native of the Cape of Good Hope. Stigma narrow. Corollas purple.

Thistle-leaved Heath. Fl. May, Aug. Clt. 1806. Shrub.

119 E. CINERA'SCENS (Willd. enum. suppl. p. 21.) branches and calyxes tomentose, and beset with long hairs; leaves 5 in a whorl, ciliated with long hairs; bracteas foliaceous, close to the calyx; style subexserted; anthers awned. ♄. G. Native of the Cape of Good Hope. Flowers purple. Nearly allied to *E. cinèrea*.

Greyish Heath. Fl. April, May. Clt. 1810. Shrub.

120 E.? PHYSÒDES (Lin. spec. ed. 2. 566. diss. no. 32. with a figure) leaves 4-6 in a whorl, spreading, viscid, slender; flowers terminal, 4-6 in a fascicle; bracteas remote from the calyx; calycine segments ovate, ciliated; corolla ovate-globose, clammy, having the interstices of the limb ending in a tumid hook; anthers crested. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 223. E. sèquax, Sal. in Lin. trans. 6. p. 378. Corolla 3-4 lines long, white. Style inclosed.

Var. β; corolla 4 lines long, with an ovate tube. ♄. G. E. physòdes, Andr. heath. 1. t. 22. Wendl. eric. fasc. 7. p. 13. with a figure. Curt. bot. mag. 443. Corollas white.

Bladdery-flowered Heath. Fl. March, May. Clt. 1788. Shrub 1 to 2 foot.

§ 3. *Anthers mutic, that is, without awns or crests.*

* *Leaves 3 in a whorl. Corollas campanulate.*

121 E. CANALICULA'TA (Andr. heath. 3. t. 38.) leaves 3 in a whorl, subulate, glabrous, spreading; pedicels terminal, by threes, bracteate, downy; calyxes coloured; corolla campanulate; stamens a little exserted. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 184. Corollas pale red, spreading.

Channelled Heath. Fl. Feb. Aug. Clt. 1799. Shrub 1 ft.

122 E. CAMPANULA'TA (Andr. heath. 1. t. 44. Wendl. eric. 13. p. 3. with a figure) leaves 3 in a whorl, subulate, glabrous; flowers terminal, solitary, drooping; bracteas remote from the calyx; corolla campanulate; calycine segments ciliated. ♄. G. Native of the Cape of Good Hope. Ait. hort. kew. 2. p. 408. Lodd. bot. cab. 115. E. tenuifòlia, Hort. E. campanulàris, Sal. in Lin. trans. 6. p. 330. Calyx coloured. Corollas $2\frac{1}{2}$ lines long, yellow, smooth. Style exserted.

Campanulate-flowered Heath. Fl. April, Aug. Clt. 1791. Shrub 1 foot.

123 E. FLA'VA (Andr. heath. 2. t. 38. Ait. hort. kew. 2. p. 292.) leaves 3 in a whorl, short, glabrous, erect; flowers terminal, crowded; pedicels bracteate; corollas campanulate. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 882. Flowers yellow. Style exserted.

Yellow-flowered Heath. Fl. April, Oct. Clt. 1795. Shrub.

124 E. COARCTA'TA (Wendl. eric. fasc. 19. no. 1.) leaves 3 in a whorl, linear, a little ciliated, erectly spreading; flowers twin, axillary, erect, on pedicels, which are equal in length to the leaves; calyx small, foliaceous; stigma peltate; anthers mutic. ♄. G. Native of the Cape of Good Hope. Corolla campanulate, purple, dilated at top. Style much exserted. Bracteas remote from the calyx.

Coarctated-flowered Heath. Fl. May, Sept. Clt. 1801. Shrub.

125 E. APPROXIMA'TA (Schlecht. ex Spreng. syst. 2. p. 196.) leaves 3 in a whorl, nearly terete, petiolate, short, glabrous, remote, spreading; branches twiggy, rather hairy; flowers subracemose, glabrous; calyx coloured, adpressed. ♄. G. Native of the Cape of Good Hope. Corolla campanulate. Anthers mutic.

Approximate Heath. Fl. May, July. Clt. 1823. Shrub.

126 E. SPICULIFLÒRA (Sal. in Lin. trans. 6. p. 324. Smith, fl. græc. t. 353.) leaves 3 in a whorl, mucronulate, ciliated; flowers disposed in terminal racemes, drooping; pedicels bractless, rather downy; style much exserted. ♄. H. Native on the top of Mount Olympus. E. Olýmpica, Sibth. mss. Corollas 1 line long, smooth, red. Calyx coloured.

Spike-flowered Heath. Shrub decumbent.

127 E. SCOPA'RIA (Lin. mant. 375. diss. eric. no. 13. with a figure of the flower) leaves 3 in a whorl, linear, glabrous; flowers axillary, disposed in secund racemes; corolla smooth, campa-

nulate, with a cup-shaped tube; bracteas remote from the calyx. ♄. G. Native of the Cape of Good Hope. E. fucàta, Thunb. diss. no. 9. E. viridipurpùrea, Hort.—Clus. hist. 1. p. 42. Stem downy. Corollas very small, green. Style inclosed or exserted.

Var. β, mínima (Hort.) plant smaller than the species.

Broom Heath. Fl. April, May. Clt. 1770. Shrub 4 to 6 feet.

128 E. virga'ta (Thunb. diss. no. 18. Wendl. ex Spreng. syst. 2. p. 197.) leaves 3 in a whorl, ovate, spreading, glandularly ciliated; branches hairy; flowers terminal, sessile, by threes, erect; calycine segments foliaceous, downy. ♄. G. Native of the Cape of Good Hope. Flowers red, small, campanulate. Stigma peltate, much exserted.

Twiggy Heath. Fl. July, Nov. Clt. 1818. Shrub 1 ft.

129 E. complana'ta (Nois. et Spreng. syst. 2. p. 196.) branches flexuous; leaves 3 in a whorl, linear, stiff, glandularly ciliated while young, spreadingly reflexed; flowers terminating the small branches, the whole forming a branched raceme; calyx adpressed, coloured, clammy; corolla bell-shaped or subrotate. ♄. G. Native of the Cape of Good Hope. Corollas yellow. Style inclosed.

Flat-flowered Heath. Fl. May, July. Clt. 1820. Shrub 2 feet.

130 E. anthìna (Spreng. syst. 2. p. 196.) branches hispid; leaves linear, obtuse, 3 in a whorl, glabrous; flowers terminal, usually by threes, drooping; bracteas close to the calyx, inflated; corolla wide, campanulate; anthers mutic. ♄. G. Native of the Cape of Good Hope. E. flórida, Lodd. bot. cab. 234. Flowers purplish-red. Style a little exserted.

Flowery Heath. Fl. April, July. Clt. 1800. Shrub.

131 E.? spa'rsa (Bedf. eric. wob. p. 23.) leaves 3 in a whorl, glabrous? flowers terminal; bracteas approximate and remote from the calyx; corollas small, bell-shaped, with deep spreading segments; anthers a little exserted. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1467. Flowers purplish-red. Style exserted.

Scattered Heath. Fl. April. Clt.? Shrub.

132 E. passerìna (Lin. suppl. 221. Thunb. diss. no. 16. prod. 70.) leaves 3 in a whorl, ovate, glabrous; flowers terminal, almost solitary; pedicels and calyxes tomentose; corolla campanulate; style exserted. ♄. G. Native of the Cape of Good Hope. Montin. in. nov. act. ups. 2. p. 289. t. 9. f. 1. E. passerinæfòlia, Sal. in Lin. trans. 6. p. 332.—Petiv. gen. t. 3. f. 7. Corolla 2½ lines long; pericarp tomentose.—Perhaps a species of *Ceràmia*.

Sparrow-wort-like Heath. Fl. Winter and Spring. Clt. 1808. Shrub.

* * *Leaves 3 in a whorl. Corollas urceolate.*

133 E. erioce'phala (Andr. heath. 2. t. 37.) leaves 3 in a whorl, and are as well as the calyxes and corollas woolly; bracteas remote and approximating the calyx; anthers a little exserted; flowers terminal, umbellate; corolla urceolate, ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1270. E. canéscens, Ait. hort. kew. 2. p. 407. E. gnaphalioìdes, Hortul. Flowers with a purplish-red calyx, and a white corolla. Style exserted.

Woolly-headed Heath. Fl. May, Aug. Clt. 1790. Shrub.

134 E. tubercula'ris (Sal. in Lin. trans. 6. p. 330.) leaves 3 in a whorl; flowers terminal; corolla 1⅓ line long, rough from tubercles, with a globose tube; filaments mutic; pericarp on a long stipe. ♄. G. Native of the Cape of Good Hope. Erìca inclyta, Sol. mss. Anthers minute, smooth. Flowers purple.

Tubercular-flowered Heath. Fl. Feb. Aug. Clt. 1790. Shrub.

135 E. cilia'ris (Lin. spec. ed. 1. p. 354. Loefl. res. p. 138. Lin. diss. no. 39. with a figure of the flower) leaves 3 in a whorl, ovate, glandularly ciliated, spreading, rather remote; flowers terminal, subracemose, secund; calycine segments spatulate, ciliated; bracteas approximating the calyx, sessile; corolla smooth, ovate, more ventricose on the upper side. ♄. H. Native of Portugal; and Cornwall. Wendl. eric. 7. p. 3. Curt. bot. mag. 484. Ait. hort. kew. 2. p. 394. Lodd. bot. cab. 1805. Corolla 4 lines long, pale red. Style exserted.

Ciliated-leaved Heath. Fl. Aug. Sept. Britain. Shrub 1 foot.

136 E. absinthoìdes (Lin. mant. p. 66.) leaves 3-4 in a whorl, linear, scabrous, more or less ovate, rather remote; flowers twin, terminal on axillary branches, drooping; calyx and corollas glabrous; bracteas remote from the calyx, leaflike; corolla globose, viscid; stamens exserted. ♄. G. Native of the Cape of Good Hope. E. virgulàris α, Salisb. in Lin. trans. 5. p. 324. E. virgàta and E. virgulàta, Wendl. E. exsérta, Hort. Corollas white, with a red apex.

Wormwood-like Heath. Fl. March, July. Clt. 1792. Shrub 1½ foot.

137 E. hispídula (Lin. suppl. p. 222.) leaves 3 in a whorl, ovate-roundish, ciliated, rather remote; flowers axillary and terminal, usually solitary, erect; corolla urceolate, viscid. ♄. G. Native of the Cape of Good Hope. E. híspida, Thunb. diss. no. 20. E. virgàta hírta, Wendl. eric. 13. p. 35. E. virgulàris, δ, Sal. in Lin. trans. 6. p. 324. Flowers terminating the small branches, reddish-purple. Bracteas remote from the calyx. Style exserted. Perhaps a species of *Ceràmia*.

Small-hispid Heath. Fl. Spring. Clt. 1791. Shrub 1 ft.

138 E. carne'ola (Bedf. eric. wob. p. 5.) leaves 3 in a whorl, scattered; pedicels bracteate; flowers terminal, umbellate; corolla oblong-ovate. ♄. G. Native of the Cape of Good Hope. Corollas purplish-red. Nearly allied to *E. Sainsburyàna* in habit. Style exserted.

Flesh-coloured-flowered Heath. Fl. Aug. Clt. 1810. Shrub.

139 E.? Cólleter (Spreng. syst. 2. p. 192.) branches straight, hairy; leaves linear-oblong, obtuse, revolute, rather hispid, spreading; flowers axillary, drooping, clammy; corolla urceolate; style exserted; stigma peltate. ♄. G. Native of the Cape of Good Hope.

Colleter Heath. Shrub.

* * * *Leaves 4 in a whorl. Corollas campanulate.*

140 E. odora'ta (Andr. heath. 3. t. 64.) leaves 4 in a whorl, glandularly ciliated, spreading; flowers terminal, umbellately verticillate, drooping; pedicels coloured; bracteas remote from the calyx; corolla campanulate, viscid. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 633. Sims, bot. mag. 1399. Corolla white, very like those of some species of *Andrómeda*. Style inclosed.

Sweet-scented Heath. Fl. April, July. Clt. 1804. Shrub 1 to 2 feet.

141 E. prope'ndens (Andr. heath. 2. t. 45. Sims, bot. mag. 21408.) downy; leaves 4 in a whorl, short, ciliated; branches flexuous; bracteas approximating the calyx; flowers terminal, solitary or by threes; corolla bell-shaped. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 63. Calycine segments jagged or serrated. Corolla purple, or deep red. Style inclosed.

Propendent-flowered Heath. Fl. July, Oct. Clt. 1800. Shrub 1 foot.

142 E. palu'stris (Andr. heath. 2. t. 46.) leaves 4 in a whorl, linear, obtuse, downy; flowers terminal, umbellate; bracteas

remote from the calyx; corollas cylindrically bell-shaped; anthers a little exserted. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. t. 4. Branches divaricate. Corollas reddish-purple.

Marsh Heath. Fl. April, June. Clt. 1799. Shrub 1 ft.

143 E. visca'ria (Andr. heath. 1. t. 43.) leaves 4 in a whorl, linear, glabrous, spreading; flowers axillary, disposed in verticillate spikes or racemes, drooping; corolla campanulate, clothed with clammy down; bracteas approximating the calyx, sessile; calycine segments ciliated; fruit silky. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 726. Icon. pl. kew. t. 1. E. víscida, Sal. in Lin. trans. 6. p. 372. Corolla pale purplish-red, 3 lines long, with a cup-shaped ribbed tube. Style inclosed.

Var. α, *incàna;* leaves hoary, $1\frac{1}{2}$ to 3 lines long. ♄. G. E. viscària, Thunb. diss. no. 40. Lin. mant. 321. diss. no. 45. with a figure.

Var. β, *glàbra;* leaves green, 3-5 lines long. ♄. G. E. viscària, Andr. heath. 1. t. 43. Icon. pl. kew. t. 1.

Clammy Heath. Fl. April and Autumn. Clt. 1774. Shrub 2 feet.

144 E. pyramidifórmis (Wendl. ex Spreng. syst. 2. p. 198.) leaves linear, hispid, spreading, 4 in a whorl; flowers terminal, usually by threes, erect; calyxes adpressed, hispid; stigma quadrifid. ♄. G. Native of the Cape of Good Hope. Flowers purplish-red, campanulate.

Pyramid-formed Heath. Fl. Sept. Dec. Clt. 1818. Shrub 2 feet.

145 E. nidicula'ria (Lodd. bot. cab. 764.) glabrous; leaves 4 in a whorl, short, obtuse; flowers terminal, umbellate; bracteas remote from the calyx; corolla cup-shaped; style exserted; anthers mutic. ♄. G. Native of the Cape of Good Hope. Flowers white.

Nest-like-flowered Heath. Fl. Oct. Clt. 1809. Shrub 1 to 2 feet.

146 E. be'lla (Lodd. bot. cab. 307. Spreng. syst. 2. p. 197.) leaves 4 in a whorl, linear, filiform, smoothish, spreading, incurved at the apex; pedicels terminal, racemose, hispid, erect; calyx reflexed: style filiform; corolla campanulate; anthers mutic. ♄. G. Native of the Cape of Good Hope. E. pulchélla, Hortul. Flowers red. Style exserted.

Beautiful Heath. Fl. Jan. Oct. Clt. 1800. Shrub 1 ft.

147 E. styla'ris (Spreng. syst. 2. p. 198.) leaves 4 in a whorl, linear, obtuse, much spreading, and are as well as the branches hispid; flowers terminal, glomerate, erectish; calyxes coloured, spreading, ciliated; corolla campanulate; style much exserted: stigma capitate. ♄. G. Native of the Cape of Good Hope. Anthers mutic.

Long-styled Heath. Fl. May, Aug. Clt. 1812. Shrub 2 feet.

148 E. juba'ta (Lodd. bot. cab. icon.) leaves 4 in a whorl, linear, filiform, rather clammy, incurvedly spreading; pedicels terminal, corymbose, hispid; calyx tetragonal, coloured, serrulated; corolla campanulately rotate; anthers mutic. ♄. G. Native of the Cape of Good Hope.

Bearded Heath. Fl. June, Oct. Clt. 1816. Shrub.

149 E. Consta'ntia (Bedf. eric. wob. p. 6.) leaves 4 in a whorl; flowers terminating the branches; bracteas remote from the calyx; corolla bell-shaped. ♄. G. Native of the Cape of Good Hope. Style exserted.

Constantia Heath. Clt. 1810. Shrub 2 feet.

150 E. conge'sta (Wendl. eric. fasc. 17. p. 75.) leaves 4 in a whorl, linear, pilose, spreading; flowers axillary, capitate, drooping; calyx foliaceous, imbricate, toothed; corolla campanulate, open; bracteas sessile; anthers mutic. ♄. G. Native of the Cape of Good Hope. Flowers white. Style exserted.

Crowded-flowered Heath. Fl. July. Clt. 1820. Shrub 1 foot.

* * * * *Leaves 4 in a whorl. Corollas urceolate.*

151 E. flexicau'lis (Dry. in hort. kew. 2. p. 395.) leaves linear, 4 in a whorl, spreading, oblong, glandularly ciliated; flowers terminal, umbellate; calyxes coloured, glandularly ciliated. ♄. G. Native of the Cape of Good Hope. E. glandulòsa, Andr. heath. 2. t. 58. but not of Thunb. Corollas purple, urceolate. Style inclosed.

Bent-stemmed Heath. Fl. May, Jan. Clt. 1800. Shrub $\frac{1}{2}$ foot.

152 E. perla'ta (Hortul. ex Bedf. hort. eric. wob. p. 18.) leaves 4 in a whorl; flowers terminal, umbellate; bracteas remote from the calyx; corolla globose; anthers a little exserted, mutic. ♄. G. Native of the Cape of Good Hope. Corolla reddish-purple; anthers reddish-orange. Style exserted.

Broad-flowered Heath. Fl. Spring and Autumn. Clt. 1810. Shrub.

153 E. crucifórmis (Andr. heath. vol. 4. icon.) leaves 4 in a whorl, linear, glabrous, spreading; flowers terminal, by fours, decussate; corolla urceolate; anthers mutic. ♄. G. Native of the Cape of Good Hope. Flowers purple. Style inclosed.

Cross-formed Heath. Fl. April, Nov. Clt. 1800. Shrub 1 foot.

154 E. mellífera (Hort. ex Link. enum. 1. p. 370.) leaves 4 in a whorl, linear, hairy, spreading, rather remote; flowers terminal, aggregate; calyxes foliaceous; corolla campanulate; anthers mutic; style capitate, exserted. ♄. G. Native of the Cape of Good Hope. Branches hairy. Corollas purple. Anthers exserted, awned.

Honey-bearing Heath. Shrub.

155 E. Sícula (Schonberg, in Linnæa. 2. p. 614.) leaves 4 in a whorl, petiolate, linear, nearly terete, canescent; flowers terminal, on long pedicels, subumbellate, canescent, erect; calycine segments and bracteas membranous, coloured, about equal in length to the corolla: corollas ovate-oblong, downy. ♄. H. Native of Sicily. Flowers red.

Sicilian Heath. Fl. April, June. Clt. 1819. Shrub 2 to 3 feet.

156 E. aggrega'ta (Wendl. eric. fasc. 13. p. 11.) leaves 4 in a whorl, linear, hairy, spreading; flowers terminating the small branches; bracteas remote from the calyx; corolla globose, downy, with an erectish limb. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1678. Flowers purplish-red the whole forming branched racemes. There is also a white-flowered variety of this. Style exserted.

Aggregate-flowered Heath. Fl. June, July. Clt. 1820. Shrub 1 foot.

* * * * * *Leaves 5-6 or more in a whorl. Corollas campanulate.*

157 E. decòra (Andr. heath. 3. t. 66. Ait. hort. kew. t. 392.) leaves 6 in a whorl, elongated, recurved; flowers axillary, mutant, disposed in spikes or racemes; bracteas remote from the calyx; corolla campanulate; anthers a little exserted. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1383. E. spiràlis, Hortul. Flowers pale red.

Graceful Heath. Fl. Nov. Jan. Clt. 1790. Shrub 2 feet.

158 E. Beaumontia'na (Roll. Lodd. bot. cab. 1686.) glabrous; leaves linear, 5-6 in a whorl; flowers axillary and terminal, drooping; pedicels many-bracteate; corolla campanulate; style a little exserted. ♄. G. Native of the Cape of Good Hope. Corollas white. Allied to *E. propéndens.*

Beaumont's Heath. Fl. June. Clt. 1820. Shrub 1 foot.

* * * * * * *Leaves 5-6 in a wkorl. Corolla urceolate.*

159 E. cerinthoìdes (Lin. spec. ed. 2. p. 505. diss. no. 43.

with a figure) leaves 5-6 in a whorl, linear-lanceolate, pilose and ciliated, bearded at the apex; flowers terminal, capitate, drooping; corolla oblong, with an inflated tube, clothed with viscid hairs outside; bracteas sessile, larger than the calyx; segments of calyx cuneated. ♄. G. Native of the Cape of Good Hope. Andr. heath. 1. t. 50. Curt. bot. mag. t. 220. Lodd. bot. cab. 1679. Berg. pl. cap. p. 104.—Breyn. cent. p. 25. t. 13. Wendl. eric. 7. p. 9. with a figure. E. crinifòlia, Sal. in Lin. trans. 6. p. 367. Corollas scarlet or crimson, 8-10 lines long. There are several trifling varieties of this species in the gardens.

Cerinthe-like Heath. Fl. May, Nov. Clt. 1774. Shrub.

§ 4. *Anthers corniculate. Leaves 3 or 4 in a whorl.*

160 E. magnífica (Andr. heath. vol. 4. icon.) leaves 3 in a whorl; flowers terminal by threes or fours; corollas ovate; bracteas remote from the calyx; anthers corniculate. ♄. G. Native of the Cape of Good Hope. Flowers purplish-red. Style inclosed.

Magnificent Heath. Fl. Aug. Nov. Clt. 1800. Shrub 2 feet.

161 E. Savillea'na (Bedf. hort. eric. wob. p. 22.) leaves 4 in a whorl, linear, glabrous, erect; peduncles loosely racemose, axillary; calyx foliaceous, narrow; corollas globose-oblong; anthers corniculate. ♄. G. Native of the Cape of Good Hope. E. Savíllea, Andr. heath. 3. t. 27. E. Savíllii, Lodd. bott. cab. 96. Flowers red, or purplish-red. Style inclosed.

Countess of Scarborough's Heath. Fl. April. Sept. Clt. 1800. Shrub 1 foot.

162 E. tene'lla (Andr. heath. 2. t. 31.) leaves 4 in a whorl, glabrous; flowers terminal by fours; corollas urceolate; anthers corniculate. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 375. Flowers small, pale purplish-red. Style inclosed.

Delicate Heath. Fl. Year. Clt. 1791. Shrub ½ foot.

163 E. gra'cilis (Andr. heath. 1. t. 2.) stem and branches glabrous; leaves glabrous, 4 in a whorl, linear; flowers terminal; corolla ovate-globose, or urceolate; anthers corniculate. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 244. Flowers small, purplish-red. Style inclosed.

Slender Heath. Fl. Feb. May. Clt. 1774. Shrub.

164 E. præ'cox (Bedf. hort. eric. p. 19. Lodd. bot. cab. 1413.) leaves 4 in a whorl, acicular, spreading; flowers small, globosely bell-shaped, disposed in terminal racemose fascicles; bracteas remote from the flower; anthers corniculate. ♄. G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style exserted.

Early Heath. Fl. March. Clt. 1820. Shrub ½ foot.

165 E. fimbria'ta (Andr. heath. 3. t. 23.) leaves 3-4 in a whorl; flowers terminal, capitate; corolla globose; bracteas imbricated, ciliated; anthers corniculate, a little exserted. ♄. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1047. Flowers red.

Fringed Heath. Fl. March, May. Clt. 1806. Shrub 1 foot.

166 E. seta'cea (Andr. heath. 1. t. 24.) leaves 3 in a whorl; flowers terminal; corolla globose, bell-shaped; bracteas remote from the calyx; anthers corniculate. ♄. G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style exserted.

Setaceous-leaved Heath. Fl. Aug. Oct. Clt. 1796. Shrub 1 foot.

† *Species, not known to which genera of the Normal Ericeæ they belong.*

167 E. lavandulæfòlia (Sal. in Lin. trans. 6. p. 332.) stem hoary; leaves 3 in a whorl, hoary?; flowers terminal; bracteas close to the calyx; corollas 2 lines long, with a 4-angled tube, and an incurved limb; filaments very broad at the base; anthers inclosed, mutic. ♄. G. Native of the Cape of Good Hope.

Lavender-leaved Heath. Fl. May, Aug. Clt. 1795. Shrub.

168 E. cristæflòra (Sal. in Lin. trans. 6. p. 332.) leaves 3 in a whorl; flowers terminal; calyx 4-toothed; corolla 2 lines long, having the limb 3 times longer than the tube, entire at the base; anthers mutic, inclosed; pericarp smooth. ♄. G. Native of the Cape of Good Hope. Erìca melanthèra, Thunb. diss. no. 12. but not of Lin. Perhaps a species of *Lophándra*.

Crest-flowered Heath. Fl. May, June. Clt. 1803. Shrub.

169 E. cumuliflòra (Sal. in Lin. trans. 6. p. 336.) leaves 3 in a whorl; fascicles 7-12-flowered, terminal; calyx hoary; corolla 2½ lines long, having the limb ciliated at bottom; anthers mutic, inclosed; pericarp hairy; stigma narrow. ♄. G. Native of the Cape of Good Hope. Erìca aggregàta, Roxb. mss. —Perhaps a species of *Lampròtis*. Flowers purplish-red.

Heap-flowered Heath. Fl. May, Sept. Clt.? Shrub.

170 E. genistæfòlia (Sal. in Lin. trans. 6. p. 337.) flowers terminal, by threes; calyx viscid; corolla 2 lines long, having the limb ciliated at bottom; anthers mutic, inclosed; pericarp smooth; stigma broad. ♄. G. Native of the Cape of Good Hope. Erìca tetráloba, Roxb. mss.—Perhaps a species of *Lampròtis*.

Genista-leaved Heath. Fl. June, Dec. Clt.? Shrub 1 foot.

171 E. periplocæflòra (Sal. in Lin. trans. 6. p. 337.) leaves 3 in a whorl, lanceolate-cuneated; flowers terminal, on long pedicels; calyxes short, orbicular; corolla 1-2 lines long; anthers appendiculate, inclosed; stigma narrow. ♄. G. Native of the Cape of Good Hope. Flowers deep purple. Filaments with short cuneated spurs.—Perhaps a species of *Lampròtis*.

Periploca-flowered Heath. Fl. May, Dec. Clt. 1812. Shb.

Cult. Elegant shrubs when in blossom, like all the other genera of the order. Turfy peat, mixed with sand, is the best soil for the species; and young tops root readily, if planted in a pot of sand in spring, with a bell-glass over them, in a moderate heat. When the plants have grown a considerable size, the balls of earth should be raised a little above the surface, so as to prevent water from remaining at the top of the stem, and the pots in which they are grown should be well drained.

II. GYPSOCA'LLIS (from γυψος, *gypsos*, lime, and καλλιστος, *kallistos*, most beautiful; the plants are very elegant, and generally inhabit calcareous districts). Sal. mss. D. Don, in edinb. phil. journ. 17. p. 153.—Erìca species of authors.

Lin. syst. *Octándria*, *Monogýnia*. Calyx 4-parted, glumaceous, naked at the base. Corolla campanulate, or short-tubular, with a dilated mouth. Stamens exserted; filaments flattened or filiform; anthers bipartite; having the cells mutic at the base, distinct and substipitate, dehiscing by an oblique pore. Stigma simple. Capsule 4-celled, many-seeded.—Small shrubs, natives of Europe and Africa, with whorled acerose leaves, and lateral or terminal crowded flowers. This genus is easily distinguished from *Erìca* in the exserted anthers, flattened filaments, and simple stigma.

§ 1. *Anthers mutic at the base, that is, without any horns, awns, or spurs.*

* *Leaves 4 in a whorl. Corollas campanulate.*

1 G. va'gans (Salisb. mss. ex Don, in edinb. phil. journ. 17. p. 153.) leaves 4-5 in a whorl, glabrous; flowers axillary, racemose; bracteas remote from the calyx; pedicels usually twin; corolla short, campanulate. ♄. H. Native of England, in Cornwall; and of the south of France and north of Africa.

E. vàgans, Lin. mant. 2 p. 230. syst. 370. Smith, eng. bot. t. 3. E. vàga, Sal. in Lin. trans. 6. p. 344. E. multiflòra, Huds. angl. 166. Bull. fl. par. t. 203. E. dídyma, Stokes, in With. arrang. 400. E. purpuráscens, Lam. dict. 1. p. 488. Flowers small, pale, purplish-red, in the axils of the leaves, which are contiguous. Stem glabrous.

Var. β, álba; flowers axillary, white.

Var. γ, tenélla; flowers white, terminating the small branches.

Var. δ, pállida; flowers pale red.

Common Cornish Heath. Fl. July, Sept. Britain. Shrub 1 foot.

2 G. PURPURA'SCENS (D. Don, in edinb. phil. journ. 17. p. 153.) leaves 3-4 in a whorl, linear, glabrous; flowers axillary; corollas tubular or campanulate; anthers deeply bifid; calycine segments awl-shaped. ♄. H. Native of the south of Europe. Erìca purpuráscens, Lin. spec. 503. Seg. veron. 280. Thunb. mon. no. 44. Flowers pale purplish-red.

Purplish-flowered Moor-Heath. Shrub 1 to 2 feet.

3 G. RASTE'LLUM; branches flexuous, hispid; leaves linear, in fascicles, reflexed; flowers terminal, tetragonal, drooping a little; calyxes coloured, adpressed; corolla campanulate. ♄. G. Native of the Cape of Good Hope. Erìca rastéllum, Spreng. syst. 2. p. 196.

Rastellum Moor-Heath. Shrub.

4 G. MICROSTÒMA; leaves 4 in a whorl, clothed with woolly hairs, linear, hispidly ciliated, spreading; flowers axillary, pedicellate, aggregate; corolla campanulate. ♄. G. Native of the Cape of Good Hope. Erìca microstòma, Berg. pl. cap. p. 97. Flowers purplish-red.

Small-mouthed Moor-Heath. Fl. Aug. Nov. Clt. 1810. Shrub.

5 G. PILÒSA; leaves 3-4 in a whorl, linear, spreading, pilose; flowers terminal, few, villous, pedicellate, erect; bracteas remote from the calyx, spreading, very villous; corollas campanulate. ♄. G. Native of the Cape of Good Hope. Erìca pilòsa, Lodd. bot. cab. 606. Flowers greenish-yellow.

Pilose Moor-Heath. Fl. May, July. Clt. 1800. Shrub 1 foot.

** *Leaves 4-5 in a whorl. Corollas urceolate.*

6 G. MULTIFLÒRA (D. Don, in edinb. phil. journ. July, 1834.) leaves 4-5 in a whorl, glabrous, linear; flowers axillary, disposed in a racemose corymb; bracteas remote from the calyx; corolla with an urceolar tube, or ovate bell-shaped; holes of anthers near the apex. ♄. H. Native of the south of Europe. Erìca multiflòra, Lin. spec. ed. 1. p. 355. diss. no. 58. with a figure of the flower. Andr. heath. 2. t. 57. Ait. hort. kew. 2. p. 367. Lodd. bot. cab. 1572. E. juniperifòlia, &c. Garid. aix. p. 160. t. 32. E. multiflòra longipedicellàta, Wendl. eric. fasc. 5. p. 7. E. pedunculàris, Presl. Corolla 1½ to 2 lines long, pale red, campanulate, with a reflexed limb; anthers black. Pedicels twice longer than the corolla.

Many-flowered Moor-Heath. Fl. Oct. Feb. Clt.

7 G. CA'RNEA (D. Don. l. c.) leaves 3-4 in a whorl, linear, glabrous; flowers axillary, drooping, disposed in secund racemes; bracteas remote from the calyx; corolla with a pyramidal tube; anthers foraminose from the middle. ♄. H. Native of the South of Germany and Switzerland, and the north of Wales. Erìca cárnea, Lin. spec. ed. 2. p. 504. Curt. bot. mag. t. 11. Jacq. fl. austr. 1. p. 21. f. 31. Scop. fl. carn. ed. 2. vol. 1. p. 275. Lodd. bot. cab. 1452. Erìca herbàcea, Lin. diss. no. 57. with a figure; spec. ed. 2. p. 501. Wendl. eric. 9. p. 7. with a figure. Erìca saxátilis, Sal. in Lin. trans. 6. p. 343. Flowers pale red. Corollas conical, 2½ lines long. Leaves sharply reduplicate.

Flesh-coloured-flowered Moor-Heath. Fl. Jan. April. Clt. 1763. Shrub ½ foot.

8 G. MEDITERRA'NEA (D. Don, l. c.) leaves 4-5 in a whorl, linear-cuneated, glabrous; flowers axillary, racemose, secund, nutant; bracteas above the middle of the pedicels; corolla urceolar; anthers foraminose from the middle. ♄. H. Native of the south of Europe, in the region of the Mediterranean; and of Ireland, &c. Erìca Mediterrànea, Lin. mant. p. 229. diss. no. 59. with a figure of the flower. Wendl. eric. 7. p. 11. Curt. bot. mag. 471. Erìca lugùbris, Sal. in Lin. trans. 6. p. 343. Flowers red, with dark anthers. Corolla 1½ to 2 lines long.

Mediterranean Moor-Heath. Fl. March, May. Ireland. Shrub 4 to 6 feet.

9 G. HORIZONTA'LIS; leaves 4 in a whorl, linear, spreading; flowers terminal, sessile, usually by threes, drooping; calycine segments spatulate, serrated; corolla conical. ♄. G. Native of the Cape of Good Hope. Erìca horizontàlis, Andr. heath. 2. t. 52. Flowers white, with brown anthers.

Horizontal Moor-Heath. Fl. July, Sept. Clt. 1800. Shrub 1 to 1½ foot.

10 G. PROCU'MBENS; leaves 4 in a whorl, linear, spreading, glabrous; flowers terminal, subaggregate, villous; bracteas remote from the calyx; corolla globosely ovate. ♄. G. Native of the Cape of Good Hope. Erìca procúmbens, Lodd. bot. cab. 1993. Flowers reddish-purple.

Procumbent Moor-Heath. Fl. June, July. Clt. 1800. Shrub procumbent.

11 G. HÍSPIDA; leaves 4 in a whorl, hispidly ciliated, linear, spreading, obtuse; flowers terminal, racemose, pendulous; bracteas remote from the calyx; corolla urceolate, globose. ♄. G. Native of the Cape of Good Hope. Erìca híspida, Andr. heath. 2. t. 56. Lodd. bot. cab. 1982. Corollas red.

Hispid Moor-Heath. Fl. July, Nov. Clt. 1791. Shrub 2 feet.

12 G. FLE'XILIS; branches villous; leaves 4 in a whorl, beset with glandular hairs; flowers axillary, racemose, drooping: pedicels viscid; corolla 1½ line long, with an ovate tube; fruit woolly. ♄. G. Native of the Cape of Good Hope. Erìca racemòsa, Thunb. diss. no. 47. with a figure. Erìca fléxilis, Sal. in Lin. trans. 6. p. 342. Calycine segments ciliated with glands.

Bent Moor-Heath. Shrub.

*** *Leaves 3 in a whorl. Corollas campanulate.*

13 G. MANIPULIFLÒRA (D. Don, l. c.) branches hoary; leaves 3 in a whorl, obtuse, smoothish; flowers disposed in interrupted axillary fascicles; corolla cup-shaped, 1½ line long; anthers erect. ♄. H. Native of Arabia and Greece. Erìca manipuliflòra, Sal. in Lin. trans. 6. p. 344. Sibth. et Smith, fl. græc. t. 352. Erìca verticillàta, Forsk. fl. p. 210. Flowers pale red.

Handful-flowered Moor-Heath. Shrub.

14 G. LANA'TA; leaves 4 in a whorl, woolly; flowers terminal; bracteas sessile, imbricated; corolla short, tubular; calyx very hairy. ♄. G. Native of the Cape of Good Hope. Erìca lanàta, Andr. heath. 3. t. 42. Erìca fláccida, Link, enum. berol. 1. p. 367. Bedf. hort. eric. wob. p. 10. Corollas white, with brown anthers.

Woolly-flowered Moor-Heath. Fl. July, Dec. Clt.? Shrub.

15 G. LEUCANTHE'RA; leaves 3 in a whorl, linear, glabrous, erect; branches twiggy; flowers terminal, drooping; pedicels glabrous; corolla 1 to 1½ line long, funnel-shaped, having the limb quite entire, and length of tube; anthers foraminose near

the apex; calyx glabrous. ♄. G. Native of the Cape of Good Hope. Erìca leucanthèra, Lin. suppl. p. 223. but not of Andr. Erìca spirææflòra, Sal. in Lin. trans. 6. p. 350. Flowers white.

White-anthered Moor-Heath. Fl. Jan. May. Clt. 1803. Shrub.

16 G. Actæ'a; leaves 3 in a whorl, glabrous; flowers terminal on short pedicels; bracteas approximating the calyx; calyx one half shorter than the corolla, with ovate segments, furnished with a green line; anthers exserted, mutic; stigma peltate. ♄. G. Native of the Cape of Good Hope. Erìca Actæ'a, Link. enum. 1. p. 371. but not of Bedf. Corollas purplish.

Actæa-flowered Moor-Heath. Fl. May, June. Clt. 1822. Shrub.

17 G. nígricans; leaves 3 in a whorl, spreading, a little reflexed, linear, glabrous, awned at the apex; flowers terminal, usually by threes; pedicels bracteate, and are as well as the calyx coloured and viscid; corolla campanulately rotate, with a revolute limb. ♄. G. Native of the Cape of Good Hope. Erìca nigrìta, Lodd. bot. cab. t. 54. Flowers white; anthers black.

Blackish Moor-Heath. Fl. June, July. Clt. 1816. Shrub.

18 G. pa'tens; leaves 3 in a whorl, oval-oblong, ciliated, spreading; branches hairy; flowers terminal, usually by threes; calyx coloured, ciliated; corolla campanulately rotate; anthers connivent, scabrous. ♄. G. Native of the Cape of Good Hope. Erìca pàtens, Andr. heath. 2. t. 35. Lodd. bot. cab. 1228. Flowers red.

Spreading-flowered Moor-Heath. Fl. March, June. Clt. 1800. Shrub ½ foot.

19 G. conca'va; leaves 3-4 in a whorl, linear, glabrous, spreading; flowers axillary; corolla campanulate; anthers a little exserted. ♄. G. Native of the Cape of Good Hope. Erìca concàva, Ker. in bot. mag. 2149. Flowers pale red.

Concave-flowered Moor-Heath. Fl. Oct. Dec. Clt. 1800. Shrub.

20 G. acuta'ngula; leaves 3 in whorl, ? linear; flowers terminal, usually by twos or threes; corolla campanulate, with a short tube, and a reflexed limb. ♄. G. Native of the Cape of Good Hope. Erìca acutángula, Lodd. bot. cab. 1868. Flowers white; anthers black, exserted. Bracteas approximating the calyx, sessile.

Acute-angled Moor-Heath. Fl. June, July. Clt. 1810. Shrub.

21 G. melanthe'ra; leaves 3 in a whorl, obtuse, smooth, spreading; flowers terminal, subumbellate, nutant; bracteas remote from the flower; corolla bell-shaped; bracteas and calyxes coloured; stigma obtuse; fruit silky. ♄. G. Native of the Cape of Good Hope. Erìca melanthèra, Lin. mant. 232. Lodd. bot. cab. 867. Erìca lysimachiæflòra, Sal. in Lin. trans. 6. p. 332. Corolla 2 lines long, having the limb twice the length of the tube. Flowers red, with black anthers. Calyx large, and is, as well as the pedicels, coloured.

Black-anthered Moor-Heath. Fl. March, July. Clt. 1803. Shrub.

22 G. thalictriflòra; branches hairy, straight; leaves 3 in a whorl, linear, glabrous, erect; flowers terminal, 2-3 together, erect, almost sessile; bracteas approximating the calyx; corolla short, campanulate, with deep open segments. ♄. G. Native of the Cape of Good Hope. Erìca thalictriflòra, Lodd. bot. cab. t. 1294. Flowers yellow.

Meadow-Rue-flowered Moor-Heath. Fl. March, May. Clt. 1820. Shrub.

**** *Leaves 3 in a whorl. Corollas urceolate.*

23 G. umbella'ta (D. Don, l. c.) branches downy; leaves 3 in a whorl, linear, short, slightly ciliated; flowers terminal, umbellate; bracteas unilateral, pressed to the calyx; corolla pea-shaped, with an 8-angled base; anthers foraminose near the apex. ♄. G. Native of the Cape of Good Hope. Erìca umbellàta, Baur. pl. kew. t. 3. Lin. spec. ed. 2. p. 501. Lœfl. res. p. 138. Andr. heath. 2. t. 40. Wendl. eric. 4. p. 3. with a figure. Lodd. bot. cab. 1217. Erìca lentifórmis, Sal. in Lin. trans. 4. p. 344. Flowers disposed in terminal, umbellate fascicles. Corollas 1½ line long, globosely conical, purplish-red. Anthers black. Calyx glabrous.

Umbellate Moor-Heath. Fl. April, July. Clt. 1782. Shrub 2 to 3 feet.

24 G. villòsa; leaves 3 in a whorl, linear, spreading, villous; flowers axillary or terminal, on long pedicels, drooping, usually by threes; calycine segments ovate, villous; corollas urceolate, with the limb a little connivent. ♄. G. Native of the Cape of Good Hope. Erìca villòsa, Andr. heath. 3. t. 53. Corollas white, with black anthers.

Villous Moor Heath. Fl. June, July. Clt. 1800. Shrub.

25 G. dumòsa; leaves 4 in a whorl, oval, with revolute edges, spreading, hispid; flowers terminal, corymbose, drooping; calyxes adpressed, foliaceous; bracteas close to the calyx; corollas urceolate. ♄. G. Native of the Cape of Good Hope. Erìca dumòsa, Andr. heath. 4. icon. Flowers pale red.

Bushy Moor Heath. Fl. April, May. Clt. 1812. Shrub 1½ foot.

26 G. nudiflòra (D. Don, in edinb. phil. journ. 17. p. 153.) leaves 3 in a whorl, linear-cuneated, ciliated, or slightly hairy, spreading; flowers axillary and terminal, aggregate, erect; corolla ovate-cone-shaped; bracteas minute, remote from the calyx; fruit smooth. ♄. G. Native of the Cape of Good Hope. Erìca nudiflòra, Lin. mant. t. 229. Lodd. bot. cab. 176. Smith, icon. ined. 3. t. 57. Ait. hort. kew. 2. p. 366. Erìca floribúnda, Wendl. eric. 14. p. 19. with a figure. Erìca sertiflòra, Sal in Lin. trans. 6. p. 342. Flowers purplish-red. Corolla 1⅓ line long, with an urceolate tube.

Naked flowered Moor Heath. Fl. July, Nov. Clt. 1783. Shrub 2 feet.

27 G. stami'nea; leaves 3 in a whorl, linear, glabrous, erect; flowers axillary, scattered; bracteas approximating the calyx; corolla subrotate, about equal in length to the calyx; stamens divaricate, much exserted. ♄. G. Native of the Cape of Good Hope. Erìca staminea, Andr. heath. 3. t. 48. Flowers sulphur-coloured.

Long-stamened Moor Heath. Fl. June, Sept. Clt. 1799. Shrub 2 feet.

28 G. tiaræflòra; leaves 3 in a whorl, stiff, spreading, obtuse; flowers terminal, glomerate, drooping; calyx bracteate; corolla covered by the calyx, having the tube dilated at the base; filaments gradually dilated. ♄. G. Native of the Cape of Good Hope. Erìca tiaræflòra, Andr. heath. 3. t. 52. Erìca placentiflòra, Sal. in Lin. trans. 6. p. 348. Plant with pale hoary aspect. Calyx coloured. Flowers red; anthers black.

Turban-flowered Moor Heath. Fl. May, Aug. Clt. 1800. Shrub 2 feet.

29 G. imbrica'ta; leaves 3 in a whorl, linear, erect, imbricated; branches rather hairy; calyx imbricated by bracteas; corolla urceolate, 1 line long, length of calyx; flowers terminal, aggregate, erectish; pericarp gegartoid. ♄. G. Native of the Cape of Good Hope. Erìca imbricàta, Lin. mant. 372. diss.

no. 52. with a figure of the flower, spec. ed. 2. p. 503. Andr. heath. 1. t. 34. Lodd. bot. cab. 1247. Erìca quinquangulàris, Berg. pl. cap. p. 117. Erìca pyramidàlis, Sal. in Lin. trans. 6. p. 349. Flowers small, white or red, with brown anthers.

Imbricated-bractead Moor Heath. Fl. July, Oct. Clt. 1786. Shrub 1 foot.

30 G. squamæflòra; leaves 3 in a whorl, linear; flowers terminal; bracteas scattered above the middle of the pedicels; corolla $\frac{2}{3}$ of a line long, shorter than the calyx; anthers acuminated; fruit broad, ovate. ♄. G. Native of the Cape of Good Hope. Erìca squamæflòra, Sal. in Lin. trans. 6. p. 349. Erìca imbricàta, Roxb. mss. but not of Lin.

Scale-flowered Moor Heath. Fl. March. Dec. Clt. 1796. Shrub 2 feet.

31 G. cæ'sia; leaves 3 in a whorl, short, linear, glabrous; flowers terminal, twin, erect; calyx imbricate by bracteas; corolla campanulate, $\frac{2}{3}$ of a line long, shorter than the calyx; anthers obtuse, with a broad dissepiment; fruit ovate; stigma broadish. ♄. G. Native of the Cape of Good Hope. Erìca cæ'sia, Sal. in Lin. trans. 6. p. 349.

Grey Moor Heath. Shrub.

32 G. flexuòsa; leaves 3 in a whorl, linear, glabrous, erect, short; flowers terminal, usually by threes, erect; bracteas scattered above the middle of the pedicels, imbricate, small; corolla bell-shaped, 1 line long, longer than the calyx, which is coloured; anthers obtuse, with a narrow dissepiment; nectarium large; fruit imbricate. ♄. G. Native of the Cape of Good Hope. Erìca flexuòsa, And. heath. 1. t. 23. Sal. in Lin. trans. 6. p. 349. Lodd. bot. cab. 1495. E. divaricàta, Wendl. eric. 7. p. 5. Flowers white, with red anthers.

Flexuous Moor Heath. Fl. April, July. Clt. 1792. Shrub 1 to 2 feet.

33 G. lascìva; leaves 3 in a whorl, linear; flowers terminal; calyx imbricated by bracteas; corolla $\frac{2}{3}$ of a line long, a little shorter than the calyx; anthers foraminose from the base; stigma peltate. ♄. G. Native of the Cape of Good Hope. Erìca lascìva, Sal. in Lin. trans. 6. p. 349. Erìca imbricàta, Thunb. diss. no. 11.

Wanton Moor Heath. Fl. June, Aug. Clt. 1800. Shrub 1 to 2 feet.

34 G. diotæflòra; leaves 3 in a whorl; flowers axillary at the top of the branches; calycine segments cuneated; corolla $1\frac{1}{2}$ line long, with an urceolate tube; anthers a little exserted; pericarp downy. ♄. G. Native of the Cape of Good Hope. Erìca diotæflòra, Sal. in Lin. trans. 6. p. 342. Erìca pistillàris, Sol. mss.

Two-eared-flowered Moor-Heath. Fl. April, May. Clt. 1795. Shrub.

35 G. stylòsa; leaves 3 in a whorl; flowers terminal; pedicels long, furnished with bracteas near the calyx; corolla 1 line long, a little longer than the calyx; anthers pointed; fruit oval; style very long. ♄. G. Native of the Cape of Good Hope. Erìca stylòsa, Sal. in Lin. trans. 6. p. 350. Erìca bracteàta, Roxb. mss. but not of Lin.

Long-styled Moor Heath. Fl. Jan. Aug. Clt. 1789. Shrub.

36 G. Pohlma'nnii; leaves 3 in a whorl, ? obtuse, imbricated; flowers terminal; corolla with a globose tube, and a 4-parted limb; anthers a little exserted. ♄. G. Native of the Cape of Good Hope. Erìca Pohlmánnii, Lodd. bot. cab. 1852. Flowers pale red, with deep red anthers.

Pohlmann's Moor-Heath. Fl. May. Clt. 1816. Shrub.

37 G. longipedunculà'ta; leaves oval, mucronate, 3 in a whorl, hispid; flowers terminal, umbellate, on long pedicels, pendulous; bracteas remote from the calyx, deciduous; calyxes adpressed; corolla ovate; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca longipedunculàta, Lodd. bot. cab. 103. Flowers large, purple, pedicellate, and are, as well as the calyxes, beset with glandular hairs.

Long-peduncled Heath. Fl. July, Nov. Clt. 1805. Shrub 1 foot.

38 G. roste'lla; leaves 3 in a whorl; flowers terminal; bracteas imbricated; corolla ovate-globose. ♄. G. Native of the Cape of Good Hope. Erìca rostélla, Bedf. eric. wob. p. 21. Flowers white.

Small-beaked Moor-Heath. Fl. April. June. Clt. 1810. Shrub 1 to 2 feet.

39 G. pelta'ta; leaves 3 in a whorl; flowers terminal; bracteas remote from and approximating the calyx; corolla round, with deep, loose segments. ♄. G. Native of the Cape of Good Hope. Erìca peltàta, Andr. heath. 4. icon. Erìca exsérta, Bedf. eric. wob. p. 9. Flowers pale purplish-red.

Peltate Moor-Heath. Fl. Spring, Autumn. Clt. 1810. Shrub 1 to 2 feet.

§ 2. *Anthers corniculate. Aberrant species.*

* *Leaves 3 in a whorl. Corollas campanulate.*

40 G. articula'ris; leaves 3 in a whorl, glabrous; flowers terminal, umbellate; bracteas remote from the calyx; anthers corniculate; corollas slender, campanulate. ♄. G. Native of the Cape of Good Hope. Erìca articulàris, Bedf. hort. eric. wob. p. 2. but not of Thunb. nor Curt. Flowers reddish-purple.

Jointed Moor-Heath. Shrub.

41 G. Loddige'sii; leaves 3 in a whorl, downy; flowers terminal; bracteas approximating the calyx, sessile; corolla campanulate, with deep segments; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca concàva, Lodd. bot. cab. 134. but not of Ker. Flowers pale purplish-red, spreading. Probably a species of *Erìca*.

Loddiges's Heath. Fl. Oct. Dec. Clt. 1824. Shrub 1 to 2 feet.

42 G. interte'xta; leaves 3 in a whorl, ciliated with long hairs; flowers sessile; bracteas approximating the calyx, which is ciliated; corolla round, campanulate; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca intertéxta, Lodd. bot. cab. 1034. Flowers yellow. Anthers black.

Interwoven-leaved Moor-Heath. Fl. June, July. Clt. 1818. Shrub $1\frac{1}{2}$ foot.

43 G. panicula'ta; leaves 3 in a whorl, linear, triquetrous, glabrous; branches tomentose; flowers terminal, by threes; corolla $\frac{2}{3}$ of a line long, campanulate, having the segments imbricate at the base; spurs of anthers linear, smooth; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca paniculàta, Lin. spec. ed. 2. p. 508. Lodd. bot. cab. 1194. Erìca millefiòra, Berg. pl. cap. p. 96. Sal. in Lin. trans. 6. p. 350. Flowers red. There is also a white-flowered variety of the species.

Panicled-flowered Moor-Heath. Fl. Feb. April. Clt. 1774. Shrub.

44 G. Bedfordia'na; leaves 3 in a whorl; flowers terminal; bracteas remote from the calyx; corolla bell-shaped; anthers awned, exserted, as well as the style. ♄. G. Native of the Cape of Good Hope. Erìca mellífera, Bedf. eric. wob. p. 15.

Duke of Bedford's Gypsocallis. Fl. Spring. Clt. 1812. Shrub.

** *Leaves 3 in a whorl. Corollas urceolate.*

45 G. fra'grans; glabrous; leaves opposite, or 3 in a whorl,

subulate; flowers terminal or lateral, usually by twos; corolla campanulate, with a revolute limb; anthers exserted, black, mutic. ♄. G. Native of the Cape of Good Hope. Erìca fràgrans, Ker, in bot. mag. 2181. Flowers pale red, with blackish anthers. Perhaps a species of *Lamprótis*.

Fragrant Moor-Heath. Fl. Spring. Clt. 1803. Shrub.

46 G. nigrìta (D. Don, in edinb. phil. journ. 17. p. 153.) leaves 3 in a whorl, linear, triquetrous, glabrous, shining, spreading; flowers terminal, usually by threes; pedicels pilose, with broad imbricating bracteas, which are coloured like the calyx; corolla globosely bell-shaped, or urceolar, with a revolute limb; fruit tomentose. ♄. G. Native of the Cape of Good Hope. Erìca nigrìta, Lin. diss. mant. 65. Thunb. diss. no. 53. Andr. heath. 1. t. 32. Wendl. eric. fasc. 12. p. 11. with a figure. Erìca larícina, Berg. pl. cap. p. 94. E. volutæflòra, Sal. in Lin. trans. 6. p. 335.—Seb. thes. 2. p. 11. t. 9. f. 7. Sides of calyx recurved at top. Corolla white, with black corniculate anthers.

Black-anthered Moor-Heath. Fl. April, July. Clt. 1790. Shrub 1 foot.

47 G. lyrígera; leaves 3 in a whorl, shining, linear, trigonal; flowers terminal; corolla urceolate, with a recurved limb; spurs of anthers serrated; anthers lyræform, hairy; fruit tomentose. ♄. G. Native of the Cape of Good Hope. Erìca lyrígera, Sal. in Lin. trans. 6. p. 336. Erìca nigrìta, Roxb. but not of Sal. Flowers white, with black anthers.

Lyre-bearing Moor-Heath. Fl. Feb. May. Clt. 1790. Shrub.

* * * *Leaves 4 in a whorl. Corollas campanulate.*

48 G. cistifòlia; leaves 4 in a whorl, beset with glandular hairs; flowers terminal; bracteas remote from the calyx; corolla bell-shaped, with reflexed segments; anthers subcorniculate. ♄. G. Native of the Cape of Good Hope. Erìca cistifòlia, Link. enum. 1. p. 369. Bedf. eric. wob. p. 5. Corollas white. Calyx hairy.

Cistus-leaved Moor-Heath. Fl. April, May. Clt. 1823. Shrub 1 to 2 feet.

49 G. expròmpta; leaves 4 in a whorl, linear, spreadingly reflexed, hairy, bearded at the apex; branches woolly; flowers aggregate, terminal, drooping; corolla campanulate; anthers awned or corniculate. ♄. G. Native of the Cape of Good Hope. Erìca exprómpta, Spreng. syst. 2. p. 195.

Drawn-out-anthered Moor-Heath. Fl. April, Sept. Clt. 1811. Shrub 1 to 2 feet.

Cult. See *Erìca*, p. 800. for culture and propagation of the greenhouse species; and *Callùna*, p. 828, for those of the hardy kinds.

III. BLÆ'RIA

(named after Patrick Blair, M.D. F.R.S. He practised medicine at Boston in Lincolnshire, and was author of Miscellaneous Observations in 1718, and Botanic Essays in 1720, &c.) Lin. gen. 139. Juss. gen. 160. D. Don, in Edinb. phil. journ. 17. p. 157. Erìca species, Sal. in Lin. trans.

Lin. syst. *Tetra-Pentándria Monogýnia.* Calyx 4-parted. Corolla short-tubular, with a 4-cleft limb. Stamens 4-6, inserted in the receptacle; filaments linear, flattened, glabrous; anthers bipartite; cells of anthers attenuated at the base, mutic, dehiscing by an oblong hole. Stigma simple, obtuse. Capsule 4-celled, many-seeded.—Much branched shrubs, natives of the Cape of Good Hope. Leaves verticillate, with revolute margins. Flowers terminal, glomerate.

Anthers mutic.

1 B. ericoìdes (Lin. spec. 162.) leaves 4 in a whorl, oblong, obtuse, ringed; bracteas 3, length of calyx; stamens 4-5, exserted. ♄. G. Native of the Cape of Good Hope. Erìca Blæ'ria, Thunb. prod. 72. Wendl. coll. 1. p. 73. p. 25. Lodd. bot. cab. 85. Erìca dumòsa, Sal. in Lin. trans. p. 341. Erìca Blæ'ria rùbra, Hortul.—Petiv. gaz. 471. t. 2. f. 10. Erìca orbiculàris, Lodd. bot. cab. 153. Corolla purplish red. Calyx bibracteate.

Var. β, pállida; (Lodd. bot. cab. 85.) Flowers pale red.

Heath-like Blæria. Fl. Aug. Oct. Clt. 1774. Shrub.

2 B. depre'ssa (Licht. mss. ex Rœm. et Schultes, syst. 3. p. 168.) leaves 3-4 in a whorl, linear, spreading, hairy; anthers exserted. ♄. G. Native of the Cape of Good Hope. Corolla cylindrical, rufescent.

Depressed Blæria. Fl. June, July. Clt. 1816. Shrub depressed.

3 B. sca'bra (Willd. spec. 1. p. 629.) leaves 4 in a whorl, lanceolate, pilose; calyx funnel-shaped, glabrous; corolla glabrous; stamens 4, exserted. ♄. G. Native of the Cape of Good Hope. Wendl. coll. 1. p. 85. t. 31. Erìca scàbra, Thunb. prod. 1. p. 72. Erìca exìlis, Sal. in Lin. trans. 6. p. 340. Flowers purplish-red.

Scabrous Blæria. Fl. May, June. Clt. 1824. Shrub 1 foot.

4 B. fasciculà'ta (Willd. spec. 1. p. 629.) leaves 4 in a whorl, lanceolate, ciliately scabrous; stamens 4, exserted. ? ♄. G. Native of the Cape of Good Hope. Erìca fasciculàta, Thunb. prod. 72. fl. cap. 2.

Fascicled-flowered Blæria. Fl. June, July. Shrub 1 foot.

5 B. articula'ta (Lin. mant. 198.) leaves 4 in a whorl, ovate or linear, glabrous, shining; bracteas solitary; calyx funnel-shaped, hairy; stamens 4-5, exserted. ♄. G. Native of the Cape of Good Hope. Erìca articulàta, Thunb. prod. 71. Wendl. coll. 2. p. 19. t. 44. Erìca paleàcea, Sal. in Lin. trans. 6. p. 341. Erìca eriocéphala, Lam. encyc. no. 73. ill. 78. Flowers reddish. Heads drooping.

Jointed-stemmed Blæria. Fl. May, June. Clt. 1795. Shrub 1 foot.

6 B. purpu'rea (Willd. spec. 1. p. 630. Lin. suppl. 122.) leaves 4 in a whorl, ovate, subciliated; stem flexuous, erect; anthers inclosed. ♄. G. Native of the Cape of Good Hope. Erìca purpùrea, Thunb. prod. 71. Flowers purple. Heads drooping.

Purple-flowered Blæria. Fl. May, June. Clt. 1791. Shrub.

7 B. mucòsa (Willd. spec. 1. p. 630. Ait. hort. kew. 1. p. 150.) leaves 4 in a whorl; calyx pilose; corolla campanulate, pilose above; flowers axillary; stigma peltate. ♄. G. Native of the Cape of Good Hope. Erìca álbens. Thunb. prod. 70. ?

Mossy Blæria. Fl. June, Aug. Clt. 1774. Shrub 1 foot.

8 B. pusílla (Lin. mant. 39. Willd. spec. 1. p. 629.) leaves 3-4 in a whorl, linear, hairy; flowers racemose, drooping. ♄. G. Native of the Cape of Good Hope. Erìca pusílla, Thunb. prod. p. 70. Branches downy. Leaves scabrous.

Least Blæria. Shrub.

9 B. hirsu'ta (Licht. in Rœm. et Schultes, syst. 3. p. 170.) leaves 3 in a whorl, fleshy, nearly terete, spreading; calyx pilose; corolla cylindrical; anthers 4, exserted. ♄. G. Native of the Cape of Good Hope. Corolla flesh-coloured. Anthers black.

Hairy Blæria. Shrub.

10 B. pauciflòra (Wendl. coll. 2. p. 17. t. 43.) leaves 3 in a whorl, ovate, glabrous; corolla clavate, glabrous; calyx

hairy; anthers exserted. ♄. G. Native of the Cape of Good Hope. Flowers red.

Few-flowered Blæria. Fl. June, July. Clt. 1812. Shrub.

11 B. Thunbe'rgii; leaves 4 in a whorl; bracteas and calyxes very pilose; corolla 2 lines long, hairy; stamens 4-5, very broad at top, inclosed. ♄. G. Native of the Cape of Good Hope. Erìca hirsùta, Thunb. prod. p. 72. Sal. in Lin. trans. 6. p. 339.

Thunberg's Blæria. Shrub.

12 B. ciliciiflòra; leaves 3 in a whorl, minute; calyx very pilose; bracteas distinct; corolla $1\frac{1}{2}$ line long, hairy; stamens 4, inclosed. ♄. G. Native of the Cape of Good Hope. Erìca ciliciiflòra, Sal. in. Lin. trans. 339. Anthers didymous, bearded.

Ciliated-flowered Blæria. Fl. May, Aug. Clt. 1800. Shrub.

13 B. xeranthemifòlia; leaves 3 in a whorl, recurved; calyx woolly, imbricate; corolla $1\frac{3}{4}$ lines long, woolly; stamens exserted. ♄. G. Native of the Cape of Good Hope. Erìca xeranthemifòlia, Sal. in Lin. trans. 6. p. 339.

Xeranthemum-leaved Blæria. Fl. June, Aug. Clt. 1812. Shrub.

14 B. nodiflòra; leaves 3 in a whorl, villous; calyx funnel-shaped, very villous; corolla $1\frac{1}{2}$ line long, hairy; stamens 4, exserted. ♄. G. Native of the Cape of Good Hope. Erìca nodiflòra, Sal. in Lin. trans. 6. p. 340.

Knot-flowered Blæria. Fl. March, Aug. Clt. 1799. Shrub.

15 B. flosculòsa; leaves 4 in a whorl; calyx fringed; corolla $\frac{3}{4}$ line long, with a very narrow tube and dilated limb; stamens 4, exserted, with very narrow filaments. ♄. G. Native of the Cape of Good Hope. Erìca flosculòsa, Sal. in Lin. trans. 16. p. 340. The flowers resemble the florets in the disk of *Compósitæ*.

Flosculose Blæria. Shrub.

16 B. barbi'gera; leaves 4 in a whorl; calyx deeply 4-cleft, imbricated by bracteas, bearded; corolla glabrous, 2 lines long; stamens 4-5, exserted; style very narrow. ♄. G. Native of the Cape of Good Hope. Erìca barbígera, Sal. in Lin. trans. 6. p. 341.

Beard-bearing Blæria. Shrub.

17 B. turma'lis; leaves 6 in a whorl; peduncles very short; calyx minute, adpressed; corolla 2 lines long; stamens 4-5, exserted; anthers broad. ♄. G. Native of the Cape of Good Hope. Erìca turmàlis, Sal. in Lin. trans. 6. p. 342.

Trooper Blæria. Shrub.

18 B. equisetifòlia; leaves 3 in a whorl; flowers 3-5 in a fascicle; peduncles long, glabrous; corolla $1\frac{1}{2}$ line long; stamens 4-5, exserted. ♄. G. Native of the Cape of Good Hope. Erìca equisetifòlia, Sal. in Lin. trans. 6. p. 342.

Horsetail-leaved Blæria. Fl. July. Clt. 1800. Shrub.

§ 2. *Anthers awned.*

19 B. glabe'lla (Willd. spec. 1. p. 631.) leaves 4 in a whorl, oblong, glabrous, with scabrous margins, numerous; bracteas solitary; calyx funnel-shaped, quadrangular; corolla 2 lines long; stamens 4, exserted; spurs of anthers deflexed. ♄. G. Native of the Cape of Good Hope. B. purpùrea, Berg. pl. cap. 34. B. pusílla, Lin. mant. p. 39. Erìca glabélla, Thunb. prod. 73. Erìca embolífera, Sal. in Lin. trans. 6. p. 340.—Seb. thes. 1. p. 30. t. 20. f. 2. Flowers purple.

Smooth Blæria. Fl. June, July. Clt. 1816. Shrub.

20 B. cilia'ris (Lin. suppl. 122.) leaves 4 in a whorl, glabrous, minute; calyx very hairy; corolla $1\frac{1}{3}$ line long, hairy; stamens 4-5, inclosed; filaments spurred. ♄. G. Native of the Cape of Good Hope. Wendl. coll. 2. p. 35. t. 49.? Erìca plumòsa, Thunb. prod. 73. Sal. in Lin. trans 6. p. 339.

Ciliated-calyxed Blæria. Fl. June, Aug. Clt. 1794. Shrub 1 foot.

21 B. dumòsa (Wendl. coll. 2. p. 3. t. 38.) leaves 3-4 in a whorl, linear, obtuse, erect, 1 line long; corolla $1\frac{1}{2}$ line long, glabrous; anthers crested, exserted. ♄. G. Native of the Cape of Good Hope. Flowers rose-coloured, drooping.

Bushy Blæria. Fl. June, July. Clt. 1806. Shrub 1 foot.

22 B. bruniæfòlia; leaves 6 in a whorl, long; bracteas near the calyx, the outer one very long; corolla $1\frac{1}{2}$ line long; stamens 6, exserted; filaments spurred. ♄. G. Native of the Cape of Good Hope. Erìca bruniæfòlia, Sal. in Lin. trans. 6. p. 341. Erìca hemisphérica, Sol. mss.

Brunia-leaved Blæria. Shrub.

Cult. Pretty little shrubs, deserving a place in every collection of greenhouse plants. A mixture of turfy peat and sand is the best soil for them; and young tops root readily, planted in a pot of sand in spring, with a bell-glass over them.

IV. SYMPIE'ZA

(from *συμπιεζω*, *sympiezo*, to press; in reference to the stamens, which adhere to the tube of the corolla.) Licht. mss. ex Rœm. et Schultes, syst. 3. p. 8. no. 447. and p. 171.

Lin. syst. *Tetrándria Monogýnia.* Calyx turbinate, compressed, bilabiate, fringed. Corolla tubular, sub-bilabiate, longer than the calyx. Stamens 4-5, inserted in the tube of the corolla, exserted; anthers erect; style length of stamens; stigma simple. Capsule 4-celled, many-seeded.—A small branched shrub, native of the Cape of Good Hope. Leaves adpressed, erect, imbricated, 3 in a whorl, linear, trigonal, glabrous, engraven by a line above. Flowers drooping, disposed in terminal heads, purplish.

1 S. capitella'ta (Licht. l. c.) ♄. G. Native of the Cape of Good Hope. Blæria bracteàta, Wendl. coll. 2. p. 1. t. 37. Erìca labiàlis, Sal. in Lin. trans. 6. p. 340. Heads of flowers disposed in a racemose manner.

Small-headed Sympieza. Fl. June, August. Clt. 1812. Shrub.

Cult. See *Blæ'ria* above for culture and propagation.

V. PACHY'SA

(from *παχυς*, *pachys*, thick; in reference to the thick substance of the corolla). D. Don, in edinb. phil. journ. 17. p. 153.—Erìca species of authors.

Lin. syst. *Octándria Monogýnia.* Calyx deeply 4-parted, (f. 135 *a.*) coriaceous. Corolla nearly globose, (f. 135 *c.*) coriaceous, with a contracted 4-lobed mouth, (f. 135 *d.*) Stamens inclosed; filaments much dilated; anthers bifid; cells of anthers short, crested at the base, opening by an oblique foramen. Style dilated at the base; stigma simple, obtuse. Disk hypogynous, elevated. Capsule 4-celled, many-seeded.—Small erect shrubs, natives of the Cape of Good Hope. Leaves loosely imbricated, compressed, 3 in a whorl. Flowers large, terminal, subcorymbose, drooping; pedicels bracteolate.

1 P. a'rdens (D. Don, in edinb. phil. journ. 17. p. 153.) leaves linear, spreading, glabrous, 3 in a whorl, stiff; corolla ovate, globose; bracteas 3, 2 approximate to the calyx and one remote from it. ♄. G. Native of the Cape of Good Hope. Erìca árdens, Andr. heath. 2. t. 14. Ker. bot. reg. t. 115. Bedf. eric. wob. pl. 3. f. 23. Lodd. bot. cab. 47. Flowers orange-red.

Ardent Pachysa. Fl. April, June. Clt. 1800. Shrub 1 to 2 feet.

FIG. 135.

2 P. ve'rnix (D. Don. l. c.) leaves 3 in a whorl, linear, rather scabrous, spreading; corolla ovate-globose, very clammy; bracteas remote from the calyx. ♄. G. Native of the Cape of Good Hope. Erìca vérnix, Andr. heath. 3. t. 19. Bedf. eric. wob. t. 3. f. 21. Lodd. bot. cab. 1443. Erìca resinòsa, Sims, bot. mag. t. 1139. Corollas orange-red, tipped with green.

Varnished Pachysa. Fl. May, Aug. Clt. 1803. Shrub 1 to 2 feet.

3 P. arista`ta; leaves 3 in a whorl, linear, spreading, roughish; corolla ovate-globose, clammy; bracteas approximating the calyx; cells of anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca vérnix, var. coccínea, Bedf. eric. wob. p. 27. t. 3. f. 22. Corolla reddish-orange, tipped with green. This species differs from the rest in the anthers being awned, not crested.

Awned-anthered Pachysa. Fl. May, June. Clt. ? Shrub 1 to 2 feet.

4 P. Lambertia`na; leaves 3 in a whorl, linear, glabrous, spreading; corollas glabrous, ovate-globose; bracteas 3, 2 near the calyx, and 1 remote from it. ♄. G. Native of the Cape of Good Hope. Erìca Lambértia, Andr. heath. 2. t. 18. Erìca Lambertiàna, Sol. in Ait. hort. kew. 2. p. 391. Lodd. bot. cab. 3. Calyx red. Corollas white.

Lambert's Pachysa. Fl. May, July. Clt. 1800. Shrub 1 to 2 feet.

5 P. physòdes; leaves 4 in a whorl, linear, with glandular margins; calycine segments ovate; corollas ovate-globose; bracteas remote from the calyx. ♄. G. Native of the Cape of Good Hope. Erìca physòdes, Thunb. diss. no. 89. Lin. diss. no. 32. spec. ed. 20. p. 506. Berg. fl. cap. 101. Andr. heath. 1. t. 22. Curt. bot. mag. 443. Wendl. eric. 7. p. 13. with a figure. Bedf. eric. wob. pl. 3. f. 24. Erìca sàlax, Sal. in Lin. trans. 6. p. 370. Leaves glutinose. Corollas white and clammy, having the interstices of the limb ending in a tumid hook.

Bladder-flowered Pachysa. Fl. March, July. Clt. 1788. Shrub.

6 P. formòsa; leaves 3 in a whorl, oblong, obtuse, spreading; calyxes spreading; corolla ovate-globose, clammy. ♄. G. Native of the Cape of Good Hope. Erìca formòsa, Thunb. diss. no. 80. t. 3. f. 3. Corolla white.

Beautiful Pachysa. Fl. June, Sept. Clt. 1795. Shrub 1 to 2 feet.

7 P. ba'ccans (D. Don, in edinb. phil. journ. 17. p. 153.) leaves 4 in a whorl, linear, trigonal, glabrous, erect; bracteas approximating the calyx; corolla turbinate, with a 4-angled tube. ♄. G. Native of the Cape of Good Hope. Erìca báccans, Lin. mant. 233. Curt. bot. mag. no. 358. Andr. heath. 1. t. 21. Wendl. eric. 6. p. 13. Baur. icon, kew. t. 22. Erìca baccæfórmis, Sal. in. Lin. trans. 6. p. 352. Seb. thes. 1. p. 32. t. 21. f. 3. Calyx and bracteas coloured. Corolla reddish-purple.

Berry-flowered Pachysa. Fl. April, July. Clt. 1774. Shrub 1 to 2 feet.

8 P. vesicula`ris; leaves 3 in a whorl, besprinkled with black vesicles; corolla 1 line long, clothed with viscid pubescence; anthers inclosed: spurs of anthers parallel, cuneated; fruit silky. ♄. G. Native of the Cape of Good Hope. Erìca vesiculàris, Sol. in Lin. trans. 6. p. 335. Erìca conàcea, Hortul.

Vesicled Pachysa. Fl. Feb. Aug. Clt. 1796. Shrub.

9. P. glomiflòra; leaves 3 in a whorl, narrow-cuneated; flowers terminal; calyx imbricated by bracteas; corolla $2\frac{1}{2}$ lines long, viscid, with a spherical tube; spurs of anthers very villous. ♄. G. Native of the Cape of Good Hope. Erìca glomiflòra, Sal. in Lin. trans. 6. p. 330. Erìca viscària, Sol. mss.

Tufted-flowered Pachysa. Shrub.

Cult. See *Erìca*, p. 800. for culture and propagation.

VI. CERA`MIA (from *κεραμιον*, *keramion*, a pitcher; shape of flowers). D. Don, in edinb. phil. journ. 17. p. 153.—Erìca species of authors.

Lin. syst. *Octándria Monogy'nia.* Calyx 4-parted, glumaceous. Corolla urceolate, with a 4-lobed limb. Stamens inclosed; filaments dilated, flat; anthers bifid; cells of anthers short, aristate at the base. Stigma capitate. Capsule 4-celled, many-seeded.—Small erect shrubs, natives of the Cape of Good Hope. Leaves scattered, bluntish, flat, glaucous beneath. Flowers terminal, subcorymbose.

1 C. urceola`ris (D. Don, in edinb. phil. journ. July, 1834). leaves 3 in a whorl, linear-lanceolate, pubescent; bracteas remote from the calyx; corollas downy, urceolate. ♄. G. Native of the Cape of Good Hope. Erìca urceolàris, Berg. pl. cap. p. 107. Sol. in hort. kew. 2. p. 395. Wendl. eric. p. 311. with a figure. Baur. pl. Ker. t. 16. Erìca Cáffra, Lin. spec. 502. Erìca lamellàris, Sol. in Lin. trans. 6. p. 327. Erìca pentaphýlla, Lin. spec. ed. 2. p. 506. Corolla 3 lines long, white. Spurs of anthers glabrous.

Pitcher-flowered Ceràmia. Fl. May, July. Clt. 1778. Shrub.

2 C. auricula`ris; leaves 3 in a whorl, linear-lanceolate; corolla 3 lines long, downy outside, with an ovate tube; spurs of anthers minute, ear-formed. ♄. G. Native of the Cape of Good Hope. Erìca auriculàris, Sal. in Lin. trans. 6. p. 327. Like the preceding, but differs in the spurs of the anthers.

Auricled-anthered Ceràmia. Fl. April, Nov. Clt. 1800. Shrub 1 foot.

3 C. marifòlia (D. Don, l. c.) leaves 3 in a whorl, ovate, downy; bracteas near the calyx; corolla ovate-globose, pubescent both inside and outside; spurs of anthers downy. ♄. G. Native of the Cape of Good Hope. Erìca marifòlia, Sol. in Ait. hort kew. 2. ed. 2d. p. 402. Baur. icon. pl. kew. t. 14. Andr. heath. 1. t. 1. Wendl. eric. 2. p. 9. with a figure. Calyxes foliaceous. Corolla white, $1\frac{2}{3}$ line long.

Cat-thyme-leaved Ceràmia. Fl. April, May. Clt. 1792. Shrub 2 feet.

4 C. helianthemifòlia; leaves opposite, obovate; corolla urceolate, 2 lines long, downy both inside and outside; spurs of anthers long. ♄. G. Native of the Cape of Good Hope. Erìca helianthemifòlia, Sal. in Lin. trans. 6. p. 328. Corollas white. ?

Rock-rose-leaved Ceràmia. Fl. Feb. April. Clt. 1796. Shrub.

5 C. planifòlia; leaves 3 in a whorl, ovate, ciliated, remotish; flowers axillary, by threes; corolla urceolate, clothed with viscid down; calyx spreading, ciliated with glands; fruit smooth. ♄. G. Native of the Cape of Good Hope. Erìca planifòlia, Thunb. diss. no. 60. Berg. pl. cap. p. 10. Lin. spec. ed. 2d. p. 508. Wendl. eric. 10. p. 59. Erìca thymifòlia, Sal. in. Lin. trans. 6. p. 325. Corolla red. Anthers inclosed. Stem diffuse.

Var. β; anthers exserted. ♄. G. Erìca planifòlia, Willd. spec. 2. p. 362.—Pluk. mant. p. 69. t. 347. f. 1.

Var. γ; corolla smooth; anthers exserted. ♄. G. Erìca thymifòlia, Wendl. obs. p. 48.

Flat-leaved Ceràmia. Fl. June, Nov. Clt. 1795. Shrub 2 feet.

6 C. THYMIFÒLIA; leaves 3 in a whorl, ovate, spreading, remotish, ciliated; flowers axillary, solitary; spurs of anthers short; corolla globose, urceolate, downy. ? ♄. G. Native of the Cape of Good Hope. Erìca thymifòlia, Andr. heath. 2. t. 29. Ait. hort. kew. 2. p. 402. Bracteas remote from the calyx. Corollas white, but in Andrew's figure they are red or purple.

Thyme-leaved Ceràmia. Fl. March, Nov. Clt. 1789. Shrub.

7 C. TEUCRIFÒLIA; leaves 3 in a whorl, lanceolate, rather villous, spreading; flowers axillary, cymose. ♄. G. Native of the Cape of Good Hope. Erìca teucrifòlia, Spreng. syst. 2. p. 109.

Teucrium-leaved Ceràmia. Fl. May, Sept. Clt. 1812. Shrub.

8 C. CORDA'TA; leaves 3 in a whorl, ovate, sub-cordate, villous above and woolly beneath; branches divaricate, hairy; corollas globose; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca cordàta, Andr. heath. 3. t. 41. Corollas white, with black anthers.

Cordate-leaved Ceràmia. Fl. April, June. Clt. 1799. Shrub diffuse.

9 C.? CALATHIFLÒRA; leaves 3 in a whorl, ovate, imbricated; flowers terminal; calyx tomentose; corolla campanulate, 1 line long, smooth; spurs of anthers cuneated, hairy; fruit tomentose; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca calathiflòra, Sal. in Lin. trans. 6. p. 328. Erìca bícolor, Thunb. diss. no. 57. Willd. spec. 2. p. 363.

Bowl-flowered Ceràmia. Fl. Nov. March. Clt. 1790. Shrub.

10 C. LATIFÒLIA; leaves 3 in a whorl, oblong-lanceolate, villous above and white beneath, as in the rest of the species; flowers axillary, aggregate; corollas conical; genitals exserted; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca latifòlia, Andr. 2. t. 41. Flowers dark red or purple. Branches flexuous.

Broad-leaved Ceràmia. Fl. May, Aug. Clt. 1800. Shrub.

11 C. OBLÌQUA; leaves obliquely verticillate, linear, truncate, with glandular margins; spikes of flowers terminal, coarctate; corollas urceolate, viscid, having the interstices of the limb ending in a tumid hook each; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca oblìqua, Thunb. diss. no. 73. with a good figure. Baur. pl. kew. t. 3. Andr. heath, l. t. 23. Wendl. eric. 17. p. 77. with a figure. Bracteas remote from the calyx; calycine segments linear-oblong. Corollas pale purple.

Oblique-leaved Ceràmia. Fl. Aug. Oct. Clt. 1789. Shrub.

12 C. OXYCOCCIFÒLIA; stems decumbent, filiform; leaves 3 in a whorl, ovate; corolla 1½ line long, campanulate, hairy; filaments mutic. ♄. G. Native of the Cape of Good Hope. Erìca oxycoccifòlia, Sal. in Lin. trans. 6. p. 325.—A very pretty species, with the habit of *Oxycóccus palústris*. Flowers red.

Cranberry-leaved Ceràmia. Fl. Feb. May. Clt. 1791. Shrub decumbent.

13 C. BLE'NNA; leaves 4-5 in a whorl, ovate, cuneated; corolla urceolate, 4-5 lines long, viscid, having the segments imbricated at the base; filaments very broad; anthers corniculate. ♄. G. Native of the Cape of Good Hope.—A very fine species. Corollas yellow, with a green mouth. Perhaps a species of *Pachy'sa*.

Blenna Ceramia. Shrub.

14 C. SERPYLLIFÒLIA; leaves 3 in a whorl, ovate, ciliated, sessile; flowers terminal; branches hairy. ♄. G. Native of the Cape of Good Hope. Erìca serpyllifòlia, Lodd. bot. cab. 744. Corollas white.

Wild-Thyme-leaved Ceràmia. Fl. June, July. Clt. 1810. Shrub.

15 C.? HUMIFU'SA; leaves opposite, or 3 in a whorl, oval; corolla 1⅓ line long, with an ample limb; flowers terminal; anthers mutic, inclosed; style much exserted. ♄. G. Native of the Cape of Good Hope. Erìca humifùsa, Sal. in Lin. trans. 6. p. 332.

Trailing Ceràmia. Fl. June, July. Clt.? Shrub.

Cult. See *Erìca*, p. 800. for culture and propagation.

VII. DE'SMIA (from δεσμη, *desme*, a fascicle; in reference to the glomerate flowers). D. Don, in edinb. phil. journ. July, 1834.—Erìca species of authors.

LIN. SYST. *Octándria, Monogýnia*. Calyx 4-toothed. Corolla globose, with a contracted 4-toothed mouth. Stamens exserted; filaments flattened; cells of anthers short, dehiscing by an oblong foramen, with the base truly simple and confluent in the filament. Stigma capitate. Capsule 4-celled, many-seeded. Seeds scrobiculate.—Small erect shrubs, natives of the Cape of Good Hope. Leaves scattered, spreading, subulate. Flowers terminal, glomerate.

1 D. CONFE'RTA (D. Don, in edinb. phil. journ. 17. p. 153.) flowers umbellate, sessile, fasciculate; filaments narrow. ♄. G. Native of the Cape of Good Hope. Erìca conférta, Andr. heath. 2. t. 50. Sol. in Ait. hort. kew. 2. p. 409. Lodd. bot. cab. 1335. Leaves 4 in a whorl. Corollas white.

Crowded-flowered Desmia. Fl. Oct. Feb. Clt. 1800. Shrub 1 foot.

2 D. ÆQUA'LIS (D. Don. l. c.) umbels pedunculate, aggregate; filaments dilated. ♄. G. Native of the Cape of Good Hope.

Equal Desmia. Shrub.

3 D. POLIFÒLIA (D. Don, l. c.) leaves 3 in a whorl, aristate; flowers fascicled; corollas oblong, with a dilated throat; filaments dilated; stigma nearly simple. ♄. G. Native of the Cape of Good Hope.

Polium-leaved Desmia. Shrub.

Cult. See *Erìca*, p. 800. for culture and propagation.

VIII. EURYLE'PIS (from ευρυς, *eurys*, broad, and λεπις, *lepis*, a scale; in reference to the dilated scales of the calyx). D. Don, in edinb. phil. journ. 17. p. 154.—Erìca species of authors.

LIN. SYST. *Octándria, Monogýnia*. Calyx 4-parted, coriaceous, bibracteate at the base. Corolla tubular, coriaceous, ventricose at the base, with a 4-cleft erect limb. Stamens inclosed; filaments dilated, canaliculate; anthers bipartite; cells of anthers coriaceous, dehiscing by an oblong foramen, auricled at the base. Stigma clavate, with a 4 tubercled disk and a crenulated ring. Capsule 4-celled, many-seeded. Segments of placenta 2-lobed. Seeds oval, ventricose.—Diffusely branched shrubs, natives of the Cape of Good Hope. Leaves scattered, with revolute margins. Flowers terminal, solitary, large, pendulous.

§ 1. *Anthers mutic at the base. Normal species.*

1 E. halica'caba (D. Don, l. c.) leaves 3 in a whorl, linear, glabrous, spreading; flowers terminal, solitary, or by threes; corolla ovate-tubular, glabrous; bracteas ovate, near the calyx; fruit spherical; calyx adpressed. ♄. G. Native of the Cape of Good Hope. Erìca halicácaba, Thunb. diss. no. 51. Lin. diss. no. 3. with a figure of the flower. spec. ed. 2. p. 507. amœn. acad. 5. p. 85. Andr. eric. 2. t. 36. Wendl. eric. 6. p. 7. with a figure. Erìca rupéstris, Sal. in Lin. trans. 6. p. 353. Corolla 7-8 lines long, sulphur-coloured, or yellowish-green.

Kettle-flowered Broad-scaled-Heath. Fl. May, Aug. Clt. 1780. Shrub.

2 E. azaleæfòlia; leaves 3 in a whorl, lanceolate; flowers terminal; corolla 1½ line long, hairy; anthers mutic, exserted, foraminose the whole length. ♄. G. Native of the Cape of Good Hope. Erìca azaleæfòlia, Sal. in Lin. trans. 6. p. 334.

Azalea-leaved Broad-scaled-Heath. Shrub.

3 E. a'lbens (D. Don, in edinb. phil. journ. 17. p. 154.) leaves 3 in a whorl, linear, pilose; flowers axillary; bracteas remote from the calyx; calyxes acuminated; corolla ovate, urceolate, 3 lines long. ♄. G. Native of the Cape of Good Hope. Erìca álbens, Lin. diss. no. 34. mant. p. 233. Curt. bot. mag. t. 440. Lodd. bot. cab. 95. Erìca viminàlis, Sal. in Lin. trans. 6. p. 387. Flowers cream-coloured.

Whitish-flowered Broad-scaled-Heath. Fl. Feb. Aug. Clt. 1789. Shrub.

4 E. tetragòna; leaves 3 in a whorl, linear, acuminated, ciliated, erectly spreading; flowers axillary, erect; corolla 4 lines long, with a pyramidal 4-angled tube; calycine segments cuspidate and ciliated. ♄. G. Native of the Cape of Good Hope. Erìca tetragòna, Thunb. diss. no. 5. with a figure. Lodd. bot. cab. 1239. Erìca pugionifórmis, Sal. in Lin. trans. 6. p. 387. Flowers yellow.

Tetragonal-flowered Broad-scaled-Heath. Fl. July, Sept. Clt. 1789. Shrub.

5 E. Thunbe'rgii (D. Don, in edinb. phil. journ. 17. p. 154.) leaves 3 in a whorl, linear, glabrous, glaucous; flowers subterminal, umbellate; corolla with a medioliform tube, and the base of the limb entire; anthers papulose. ♄. G. Native of the Cape of Good Hope. Erìca Thunbérgii, Lin. suppl. p. 220. Andr. heath. vol. 4. icon. Lodd. bot. cab. 277. Ait. hort. kew. 2. p. 389. Bedf. eric. wob. pl. 4. f. 2. Sims, bot. mag. 1214. Erìca medioliflòra, Sal. in Lin. trans. 6. p. 331. Corolla with a globose tube and a large limb, of a reddish-orange colour at top, and greenish-yellow at the base.—A remarkable species.

Thunberg's Broad-scaled-Heath. Fl. Feb. Aug. Clt. 1794. Shrub 1 foot.

6 E. bractea'ta; leaves 3 in a whorl, lanceolate, glabrous, adpressed; flowers terminal, umbellate; bracteas large, obovate, and are, as well as the calyxes, coloured; corolla 2 lines long, having the segments crenulated. ♄. G. Native of the Cape of Good Hope. Erìca bracteàta, Thunb. diss. no. 3. Erìca obvallàris, Sal. in Lin. trans. 6. p. 387. Filaments spurred.

Bracteate Broad-scaled-Heath. Fl. May, June. Clt. 1800. Shrub 1 foot.

7 E. mucrona'ta; leaves 3 in a whorl, linear-lanceolate, cuspidate, spreading, glabrous; flowers terminal, racemose; calyx bracteate, coloured, about equal in length to the corolla, which is campanulate. ♄. G. Native of the Cape of Good Hope. Erìca mucronàta, Andr. heath. 3. t. 43. Flowers reddish-purple.

Mucronate-leaved Broad-scaled-Heath. Fl. May, Aug. Clt. 1800. Shrub 1 foot.

8 E. petiola'ta; leaves 3 in a whorl, lanceolate-linear spreading, on cuneated fringed petioles; flowers terminal, by threes; bracteas broad, imbricated, ribbed, about equal in length to the corolla, which is bell-shaped, 2½ lines long, and downy at apex. ♄. G. Native of the Cape of Good Hope. Erìca petiolàris, Sal. in Lin. trans. 6. p. 334. Erìca petiolàta, Thunb. diss. no. 7. with a figure. Andr. heath. 3. t. 40. Lodd. bot. cab. 1150. Bracteas pale red. Corollas white, with black anthers.

Petiolate-leaved Broad-scaled-Heath. Fl. May, July. Clt. 1774. Shrub 1 foot.

9 E.? obcordàta; leaves 3 in a whorl, lanceolate, keeled, broad, erect, with scabrous margins; floral leaves or bracteas dilated; flowers terminal; calyxes spreading, about equal in length to the corolla, which is urceolate; bracteas loose, ribbed. ♄. G. Native of the Cape of Good Hope. Erìca obcordàta, Link. Bedf. eric. wob. p. 17. Calyx and corolla purplish-red.

Obcordate Broad-scaled-Heath. Fl. Aug. Sept. Clt. 1800. Shrub 1 foot.

10 E. crossa'ta; leaves opposite, or 3 in a whorl, linear, cuspidately awned, glabrous, spreading; flowers terminal, usually by threes; peduncles, bracteas, and calyxes fringed; corolla conical. ♄. G. Native of the Cape of Good Hope. Erìca crossàta, Spreng. syst. 2. p. 201.

Pot-flowered Broad-scaled-Heath. Fl. May, June. Clt.? Shrub.

§ 2. *Anthers awned or corniculate at the base.*

11 E. fra'grans; leaves 3 in a whorl, subulate, glaucous, erect; flowers drooping, terminal, usually by threes; bracteas large; calyx coloured, about equal in length to the corolla, which is campanulate and spreading; anthers bifid at the base, corniculate; stigma obtuse. ♄. G. Native of the Cape of Good Hope. Erìca fràgrans, Andr. heath. 2. t. 27. Lodd. bot. cab. 288. Ait. hort. kew. 2. p. 407. Calyx and corolla purplish-red.

Fragrant Broad-scaled-Heath. Fl. March, June. Clt. 1803. Shrub ¼ foot.

12 E. gla'bra; leaves 4 in a whorl, spreading, glabrous; flowers terminal, on short pedicels; bracteas remote from the calyx; calyx foliaceous; corolla 7-8 lines long, white; anthers subinclosed. ♄. G. Native of the Cape of Good Hope. Erìca glàbra, Link. enum. 1. p. 362. Corolla white.

Glabrous Broad Scaled Heath. Fl. May, Aug. Clt. 1820. Shrub.

13 E. sexfa'ria (D. Don, in edinb. phil. journ. 17. p. 154.) leaves 3 in a whorl, linear, glabrous, spreading, placed so as to appear in 6 ranks; flowers terminal, nearly sessile, drooping; bracteas imbricate, angular; corolla campanulate, a little shorter than the calyx, glabrous, scarious; stigma obtuse; fruit smooth; spurs of anthers long. ♄. G. Native of the Cape of Good Hope. Erìca sexfària, Bauer. pl. kew. t. 11. Andr. heath. 2. t. 28. Ait. hort. kew. 2. p. 364. Erìca spumòsa, Thùnb. diss. no. 14. Flowers white; anthers black, a little exserted.

Six-ranked-leaved Broad-scaled-Heath. Fl. May, June. Clt. 1774. Shrub ½ foot.

14 E. pyrolæflòra (D. Don, l. c.) leaves 3 in a whorl, linear-cuneated, glabrous; flowers terminal, aggregate; calyx bracteate, equal in length to the corolla, which is urceolate; segments of the calyx ovate, cuneated; spurs of anthers broad, ear-formed. ♄. G. Native of the Cape of Good Hope. Erìca triflòra, Willd. spec. 2. p. 356. exclusive of the synonymes. Erìca pyrolæflòra, Sal. in Lin. trans. p. 2. Flowers white. Corolla 2 lines long, with a 4-angled spherical tube.

Winter-Green-flowered Broad-scaled Heath. Shrub.

15 E. triflòra; leaves 3 in a whorl, linear-cuneated, glabrous, spreading; flowers terminal; segments of calyx obcuneated; corolla $1\frac{3}{4}$ line long, with a turbinate rather 4-angled tube; spurs of anthers narrow-cuneated. ♄. G. Native of the Cape of Good Hope. Erìca triflòra, Lin. mant. 374. diss. no. 23. with a figure of the flower. Thunb. diss. no. 79. with a figure. Lodd. bot. cab. 1733. Erìca triflòra aristàta, Wendl. obs. p. 47. eric. fasc. 12. p. 13. Erìca fùgax, Sal. in. Lin. trans. 6. p. 351. Corolla white, about the length of the calyx.

Three-flowered Broad-scaled Heath. Fl. March, June. Clt. 1774. Shrub 1 foot.

16 E. palliiflòra; stem angular; leaves lanceolate-cuneated, glabrous; flowers terminal; corolla $1\frac{1}{3}$ line long, a little longer than the calyx; spurs of anthers ear-formed, glabrous. ♄. G. Native of the Cape of Good Hope. Erìca palliiflòra, Sal. in Lin. trans. 6. p. 351. Erìca cándida, Sol. mss. Flowers white.

Chaff-flowered Broad-scaled Heath. Fl. Feb. Aug. Clt. 1796. Shrub 1 foot.

17 E. ? diosmæfòlia; leaves 3 in a whorl, shining; flowers terminal; corolla 2 lines long, with imbricated segments; filaments very narrow; spurs of anthers attenuated, serrulated. ♄. G. Native of the Cape of Good Hope. Erìca diosmæfòlia, Sal. in Lin. trans. 6. p. 350. Erìca subserràta, Roxb. mss.

Diosma-leaved Broad-scaled Heath. Fl. April, July. Clt. 1792. Shrub.

18 E. rigidifòlia; leaves 3 in a whorl, linear, stiff, shining, erectly spreading; flowers terminal, aggregate, drooping; calyxes coloured, about equal in length to the corolla, which is campanulate; anthers appendiculate. ♄. G. Native of the Cape of Good Hope. Erìca rigidifòlia, Wendl.

Stiff-leaved Broad-scaled Heath. Fl. June, July. Clt. 1818. Shrub.

19 E. pachyphy'lla; leaves 3 in a whorl, petiolate, elliptic, thick, short, quite glabrous, shining, with scabrous edges; flowers aggregate, terminal, glabrous; calyx equal in length to the corolla, which is urceolate. ♄. G. Native of the Cape of Good Hope. Erìca pachyphýlla, Spreng. syst. 2. p. 199.

Thick-leaved Broad-scaled Heath. Clt. 1800. Shrub 1 foot.

20 E. Monsòniæ; leaves 3 in a whorl, linear, attenuated and ovate, erect, placed so as to appear in 4 ranks; flowers terminal, nutant; corollas oblong, inflated, 7-9 lines long; bracteas imbricate, reflexed; calyx recurvedly spreading; anthers awned; fruit globose, quadrangular. ♄. G. Native of the Cape of Good Hope. Erìca Monsòniæ. Bauer, pl. kew. t. 7. Andr. heath. 2. t. 1. Sims, bot. mag. 1915. Erìca Monsoniàna, Lin. suppl. 223. Thunb. diss. no. 52. with a figure. Wendl. eric. fasc. 10. p. 9. with a figure. Erìca variifòlia, Sal. in Lin. trans. 6. p. 353. Flowers white. Corolla twice longer than the calyx.

Lady Monson's Broad-scaled Heath. Fl. April, Sept. Clt. 1787. Shrub 2 to 3 feet.

Cult. For culture and propagation see *Erìca*, p. 800.

IX. EURYSTE'GIA (from *ευρυς*, *eurys*, broad, and *στεγη*, *stege*, a cover; in reference to the large calyx). D. Don, in edinb. phil. journ. 17. p. 154.—Erìca species of authors.

Lin. syst. *Octándria Monogy'nia*. Calyx 4-parted, large, glumaceous. Corolla urceolate, with a contracted 4-toothed mouth. Stamens inclosed; filaments dilated, flat; anthers bipartite, opening by an oblong foramen, biappendiculate at the base: appendages flattened, decurrent, erosely crenated. Stigma capitate. Capsule 4-celled, many-seeded.—Densely branched shrubs, natives of the Cape of Good Hope. Leaves loose, subulate, with revolute margins. Flowers almost solitary, drooping, white or rose-coloured.

1 E. glau'ca (D. Don. in. edinb. phil. journ. 17. p. 154.) leaves 3 in a whorl, glaucous, linear, erectly spreading; flowers terminal, umbellate; bracteas remote from the calyx. ♄. G. Native of the Cape of Good Hope. Erìca glaúca, Andr. heath. 1. p. 15. Sims, bot. mag. 580. Ait. hort. kew. 2. p. 386. Calyx and bracteas red. Corolla purplish.

Glaucous Large-calyxed Heath. Fl. May, July. Clt. 1792. Shrub 1 to 3 feet.

2 E. e'legans; leaves 3 in a whorl, linear, glaucous, spreading; flowers terminal, numerous, capitate; bracteas near the calyx. ♄. G. Native of the Cape of Good Hope. Erìca élegans, Andr. heath. 3. t. 16. Sims, bot. mag. 966. Lodd. bot. cab. 105. Bracteas and calyxes pink. Corolla pink, tipped with green.

Elegant Large-calyxed Heath. Fl. Nov. Feb. Clt. 1799. Shrub $\frac{1}{2}$ to 1 foot.

3 E. andromedæflòra (D. Don, in edinb. phil. journ. 17. p. 154.) leaves 3 in a whorl, green, ciliated, stiff, spreading; flowers axillary; bracteas remote from the calyx. ♄. G. Native of the Cape of Good Hope. Erìca andromedæflòra, Andr. heath. 3. t. 13. Sims, bot. mag. 1250. Lodd. bot. cab. 521. Erìca pomífera, Hortul. Flowers deep red, or reddish-purple. Calyx pale.

Andromeda-flowered Large-calyxed Heath. March, June. Clt. 1803. Shrub 1 to 2 feet.

4 E. lanuginòsa; leaves 3 in a whorl, linear, ciliated; flowers solitary, axillary; bracteas ovate, near the calyx; corolla hardly twice longer than the calyx, tomentose; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca lanuginòsa, Andr. heath. 3. t. 5. Ait. hort. kew. 2. p. 382. Corollas brownish-red, or reddish-green.

Woolly-flowered Large-calyxed Heath. Fl. Sept. Jan. Clt. 1803. Shrub.

5 E. emargina'ta; leaves 3 in a whorl, oblong, channelled, recurved, ciliated; flowers terminal, by threes; bracteas near the calyx, and are, as well as the calyxes, ciliated. ♄. G. Native of the Cape of Good Hope. Erìca emarginàta, Andr. heath. 3. t. 20. Flowers white, with black anthers. Very like *Erìca nigríta*, and *Erìca lachneæfòlia*.

Emarginate Large-calyxed Heath. Fl. June, July. Clt. 1802. Shrub.

6 E. tríceps; leaves 3 in a whorl, somewhat trigonal, ciliated, erectly spreading; branches downy; flowers terminal, by threes; bracteas imbricate; calycine segments oblong, scarious, a little shorter than the corolla; anthers ciliated, mutic, and are, as well as the style, which is capitate, exserted; corolla ovate. ♄. G. Native of the Cape of Good Hope. Erìca tríceps, Link, enum. 1. p. 371. Bedf. eric. wob. p. 25. Lodd. bot. cab. 962. Flowers white. Calyx white.

Three-headed Large calyxed Heath. Fl. May, July. Clt. 1820. Shrub.

7 E. triu'mphans; leaves 3 in a whorl, ciliated; flowers axillary; bracteas remote from the calyx; calyx large, inflated, angular; corolla ovate, inflated; anthers crested; style inclosed. ♄. G. Native of the Cape of Good Hope. Erìca triúmphans, Lodd. bot. cab. 257. Bedf. eric. wob. pl. 3. f. 19. Flowers large, white.

Conquering Large-calyxed Heath. Fl. June, July. Clt. 1802. Shrub.

8 E. tegulæfòlia; leaves oval, downy; flowers terminal;

corolla 1½ line long, with a turbinate, rather 4-angled limb; spurs of anthers large, orbicular. ♄. G. Native of the Cape of Good Hope. Leaves broad, imbricated in the straight order.

Tile-leaved Large-calyxed Heath. Clt. 1800. Shrub.

9 E. cory'dalis; leaves 3 in a whorl, lanceolate-cuneated; flowers terminal; corolla 2 lines long, having the limb entire at the base; anthers inclosed, winged on the back. ♄. G. Native of the Cape of Good Hope. Erìca corýdalis, Sal. in Lin. trans. 6. p. 334.

Helmet-anthered Large-calyxed Heath. Fl. Feb. May. Clt.? Shrub.

10 E.? pannòsa; leaves 3-5 in a whorl, a little reduplicate; flowers terminal; corolla 2 lines long, woolly; filaments broad, with short spurs; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca pannòsa, Sal. in Lin. trans. 6. p. 339. —This plant is very like *Eriodésmia capitàta*, but differs in the leaves being 3-5 in a whorl, and greatly in the anthers.

Cloth-flowered Large-calyxed Heath. Fl. Feb. June. Clt.? Shrub.

11 E.? lachnæfòlia; leaves 3 in a whorl, ovate, imbricated, downy; flowers terminal, subcapitate; bracteas imbricated, approximating the calyx; anthers crested; corolla ovate, rather longer than the calyx. ♄. G. Native of the Cape of Good Hope. Erìca lachneæfòlia, Sal. in Lin. trans. 6. p. 335. Ait. hort. kew. 2. p. 387. E. làchnæ`a, Andr. heath. 3. t. 2. Flowers white.

Lachnæa-leaved Large-calyxed Heath. Fl. May, July. Clt. 1793. Shrub 1 foot.

Cult. For culture and propagation see *Erìca*, p. 800.

X. LOPHA'NDRA (from λοφος, *lophos*, a crest, and *ανηρ ανδρος*, *aner andros*, a male; in reference to the cells of the anthers being crested). D. Don, in edinb. phil. journ. 17. p. 154. —Erìca species of authors.

Lin. syst. *Octándria Monogýnia.* Calyx 4-parted, furnished with 4 bracteas at the base; segments roundish, scarious, ventricose on the outside. Corolla campanulate, 4-lobed. Stamens inclosed; filaments dilated, flat; anthers bifid; cells of anthers beaked at the apex, opening by an oblong foramen in the middle: with the sides winged, crested, and crenulated. Stigma truncate. Capsule 4-celled, many-seeded.—Erect, much branched shrubs, natives of the Cape of Good Hope. Leaves spreading, short, obtuse, glaucous. Flowers terminal, usually by threes, rose-coloured.

1 L. cu'bica (D. Don, in edinb. phil. journ. 17. p. 154.) leaves 4 in a whorl, semicylindrical; bracteas remote from the calyx, which is coloured; calycine segments serrulated. ♄. G. Native of the Cape of Good Hope. Erìca cúbica, Andr. heath. 1. t. 27. Ait. hort. kew. 2. p. 397. Erìca cûbica màjor, Hortul. Erìca hottoniæflòra, Sal. in. Lin. trans. 4. p. 331. Calyx and corolla purplish-red.—The flowers are at first disposed in a terminal fascicle, but when the terminal branches grow, they in consequence appear axillary and verticillate.

Var. β, mìnor (Andr. heath. 2. t. 49). This is probably a distinct species.

Cube-flowered Lophandra. Fl. April. Sept. Clt. 1790. Shrub 1 foot.

2 L. bla'nda; leaves 3 in a whorl; flowers terminal, glomerate; corolla 1⅓ line long, having the limb one half longer than the tube, with semi-orbicular segments; stigma broad; cells of anthers drawn out into a crest beyond the foramen. ♄. G. Native of the Cape of Good Hope. Erìca blánda, Sal. in Lin. trans. 6. p. 331. Erìca cornùta, Roxb. mss. Flowers pale red.

Blush-flowered Lophandra. Shrub.

3 L.? seriphiifòlia; leaves 5 in a whorl; calycine segments minutely ciliated; corolla 1½ line long, having the limb entire at the base, obtuse; anthers inclosed, mutic. ♄. G Native of the Cape of Good Hope. Erìca seriphiifòlia, Sal. in Lin. trans. 6. p. 331. Erìca cúbica, Thunb. diss. no. 46. but not of Andr. Flowers reddish-purple, axillary.

Seriphium-leaved Laphandra. Shrub.

Cult. For culture and propagation see *Erìca*, p. 800.

XI. LAMPRO'TIS (from λαμπροτης, *lamprotes*, splendour; in reference to the shining calyx). D. Don, in edinb. phil. journ. 17. p. 154.—Erìca species of authors.

Lin. syst. *Octándria Monogy'nia.* Calyx large, 4-parted, glumaceous, coloured, bibracteate at the base. Corolla urceolate, with a 4-lobed limb. Stamens inclosed; filaments capillary; cells of anthers short, dehiscing lengthwise, mutic or crested at the base. Stigma capitate. Capsule 4-celled, many-seeded. Seeds round, scrobiculate.—Small, much branched shrubs, natives of the Cape of Good Hope. Leaves opposite, or 3 in a whorl, terminal, subulate, glabrous, always adpressed to the branches. Flowers numerous, terminal.

* *Leaves 3 in a whorl.*

1 L. calyci'na (D. Don, l. c.) leaves 3 in a whorl, linear, imbricate, downy; flowers in terminal fascicles, drooping; calyx spreading, coloured; anthers crested. ♄. G. Native of the Cape of Good Hope. Erìca calycìna, Lin. spec. ed. 2. p. 507. Lodd. bot. cab. 594. Erìca calycìna màjor, Andr. heath. 3. t. 14. Erìca gnidiæfòlia, Sal. in Lin. trans. 6. p. 336. Thunb. diss. no. 78. Erìca vespertìna, Lin. suppl. 221. Corolla 2 lines long, red, ovate, ventricose. Calycine segments obcuneated. Bracteas coloured.

Var. β, mìnor (Andr. heath. 3. t. 15.) smaller.

Large-calyxed Lamprotis. Fl. June, Sept. Clt. 1799. Shrub 1 foot.

2 L. corifòlia; leaves 3 in a whorl, linear, imbricate; flowers in terminal fascicles; calyx spreading, about equal to the corolla in length; corolla 1½ line long, with acute segments; anthers crested. ♄. G. Native of the Cape of Good Hope. Erìca corifòlia, Lin. diss. no. 26. Thunb. diss. no. 77. Sal. in Lin. trans. 6. p. 386. Bauer, icon. hort. kew. 21. Wendl. eric. 10. p. 11. with a figure. Erìca calycìna, Andr. heath. 1. t. 14. Erìca articulàris, Lin. mant. 65. Curt. bot. mag. t. 423. Flowers pink or red. Bracteas remote from the calyx.

Coris-leaved Lamprotis. Fl. May, Dec. Clt. 1774. Shrub 1 foot.

3 L. pa'llida; leaves 3 in a whorl, linear, imbricate, glabrous, acute, glaucous; flowers terminal, erect; bracteas large, loose, coloured; calyx exceeding the corolla, which is urceolate; anthers crested. ♄. G. Native of the Cape of Good Hope. Erìca pállida, Wendl. eric. with a figure. Flowers red.

Pale Lamprotis. Fl. April, July. Clt. 1812. Shrub.

4 L. tu'rgida; leaves 3 in a whorl, mucronate, with white margins, glabrous as well as the branches; flowers terminal; bracteas remote from the calyx; calycine segments purplish, acute, longer than the corolla; style inclosed; anthers crested. ♄. G. Native of the Cape of Good Hope. Erìca túrgida, Link, enum. 2. p. 365. Flowers purple.

Turgid Lamprotis. Fl. April, July. Clt. 1821. Shrub.

5 L. spumòsa; leaves 3 in a whorl, erectly spreading, glabrous; flowers terminal, by threes, erect; calyx spreading, about equal in length to the corolla; bracteas nearly orbicular, imbricate; genitals a little exserted; anthers crested; stigma narrow. ♄. G. Native of the Cape of Good Hope. Erìca spumòsa, Lin. spec. ed. 2. p. 508. Berg. pl. cap. 103. but not of Lodd. Erìca scariòsa, Berg. pl. cap. 102. Corolla white, 1½ line long, with sublanceolate segments.

Frothy Lamprotis. Fl. May, July. Clt. 1786. Shrub.

6 L.? LODDIGE'SII; leaves 3 in a whorl, erectly spreading; flowers terminal, by twos or threes; bracteas imbricate, angular; genitals exserted, with black corniculate anthers. ♄. G. Native of the Cape of Good Hope. Erìca spumòsa, Lodd. bot. cab. 566. but not of Lin. Flowers purplish-red.

Loddiges's Lamprotis. Fl. June, July. Clt.? Shrub.

7 L. FLAGELLA'RIS; leaves 3 in a whorl, linear-lanceolate, glabrous, finely ciliated, adpressed; branches twiggy, downy; flowers terminal, usually by threes, erect; calyx bracteate, exceeding the corolla; anthers crested. ♄. G. Native of the Cape of Good Hope. Erìca flagellàris, Link, enum. 1. p. 365. Flowers dirty-yellow. Calycine segments lanceolate, keeled, purple.

Whip Lamprotis. Fl. May. Clt. 1820. Shrub 1 foot.

8 L. FLAGELLIFÓRMIS; leaves 3 in a whorl, imbricate, smooth; flowers terminal, umbellate, erect; bracteas remote from the calyx; calyx coloured, larger than the corolla, which is urceolate; anthers crested. ♄. G. Native of the Cape of Good Hope. Erìca flagellifórmis, Andr. eric. 4. icon. Flowers reddish-purple.

Whip-formed Lamprotis. Fl. June, Aug. Clt. 1800. Shrub 1 foot.

9 L. CALYCINOÌDES; leaves 3 in a whorl, linear, subulate, imbricate, glabrous; flowers terminal, glomerate or capitate; bracteas imbricate; calyx coloured, rather shorter than the corolla, which is urceolate; anthers almost mutic. ♄. G. Native of the Cape of Good Hope. Erìca calycinoìdes, Bedf. eric. wob. p. 4. Erìca glomeràta, Andr. heath. vol. 4. Erìca calycìna capitàta, Hortul. Flowers purplish-red.

Calycine-like Lampròtis. Fl. July, Sept. Clt. 1789. Shrub 1 foot.

10 L. GNAPHALÒDES; leaves 3 in a whorl, ovate, glabrous, imbricate; flowers in terminal fascicles; calyxes spreading, with exquisitely ciliately glandular margins; corolla 1 line long, hardly longer than the calyx; fruit smooth; stigma large, 4-cleft; anthers crested. ♄. G. Native of the Cape of Good Hope. Erìca gnaphalòdes, Lin. diss. no. 25. Berg. pl. cap. 119. Thunb. diss. 75. Erìca gnaphaliifòlia, Sal. in Lin. trans. 6. p. 337. Flowers white.

Woolly Lamprotis. Feb. May. Clt. 1812. Shrub.

11 L.? PHYLLICOÌDES; leaves 3 in a whorl, imbricating in 6 rows, glabrous; flowers axillary, drooping; calyx large, elongated; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca phyllicoìdes, Willd. spec. 2. p. 361. Corolla campanulate, purple, 1-2 lines long.—Perhaps a species of *Eurylèpis*.

Phyllica-like Lamprotis. Fl. April, June. Clt. 1800. Shb.

12 L.? HOLOSERÍCEA; leaves 3 in a whorl, sharply reduplicate; flowers terminal; corolla 3 lines long, silky, with an ovate tube; anthers crested, hairy. ♄. G. Native of the Cape of Good Hope. Erìca holoserícea, Sal. in Lin. trans. 6. p. 352. Flowers red.

Whole-silky Lamprotis. Shrub.

13 L. LU'CIDA; leaves 3 in a whorl; flowers terminal; calyx minutely ciliated, shining; corolla 1 line long; crests of anthers ear-formed, deeply serrated; stigma narrow. ♄. G. Native of the Cape of Good Hope. Erìca lùcida, Sal. in Lin. trans. 6. p. 337.

Shining-calyxed Lamprotis. Shrub.

14 L. MU'NDA; leaves 3 in a whorl, imbricate; bracteas and calyxes quite entire; corolla 1 line long; crests of anthers ear-formed and ciliated; fruit hairy. ♄. G. Native of the Cape of Good Hope. Erìca múnda, Sal. in Lin. trans. 6. p. 337.

Neat Lamprotis. Fl. May, July. Clt.? Shrub.

15 L. FABRÌLIS; leaves 3 in a whorl, densely imbricated; flowers terminal; corolla 1 line long, hardly longer than the calyx; crests of anthers quite entire; anthers minute. ♄. G. Native of the Cape of Good Hope. Erìca fabrìlis, Sal. in. Lin. trans. 6. p. 338. Flowers reddish-purple.

Carpenters' Lampròtis. Fl. April, May. Clt. 1791. Shrub 1 foot.

16 L. CHLAMYDIFLÒRA; leaves 3 in a whorl, linear, hairy, imbricate, flowers terminal; corolla 2 lines long, hardly longer than the calyx; crests of anthers ear-formed. ♄. G. Native of the Cape of Good Hope. Erìca chlamydiflòra, Sal. in Lin. trans. 6. p. 338. Flowers reddish-purple.

Cloak-flowered Lamprotis. Fl. May, Oct. Clt. 1801. Shrub 1 foot.

17 L. SELAGINIFÒLIA; stem tomentose; leaves linear, 3 in a whorl; flowers terminal; corolla smooth, 1⅔ line long, with a globose tube; crests of anthers very broad, orbicular. ♄. G. Native of the Cape of Good Hope. Erìca selaginifòlia, Sal. in Lin. trans. 6. p. 338.

Selago-leaved Lamprotis. Shrub.

18 L. BREVIFÒLIA; leaves 3 in a whorl, ovate; flowers terminal; corolla 1⅔ line long, hardly longer than the calyx; spurs of anthers linear, attenuated. ♄. G. Native of the Cape of Good Hope. Erìca brevifòlia, Sol. mss. ex Sal. in Lin. trans. 6. p. 338.

Short-leaved Lamprotis. Fl. Jan. May. Clt. 1800. Shrub 1 foot.

19 L. HYSSOPIFÒLIA; leaves 3 in a whorl, densely ciliated; corolla 2 lines long, hairy towards the apex, with curled retuse segments; anthers crested. ♄. G. Native of the Cape of Good Hope. Erìca hyssopifòlia, Sal. in Lin. trans. 6. p. 387. Erìca pígra, Sol. ex Salisb. Flowers red.

Hyssop-leaved Lamprotis. Fl. May, Oct. Clt. 1800. Shrub 1 foot.

20 L. MODE'STA; leaves 3 in a whorl, densely imbricated; corolla tomentose, 3½ lines long, with a broad ovate tube and a recurved limb; flowers terminal; spurs of anthers linear, attenuated. ♄. G. Native of the Cape of Good Hope. Erìca modésta, Sal. in Lin. trans. 6. p. 352. Flowers very pale red.

Modest Lamprotis. Shrub.

21 L. PANICULA'TA; leaves 3 in a whorl, adpressed; flowers terminal, drooping; bracteas close to the calyx; corolla ovate, ventricose, equal in length to the calyx; anthers cornute; style inclosed. ♄. G. Native of the Cape of Good Hope. Erìca paniculàta, Lodd. bot. cab. 419. but not of Thunb. Bedf. eric. wob. p. 17. Flowers pale purplish-red.

Panicled-flowered Lamprotis. Fl. Summer. Clt. 1810. Shrub.

22 L. BEDFORDIA'NA; leaves 3 in a whorl, linear, glabrous; flowers terminal; bracteas remote from the calyx; corolla ovate-campanulate; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca lùtea álba, Bedf. eric. wob. p. 14. Flowers pale yellow.

Duke of Bedford's Lamprotis. Fl. Oct. Nov. Clt. 1810. Shrub ½ to 1 foot.

23 L. TAXIFÒLIA (D. Don, in edinb. phil. journ. 17. p. 154.) leaves 3 in a whorl, trigonal, glabrous, spreading; flowers terminal, umbellate; corolla with a cone-shaped tube and a spreading limb; bracteas remote from and approximating the calyx; calyx coloured, about equal in length to the corolla; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca taxifòlia, Wendl. eric. fasc. 2. p. 19. with a figure. Bauer, pl. kew. t. 19. Andr. heath. 1. t. 35. Erìca túrgida, Hortul. Flowers pale red. Leaves mucronate. Corolla 3 lines long, with ovate, cuneated, bifid segments.

Yew-leaved Lamprotis. Fl. July, Nov. Clt. 1788. Shrub 1 foot.

24 L. RU'BIDA; leaves 3 in a whorl, linear, glabrous; flowers

terminal, capitate; bracteas approximate, 3, 1 large and 2 small; calyx equal to the corolla in length, which is ovate-ventricose; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca rubélla, Bedf. eric. wob. p. 22. Flowers red.

Ruby-flowered Lamprotis. Fl. June, July. Clt.? Shrub 1 foot.

* * *Leaves 4 in a whorl.*

25 L. SQUAMÒSA; leaves 4 in a whorl, imbricated, serrulated; flowers terminal, drooping; bracteas imbricate; calyx large, coloured, about equal in length to the corolla, which is urceolate; anthers crested. ♄. G. Native of the Cape of Good Hope. Erìca squamòsa, Andr. heath. 3. t. 22. Flowers pale red.

Scaly-cupped Lamprotis. Fl. April, July. Clt. 1794. Shrub ½ foot.

* * * *Leaves opposite.*

26 L. TENUIFÒLIA (D. Don, in edinb. phil. journ. 17. p. 154.) leaves opposite, linear, adpressed; flowers terminal, aggregate, sessile; calyx coloured, not much shorter than the corolla; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca tenuifòlia, Lin diss. 33. with a figure of the flower. spec. ed. 2d. p. 507. Berg. pl. cap. p. 116. Erìca linifòlia, Sal. in Lin. trans. 6. p. 386.—Seb. thes. 1. p. 157. t. 73. f. 6.—Lin. hort. cliff. p. 148. Calycine segments oval, acuminated. Corolla 2 lines long, with an ovate tube. Fruit turbinate. Flowers pale red.

Fine-leaved Lamprotis. Fl. April, May. Clt. 1794. Shrub ½ foot.

27 L. LU'TEA; leaves opposite, linear, imbricate, glabrous; flowers nearly terminal; bracteas imbricate; branches flexuous; calycine segments narrow, ovate-cuneated; corolla 2½ lines long, ovate, ventricose; fruit obovate; anthers mutic or awned.? ♄. G. Native of the Cape of Good Hope. Erìca lùtea, Lin. diss. no. 2. mant. p. 234. Berg. pl. cap. 115. Wendl. eric. 1. p. 13. with a figure. Andr. eric. 1. t. 31. Erìca imbéllis, Sal. in Lin. trans. 6. p. 385. Flowers yellow.—There appears to be two species confounded under this name; one with crested or awned anthers, and another with mutic anthers.

Yellow-flowered Lamprotis. Fl. Sept. May. Clt. 1774. Shrub 1 foot.

28 L. BIFLÒRA; leaves opposite, canaliculate, adpressed, glabrous; flowers terminal, twin, on short pedicels; bracteas approximating the calyx; calycine segments ovate, acute, white; anthers crested. ♄. G. Native of the Cape of Good Hope. Erìca biflòra, Link, enum. 1. p. 367. Lodd. bot. cab. 683. Corolla white.

Two-flowered Lamprotis. Fl. April, June. Clt. 1819. Shrub ¾ foot.

29 L. BORBONIÆFÒLIA; leaves opposite; flowers axillary; calycine segments broad, ovate-acuminated, equal in length to the corolla, which is urceolate; fruit obovate; anthers crested or awned. ♄. G. Native of the Cape of Good Hope. Erìca borboniæfòlia, Sal. in Lin. trans. 6. p. 386. Flowers red, 3½ lines long.

Borbonia-leaved Lamprotis. Fl. March, July. Clt. 1816. Shrub.

30 L. OPPOSITIFÒLIA; leaves opposite, filiform, imbricate; flowers terminal, crowded, erect; bracteas sessile; corolla urceolate, about equal in length to the calyx, which is spreading; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca oppositifòlia, Andr. heath. 3. p. 35. Lodd. bot. cab. 1343. Flowers white.

Var. β, *rùbra* (Andr. heath. 3. t. 36. Lodd. bot. cab. 1060.) flowers red.

Opposite-leaved Lamprotis. Fl. Spring and Autumn. Clt. 1804. Shrub ½ to ¾ foot.

31 L.? APE'RTA; leaves opposite, linear, cuspidate, erect, quite glabrous, with scarious margins; flowers terminal, aggregate; bracteas and calyxes coloured; corolla rotate; genitals exserted; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca apérta, Spreng. syst. 2. p. 200.

Open-flowered Lamprotis. Fl. March, May. Clt. 1820. Shrub.

32 L. RUBE'LLA; leaves opposite, or 3 in a whorl, linear, imbricate; flowers terminal, capitate; corolla with a ventricose tube and a spreading limb; calyx about equal in length to the corolla, bracteate; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca rubélla, Ker. bot. mag. 2165. Lodd. bot. cab. 658. Flowers red.

Red-flowered Lamprotis. Fl. June. Clt. 1814. Shrub 1 foot.

33 L. TOGA'TA; leaves opposite, linear, imbricate; flowers terminal; bracteas remote from the calyx, broad; calyx coloured, large, cup-shaped; corollas urceolate, with a spreading limb; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca togàta, Sims, bot. mag. 1626. Flowers fine red.

Gowned Lamprotis. Fl. June, July. Clt.? Shrub ½ to ¾ foot.

34 L.? DIANTHIFÒLIA; leaves opposite, long; flowers terminal; calycine segments ovate-cuneated; corolla 3 lines long; spurs of anthers serrated; pericarp glabrous. ♄. G. Native of the Cape of Good Hope. Erìca dianthifòlia, Sal. in Lin. trans. 6. p. 338. Flowers pale purple.

Pink-leaved Lamprotis. Fl. April, May. Clt. 1796. Shb.

35 L.? A'PHANES; branches hairy; leaves opposite, linear-trigonal, bluntish, scabrous; flowers axillary and terminal. ♄. G. Native of the Cape of Good Hope. Erìca áphanes, Spreng. syst. 2. p. 196.

Insignificant Lamprotis. Fl. March, June. Clt. 1820. Shrub.

Cult. See *Erìca*, p. 800, for culture and propagation.—Pretty little shrubs, easily distinguished from the other genera broke off from *Erìca* by the large coloured calyx and small adpressed leaves.

XII. CALLI'STA (from καλλιστος, *kallistos*, very beautiful; flowers). D. Don, in edinb. phil. journ. 17. p. 155.—Erìca species of authors.

LIN. SYST. *Octándria*, *Monogýnia*. Calyx 4-parted, foliaceous. Corolla salver-shaped, with a dilated spreading 4-cleft limb, and a ventricose or cylindrical tube. Stamens inclosed; filaments capillary; cells of anthers short, dehiscing lengthwise, mutic at the base. Stigma capitate. Capsule 4-celled, many-seeded.—Small, much branched shrubs, natives of the Cape of Good Hope. Leaves acerose, loosely imbricated. Flowers terminal, almost solitary, or in fascicles.

* *Leaves 3 in a whorl.*

1 C. TENUIFLÒRA; leaves 3-4 in a whorl, linear, glabrous, spreading; flowers terminal, usually by fours; calyx bracteate; corolla with a slender tube. ♄. G. Native of the Cape of Good Hope. Erìca tenuiflòra, Andr. heath. 3. t. 49. Lodd. bot. cab. 1717. Erìca cylíndrica, Thunb. diss. no. 39. Erìca fistulæflòra, Sal. in Lin. trans. 6. p. 383. Calycine segments minutely ciliated. Pericarp obovate, glabrous. Corolla 5-6 lines long, yellow. Style exserted.

Var. β, *álba* (Andr. heath. 3. t. 50.) flowers white, sub-axillary, or terminating the small branches, sweet-scented.

Fine-flowered Callista. Fl. April, June; β July, Dec. Clt. 1800. Shrub 1 foot.

2 C. TETRAGÒNA; leaves 3 in a whorl, linear, pointed, ciliated, erectly spreading; flowers terminating small branches; calyx bracteate, with ciliated cuspidate segments; corolla with

a small, tetragonal, pyramidal tube. ♄. G. Native of the Cape of Good Hope. Erìca tetragòna, Thunb. diss. no. 5. with a figure. Andr. heath. 3. t. 51. Lodd. bot. cab. 1239. Erìca pugionifòlia, Sal. in Lin. trans. 6. p. 358. Erìca trigòna, Hort. Corollas 4 lines long, yellow. Style exserted.

Tetragonal-flowered Callista. Fl. July, Sept. Clt. 1789. Shrub.

3 C. buccinifl`ora; leaves 4 in a whorl, linear, ciliated; bracteas sessile; flowers in terminal umbellate fascicles; corolla with a trumpet-shaped tube and a spreading border. ♄. G. Native of the Cape of Good Hope. Erìca buccinifl`ora, Sims, bot. mag. 2465. Lodd. bot. cab. 1127. Erìca buccinæfórmis, Bedf. eric. wob. p. 4. Corolla red, with a white limb. Anthers cornute.

Trumpet-flowered Callista. Fl. June, July. Clt.? Shrub.

4 C. Band`onia; leaves 3 in a whorl, linear-lanceolate, glabrous, spreading: flowers terminal, umbellate, on long pedicels, erect; bracteas remote from the calyx; calycine segments broad; tube of corolla ovate, ventricose; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca Bandònia, Andr. heath. vol. 4. Corolla reddish-purple.

Countess Bandon's Callista. Fl. July, Aug. Clt. 1810. Shrub.

5 C. magni'fica; leaves 3 in a whorl, linear, obtuse, spreading; flowers terminal, usually by threes, drooping; bracteas remote from the calyx; calyx coloured; corolla with an ovate tube, and an erectish limb; style inclosed. ♄. G. Native of the Cape of Good Hope. Erìca magnífica, Andr. heath. vol. 4. Corollas pale red. Anthers cornute.

Magnificent Callista. Fl. Aug. Nov. Clt. 1810. Shrub.

6 C. Broadleya`na; leaves 3 in a whorl, linear, fasciculated, spreading; flowers axillary, on long pedicels, drooping; calycine segments foliaceous, narrow; corolla ventricose, contracted at the mouth, with hardly any limb; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca Broadleyàna, Andr. heath. vol. 4. Flowers red.

Broadley's Callista. Fl. June, July. Clt. 1800. Shrub 1 to 2 feet.

7 C. Julia`na; leaves 3 in a whorl, linear, trigonal, erect, shining, short; flowers terminal, aggregate; bracteas almost sessile; calycine segments dilated and ciliated; corolla ovate, ventricose, with a small limb. ♄. G. Native of the Cape of Good Hope. Erìca Juliàna, Nois. Lodd. bot. cab. 799. Bedf. eric. wob. p. 13. Corolla reddish-purple. Style a little exserted.

July-flowered Callista. Fl. July. Clt. 1800. Shrub 1 ft.

8 C. Celsia`na; glabrous; leaves 3 in a whorl; flowers terminal; bracteas remote from the calyx; corolla with a globular tube; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca Celsiàna, Lodd. bot. cab. 1777. Corolla with a pale red tube and a deep red border.

Cels's Callista. Fl. June. Clt. 1800. Shrub.

9 C. arma`ta; leaves 3, sometimes 5, in a whorl, linear, erect, spinulose; flowers terminal, aggregate, clothed with yellow strigæ; calycine segments foliaceous, spinose; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca armàta, Spreng. syst. 2. p. 184.

Armed Callista. Fl. May, July. Clt. 1816. Shrub.

10 C. Humea`na; leaves 3 in a whorl, linear, glabrous; flowers terminal, by threes; bracteas sessile; corolla with a short ventricose tube, and a large limb; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca Humeàna, Lodd. bot. cab. 389. E. Hùmea, Hortul. Corolla with a red tube, reddish-purple segments, and a dark eye.

Lady Hume's Callista. Fl. June, July. Clt. 1808. Shrub.

11 C. carni`ula; leaves 3-4 in a whorl, linear, glabrous; flowers terminal, racemose; calyx bracteate; corolla with an inflated tube, and a short limb. ♄. G. Native of the Cape of Good Hope. Erìca carnìula, Lodd. bot. cab. 926. Flowers pale red.

Flesh-coloured-flowered Callista. Fl. July, Sept. Clt. 1804. Shrub.

12 C. Sainsburia`na; leaves 3 in a whorl, filiform, elongated, glabrous, erectly spreading; flowers terminal, umbellate; bracteas remote from the calyx; corolla oblong-ovate, with a short limb; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca Sainsbùrya, Andr. heath. vol. 4. Flowers pale red. Style a little exserted.

Sainsbury's Callista. Fl. June, Sept. Clt. 1800. Shrub.

13 C. Comptonia`na; leaves 3 in a whorl, subulate, glabrous, spreading, recurved; flowers terminal, aggregate, pedicellate. ♄. G. Native of the Cape of Good Hope. Erìca Comptoniàna, Andr. heath. vol. 4. Style inclosed.

Compton's Callista. Fl. May, July. Clt. 1802. Shrub.

14 C. infundibulifo'rmis; leaves 4 in a whorl, filiform, obtuse, glabrous, erect; flowers terminal, aggregate; bracteas sessile; corolla with a slender tube, and large segments. ♄. G. Native of the Cape of Good Hope. Erìca infundibulifórmis, Link. enum. 1. p. 364. Andr. heath. vol. 4. Lodd. bot. cab. 589. Flowers pale red, or pale purplish-red. Style inclosed.

Funnel-formed Callista. Fl. Aug. Nov. Clt. 1802. Shrub.

15 C. va`ria; leaves 3 in a whorl; flowers terminal; bracteas approximating the calyx; corolla short, with revolute segments; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca vària, Lodd. bot. cab. 1325. Erìca Cassònii, Hortul. Flowers purplish-red.

Variable Callista. Fl. July. Clt. 1810. Shrub.

16 C. undula`ta; glabrous; leaves 3-4 in a whorl; flowers terminal, by fours, sessile; corolla with an elongated, ventricose, twisted tube, and a spreading limb. ♄. G. Native of the Cape of Good Hope. Erìca undulàta, Lodd. bot. cab. 1792. Flowers deep red.

Waved Callista. Fl. Summer. Clt. 1827. Shrub.

* * *Leaves 4 in a whorl.*

17 C. præ'gnans; leaves 4 in a whorl, linear, ciliated, spreadingly recurved; flowers terminal, crowded; bracteas remote from the calyx; calycine segments acute: corolla ventricose at the base. ♄. G. Native of the Cape of Good Hope. Erìca præ'gnans, Andr. heath. 3. t. 32. Lodd. bot. cab. 945. Corolla pale red, almost white. Very like *C. ventricòsa*, and probably only a variety of it. Style inclosed.

Swelled-flowered Callista. Fl. April, Aug. Clt. 1796. Shrub 1 to 2 feet.

18 C. metulæfl`ora; leaves 4-5 in a whorl, subulate, spinulosely ciliated; flowers terminal, umbellate; bracteas remote from the calyx; corolla ventricose at the base. ♄. G. Native of the Cape of Good Hope. Erìca metulæfl`ora, Sims, bot. mag. t. 612. Andr. heath. 3. t. 33. Lodd. bot. cab. 1763. Flowers red, with a paler border. Style a little exserted.

Nine-pin-flowered Callista. Fl. June, Aug. Clt. 1798. Shrub.

19 C. acumina`ta; leaves 4 in a whorl, trigonal, cuspidate, recurved; flowers terminal, nearly sessile, aggregate; calycine segments acuminated; corolla with an inflated acuminated tube, and a short revolute limb; bracteas close to the calyx. ♄. G. Native of the Cape of Good Hope. Erìca acuminàta, Andr. heath. 3. t. 54. Lodd. bot. cab. t. 216. Flowers reddish-purple. Style inclosed.

Acuminated-flowered Callista. Fl. July, Oct. Clt. 1800 Shrub.

20 C. ferrugínea; leaves 4 in a whorl, linear, secund, ciliated with rusty hairs; flowers terminal, umbellately verticillate, horizontal; calyx bracteate, with the segments bearded at the

apex; filaments terminating in a flat glandular substance; corolla with an acuminated inflated tube. ♄. G. Native of the Cape of Good Hope. Erìca ferrugínea, Andr. heath. 3. t. 57. Corolla with a red tube, and a greenish-yellow limb; but in the figure given by Andrews it is white, tipped with red. Style inclosed.

Rusty Callista. Fl. May, July. Clt. 1798. Shrub 1 ft.

21 C. hyacinthoìdes; leaves 4 in a whorl, shining, spreading; flowers aggregate; calyx bracteate, having the segments serrulated or ciliated; corolla with a ventricose tube. ♄. G. Native of the Cape of Good Hope. Erìca hyacinthoìdes, Andr. heath. 3. t. 158. Ait. hort. kew. 2. p. 384. Flowers red. Style subexserted.

Hyacinth-like Callista. Fl. June, Aug. Clt. 1798. Shb. 1 ft.

22 C. fastigia`ta; leaves 4 in a whorl, shining, erect, imbricated; flowers terminal, crowded, sessile; bracteas serrulated; calycine segments serrulated; corolla with a narrow tube. ♄. G. Native of the Cape of Good Hope. Erìca fastigiàta, Lin. diss. no. 44. mant. 66. Thunb. diss. no. 37. Andr. heath. 2. t. 57. Lodd. bot. cab. t. 207. Erìca falciformis, Sal. in Lin. trans. 6. p. 382. Corolla white, with the limb mealy inside, according to Sal. l. c. In bot. mag. t. 2084. the corollas are painted pale red; it is therefore perhaps a distinct species.

Fastigiate-flowered Callista. Fl. May, Sept. Clt. 1797. Shb.

23 C. pellu`cida; leaves 4 in a whorl, linear, attenuated; stem slender; flowers terminal; calycine segments spatulate, serrated; corolla 5-6 lines long, having the limb 3 times shorter than the tube. ♄. G. Native of the Cape of Good Hope, Erìca pellùcida. Sol. ex Sal. in Lin. trans. 6. p. 384. Corollas white, with very little red, pellucid.

Pellucid-flowered Callista. Shrub.

24 C. Walkeria`na; stem glabrous; leaves 4 in a whorl, linear, shining; flowers terminal, almost sessile; bracteas approximating the calyx, ciliated; calycine segments lanceolate, serrated; corolla 4-5 lines long, with an ovate ventricose tube, and a wide-spreading limb, which is doubly shorter than the tube. ♄. G. Native of the Cape of Good Hope. C. pellùcida, D. Don, in edinb. phil. journ 17. p. 155. Erìca Walkèria, Andr. heath. 1. t. 42. Lodd. bot. cab. 256. E. pùlchra, Sal. in Lin. trans. 6. p. 384. Flowers pink or pale red. Style inclosed.

Var. β, rùbra (Andr. heath. 2. t. 43.) flowers red.

Var. γ, supérba (Andr. heath. 1. t. 42.) flowers purplish-red. Erìca fastigiàta, Wendl. eric. fasc. 19. p. 103.

Walker's Callista. Fl. Feb. June. Clt. 1797. Shrub 1½ foot.

25 C. denticula`ta (D. Don, in edinb. phil. journ. 17. p. 155.) stem pubescent; leaves 4 in a whorl, linear, glabrous; flowers terminal, fastigiate: bracteas remote from the calyx; calycine segments obcuneated, serrated; corolla 3 lines long, with a cylindrical tube: having the limb one-half shorter than the tube. ♄. G. Native of the Cape of Good Hope. Erìca denticulàta, Lin. mant. p. 22. Erìca dentàta, Thunb. diss. no. 39. Erìca denticulàris, Sal. in Lin. trans. 6. p. 384. Erìca primuloìdes β, Wendl. Flowers purple.

Denticulated-calyxed Callista. Fl. April, May. Clt. 1821. Shrub 1 foot.

26 C. Bedfordia`na; leaves 4 in a whorl, linear; flowers terminal; bracteas sessile; calycine segments deeply serrated or toothed; corolla with an ovate ventricose tube. ♄. G. Native of the Cape of Good Hope. Erìca denticulàta, Bedf. hort. wob. p. 8. Lodd. bot. cab. 1090.? but not of Lin. nor others. Flowers yellow. Style a little exserted.

Var. β, moschàta (Bedf. l. c.) calycine segments serrated; flowers yellowish-green.

Bedford's Callista. Fl. May, June. Clt.? Shrub.

27 C. Templea`na; leaves 4 in a whorl, linear, ciliated? flowers terminal, almost sessile; bracteas approximating the calyx, ciliated, as well as the calycine segments; anthers curved; corolla with an oblong ventricose tube, and a small limb. ♄. G. Native of the Cape of Good Hope. Erìca Témplea, Hortul. Bedf. eric. wob. p. 24. pl. 4. f. 17. Corolla about the size and shape of those of *C. ventricòsa*, pale red, or reddish-purple. Style inclosed.

Temple's Callista. Fl. July, Aug. Clt. 1820. Shrub 1 to 2 feet.

28 C. comòsa (D. Don, in edinb. phil. journ. 17. p. 155.) stem pubescent; leaves 4 in a whorl, linear, short, erectly spreading; flowers terminal, tufted; bracteas imbricate, and are ciliated as well as the calycine segments, coloured; corolla with an ovate ventricose tube. ♄. G. Native of the Cape of Good Hope. Erìca comòsa, Andr. heath. 2. t. 54. Erìca transpàrens, Berg. pl. cap. p. 108. Erìca galiiflòra, Sal. in Lin. trans. 2. p. 583. Flowers small, white, with dark anthers. Style inclosed.

Var. β, rùbra (Andr. heath. 2. t. 55.) corollas red. ♄. G. Erìca comòsa, Lin. diss. no. 48. mant. p. 234. Thunb. diss. no. 38. Bauer, icon. hort. kew. t. 18.

Tufted Callista. Fl. April, Aug. Clt. 1787. Shrub ¾ ft.

29 C. ventricòsa (D. Don, in edinb. phil. journ. 17. p. 155.) leaves 4 in a whorl, short, acerose, semi-cylindrical, and are ciliated as well as the calyxes and bracteas: floral leaves the broadest; flowers disposed in terminal umbellate fascicles; bracteas remote from the calyx; corolla with a ventricose tube. ♄. G. Native of the Cape of Good Hope. Erìca ventricòsa, Thunb. diss. no. 36. with a figure. Andr. heath. 1. t. 28. Curt. bot. mag. t. 350. Wendl. eric. fasc. 3. p. 11. Bedf. eric. wob. pl. 4. f. 18. a. Lodd. bot. cab. 431. Erìca venústa, Sal. in Lin. trans. 6. p. 385. Peduncles bibracteate below the middle. Corolla waxy, purplish-red. Style inclosed.

Var. β, coccínea; flowers reddish-purple.

Var. γ, stellífera; flowers purplish-red.

Var. δ, cárnea; flowers pale red.

Var. ε, álba; flowers very pale red, almost white.

Var. ι, supérba; flowers deep red.

Var. η, erécta; erect; flowers pale red.

Var. ϑ, nàna; dwarf; flowers pale red.

Ventricose-flowered Callista, or Porcelain Heath. Fl. April, Sept. Clt. 1787. Shrub 1 to 2 feet.

30 C. infla`ta; leaves 4 in a whorl, glabrous, linear; flowers in terminal umbellate fascicles; corolla with an elongated, ovate, ventricose tube, and a short limb; pedicels bibracteate below the middle; calycine segments subulate. ♄. G. Native of the Cape of Good Hope. Erìca inflàta, Thunb. diss. no. 67. with a figure. Erìca amábilis, Sal. in Lin. trans. 6. p. 385. Erìca glàbra, Link. enum. 1. p. 362. Corolla large, with a reddish-purple base, and a green top. Anthers corniculate at the base.

Inflated-flowered Callista. Fl. May, Sept. Clt. 1800. Shrub 1 to 2 feet.

31 C. musca`ri; leaves 4 in a whorl, linear-trigonal, glabrous, spreading; flowers terminal, sessile, usually by fours; bracteas approximating the calyx, leaf-like; calycine segments subulate; corolla ovate-ventricose, with a short obtuse revolute limb. ♄. G. Native of the Cape of Good Hope. Erìca muscàri, Andr. heath. 1. t. 41. Ait. hort. kew. 2. p. 395. Wendl. eric. fasc. 18. p. 95. with a figure. Erìca frágrans, Sal. in Lin. trans. 4. p. 383. Stem glabrous. Flowers small, pale yellow or yellowish-green. Corolla flat at the base. Fruit obpyramidal.

Musk-scented Callista. Fl. March. Clt. 1790. Shrub 1 foot.

32 C. Lawsònii; leaves 4 in a whorl, filiform, spreading, ciliated; flowers terminal; bracteas sessile; corolla with a cylindrical tube, which is ventricose at the base; calycine segments narrow. ♄. G. Native of the Cape of Good Hope. Erìca Lawsònia, Andr. heath. vol. 4. icon. Sims, bot. mag. 1720. Lodd. bot. cab. 488. Erìca Kennèdia, Hortul. Flowers red.

Lawson's Callista. Fl. Sept. Clt. 1802. Shrub 1 foot.

33 C. DAPHNIFLÒRA; leaves 4 in a whorl, short, glabrous, acerose, erectly spreading; bracteas sessile; calycine segments lacerated a little; flowers terminal, usually by fours; corollas with an ovate ventricose tube, and a spreading obtuse limb. ♄. G. Native of the Cape of Good Hope. Erìca daphneflòra, Lodd. bot. cab. 543. Bedf. eric. wob. p. 7. Flowers small, white or deep red. Style exserted.

Daphne-flowered Callista. Fl. April, June. Clt. 1791. Shrub 1 foot.

34 C. DAPHNOÌDES; leaves 4 in a whorl, linear, glabrous; flowers terminal by fours; bracteas sessile; corolla with an ovate ventricose tube and a large limb. ♄. G. Native of the Cape of Good Hope. Erìca daphnoìdes, Lodd. bot. cab. 154. Erìca mirábilis, Hortul. Flowers pale red. Style a little exserted.

Daphne-like-flowered Callista. Fl. May, June. Clt. 1800. Shrub 1 to 2 feet.

35 C. Coventrya'na; leaves 4 in a whorl, linear-trigonal, ciliated, as well as the calyxes and bracteas; flowers terminal, aggregate, sessile; bracteas sessile; calycine segments foliaceous, narrow; corolla with a slender tube, and large segments. ♄. G. Native of the Cape of Good Hope. Erìca Covéntrya, Andr. heath. 4. icon. Lodd. bot. cab. 423. Corolla with a greenish-yellow tube, and a red limb, with ovate segments. Style a little exserted.

Lord Coventry's Callista. Fl. July, Sept. Clt. 1808. Sh.

36 C. VERECU'NDA; leaves 4? in a whorl, linear, obtuse; flowers lateral, verticillate; corolla with a ventricose tube, and a spreading limb. ♄. G. Native of the Cape of Good Hope. Erìca verecúnda, Lodd. bot. cab. 1827. but not of Sal. Flowers red.

Reddish-flowered Callista. Fl. Spring, Autumn. Clt. 1820. Shrub 1 foot.

37 C. STELLI'FERA; leaves 4 in a whorl, linear-lanceolate, subulate, pilose, spreading; flowers axillary and terminal, racemose, erect; bracteas remote from the calyx; limb of corolla 6-cleft. ♄. G. A hybrid. Erìca stellífera, Andr. heath. vol. 4. Lodd. bot. cab. 1622. Flowers reddish-purple.

Star-bearing Callista. Fl. April, July. Clt. 1800. Shrub.

38 C. PRÆ'STANS; leaves 4 in a whorl, linear, erect, glabrous; flowers terminal, aggregate; bracteas sessile, smooth; calycine segments ovate, cuspidate, with scarious hardly serrated edges; corolla with a ventricose tube, and a recurvedly reflexed limb. ♄. G. Native of the Cape of Good Hope. Erìca præ'stans, Andr. heath. vol. 4. Lodd. bot. cab. 1695. Erìca daphniflòra, Sal. in Lin. trans. 6. p. 384. Corollas white. Style exserted.

Excelling Callista. Fl. June, Nov. Clt. 1810. Shrub 1 foot.

39 C. MU'NDULA; leaves 4 in a whorl, subulate, spreading, shining, glabrous; flowers terminal, usually by fours, sessile; bracteas sessile; calyx naked; corolla with a short narrow tube, and a wide limb; style inclosed. ♄. G. Native of the Cape of Good Hope. Érica múndula, Andr. heath. vol. 4. Lodd. bot. cab. 114. Flowers reddish-purple.

Neat Callista. Fl. Oct. Feb. Clt. 1810. Shrub.

40 C. RÍGIDA; glabrous; leaves 4 in a whorl, linear, spreading; flowers terminal, pedicellate; corolla ventricosely tubular, with a blunt border; pedicels red; bracteas remote from the calyx. ♄. G. Native of the Cape of Good Hope. Erìca rígida, Lodd. bot. cab. 286. Erìca metulæflòra bícolor, Bedf. eric. wob. p. 15. Corolla red. Limb short, white.

Stiff Callista, Fl. July, Aug. Clt. 1820. Shrub 1 foot.

41 C. TRÓSSULA; leaves 4 in a whorl, linear, glabrous; flowers terminal; bracteas approximating the calyx; corolla with an ovate ventricose tube. ♄. G. Native of the Cape of Good Hope. Erìca tróssula, Lodd. bot. cab. 1742. Flowers white.

Var. β, rùbra; flowers red.

Spruce Callista. Fl. May, July. Clt. 1806. Shrub.

42 C. STRUTHIOLÆFLÒRA.—This species has not yet been described or figured. ♄. G. Native of the Cape of Good Hope. Erìca struthiolæflòra, Lodd. bot. cab. p. 25.

Struthiola-flowered Callista. Shrub.

43 C. Cliffordia'na; leaves 4 in a whorl, glabrous; flowers terminal; bracteas rather remote from the calyx; corolla with a slender ventricose tube; style inclosed. ♄. G. Native of the Cape of Good Hope. Erìca Cliffordiàna, Lodd. bot. cab. 34. Flowers white.

Lady De Clifford's Callista. Fl. April, May. Clt. 1812. Shrub.

44 C. PAVETTÆFLÒRA; leaves 4 in a whorl, linear; flowers terminal; pedicels very short; corolla 9-10 lines long, having the limb mealy inside; filaments spurred near the top of the anthers. ♄. G. Native of the Cape of Good Hope. Erìca pavettæflòra, Sal. in Lin. trans. 6. p. 382. Erìca infundibulifórmis, Roxb. mss.

Pavetta-flowered Callista. Fl. May, Aug. Clt. 1800. Shrub.

45 C. NIDIFLÒRA; stem pubescent; leaves 4 in a whorl, linear; flowers terminal; calycine segments obcuneated, serrated; corolla 3 lines long, with the limb one-half shorter than the tube; spurs of anthers very minute, ear-formed. ♄. G. Native of the Cape of Good Hope. Erìca nidiflòra, Sal. in Lin. trans. 6. p. 383. Erìca denticulàta, Roxb. mss.

Nest-flowered Callista. Fl. May, Oct. Clt. 1800. Shrub.

46 C. Parmentie'rii; leaves 4 in a whorl; flowers terminal; bracteas sessile; corolla with a cylindrically ventricose tube, and broad-spreading segments. ♄. G. Native of the Cape of Good Hope. Erìca Parmentièrii, Lodd. bot. cab. 197. Flowers reddish-purple. Style a little exserted.

Parmentier's Callista. Fl. April, June. Clt. 1810. Shrub 1 foot.

47 C. MOSCHA'TA; glabrous; leaves 4 in a whorl?; flowers terminal; corolla short, with a ventricose tube, and a small spreading limb. ♄. G. Native of the Cape of Good Hope. Erìca moschàta, Andr. heath. 4 icon. Lodd. bot. cab. 614. Corollas yellow.

Musky Callista. Fl. May, July. Clt. 1805. Shrub.

48 C. CALÓSTOMA; glabrous; leaves linear, 4 in a whorl; flowers terminal, crowded; corolla with a ventricose elongated tube, a dark neck, and a white limb. ♄. G. Hybrid. Erìca calóstoma, Lodd. bot. cab. 1759.

Beautiful-mouthed Callista. Fl. May, June. Hybrid Shrub.

49 C. Russelia'na; leaves 4 in a whorl, linear, glabrous; flowers terminal; bracteas remote from the calyx; corolla ovate-globose, with large open segments. ♄. G. Native of the Cape of Good Hope. Erìca Russeliàna, Lodd. bot. cab. 1013. Bedf. eric. wob. p. 22. Flowers reddish-purple.

Duke of Bedford's Callista. Fl. June, July. Clt. 1820. Shrub.

50 C. VENU'STA; leaves 4 in a whorl, ciliated; flowers terminal, sessile; bracteas sessile, præmorse, membranous, ciliated, as well as the calyxes; corolla ovate, ventricose, with broad segments; ♄. G. Native of the Cape of Good Hope. Erìca venústa, Hortul.

Graceful Callista. Fl. Spring, Summer. Clt. 1800. Shrub.

*** *Leaves 5-6 in a whorl.*

51 C. BLA'NDA; leaves 6 in a whorl, spreadingly reflexed, imbricate; flowers terminal, umbellate, horizontal; calyx bracteate; genitals a little exserted; corolla with an oblong tube, and small border. ♄. G. Native of the Cape of Good Hope. Erìca blánda, Andr. heath. 3. t. 34. Flowers reddish-purple or bluish.—Perhaps a species of *Syringòdea*. Style exserted.

Charming Callista. Fl. April, Sept. Clt. 1800. Shrub ¾ foot.

52 C. primuloìdes; leaves 5 in a whorl, glabrous; flowers, terminal, nearly sessile, fastigiate; corolla with an ovate tube. and a broad-spreading limb; calycine segments serrulated. ♄, G. Native of the Cape of Good Hope. Erìca primuloìdes Andr. heath. 3. t. 63. Lodd. bot. cab. 715. Erìca delécta, Hortul. Sims, bot. mag. 1548. Flowers pink and white, with a dark eye, and sometimes reddish-purple. Style exserted.

Primrose-like-flowered Callista. Fl. May, July. Clt. 1802. Shrub 1 foot.

53 C. Swainsònii; leaves 5-6 in a whorl, linear, obtuse, crowded, erect; flowers terminal, umbellate; bracteas sessile; calycine segments lanceolate; corolla with a cylindrical furrowed tube, and a spreading border; anthers somewhat exserted. ♄. G. Native of the Cape of Good Hope. Erìca Swainsònia, Andr. heath. 3. t. 65. Flowers reddish-purple or buff-red.

Swainson's Callista. Fl. July, Oct. Clt. 1794. Shrub 1 to 2 feet.

54 C. quadrangula'ris; leaves recurved, glabrous, scattered: flowers terminating small branches; bracteas sessile; corolla with a 4-angled tube, winged; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca quadrangulàris, Andr. heath. vol. 4. with a figure. Erìca eròsa, Lodd. bot. cab. 133. Bedf. eric. wob. pl. 2. f. 2. Corolla with a purplish-red tube, and a white crenulated limb.

Quadrangular-flowered Callista. Fl. June, Aug. Clt. 1817. Shrub.

Cult. For culture and propagation see *Erìca*, p. 800.—Elegant shrubs when in blossom. The wood being harder than that of the species of *Erìca*, cuttings are more difficult to root.

XIII. EURYLO'MA (from *ευρυς*, *eurys*, wide, and *λωμα*, *loma*, a margin; in reference to the wide limb of the corolla). D. Don, in edinb. phil. journ. 17. p. 155.—Erìca species of authors.

Lin. syst. *Octándria Monogy'nia.* Calyx 4-parted, foliaceous. Corolla salver-shaped, with an elongated filiform or ventricose tube, and a 4-parted dilated limb. Stamens inclosed; filaments dilated, membranous, channelled; anthers bipartite; cells of anthers membranous, dehiscing lengthwise, and drawn out at the base into a short tumid spur. Stigma with an elevated 4-lobed disk. Capsule 4-celled, many-seeded. — Diffusely branched shrubs, natives of the Cape of Good Hope. Leaves adpressed, semi-cylindrical, minutely denticulated. Flowers terminal, solitary or by threes, large, showy, on short pedicels, clammy.

* *Leaves 3 in a whorl.*

1 E. Aitòni (D. Don, l. c.) leaves 3 in a whorl, linear, serrulated, erect; flowers terminal, usually by threes; bracteas remote from the calyx; corolla viscid, with a cylindrical tube, which is ventricose at top, and large ovate segments; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca Aitònia, Andr. 1. t. 25. Curt. bot. mag. 429. Erìca Aitoniàna, Ait. hort. kew. 2. p. 372. Lodd. bot. cab. 144. Erìca Aitòni, Willd. spec. 2. p. 398. Erìca jasminiflòra, Sal. in Lin. trans. 6. p. 382. Corolla pale red, or nearly white, 16 to 19 lines long.

Aiton's Euryloma. Fl. June, Sept. Clt. 1790. Shrub 2 feet.

2 E. jasminiflòra (D. Don, l. c.) leaves 3 in a whorl, linear-oblong, serrulated, recurved, imbricated in 6 rows; flowers terminal, aggregate; bracteas ciliated, remote from the calyx; corolla viscid, with an ovate tube, which is ventricose at the apex, and ovate segments; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca jasminiflòra, Andr. heath. 1. t. 26. Erìca lagenæflòra, Sal. in Lin. trans. 6. p. 382. Corolla 12-14 lines long, with a reddish tube, and a yellowish-green border.

Var. β, álba; flowers pure white.

Jasmine-flowered Euryloma. Fl. June, Nov. Clt. 1794. Shrub 1 to 2 feet.

3 E. trícolor; leaves 3 in a whorl, linear, recurved, ciliated, as well as the bracteas and calyxes: the terminating hairs the longest; pedicels bibracteate near the base; flowers terminal, usually about 6 together; corolla viscid, with a large ventricose tube, and ovate-cordate slightly crenulated segments; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca trícolor, Nois. Bedf. hort. eric. wob. p. 25. Corolla red at the base, white at top, but greenish-yellow below the contraction of the limb.

Var. β, màjor (Bedf. eric. wob. p. 26.) leaves adpressed, shortly ciliated; corolla oblong, inflated, with a red tube and segments, and yellowish-green below the contraction.

Var. γ, dumòsa; leaves long-ciliated, recurved; corolla with an ovate-oblong inflated tube. ♄. G. Corolla with a red tube, a greenish-yellow contraction, and white segments. Bedf. eric. wob. p. 25. t. 4. f. 17.

Var. δ, mìnor (Bedf. eric. wob. p. 26.) leaves 4 in a whorl; style inclosed; corolla inflated, ventricose. ♄. G. Corolla with a red tube, greenish-yellow top, and red segments.

Three-coloured Euryloma. Fl. June, July. Clt. 1810. Shrub.

4 E. mira'bilis; leaves 3 in a whorl, ? obtuse; flowers terminal, disposed in umbellate fascicles; corolla viscid? with a ventricose base, a contracted neck, and a wide-spreading border. ♄. G. Native of the Cape of Good Hope. Erìca mirábilis, Lodd. bot. cab. 1804. Corollas white, tinged with red.

Admirable Euryloma. Fl. May, June. Clt. 1804. Shrub.

5 E. ampulla'cea; leaves 3-4 in a whorl, lanceolate, ciliated, reflexed; flowers terminal, usually by fours; bracteas approximating the calyx, ciliated, as well as the calycine segments; corolla viscid, with a ventricose tube, ribbed neck, and ovate-cordate slightly crenulated obtuse segments; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca ampullàcea, Curt. bot. mag. 303. Andr. heath. 1. t. 29. Lodd bot. cab. 508. Erìca ampulæfórmis, Sal. in Lin. trans. 6. p. 381. Leaves imbricate at the base, moderately spreading at top. Corolla 8-10 lines long, red. Anthers incurved at top.

Flask-flowered Euryloma. Fl. July, Aug. Clt. 1790. Sh.

6 E. Irbya'na; leaves 3 in a whorl, cuspidate, with scabrous margins, erect; bracteas remote from and approximating the calyx; flowers terminal, umbellate; corolla viscid, with a cylindrical ventricose tube, and large segments; style exserted; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca Irbyàna, Andr. heath. 3. t. 25. Lodd. bot. cab. 816. Flowers white.

Var. β, rùbra; flowers reddish-purple.

Irby's Euryloma. Fl. June, Oct. Clt. 1800. Shrub 1 to 2 feet.

7 E. nota'bilis; leaves linear-oblong, 3 in a whorl, serrulately ciliated, short, adpressed; branches slender, flexuous; flowers small, terminal, aggregate, viscid; corolla tubular, with a constricted neck, and small limb. ♄. G. Native of the Cape of Good Hope. Erìca notábilis, Wendl. Licht. ex Spreng. syst. 2. p. 184. Style inclosed.

Notable Euryloma. Fl. March, Aug. Clt. 1816. Shrub 1 to 2 feet.

8 E. curvifòlia; leaves 3 in a whorl, recurved, ciliated?; spikes coarctate; corolla 4 lines long, viscid, with an ovate pyramidal tube; spurs of anthers linear-attenuated; pericarp hairy. ♄. G. Native of the Cape of Good Hope. Erìca curvifòlia, Sal. in Lin. trans. 6. p. 380. Flowers lateral.

Curved-leaved Euryloma. Shrub.

9 E. Shannonia'na; leaves 3-4 in a whorl, stiff, spreading,

ending each in a hair; flowers terminal, umbellate, drooping; calyx coloured; bracteas remote from the calyx; corolla with a ventricose ribbed tube; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca Shannònia, Andr. heath. vol. 4. Erìca Shannoniàna, Lodd. bot. cab. 168. Spreng. syst. 2. p. 185. Flowers red.

Countess Shannon's Euryloma. Fl. June, Sept. Clt. 1806. Shrub 1 to 2 feet.

** *Leaves 4 in a whorl.*

10 E. Hartne'lli; leaves 4 in a whorl, lanceolate, imbricated, finely ciliated: the terminating hairs the longest; corolla viscid nearly tubular, rather ventricose at the base, with ovate-triangular lobes. ♄. G. Native of the Cape of Good Hope. Erìca Hartnélli, Roll. cat.

Hartnell's Euryloma. Fl. May, Oct. Clt. 1820. Shrub.

11 E. ampullaceoìdes; leaves 4 in a whorl, ciliated; flowers terminal; bracteas remote from the calyx; corolla with a ventricose curved tube. ♄. G. Native of the Cape of Good Hope. Erìca ampullaceoìdes, Bedf. eric. wob. p. 2. Erìca ampullàcea, Hort. Corolla with a red tube, and a greenish-yellow neck.

Ampullacea-like Euryloma. Fl. Summer. Clt. 1800. Shrub.

12 E. prínceps; leaves 4 in a whorl, linear, ciliated, recurved; flowers terminal, umbellate; bracteas approximating the calyx, ciliated, as well as the calycine segments; corolla viscid, with a ventricose tube, and a hairy top; style inclosed. ♄. G. Native of the Cape of Good Hope. Erìca prínceps, Andr. heath. 2. t. 44. Lodd. bot. cab. 647. Corollas reddish-purple.

Var. β, cárnea; flowers pale red.

Princely Euryloma. Fl. May, July. Clt. 1800. Shrub 1 to 2 feet.

13 E. retórta; leaves 4 in a whorl, squarrosely recurved, and are as well as the calyxes and bracteas fimbriately ciliated and aristate; flowers terminal, umbellate, usually 7-8 together; corolla viscid, with an ovate ventricose tube, and acute segments; anthers woolly; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca retórta, Lin. suppl. p. 220. Montin, in act. holm. 1774. p. 297. t. 7. Curt. bot. mag. 362. Andr. heath. 1. t. 47. Lodd. bot. cab. 804. Wendl. eric. fasc. 15. p. 45. with a figure. E. gorteriæfòlia, Sal. in Lin. trans. 6. p. 381. Corolla 8-9 lines long, pale red.

Var. β, álba; corolla white, Sal. l. c.

Twisted-leaved Euryloma. Fl. July, Oct. Clt. 1781. Shrub.

14 E. ca'pax; leaves 4 in a whorl, ovate-cuneated; flowers terminal; corolla viscid, 8-10 lines long, with a flask-formed tube, and retuse segments. ♄. G. Native of the Cape of Good Hope. Erìca cápax, Sal. in Lin. trans. 6. p. 381. Erìca præ'gnans, Sol. mss.

Capacious Euryloma. Fl. May, Aug. Clt. 1806. Shrub 1 to 2 feet.

15 E. arista'ta; leaves 4-5 in a whorl, oblong, subsecund, hispid, imbricated, awned at the apex; flowers terminal; bracteas approximating the calyx; corolla inflated upwards with revolute projecting segments: calycine segments obtuse. ♄. G. Native of the Cape of Good Hope. Erìca aristàta, Andr. heath. 3. t. 28. Curt. bot. mag. t. 1449. Ait. hort. kew. 2. p. 384. Bedf. eric. wob. p. 2. pl. 2. t. 11. Lodd. bot. cab. 73. Corollas reddish-purple, with a paler limb.

Awned-leaved Euryloma. Fl. March, Aug. Clt. 1801. Shrub 1 to 2 feet.

16 E. ariste'lla; leaves 4 in a whorl, hispid, awned, imbricated, subsecund; flowers terminal; bracteas approximating the calyx; corolla with an oblong acuminated tube; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca aristélla, Bedf. eric. wob. p. 2. Erìca aristàta mìnor, Hortul. Corolla reddish-purple.

Small-awned Euryloma. Fl. June, July. Clt. 1806. Shrub.

17 E. obba'ta; leaves 4 in a whorl, linear, ciliated, secund; flowers terminal; bracteas approximating the calyx, ciliated, as well as the calyxes; corolla viscid, with a globose-ventricose ribbed tube, and spreading obtuse segments. ♄. G. Native of the Cape of Good Hope. Erìca obbàta, Andr. heath. 2. t. 33. Corolla with a reddish-purple tube, a greenish-yellow neck, and a pale limb.?

Var. β, umbellàta (Andr. heath. 3. t. 29.) flowers terminal, umbellate, white. ♄. G. Native of the Cape of Good Hope.

Bottle-flowered Euryloma. Fl. April, July. Clt. 1796. Shrub.

18 E. oblonga (Bedf. eric. wob. p. 17.) leaves 4 in a whorl, linear, ciliated, recurved; flowers terminal, umbellate; bracteas approximating the calyx, ciliated; calyx inflated, ciliated; corolla oblong, ruffed; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca oblónga, Bedf. eric. wob. p. 17. Erìca obbàta ròsea, Hortul. Flowers reddish-purple.

Oblong-flowered Euryloma. Fl. June, Sept. Clt.? Shrub.

*** *Leaves 6 in a whorl.*

19 E. squarròsa; leaves 6 in a whorl, squarrose; flowers terminal; corolla viscid, 5-6 lines long, with an ovate pyramidal tube, and an obtuse limb; anthers smooth; spurs marginal. ♄. G. Native of the Cape of Good Hope. Erìca squarròsa, Sal. in Lin. trans. p. 380. Leaves very dense.

Squarrose Euryloma. Fl. March, Aug. Clt. 1808. Shrub.

20 E. imperia'lis; leaves 6 in a whorl, filiform, erect, imbricated; flowers terminal, corymbose, drooping; corolla viscid,? with a discoloured limb. ♄. G. Native of the Cape of Good Hope. Erìca imperiàlis, Andr. heath. 4. icon.

Imperial Euryloma. Fl. May, July. Clt. 1802. Shrub.

21 E. recurva'ta; leaves 6 in a whorl, linear, flexuous, recurved; flowers terminal, nearly sessile, drooping, capitate; bracteas sessile; corolla curved, ovate-oblong; style exserted; anthers mutic. ♄. G. Native of the Cape of Good Hope. Erìca recurvàta, Andr. heath. vol. 4. Flowers pale red.

Recurved-flowered Euryloma. Fl. April, June. Shrub.

22 E. crinìta; leaves crowded, lanceolate, terminated each by a hair; flowers nearly terminal, drooping; pedicels red; corolla cylindrical, contracted at the neck. ♄. G. Native of the Cape of Good Hope. Erìca crinìta, Lodd. bot. cab. 1432. Corolla purplish-red, with a pale border.

Long-haired Euryloma. Fl. May, Aug. Clt. 1826. Shrub.

Cult. For culture and propagation see *Erìca*, p. 800. Most elegant shrubs when in blossom. The wood of the species being more hard than that of *Erìca*, the cuttings do not strike root so freely.

XIV. CHO'NA (from χωνη, *chone*, a funnel; from the figure of the corolla). D. Don, in edinb. phil. journ. 17. p. 155.—Erìca species of authors.

Lin. syst. *Octándria Monogy'nia.* Calyx 4-parted, foliaceous. Corolla funnel-shaped, with a 4-lobed revolute limb. Stamens exserted; filaments capillary; anthers truncate, combined; cells of anthers elongated, parallel, awned at the base. Stigma simple, obtuse. Capsule 4-celled, many-seeded.—A small diffuse shrub, native of the Cape of Good Hope. Leaves 3 in a whorl, linear, awned, with revolute setosely-ciliated margins. Flowers terminal, corymbose, blood-red. Anthers black. Perhaps *Syringòdea mutábilis* belongs to this genus.

1 C. sangui'nea (D. Don, l. c.). ♄. G. Native of the Cape of Good Hope. Erìca Nivènia, Andr. heath. 2. t. 26.

Var. β, *longiflòra* (Andr. heath. 3. t. 4.) flowers longer and more tubular, blood-red.

Bloody-flowered Chona. Fl. year. Clt. 1799. Shrub 1 to 2 feet.

Cult. For culture and propagation see *Erìca*, p. 800.

XV. SYRINGO'DEA (from *συριγξ*, *syrinx*, a pipe; in reference to the long tubular corollas). D. Don, in edinb. phil. journ. 17. p. 155.—Erìca species of authors.

Lin. syst. *Octándria*, *Monogýnia*. Calyx 4-leaved, glumaceous. Corolla long, tubular, usually rather dilated at top, rarely a little contracted; limb short, 4-lobed. Stamens for the most part inclosed; filaments capillary; anthers bipartite; cells of anthers short, obtuse, mutic or aristate at the base, dehiscing by an oblong foramen. Stigma simple or capitate, and in some species annulated, with an elevated disk. Capsule 4-celled, many-seeded. Seeds oval, compressed, smooth.—Erect shrubs, natives of the Cape of Good Hope. Leaves loose, acerose. Flowers large, showy, crowded at the tops of the branches on every side, disposed in something like spikes.

§ 1. *Anthers mutic at the base. Normal species.*

* *Leaves 3 in a whorl.*

1 S. costa'ta; leaves bluntish, downy, spreading; flowers terminal, by threes; bracteas close to the calyx; calycine segments serrulated; corolla glabrous, curved, ribbed; style a little exserted. ♄. G. Native of the Cape of Good Hope. Erìca costàta, Andr. heath. 1. t. 40. Corolla pale red, with a greenish border.

Var. β, *supérba* (Andr. heath. vol. 4.) corolla larger, reddish-purple, with a greenish-yellow mouth.

Ribbed-flowered Syringodea. Fl. March, June. Clt. 1795. Shrub.

2 S. dia'phana; leaves spreading, glabrous; flowers terminal, by threes, pendulous, glabrous; bracteas foliaceous, close to the calyx; calyxes obtuse, foliaceous; corolla with a clavate inflated tube; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca transpàrens, Andr. heath. vol. 4. with a figure. Lodd. bot. cab. 177. Erìca diáphana, Spreng. syst. 2. p. 178. Corollas deep reddish-purple.

Diaphanous Syringodea. Fl. June, July. Clt. 1796. Shrub.

3 S. cla'va'ta; leaves erect; flowers terminal, by threes, drooping; bracteas close to the calyx, adpressed; genitals exserted a little. ♄. G. Native of the Cape of Good Hope. Erìca clavàta, Andr. heath. 3. t. 40. Corolla green, cylindrically clavate. Anthers black.

Clavate-flowered Syringodea. Fl. July, Aug. Clt. 1800. Shrub.

4 S. pa'llens: leaves linear, hoary, spreading; flowers disposed in terminal racemes, horizontal; bracteas close to the calyx. ♄. G. Native of the Cape of Good Hope. Erìca pállens, Andr. heath. 3. t. 45. Corolla sulphur-coloured.

Pale-flowered Syringodea. Fl. June, Aug. Clt. 1800. Shrub.

5 S. di'chrus; leaves 3-4 in a whorl, villous; flowers terminal, by threes; bracteas close to the calyx; calyxes coloured, ciliated; corolla cylindrical; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca díchrus, Spreng. syst. 2. p. 179. Erìca bícolor, Andr. heath. 2. t. 39. Lodd. bot. cab. 1001. but not of Thunb. nor Willd. Erìca dichromàta, Lodd. bot. cab. 1813. Corolla purplish-red, with a greenish-yellow mouth.

Two-coloured-flowered Syringodea. Fl. April, July. Clt. 1800. Shrub.

6 S. Linnæa'na (D. Don, l. c.) leaves ciliated, spreading; flowers axillary, numerous, nearly sessile, horizontal; corollas clavate, downy or villous; bracteas close to the calyx, and are as well as the calycine segments serrated; style subexserted. ♄. G. Native of the Cape of Good Hope. Erìca Linnæàna, Lodd. bot. cab. 102. Erìca Linnæ'a, Andr. heath. 2. t. 34. Erìca perspícua β, Ait. hort. kew. 2. p. 371. Corolla white, with a red base. Anthers bearded on the back at top. In this and *S. abietìna* the ovarium is 6-8-celled.

Var. β, *supérba* (Lodd. bot. cab. 1778.) flowers large, white tinged with red, erect. ♄. G. Erìca Bedfordiàna, G. Don, in Loud. hort. brit. p. 147.

Linnæus's Syringodea. Fl. Jan. May. Clt. 1790. Shrub.

7 S. versícolor; leaves glabrous, spreading; flowers terminal, by threes; calyxes coloured; bracteas close to the calyx, denticulated, as well as the calycine segments; corolla nearly cylindrical; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca versícolor, Andr. heath. 1. t. 39. Lodd. bot. cab. 208. Corolla purplish-red, with a greenish-yellow mouth.

Var. β, *màjor* (Lodd. bot. cab. 1316.) flowers larger.

Party-coloured-flowered Syringodea. Fl. April, Oct. Clt. 1790. Shrub.

8 S. triphy'lla; leaves glabrous, spreading; flowers terminal, 2-3 together, on short pedicels; bracteas approximating the calyx; calyx foliaceous, spreading; anthers inclosed; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca triphýlla, Link. enum. 1. p. 360. Corolla clammy, red, yellow at top.

Three-leaved Syringodea. Fl. July, Nov. Clt. 1822. Shb.

9 S. Broadleya'na; leaves linear, spreading; flowers axillary, on long pedicels, drooping; calycine segments narrow, foliaceous; bracteas remote from the calyx; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca Broadleyàna, Andr. heath. 3. t. 44. Corolla deep red, with a yellow mouth. Anthers mutic.

Broadley's Syringodea. Fl. June, Aug. Clt. 1800. Shrub.

10 S. insu'lsa; leaves 3 in a whorl; flowers terminal; bracteas close to the calyx, foliaceous; corolla with a cylindrical incurved tube, and ciliated segments; style a little exserted; ♄. G. Native of the Cape of Good Hope. Erìca insúlsa, Hortul. Bedf. eric. wob. p. 12. Lodd. cat. p. 25. Flowers yellowish-green.

Dull Syringodea. Fl. June, July. Clt. 1810. Shrub.

* * *Leaves 4 in a whorl.*

11 S. refu'lgens; leaves glabrous, spreading; flowers terminal, drooping, by fours; calyxes coloured, subulate, adpressed; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca refúlgens, Andr. heath. vol. 4. with a figure. Corollas scarlet or deep purplish-red.

Refulgent Syringodea. Fl. April, July. Clt. 1800. Shrub.

12 S. transpa'rens; leaves ovate-cuneated, shortly pectinated; calycine segments cuneated; corolla 6-7 lines long, bristly towards the apex outside; filaments spurred. ♄. G. Native of the Cape of Good Hope. Erìca transpàrens, Thunb. prod. p. 71. Erìca cerinthoìdes γ, Thunb. diss. no. 33. Erìca strigilifòlia, Sal. in Lin. trans. 6. p. 367. Corollas white.?

Transparent Syringodea. Fl. May. Clt. 1800. Shrub.

13 S. pellu'cida; leaves linear, horizontal, ciliated; flowers terminal, pedicellate, drooping; bracteas close to the calyx; corolla with an oblong inflated tube, subpellucid; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca pellùcida, Andr. heath. 3. t. 60. Lodd. bot. cab. 276. Corolla white. Calycine segments linear-subulate.

Var. β, *rùbra* (Bedf. eric. wob. p. 18. but not of Andr.) co-

rolla reddish-purple, with an inflated ribbed tube. Calycine segments linear-subulate.

Pellucid-flowered Syringodea. Fl. Nov. June. Clt. 1800. Shrub.

14 S. BEDFORDIA'NA; leaves linear, ciliated; flowers terminal, pedicellate, drooping; bracteas remote from and approximating the calyx; corolla cylindrical, curved; style subexserted. ♄. G. Native of the Cape of Good Hope. Erìca pellùcida rùbra, Andr. heath. vol. 4. with a figure. Erìca pellucidoìdes, Bedf. eric. wob. p. 18. Corollas reddish-purple.

Duke of Bedford's Syringodea. Fl. Aug. Nov. Clt. 1808. Shrub.

15 S. EXU'DANS; leaves linear, obtuse, spreading, clammy from glands; flowers terminal, subaggregate, drooping; bracteas spatulate, close to the calyx; corolla oblong, curved, ribbed; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca exùdans, Andr. heath, vol. 4. with a figure. Erìca exsùdans, Lodd. bot. cab. 287. Erìca ròsa sòlis, Hortul. Corollas reddish-purple. Bracteas awned.

Sweating Syringodea. Fl. Sept. Nov. Clt. 1810. Shrub.

16 S. SULPHU'REA; leaves linear, obtuse, villous; flowers fasciculate, axillary and terminal, nearly sessile, horizontal; bracteas close to the calyx: corolla cylindrical, trumpet-shaped, villous; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca sulphùrea, Andr. heath. vol. 4. with a figure. Sims, bot. mag. 1984. Lodd. bot. cab. 1762. Corollas pale yellow or sulphur-coloured.

Sulphur-coloured-flowered Syringodea. Fl. June, Oct. Clt. 1805. Shrub.

17 S.? FLA'VA; leaves 3 in a whorl, filiform, glabrous, short, erect; flowers horizontal, axillary, crowded; calyx bracteate; corolla urceolately tubular, short; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca flàva, Lodd. bot. cab. 882. Andr. heath. vol. 2. t. 38. Flowers yellow.

Yellow-flowered Syringodea. Fl. April, Sept. Clt. 1795. Shrub.

18 S. ERUBE'SCENS; leaves linear-lanceolate, with revolute ciliated margins; floriferous branches pendulous; bracteas awned, close to the calyx, and are as well as the calycine segments dentately fringed; corollas cylindrical, inflated, beset with glandular hairs both inside and outside, with a revolute limb; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca erubéscens, Andr. heath. 3. t. 56. Lodd. bot. cab. 1826. Erìca elongàta, Hortul. Corolla from pale purplish-red to white. Calycine segments ovate, roundish.

Reddish-flowered Syringodea. Fl. March, July. Clt. 1800. Shrub.

19 S. ELA'TA; leaves filiform, bluntish; branches spreading; flowers axillary or terminating small branches, crowded in the manner of a spike; bracteas remote from and approximating the calyx; corolla curved, trumpet-shaped, villous, with a rather revolute limb; genitals exserted. ♄. G. Native of the Cape of Good Hope. Erìca elàta, Andr. heath. 2. t. 18. Lodd. bot. cab. 1788. Erìca longiflòra, Sal. in Lin. trans. 6. p. 359. Corolla orange-red, 18-20 lines long, downy, with an obtuse limb. Herb powdery. Pedicels glabrous. Calyx recurvedly spreading, convex on the outside at the base.

Tall Syringodea. Fl. July, Sept. Clt. 1790. Shrub.

20 S.? LÍNKII; leaves spreading, beset with a few hairs; flowers terminal, umbellate; bracteas remote from the calyx; calycine segments ovate, white; anthers mutic, subexserted. ♄. S.? Native of the Cape of Good Hope. Erìca protrùdens, Link. enum. 1. p. 372. Corolla 2-3 lines long, white.—Probably a species of *Gypsocállis*.

Link's Syringodea. Fl. April, May. Clt. 1805. Shrub.

21 S. STAGNA'LIS; leaves linear, hairy; flowers terminal; pedicels glabrous; corolla 10-11 lines long, hairy; anthers straight, papillose, mutic. ♄. G. Native of the Cape of Good Hope. Erìca stagnàlis, Sal. in Lin. trans. 6. p. 359. Erìca tubiflòra, Roxb. mss.

Stagnant Syringodea. Fl. March, June. Clt. 1790. Shrub.

22 S. FLA'MMEA; leaves filiform, erectish, glabrous; flowers subsolitary, terminating the small branches, spike-like, horizontal; bracteas close to the calyx; calycine segments subulate, imbricated, unequal; corolla 8 lines long, downy, with a clavate tube, and the segments of the limb imbricated at the base; genitals a little exserted. ♄. G. Native of the Cape of Good Hope. Erìca flámmea, Andr. heath. 2. t. 53. Erìca bìbax, Sal. in Lin. trans. 6. p. 358. Erìca curviflòra, Thunb. diss. no. 30. Corollas pale yellow.

Flame-coloured-flowered Syringodea. Fl. Oct. Nov. Clt. 1793. Shrub.

23 S. LINNÆOI'DES; leaves linear-lanceolate, pilose, spreading; flowers almost sessile, terminating small branches; bracteas close to the calyx; calycine segments lanceolate; corolla villous, cylindrical, swollen at top; style subexserted. ♄. G. Native of the Cape of Good Hope. Erìca linnæoides, Andr. heath. 2. t. 42. Erìca Linnæàna, Ait. hort. kew. 2. p. 375. Lodd. bot. cab. 102. Corollas with a purplish-red base, and a white top.

Linnæa-like Syringodea. Fl. Jan. May. Clt. 1790. Shrub.

24 S. RADIA'TA; leaves filiform, spreading; flowers terminal, umbellately verticillate; bracteas remote from the calyx; calyx adpressed; corolla 9-10 lines long, glabrous, with a cylindrical tube, and recurved limb; style exserted; fruit glabrous. ♄. G. Native of the Cape of Good Hope. Erìca radiàta, Andr. heath. 1. t. 46. Erìca calamifórmis, Sal. in Lin. trans. 6. p. 380. Flowers reddish-purple.

Ray-flowered Syringodea. Fl. Aug. Nov. Clt. 1798. Shrub.

25 S. SPU'RIA; leaves linear, subciliated, erectly spreading; flowers aggregate, terminating the small branches; bracteas remote from the calyx; calycine segments ovate, acuminated; corolla 7-8 lines long, downy, with a cylindrical tube, and a spreading border; genitals inclosed; pericarp obpyramidal. ♄. G. Native of the Cape of Good Hope. Erìca spùria, Andr. heath. 1. t. 54. Erìca culcitæflòra, Sal. in Lin. trans. 6. p. 357. Corolla red.

Var. β, *translùcens;* corolla purplish-red, rather ventricose at the base.—Erìca translùcens, Andr. heath. vol. 4. with a figure.

Spurious Syringodea. Fl. April, May. Clt. 1796. Shrub.

26 S. EXSU'RGENS; leaves filiform, spreadingly recurved; flowers axillary, verticillate, horizontal, crowded; bracteas remote from and approximate to the calyx: corolla cylindrically clavate, 13-15 lines long, viscid, with ovate cuneated segments; filaments exserted; pericarp 4-furrowed. ♄. G. Native of the Cape of Good Hope. Erìca exsúrgens, Andr. heath. 1. t. 57. Lodd. bot. cab. 835. Erìca grandiflòra breviflòra, Wendl. eric. 7. p. 7. with a figure. Erìca pharetræfórmis, Sal. in Lin. trans. 6. p. 361. Corollas orange-red. This species differs from all others in the corolline segments being attenuated at the apex, and bifid. There are several varieties of the species in the gardens, besides those mentioned below, differing in the colour of the flowers.

Var. β, *grandiflòra* (Bedf. eric. wob. p. 7.) leaves 6-7 in a whorl; anthers a little exserted; style exserted; corolla long, cylindrical, trumpet-shaped, with an orange-red tube, and orange-yellow segments.

Var. γ, *rútila* (Sal. in Lin. trans. 6. p. 361.) corolla golden-yellow. ♄. G. Erìca abietìna, Roxb. mss. ex Sal.

Rising-stamened Syringodea. Fl. March, Oct. Clt. 1792. Shrub.

27 S. CURVIFLO'RA; leaves linear, spreading, glabrous; flowers usually solitary, terminating small branches; bracteas close to

the calyx; corolla glabrous, 10-11 lines long, with a curved cylindrical tube, and an erect or spreadingly reflexed limb; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca curviflòra, Lin. diss. no. 41. a. Andr. heath. 1. t. 52. Lodd. bot. cab. 1668. Wendl. eric. fasc. 3. no. 3. p. 3. with a figure. Erìca fastuòsa, Sal. in Lin. trans. 6. p. 359. Flowers orange-yellow. Fruit broadly turbinate.

Var. β, rùbra (Andr. heath. 3. t. 61.) corolla orange-red, cylindrically trumpet-shaped. ♄. G. Erica simpliciflòra, Hortul.

Curved-flowered Syringodea. Fl. July, Nov. Clt. 1774. Shrub tall.

28 S. SIMPLICIFLO'RA; leaves trigonal, erectly spreading, glabrous; flowers terminating the small branches, solitary, erect; bracteas remote from the calyx; calycine segments lanceolate, adpressed; corolla tubular, constricted in the middle, with a spreading limb; genitals exserted. ♄. G. Native of the Cape of Good Hope. Erìca simpliciflòra, Willd. spec. 2. p. 402. Wendl. eric. 17. p. 69. with a figure. Erìca curviflòra, Lin. syst. ed. 13. p. 305. but not of his diss. Sal. in Lin. trans. 6. p. 358. Flowers rufous or reddish-orange. Pedicels downy. Corolla 9 lines long, downy; interstices of the limb lanceolate. Calycine segments ovate, acuminated.

Simple-flowered Syringodea. Fl. March, July. Clt. 1774. Shrub.

29 S. TUBIFLO'RA; leaves linear, obtuse, downy, erect; flowers usually solitary, terminating the small branches; bracteas almost close to the calyx; corolla downy, cylindrical, 9-10 lines long, a little curved, with a revolute limb; calycine segments oblong; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca tubiflòra, Lin. diss. no. 40. spec. ed. 2. p. 505. Andr. heath. 1. t. 52. Wendl. eric. 4. p. 7. with a figure. Icon. hort. kew. 28. Sal. in Lin. trans. 6. p. 357. Flowers purplish-red. Pedicels glabrous.

Var. β, coccínea (Sal. in Lin. trans. 6. p. 357.) flowers deeper red. ♄. G. Erìca coccínea, Lin. diss. no. 42. with a figure of the flower.

Tube-flowered Syringodea. Fl. April, Aug. Clt. 1775. Shrub.

30 S. IGNE'SCENS; leaves linear, glabrous, spreading; flowers solitary, terminating the small branches, drooping; calycine segments ovate, acuminated, a little ciliated; bracteas ovate, ribbed, close to the calyx, or rather remote; corolla cylindrical, rather pilose at top, with a revolute limb; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca ignéscens, Andr. heath. 2. t. 47. Corollas reddish-orange. Calycine segments ovate, acuminated.

Fiery Syringodea. Fl. March, June. Clt. 1792. Shrub.

31 S. SÓRDIDA; branches scattered, hairy; leaves linear, obtuse, woolly, spreading; flowers usually solitary, terminating the small branches, drooping; bracteas remote from the calyx; calyxes adpressed, convex outside at the base; corolla 12 lines long, cylindrical, curved, villous, with a revolute limb; genitals inclosed. ♄. G. Native of the Cape of Good Hope. Erìca sórdida, Andr. heath. 1. t. 55. Lodd. bot. cab. 1973. Erìca laniflòra, Wendl. eric. fasc. 19, no. 4. with a figure. Erìca floccòsa, Sal. in Lin. trans. 6. p. 360. Flowers dirty orange-red. Style exserted.

Dirty-flowered Syringodea. Fl. Aug. Dec. Clt. 1790. Shrub.

32 S. BRACHIA'LIS; leaves linear, hairy; flowers terminal; corolla 6-8 lines long, hairy both inside and outside, with a curved pyramidal tube; anthers mutic, very long. ♄. G. Native of the Cape of Good Hope. Erìca brachiàlis, Sal. in Lin. trans. 6. p. 367.

Branched Syringodea. Fl. March, July. Clt. 1792. Shrub.

33 S. SERRATIFO'LIA; leaves linear, acute, spreading, with plumose margins; flowers aggregate, terminal; bracteas close to the calyx; calyxes foliaceous, glandularly ciliated, a little recurved; corolla 9 lines long, glabrous, cylindrical, with a spreading limb; anthers a little exserted; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca serratifòlia, Andr. heath. 1. t. 48. Lodd. bot. cab. 1703. Erìca cylindriciflòra, Sal. in Lin. trans. 6. p. 356. Erìca plumòsa, Wendl. eric. no. 12. p. 5. Corolla greenish-yellow at top, and orange-red at base. Leaves 4-6 in a whorl.

Saw-leaved Syringodea. Fl. Aug. Dec. Clt. 1790. Shrub.

34 S. MASSO'NII; leaves 4-5 in a whorl, linear, serrulated, hairy, imbricately spreading; flowers axillary, crowded, drooping, disposed in a verticillate crown; bracteas imbricate; corolla 10-12 lines long, viscid, swollen at top; style exserted; pericarp clavate, stipitate. ♄. G. Native of the Cape of Good Hope. Erìca Massònii, Lin. suppl. 219. Curt. bot. mag. t. 356. Pl. kew. t. 20. Lodd. bot. cab. 1069. Erìca Massònia, Andr. heath. 1. t. 51. Erìca lycopodifòlia, Sal. in Lin. trans. 6. p. 361. Corolla with a scarlet or reddish-purple tube, and a greenish-yellow constricted mouth.

Var. α, mìnor (Bedf. eric. wob. p. 14.) corolla smaller, with an inflated clavate tube. ♄. G.

Masson's Syringodea. Fl. July, Oct. Clt. 1787. Shrub.

35 S. PROCE'RA; leaves linear, erect, downy; flowers solitary, terminating the small branches, erectish; corolla constricted in the middle, with a spreading limb; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca procèra, Wendl. eric. with a figure. Corollas white. ?

Lofty Syringodea. Fl. April, June. Clt. 1791. Shrub.

36 S. CONSPI'CUA; leaves linear, oblong, glabrous, spreading; flowers terminal, rather aggregate, drooping; bracteas near the calyx, spatulate; calycine segments ovate, obtuse, concave at the base outside; pedicels pubescent; corolla 15 lines long, with a clavate tube, and a retuse limb; genitals exserted a little. ♄. G. Native of the Cape of Good Hope. Erìca conspícua, Sol. in hort. kew. 2. p. 373. Willd. spec. 2. p. 404. Pl. kew. t. 12. Andr. heath. 1. t. 30. Wendl. eric. 4. p. 9. with a figure. Corollas orange-yellow.

Conspicuous Syringodea. Fl. May, Aug. Clt. 1774. Shrub.

37 S. GLANDULO'SA; leaves linear, acute, beset with glandular hairs, spreading; flowers nearly terminal, crowded, disposed in a verticillate crown; bracteas close to the calyx, and are as well as it ciliated with glandular hairs; corolla glabrous, with a clavate tube; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca glandulòsa, Thunb. prod. p. 71. diss. no. 32. Corollas orange-red. ?

Glandular Syringodea. Fl. May, June. Clt. 1801. Shrub.

38 S. GEMMÍFERA; leaves oblong, adpressed, ciliated, aristate, 4-5 in a whorl; branches thickened at top; bracteas remote from and approximating the calyx; flowers drooping, crowded, disposed in a verticillate crown; corolla villous, cylindrical, inflated; genitals inclosed. ♄. G. Native of the Cape of Good Hope. Erìca gemmífera, Sims, bot. mag. t. 2266. Lodd. bot. cab. 457. Erìca Massònii mìnor, Hortul. Corollas reddish-purple or scarlet, with a green apex.

Gem-bearing Syringodea. Fl. May, July. Clt. 1802. Shrub.

39 S. LITUIFLO'RA; leaves linear, nearly smooth; flowers solitary or by threes, terminating the branches; bracteas close to the calyx; corolla 6-8 lines long, downy or villous, with the tube clavate; filaments bearded on the back at the apex. ♄. G. Native of the Cape of Good Hope. Erìca lituiflòra, Sal. in Lin. trans. 6. p. 356. Erìca perspícua, Wendl. eric. fasc. 1. p. 7. with a figure. Corolla white, tinged with red.

Trumpet-flowered Syringodea. Fl. March, June. Clt. 1796. Shrub.

40 S. PERSPÍCUA; leaves linear, nearly smooth; flowers terminating the small branches, spike-formed; bracteas remote from the calyx; pedicels hairy; corolla cylindrical, erect; genitals inclosed. ♄. G. Native of the Cape of Good Hope. Erìca perspícua. Hort. Bedf. eric. wob. p. 18. Corolla reddish-purple.

Var. β, nàna (Bedf. l. c.) leaves hairy; pedicels slightly hairy; tube of corolla cylindrical, straight. ♄. G. Corollas purplish-red.

Clear-flowered Syringodea. Fl. April, June. Clt. 1800. Shrub.

41 S. BEDFORDIA'NA; leaves linear, ciliated, hairy; flowers terminal, subcapitate; pedicels slightly hairy; bracteas remote from the calyx; corolla downy, ? with a cylindrical, subventricose tube; genitals inclosed. ♄. G. Native of the Cape of Good Hope. Erìca perspicuoìdes, Bedf. eric. wob. 18. Flowers reddish-purple.

Duke of Bedford's Syringodea. Fl. May, July. Clt. 1800. Shrub.

42 S. CYRILLÆFLO'RA; stem slender; leaves linear, glabrous? corolla 2-3 lines long, downy, with a narrow campanulate tube, and a short limb. ♄. G. Native of the Cape of Good Hope. Erìca cyrillæflòra, Sal. in Lin. trans. 6. p. 357. Flowers pale scarlet.

Cyrilla-flowered Syringodea. Fl. Feb. Sept. Clt. 1800. Shrub.

43 S. OBPYRAMIDA'LIS; leaves pubescent, spreading; flowers terminal, usually by threes; bracteas remote from the calyx, broad at the base; corolla funnel-shaped, with a spreading border, having the interstices of the limb tumid on the outside; fruit spherical. ♄. G. Native of the Cape of Good Hope. E. pyramidàlis, Andr. heath. 1. t. 45. Sims, bot. mag. 366. kew. Lodd. bot, cab. 319. Ait. hort. kew. 3. p. 401. Icon. pl. t. 27. Wendl. eric. 5. p. 3. with a figure. Erìca obpyramidàlis, Sal. in Lin. trans. 6. p. 356. Corollas purplish-red, $3\frac{1}{2}$ to 4 lines long. Style exserted.

Obpyramidal-flowered Syringodea. Fl. Year. Clt. 1787. Shrub $1\frac{1}{2}$ foot.

44 S. VERTICILLA'TA; leaves linear, glabrous; flowers crowded, nearly terminal, verticillate, drooping; bracteas linear, remote from the calyx; corolla with a cylindrical inflated tube, glabrous, constricted at top; genitals inclosed. ♄. G. Native of the Cape of Good Hope. Erìca verticillàta, Andr. heath. 1. t. 7. Lodd. bot. cab. 145. Erìca mammòsa, β, verticillàta, Ait. hort. kew. 2. p. 369. Flowers scarlet.

Whorled-flowered Syringodea. Fl. July, Oct. Clt. 1774. Shrub.

45 S. COLO'RANS; leaves linear, spreading, ciliated; flowers crowded, terminating the small branches; bracteas close to the calyx; corolla cylindrical, clavate, glabrous; style almost inclosed; calyxes coloured, subulate. ♄. G. Native of the Cape of Good Hope. Erìca colòrans, Andr. heath. vol. 4. with a figure. Lodd. bot. cab. 224. Ker. bot. reg. 601. Bedf. eric. wob. pl. 4. f. 11. Corollas varying from white to red.

Colouring Syringodea. Fl. April, June. Clt. 1827. Shrub.

* * * *Leaves 6 or more in a whorl.*

46 S. SPLE'NDENS; leaves linear, obtuse, spreading; flowers densely crowded, drooping; calycine segments ovate; corolla downy, with a subrevolute limb; genitals exserted. ♄. G. Native of the Cape of Good Hope. Erìca spléndens, Wendl. eric. fasc. 8. p. 5. with a figure, but not of Andr. Corolla deep red.

Splendent Syringodea. Fl. April, Sept. Clt. 1792. Shrub.

47 S. LONGIFO'LIA; leaves long, linear, incurvedly spreading, with scabrous edges; flowers crowded in whorls, drooping; bracteas close to the calyx; corolla pubescent, clammy; calycine segments linear; genitals inclosed. ♄. G. Native of the Cape of Good Hope. Erìca longifòlia, Pl. hort. kew. t. 4. Willd. spec. 2. p. 398. Erica longifòlia δ, Sal. in Lin. trans. 6. p. 363. Erìca pínea, Wendl. eric. 1. p. 11. with a figure. Corolla more or less clavate, deep red.

Long-leaved Syringodea. Fl. Feb. July. Clt. 1787. Shrub.

48 S. VESTI'TA; leaves linear, erect, with scabrous edges; flowers crowded, verticillate, nearly sessile, spreading; bracteas close to the calyx; corolla cylindrical, more or less clavate, 9-11 lines long, downy, with a revolute limb: style exserted; pericarp silky at top. ♄. G. Native of the Cape of Good Hope. Erìca vestìta, Thunb. diss. no. 25. Erìca longifòlia, var. α, Sal. in Lin. trans. 6. p. 363. Erìca vestìta àlba, Andr. heath. 1. t. 62. Wendl. eric. no. 12. p. 3. with a figure. Calycine segments ciliated with glandular hairs. Corolla white, cylindrical, curved.

Var. β, lùtea (Andr. heath. 3. t. 72.) leaves 6-8 in a whorl; corolla cylindrical, pale yellow.

Var. γ, incarnàta (Andr. heath. 2. t. 66. Lodd. bot. cab. 1698.) leaves 7 in a whorl; genitals a little exserted; corolla cylindrical, almost straight, pale reddish-purple. Erìca longifòlia, Curt. bot. mag. 706.

Var. δ, ròsea (Andr. heath. 2. t. 67.) leaves 7-8 in a whorl; anthers a little exserted; corolla cylindrical, subclavate, reddish-purple.

Var. ε, fúlgida (Andr. heath. 2. t. 68.) anthers a little exserted; flowers nearly terminal; corolla with a cylindrical tube, and straight segments, reddish-purple or deep red. Erìca fúlgida, Bedf. eric. wob. p. 11. Lodd. bot. cab. 1633.

Var. ζ, purpùrea (Andr. heath. 1. t. 63.) anthers a little exserted; corolla cylindrical, subclavate, purplish-red. Lodd. bot. cab. 217. Wendl. eric. 10. p. 7. with a figure.

Var. η, coccínea (Andr. heath. 1. t. 6. bot. mag. 402. Wendl. eric. 11. p. 5. with a figure.) anthers a little exserted; corolla erect, cylindrical, curved, deep red, not exactly scarlet.

Clothed Syringodea. Fl. year. Clt. 1789. Shrub.

49 S. PÍNEA; leaves linear, obtuse, spreading; flowers crowded, verticillate, almost sessile, spreading; bracteas close to the calyx; calycine segments dilated at the base, and linear-subulate at the apex, imbricate; corolla 6-7 lines long, glabrous, with a cylindrical clavate tube, and a serrulated spreading limb; pericarp glabrous; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca pínea, Thunb. diss. no. 26. Andr. heath. 1. t. 61. Erìca pinifòlia, Sal. in Lin. trans. 6. p. 362. but not of Andr. Flowers deep red and blue.

Var. β, purpùrea (Lodd. bot. cab. 1259.) corollas purple. There are several other varieties in the gardens.

Pine-like Syringodea. Fl. Aug. Dec. Clt. 1790. Shrub.

50 S. PINIFO'LIA; leaves filiform, elongated, glabrous, spreading, 6-8 in a whorl; flowers nearly terminal, crowded, horizontal, verticillate; bracteas close to the calyx; calyx villous, with linear segments; corolla tomentose, cylindrically club-shaped, inflated, ribbed; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca pinifòlia, Andr. heath. 3. t. 69. Erìca pityophýlla, Spreng. syst. 2. p. 181. Corolla white, with dark anthers.

Var. β, discolor (Andr. heath. 3. t. 70.) corolla with a cylindrical ribbed tube, reddish-purple or pale red.

Var. γ, spiràlis (Hort. Bedf. eric. wob. 19.) corolla with a clavate inflated tube, white and purplish-red.

Var. δ, coccínea (Andr. heath. 2. t. 65.) flowers scarlet.

Fine-leaved Syringodea. Fl. Feb. July. Clt. 1810. Shrub.

51 S. AU'REA; leaves linear, recurvedly spreading; flowers horizontal, crowded, verticillate, nearly terminal; bracteas close to the calyx, aristate; corolla cylindrical, with reflexed segments; style exserted; calycine segments ovate, acuminated. ♄. G. Native of the Cape of Good Hope. Erìca aúrea, Andr. heath. 2. t. 61. Corollas orange-yellow.

Var. β, *flòre pállido* (Andr. heath. 3. t. 71.) flowers pale red, with dark anthers.

Golden-flowered Syringodea. Fl. July, Sept. Clt. 1799. Shrub.

52 S. VÍRIDIS; leaves linear, spreading, subrecurved; flowers crowded, verticillate, horizontal; bracteas one-half shorter than the calyx; corolla cylindrical, ribbed, dilated in the middle, with a revolute limb; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca víridis, Andr. heath. 2. t. 59. Ait. hort. kew. 2. p. 376. Flowers greenish-yellow.

Green-flowered Syringodea. Fl. May, Sept. Clt. 1800. Shrub.

53 S. HIBBERTIA'NA; leaves 4-6 in a whorl, linear, glabrous, spreading; flowers horizontal, crowded, disposed in a whorled crown; bracteas 3, two of which are close to the calyx, and the third remote; corolla glabrous, clammy, cylindrical, curved, clavate, with an erect limb; anthers a little exserted. ♄. G. Native of the Cape of Good Hope. Erìca Hibbértia, Andr. heath. 3. t. 68. Erìca Hibbertiàna, Ait. hort. kew. 2. p. 378. Sims, bot. mag. 1758. Corollas dark red or purplish-red, with a yellow mouth.

Hibbert's Syringodea. Fl. June, Sept. Clt. 1800. Shrub.

54 S. ONOSMÆFLÒRA; leaves linear, spreading, glabrous; flowers crowded, axillary, subverticillate; corolla viscid, with a cylindrical tube and spreading limb; bracteas one-half shorter than the calyx. ♄. G. Native of the Cape of Good Hope. Erìca glutinòsa, Andr. heath. 1. t. 60. Erìca viscòsa, Wendl. eric. with a figure. Erìca onosmæflòra, Sal. in Lin. trans. 6. p. 363. Corolla sulphur-coloured; tube clavate, 9-10 lines long. Calycine segments ovate-oblong.

Onosma-flowered Syringodea. Fl. Sept. March. Clt. 1789. Shrub.

55 S. ECHIIFLÒRA; leaves 5-7 in a whorl, linear, downy, with rough margins, spreading; flowers axillary, horizontal, spicate; bracteas close to the calyx; corolla with a short inflated ribbed tube, clammy; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca echiiflòra, Andr. heath. 3. t. 62. Lodd. bot. cab. 364. Erìca echiiflòra, var. supérba, Bedf. eric. wob. p. 8. Corollas deep red or reddish-purple.

Var. β, *purpùrea* (Bedf. eric. wob. p. 8.) corolla purple, with a short equal tube, that is not inflated.

Var. γ, *coccínea* (Lodd. cat. p. 25.) corollas deep red or scarlet.

Bugloss-flowered Syringodea. Fl. March, May. Clt. 1798. Shrub.

56 S. ARGENTIFLÒRA; leaves linear, glabrous, spreadingly incurved; flowers axillary, horizontal, spicate, rather pellucid; bracteas close to the calyx; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca argentiflòra, Andr. heath. vol. 4. with a figure. Corolla tubular, short, white.

Silver-flowered Syringodea. Fl. April, July. Clt. 1800. Shrub.

57 S. ARCHERIA'NA; leaves 6-7 in a whorl, serrulately ciliated, spreading; flowers axillary and terminal, crowded, verticillate; pedicels tribracteate, 2 of the bracteas near the calyx, and the third remote; corolla downy, viscid, with a cylindrical inflated tube; calycine segments serrulately hispid, as well as the bracteas; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca Archèria, Andr. heath. 2. t. 66. Erìca Archeriàna, Ait. hort. kew. 2. p. 378. Lodd. bot. cab. 1466. Corolla deep reddish-purple or scarlet. Ovarium cylindrical.

Lady Archer's Syringodea. Fl. April, Sept. Clt. 1796. Shrub.

58 S. RÒSEA; leaves filiform, erect, 5-6 in a whorl; flowers sessile, terminating small branches; bracteas close to the calyx; corolla glabrous, with a cylindrical tube and erect segments; calycine segments subulate; genitals inclosed. ♄. G. Native of the Cape of Good Hope. Erìca ròsea, Andr. heath. 2. t. 13. Lodd. bot. cab. 782. Flowers red.

Rosy-flowered Syringodea. Fl. April, Oct. Clt. 1798. Shrub.

59 S. SALISBURIA'NA; leaves linear, erect, with revolute margins, white beneath; flowers axillary, racemosely spicate, tufted, crowded, drooping; corollas cylindrically clavate; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca Salisbùria, Andr. heath. vol. 4. with a figure. Erìca ròsea, Hort. Bedf. eric. wob. p. 132. Flowers purplish red.

Salisbury's Syringodea. Fl. May, Sept. Clt. 1800. Shrub.

60 S. GRANDIFLÒRA; leaves linear, bluntish, glabrous, reclinate; flowers axillary near the tops of the branches and stem, verticillate; bracteas small, close to the calyx; calycine segments ovate-lanceolate; corolla long, curved, trumpet-shaped, viscid, with a revolute limb; genitals exserted. ♄. G. Native of the Cape of Good Hope. Erìca grandiflòra, Thunb. diss. no. 28. Lin. suppl. 223. Curt. bot. mag. 189. Pl. hort. kew. t. 8. Andr. heath. 1. t. 50. Erìca grandiflòra longifòlia, Wendl. eric. 6. p. 5. with a figure. Lodd. bot. cab. 498. Corolla orange-yellow outside, yellow inside. Leaves from 4 to 6 in a whorl, but usually the latter number.

Var. β, *formòsa;* leaves 8 in a whorl; pedicels bracteate, 2 of the bracteas close to the calyx, and the third remote from it; corollas reddish-orange. Erìca formòsa, Bedf. eric. wob. p. 10.

Var. γ, *hùmilis;* leaves 4 in a whorl. Shrub dwarf.

Var. δ, *Andrèwsii;* flowers scarlet. ♄. G. Erìca formòsa, Andr. heath. 2. t. 64.

Great-flowered Syringodea. Fl. May, Sept. Clt. 1775. Shrub.

61 S. LEEA'NA; leaves linear, filiform, stiff, obtuse, spreading; flowers axillary, verticillate; bracteas close to the calyx, and length of it; corolla 5-6 lines long, viscid, with a clavate 4-ribbed tube, and a spreading limb; calyx adpressed; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca Lèea, Andr. heath. 1. t. 59. Erìca Leeàna, Ait. hort. kew. 2. t. 376. Pl. kew. 24. Lodd. bot. cab. 298. Erìca costæflòra, Sal. in Lin. trans. 6. p. 363. Corollas orange-red.

Lee's Syringodea. Fl. May, Jan. Clt. 1788. Shrub.

62 S. CEPHALÒTES; leaves linear; flowers disposed in capitate whorls; calyx downy; corolla tubularly clavate; anthers inclosed; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca cephalòtes, Thunb. diss. no. 23. prod. 70. Willd. spec. 2. p. 398. Corolla purple.

Headed Syringodea. Fl. May, July. Clt. 1812. Shrub.

63 S. COCCÍNEA; stem angular; leaves linear, cuspidate, ciliated, spreading; flowers axillary, crowded; bracteas close to the calyx; calyx spreading, woolly or villous; corolla viscid, 9-10 lines long, having the tube hardly clavate, and the limb erect; style exserted; ovarium turbinate. ♄. G. Native of the Cape of Good Hope. Erìca coccínea, Berg. pl. cap. p. 93. Wendl. eric. fasc. 3. p. 9. with a figure. Andr. heath, 1. t. 49. Lodd. bot. cab. 1374. Erìca abietìna, Lin. spec. ed. 1. p. 355. Erìca frondòsa, Sal. in Lin. trans. 6. p. 364. Flowers scarlet or deep red.

Var. β, *Bedfordiàna;* bracteas coloured; calyx woolly; genitals exserted; flowers nearly terminal, verticillate; corolla with

a trumpet-shaped tube. ♄. G. Erìca coccínea, Hortul. Bedf. eric. wob. p. 6. Flowers red-orange.

Scarlet-flowered Syringodea. Fl. Year. Clt. 1793. Shrub.

64 S. PURPU`REA; stem terete; leaves short, linear, ciliated, spreading, 6-7 in a whorl, rather remote; flowers crowded, horizontal, verticillate; bracteas close to the calyx; calyx incurvedly erect; corolla cylindrical, trumpet-shaped, 8-9 lines long, viscid, with a hardly clavate tube, and a spreading limb; genitals exserted; ovarium turbinate. ♄. G. Native of the Cape of Good Hope. Erìca purpùrea, Andr. heath. 1. t. 58. Lodd. bot. cab. 703. Erìca phylicifòlia, Sal. in Lin. trans. 6. p. 364. Corollas purple.

Purple-flowered Syringodea. Fl. Year. Clt. 1789. Shrub.

65 S. CONCÍNNA; leaves linear, rather villous, erect; flowers axillary, verticillate, crowded; bracteas close to the calyx; corolla 7-9 lines long, downy, cylindrical, with the tube rather clavate, and the limb spreading; calyxes denticulated, villous; genitals inclosed; anthers bearded at the base. ♄. G. Native of the Cape of Good Hope. Erìca concínna, Sol. in Ait. hort. kew. ed. 1. vol. 2. p. 23. ed. 2. vol. 2. p. 374. Schnev. icon. no. 31. Wendl. eric. 9. p. 9. with a figure. Erìca abietìna, Andr. eric. 2. t. 62. Erìca verticillàta, Berg. pl. cap. p. 99. Erìca paludòsa, Sal. in Lin. trans. 6. p. 356. Corollas pale purplish-red.

Neat Syringodea. Fl. Sept. Oct. Clt. 1773. Shrub.

66 S. FILAMENTÒSA; leaves linear, glabrous?; flowers axillary, nearly terminal, verticillate, crowded; bracteas remote from the calyx; calycine segments subulate; corolla with a large bell-shaped tube; style exserted; pedicels longer than the flowers. ♄. G. Native of the Cape of Good Hope. Erìca filamentòsa, Andr. heath. 2. t. 63. Ker. bot. reg. t. 6. Lodd. bot. cab. 395. Ait. hort. kew. 2. p. 398. Corolla short, purple.

Thready Syringodea. Fl. Year. Clt. 1800. Shrub.

67 S. LANA`TA; leaves 5-6 in a whorl, woolly, as well as the branches, which are also verticillate; flowers terminal; calyx incurvedly spreading, concave at the base outside; corolla 9-11 lines long, rather woolly. ♄. G. Native of the Cape of Good Hope. Erìca lanàta, Wendl. eric. p. 45. with a figure. Erìca verticillàris, Sal. in Lin. trans. 6. p. 360. Flowers of a rufous fulvous colour. Anthers mutic.

Woolly Syringodea. Fl. Feb. May. Clt. 1775. Shrub.

68 S. PU`RA; leaves linear, glabrous; flowers axillary, verticillate, near the tops of the branches; bracteas close to the calyx; style exserted; corolla with a cylindrical subclavate tube. ♄. G. Native of the Cape of Good Hope. Erìca pùra, Andr. heath. vol. 4. with a figure. but not of Lodd. Flowers pure white.

Pure-flowered Syringodea. Fl. June, Oct. Clt. 1827. Shrub.

69 S. PULCHE'LLA; leaves linear, attenuated, with revolute edges, glabrous?; bracteas close to the calyx; flowers axillary, crowded; calycine segments subulate; pedicels much shorter than the flowers; corolla viscid, 5-6 lines long, with a funnel-formed tube. ♄. G. Native of the Cape of Good Hope. Erìca pulchélla, Thunb. diss. no. 24. with a figure. Ait. hort. kew. 2. p. 398. Lodd. bot. cab. 307.? Erìca argutifòlia, Sal. in Lin. trans. 6. p. 364.

Pretty Syringodea. Fl. Autumn. Clt. 1792. Shrub.

70 S. PULVINIFÓRMIS; leaves linear, attenuated, serrulately ciliated; flowers longish, on the rudiments of the branches; corolla 7-9 lines long, viscid, with a cylindrically urceolar tube. ♄. G. Native of the Cape of Good Hope. Erìca pulviniformis, Sal. in Lin. trans. 6. p. 364. Corollas red.—Habit of *Erìca cerinthoìdes*.

Pillow-formed-flowered Syringodea. Fl. Feb. Clt. 1800. Shrub.

§ 2. *Anthers awned or crested. Aberrant species.*

* *Leaves 3 in a whorl.*

71 S. DÍSCOLOR; leaves linear, spreading, ciliated; flowers terminal, by threes; bracteas close to the calyx; calycine segments serrulated; corolla 9-10 lines long, anointed with gluten, cylindrical, having the tube finely striated; awns of anthers short, glabrous. ♄. G. Native of the Cape of Good Hope. Erìca díscolor, Andr. heath. 1. t. 3. Wendl. eric. 5. p. 9. with a figure. Lodd. bot. cab. 1453. Erìca cupressifórmis, Sal. in Lin. trans. 6. p. 354. Corollas pale red.

Two-coloured-flowered Syringodea. Fl. Nov. March. Clt. 1788. Shrub.

72 S. RUGÒSA; leaves crowded, linear, spreadingly reflexed, 3-5 in a whorl; flowers axillary, verticillate, near the tops of the branches; bracteas broad at the base, remote from the calyx; calyx foliaceous; corolla with a wrinkled tube; genitals exserted; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca rugòsa, Andr. heath. vol. 4. with a figure. Flowers reddish-purple.

Wrinkled-flowered Syringodea. Fl. Feb. Nov. Clt. 1800. Shrub.

73 S. DENSIFÒLIA; leaves linear-oblong, imbricated, glabrous; flowers axillary, crowded; corolla cylindrically-clavate, downy; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca densifòlia, Willd. spec. 2. p. 359. Flowers purplish-red.

Dense-leaved Syringodea. Fl. March, May. Clt. 1811. Shrub.

74 S. EWERA`NA; leaves linear, scabrous, spreading; flowers subspicate; bracteas remote from the calyx; calyx flat, with thick margins; corolla cylindrical, 8-10 lines long, clothed with viscid down, curved and clavate; style exserted; awns of anthers long, downy. ♄. G. Native of the Cape of Good Hope. Erìca Eweràna, Dry. in Ait. hort. kew. 2. p. 368. Lodd. bot. cab. 303. Erìca Ewèra, Hort. Erìca U'hria, Andr. heath. 2. t. 3. Wendl. eric. 18. p. 91. Erìca decòra, Sal. in Lin. trans. 6. p. 354, with a figure. Corolla dark red, or reddish-purple, with a greenish-yellow mouth.

Var. β, pilòsa (Andr. heath. 2. t. 4.) leaves pilose; bracteas close to the calyx; flowers terminating small branches; corolla slightly curved and clavate, purplish-red, with a greenish-yellow mouth.

Ewer's Syringodea. Fl. July, Nov. Clt. 1790. Shrub.

75 S. HÍRTA; leaves linear, ciliated; flowers terminal; bracteas sessile, close to the calyx, ciliated; corolla cylindrical; style exserted; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca hírta, Andr. heath. 3. t. 5. Lodd. bot. cab. 1116. but not of Thunb. nor Willd. Corolla reddish-purple, with a greenish-yellow mouth.

Hairy Syringodea. Fl. Feb. May. Clt. 1800. Shrub.

76 S. CRUE'NTA; leaves linear, subulate, glabrous, spreading; flowers terminal, by threes; bracteas remote from the calyx; calyx serrated; corolla 9-12 lines long, shining, smooth, with a clavate, more or less compressed, curved tube; style exserted; pericarp ovate. ♄. G. Native of the Cape of Good Hope. Erìca cruénta, Pl. kew. t. 13. Lodd. bot. cab. 1656. Erìca melliflùa, Sal. in Lin. trans. 6. p. 354. Corolla reddish-purple or blood-coloured.

Var. β; calyx slightly serrated; corolla deep red or scarlet. ♄. G. Erìca cruénta, Andr. heath. 1. t. 9. Sol. in Ait. hort. kew. ed. 1. vol. 2. p. 16. Wendl. eric. 4. p. 11. with a figure.

Bloody-flowered Syringodea. Fl. Year. Clt. 1774. Shrub.

77 S. viridiflòra; leaves 3 in a whorl, or alternate, ciliated; flowers terminal, drooping; bracteas imbricate; corolla with a cylindrical clavate tube; style exserted; anthers a little exserted, subaristate. ♄. G. Native of the Cape of Good Hope. Erìca hírta, var. viridiflòra, Andr. heath. 3. t. 7. Lodd. bot. cab. 917. Flowers deep green.

Green-flowered Syringodea. Fl. July, May. Clt. 1810. Shrub.

78 S. specio`sa; leaves linear, downy, spreading; flowers terminal, by threes; bracteas close to the calyx; calycine segments broad, short, imbricate, with woolly edges; corolla with a cylindrical, inflexed, curved tube, and an erect limb; style exserted, incurved at top; anthers awned, about the length of the corolla. ♄. G. Native of the Cape of Good Hope. Erìca speciòsa, Andr. heath. 2. t. 2. Lodd. bot. cab. 575. Ait. hort. kew. 2. p. 369. Corollas dark red or reddish-purple, with a greenish-yellow mouth.

Specious Syringodea. Fl. June, Sept. Clt. 1800. Shrub.

79 S.? Dickensònii; leaves glabrous; flowers terminating the small branches; bracteas imbricate, angular; corolla with a bell-shaped tube, and large spreading segments; anthers a little exserted, crested; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca Dickensònia, Bedf. eric. wob. p. 8. Lodd. bot. cab. t. 1816. Flowers yellow.

Var. β, *álba;* flowers white.

Var. γ, *rùbra;* flowers red.

Dickenson's Syringodea. Fl. May, Aug. Clt. 1809. Shrub.

* * *Leaves 4 in a whorl.*

80 S. muta`bilis; leaves linear, ciliated, spreading, 3-4 in a whorl, the 3 terminal hairs the longest; flowers terminal, umbellate; pedicels downy; bracteas 3, 2 near the calyx, and the third remote from it; calycine segments ciliated, with glandular hairs; corolla cylindrical, inflated; filaments awned; anthers a little exserted; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca mutàbilis, Andr. heath. 3. t. 31. Sims, bot. mag. 2348. Lodd. bot. cab. 46. Corolla purplish-red, deeper towards the top. The hairs or down on the plant are tipped with black glands in the young state.

Changeable-flowered Syringodea. Fl. Year. Clt. 1798. Shrub 1 to 2 feet.

81 S. cuspidi'gera; leaves linear, pedicels glabrous; calycine segments ovate, cuspidate; flowers terminal; corolla 11-12 lines long, downy, having the interstices of the limb lanceolate at the base; anthers hairy, awned; filaments rather villous. ♄. G. Native of the Cape of Good Hope. Erìca cuspidígera, Sal. in Lin. trans. 6. p. 358.

Point-bearing Syringodea. Fl. Feb. May. Clt. 1796. Shrub.

82 S. de'nsa; leaves 4-5 in a whorl, linear, somewhat imbricated, spreading; flowers axillary, crowded, nearly sessile; bracteas close to the calyx; calyx adpressed; corolla with an oblong-cylindrical tube, and a short spreading limb; anthers awned; style a little exserted. ♄. G. Native of the Cape of Good Hope. Erìca dénsa, Andr. heath. 3. t. 30. Corolla pale red, with a deep spreading border, like a *Callísta*, of which it may probably be a species.

Dense-flowered Syringodea. Fl. May, Oct. Clt. 1810. Shrub.

83 S. na`na; stem trailing; leaves linear, spreading, obtuse; flowers terminal; bracteas close to the calyx, imbricated, ciliated; corolla 9-11 lines long, downy outside, with a clavate compressed tube; style exserted; awns of anthers long. ♄. G. Native of the Cape of Good Hope. Erìca nàna, Sal. in Lin. trans. 355. Erìca depréssa, Andr. heath. 2. t. 12. but not of Thunb. nor Willd. Corollas yellow-green.

Dwarf Syringodea. Fl. Aug. Nov. Clt.? Shrub trailing.

84 S. ostrìna; leaves 4-5 in a whorl, glabrous; flowers terminal; corolla cylindrical, curved, widened to the throat. ♄. G. Native of the Cape of Good Hope. Erìca ostrìna, Lodd. bot. cab. 1218. Corolla purplish-red.

Purple-flowered Syringodea. Fl. June, Nov. Clt. 1820. Shrub.

85 S. hy'brida; leaves linear, glabrous, flowers terminal; bracteas close to the calyx; corolla glabrous, with a cylindrical, slightly curved tube; style exserted; anthers aristate. ♄. G. Native of the Cape of Good Hope. Erìca hýbrida, Hort. Flowers purplish-red. Nearly allied to *S. cylíndrica*.

Hybrid Syringodea. Fl. May, June. Clt.? Shrub.

86 S. nítens; leaves hairy, flowers terminal; pedicels tribracteate, 2 of the bracteas near the calyx, and the third remote; calyx coloured, hairy; corolla with a curved subclavate tube; genitals aristate, a little exserted. ♄. G. Native of the Cape of Good Hope. Erìca nítens, Hortul. Bedf. eric. wob. p. 16. Corolla purplish-red, with a green top.

Shining Syringodea. Fl. June, Sept. Clt.? Shrub.

87 S. sanguínea; leaves linear, glabrous; flowers nearly terminal, crowded, verticillate; calyxes broad; bracteas remote from the calyx; corolla cylindrical; anthers a little exserted, subaristate; style exserted. ♄. G. Native of the Cape of Good Hope. Erìca sanguínea, Lodd. bot. cab. 86. Flowers deep red.

Bloody-flowered Syringodea. Fl. Year. Clt. 1815. Shrub.

88 S. vire'scens; leaves linear, incurvedly erect, hairy; flowers terminal, sessile; bracteas close to the calyx; corolla clammy; style exserted, incurved. ♄. G. Native of the Cape of Good Hope. Erìca viréscens, Lodd. bot. cab. 233. Corolla greenish-yellow. Anthers awned.

Greenish-flowered Syringodea. Fl. May. Clt. 1804. Shrub.

89 S. ambígua; leaves linear, rather hairy, spreading; flowers terminal, usually solitary; bracteas close to the calyx; calycine segments subulate, adpressed; corolla striated, glabrous, with a cylindrical tube and short reflexed limb; style a little exserted; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca ambígua, Wendl. eric. fasc. 16. p. 61. with a figure. Erìca cylíndrica, Andr. heath. 2. t. 30. Lodd. bot. cab. 1734. Corolla reddish-purple.

Ambiguous Syringodea. Fl. April, June. Clt. 1800. Shrub.

90 S. buccinæfórmis; leaves linear, downy; flowers terminal; pedicels downy; corolla 9-10 lines long, downy, with a recurvedly spreading limb; filaments downy; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca buccinæfórmis, Sal. in Lin. trans. 6. p. 359. Erìca tubiflòra, Thunb. diss. no. 31. Flowers reddish-purple.

Trumpet-formed flowered Syringodea. Fl. June, July. Clt. 1818. Shrub.

91 S. clavæflòra; leaves linear, glabrous, spreading; flowers axillary, nearly sessile, spicate; bracteas imbricate; calyx fleshy, with orbicularly spatulate entire segments; corolla downy, 10-12 lines long, clavate; style exserted; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca clavæflòra, Sal. in Lin. trans. 6. p. 365. Erìca sessiliflòra, Andr. heath. 2. t. 10. Corollas greenish-yellow.

Club-flowered Syringodea. Fl. Aug. Oct. Clt. 1799. Shrub.

92 S. epistòmia; leaves glabrous; flowers terminal; bracteas remote and close to the calyx; calyx green, large, inflated; corolla with an oblong inflated tube; genitals inclosed, aristate. ♄. G. Native of the Cape of Good Hope. Erìca epistòmia,

Nois. Bedf. eric. wob. p. 9. pl. 4. f. 7. Lodd. bot. cab. 1186. Flowers yellow-green.

Spout-flowered Syringodea. Fl. May, June. Clt. 1810. Shrub.

93 S. SACCIFLÒRA; leaves linear, flowers terminal; calycine segments broad, ovate, acuminated; corolla 6-8 lines long, glabrous, with a cylindrical tube; awns of anthers long; anthers linear, papillose. ♄. G. Native of the Cape of Good Hope. Erìca sacciflòra, Sal. in Lin. trans. 6. p. 355.

Sack-flowered Syringodea. Fl. March, June. Clt. 1800. Shrub.

94 S. PATERSÒNII; leaves dense, linear, straight, spreading, glabrous; flowers crowded, axillary; bracteas close to the calyx; calycine segments ciliated at the base, and cuspidate at the apex; corolla 6-8 lines long, glabrous, with a cylindrical tube and a short reflexed limb; style exserted; awns of anthers long. ♄. G. Native of the Cape of Good Hope. Erìca Patersònia, Andr. heath. 1. t. 10. Wendl. eric. fasc. 1. p. 16. with a figure. Erìca Patersònii, Ait. hort. kew. 2. p. 379. Lodd. bot. cab. 1729. Erìca abietìna, Lin. spec. ed. 2. p. 506. diss. no. 20. Erìca spissifòlia, Sal. in Lin. trans. 6. p. 355. Flowers yellow.

Var. β, *monstròsa* (Bedf. eric. wob. p. 17.) corolla larger.

Var. γ, *Màjor* (Andr. heath. 3. t. 10.) calyx slightly toothed.

Paterson's Syringodea. Fl. April, July. Clt. 1791. Shrub.

95 S. VELITA'RIS; leaves linear; flowers terminal; corolla $2\frac{1}{2}$ to 3 lines long, downy, with an obovate tube and a recurvedly spreading limb; crests of anthers long, cuneated, and a little serrated. ♄. G. Native of the Cape of Good Hope. Erìca velitàris, Sal. in Lin. trans. 6. p. 357.

Javelin-flowered Syringodea. Fl. Jan. June. Clt. 1790. Shrub.

96 S. GI'LVA; leaves linear, triquetrous, stiff, glabrous; spreading; flowers axillary, verticillate, pendulous, crowded; pedicels glabrous; bracteas lanceolate, close to the calyx, ribbed; calycine segments lanceolate; corolla downy, 7-9 lines long, with a cylindrical inflated tube, 4-angled at the base; genitals inclosed; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca gílva, Wendl. eric. with a figure. Erìca gélida, Andr. heath. 2. t. 11. Ait. hort. kew. 2. p. 370. Lodd. bot. cab. 699. Erìca alveiflòra, Sal. in. Lin. trans. 6. p. 366. Flowers green. Leaves 4-6 in a whorl.

Var. β, *álbens* (Bedf. eric. wob. p. 11.) corolla with a white base and a green top.

Var. γ, *gílva* (Wendl. eric. fasc. 12. p. 13. with a figure); bracteas remote from the calyx; flowers disposed in a verticillate crown, greenish-yellow. Leaves 4-5 in a whorl.

Iron-grey-flowered Syringodea. Fl. April, July. Clt. 1790. Shrub.

97 S. MAMMÒSA; leaves linear, subulate, glabrous, erect, spreading; flowers drooping, axillary, crowded, verticillate, near the tops of the branches; bracteas linear, remote from the calyx; calyx coloured; pedicels downy; corolla downy, 8-10 lines long; with a cylindrical inflated tube, having 4 pits near the base; genitals inclosed; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca mammòsa, Lin. mant. 234. diss. 21. Andr. heath. 1. t. 8. Lodd. bot. cab. 125. Erìca mammòsa, β, Sal. in Lin. trans. 6. p. 366. Erìca abietìna, Thunb. diss. no. 68. Schnev. pl. no. 23. with a figure. Berg. pl. cap. 105.—Buxb. cent. 4. p. 25. t. 41-42. Corollas pale purplish-red, or dark pink.

Var. β, *mìnor* (Andr. heath. 3. t. 9.) corolla more slender, purplish-red.

Var. γ, *pállida* (Lodd. bot. cab. 951.) flowers paler.

Mammose. Syringodea. Fl. July, Oct. Ctl. 1769. Shrub.

98 S. TU'MIDA; leaves linear, obtuse, hairy, reflexed; flowers terminal, usually by fours; pedicels tribracteate, 2 of the bracteas close to the calyx, and the third remote; corolla downy, with an oblong-cylindrical tube; calyx spreading; style somewhat exserted; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca tùmida, Ker. bot. reg. t. 65. Erìca splèndens, Andr. heath. vol. 4. with a figure. Erìca splèndida, Hort. Loud. hort. brit. p. 146. Flowers red.

Tumid-flowered Syringodea. Fl. May, Aug. Clt. 1812. Shrub.

99 S. BOWIEA'NA; leaves linear, glaucous, glabrous; bracteas remote from the calyx; flowers crowded, axillary, verticillate, near the tops of the branches, pendulous; corolla cylindrical, with an inflated tube, and contracted mouth; genitals inclosed; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca Bowieàna, Lodd. bot. cab. 842. Erìca Bòwia, Bedf. eric. wob. p. 4. Erìca Baùrea, Andr. heath. vol. 4. with a figure. Flowers white.—Habit of *S. mammòsa*, and *S. verticillàta*, &c.

Bowie's Syringodea. Fl. Year. Clt. 1822. Shrub.

* * * *Leaves* 5-6 *to* 8 *in a whorl.*

100 S. CERVICIFLÒRA; leaves 5-6 in a whorl, linear; flowers axillary, crowded; corolla 5-6 lines long, downy, with a very narrow urceolate tube and a spreading limb; filaments minutely spurred. ♄. G. Native of the Cape of Good Hope. Erìca cervicifiòra, Sal. in Lin. trans. 6. p. 362. Erìca inapérta, Hort. Pedicels tribracteate.

Neck-flowered Syringodea. Fl. March, July. Clt. 1810. Shrub.

101 S. PATERSONIOÌDES; leaves linear, glabrous, 5-6 in a whorl; flowers crowded, verticillate; bracteas close to the calyx, toothed; corolla with a cylindrical, clavate, curved tube; style exserted; anthers aristate. ♄. G. Native of the Cape of Good Hope. Erìca patersonioìdes, Bedf. eric. wob. p. 18. Erìca Patersònia coccínea, Andr. heath. 3. t. 11. Corolla deep reddish-orange or scarlet.

Patersonia-like Syringodea. Fl. April. May. Clt. 1800. Shrub.

102 S. CARINA'TA; leaves 5 in a whorl, reflexed, woolly; flowers terminal; bracteas remote from the calyx; corolla with a cylindrical, inflated, ribbed tube; crests of anthers plumose; style a little exserted. ♄. G. Native of the Cape of Good Hope. Erìca carinàta, Lodd. bott. cab. 1071. Corollas reddish-purple.

Keeled-leaved Syringodea. Fl. Sept. Clt. 1820. Shrub.

103 S. FOLIÒSA. We know nothing further about this species. ♄. G. Native of the Cape of Good Hope. Erìca foliòsa, or foliàcea, Andr. heath. vol. 4. with a figure. Flowers of an orange-yellow colour.

Leafy Syringodea. Fl. May, July. Clt. 1800. Shrub.

104 S. SPICA'TA; leaves linear, subulate, hispid, spreadingly reflexed, 6 in a whorl; pedicels very short; bracteas sessile; flowers axillary, crowded, verticillately spicate, drooping; calycine segments callous, spatulate, entire; corolla dewy, 7-9 lines long, cylindrical; genitals inclosed; anthers awned. ♄. G. Native of the Cape of Good Hope. Erìca spicàta, Thunb. diss. no. 71. with a figure. Wendl. eric. fasc. 2. p. 27. with a figure. Erìca sessiliflòra, Lin. suppl. 222. Erìca favòsa, Sal. in Lin. trans 6. p. 365. Corolla yellowish-green.

Var. β; corolla 5-7 lines long, having the segments contiguous at the base. ♄. G. Erìca spicàta, Andr. heath. 1. t. 11. Lodd. bot. cab. 1203. Flowers greenish-yellow.

Spike-flowered Syringodea. Fl. Year. Clt. 1789. Shrub.

105 S. FASCICULA'RIS; leaves 8 in a whorl, narrow-linear, obtuse, glandularly ciliated, spreading, a little recurved; bracteas remote from the calyx; flowers crowded, axillary, verticillate, near the tops of the branches, horizontal; corolla 13 lines

long, viscid, with a cylindrical clavate tube and an erect limb; pedicels and bracteas glandular; style a little exserted; awns of anthers subulate. ♄. G. Native of the Cape of Good Hope. Erìca fasciculàris, Lin. suppl. 219. Pl. kew. t. 6. Erìca coronàta, Andr. 1. t. 12. Bedf. eric. wob. pl. 11. f. 17. Erìca octophýlla, Thunb. diss. no. 72. with a figure, Willd. spec. 2. p. 372. Erìca radiiflòra, Sal. in Lin. trans. 6. p. 360. Corollas reddish-purple, with a green apex.

Fascicled-flowered Syringodea. Fl. Feb. June. Clt. 1787. Shrub.

106 S. sceptrifórmis; leaves 8 in a whorl; stem straight; pedicels very short, axillary, crowded; calyx callous, with broad, spatulate, deeply serrated segments; corolla 7-10 lines long, downy. ♄. G. Native of the Cape of Good Hope. Erìca sceptrifórmis, Sal. in Lin. trans. 6. p. 365. Erìca enneaphýlla, Roxb. mss.

Sceptre-formed flowered Syringodea. Fl. Aug. Sept. Clt. 1790. Shrub.

107 S.? doliifórmis; leaves hairy, linear, 6 in a whorl; bracteas close to the calyx; flowers terminal; corolla 4-5 lines long, viscid, with an urceolar tube; awns of anthers short, cuneated. ♄. G. Native of the Cape of Good Hope. Erìca doliifórmis, Sal. in Lin. trans. 6. p. 368. Erìca mammòsa, Thunb. diss. no. 69. with a figure.

Tun-formed-flowered Syringodea. Fl. May, Sept. Clt. 1798. Shrub.

† *Species hardly known.*

108 S. hirsu'ta; leaves 4 in a whorl, hairy, hoary, linear; flowers axillary, crowded, verticillate; anthers awned ?. ♄. G. Native of the Cape of Good Hope. Erìca hirsùta, Lodd. bot. cab. 754. Corolla with a red base and white apex.

Hairy Syringodea. Fl. March, April. Clt. 1800. Shrub.

109 S. ru'bida; leaves linear, 4 in a whorl, glabrous; flowers terminal and axillary; bracteas distant from the calyx; corolla tubular, drooping; anthers ?. ♄. G. Native of the Cape of Good Hope. Erìca rúbida, Lodd. bot. cab. 1166. Pedicels and calyxes red. Corollas white.

Reddish-calyxed Syringodea. Fl. May, June. Clt. 1826. Shrub.

110 S. expo'sita; leaves 4 in a whorl, hairy; calyx, bracteas, and pedicels, clothed with glandular hairs; flowers terminal, by threes or fours; corolla cylindrical. ♄. G. Native of the Cape of Good Hope. Erìca expósita, Lodd. bot. cab. 1521. Flowers red.

Exposed Syringodea. Fl. May, Aug. Clt. 1812. Shrub.

111 S. elonga'ta; leaves hoary, linear, 4 in a whorl; flowers terminal; corolla hairy at top. ♄. G. Native of the Cape of Good Hope. Erìca elongàta, Lodd. bot. cab. 738. Flowers white.

Elongated Syringodea. Fl. Feb. Nov. Clt. 1810. Shrub.

112 S. Rollinsònii; leaves 4 in a whorl?; flowers nearly terminal, verticillate; corolla with a straight cylindrical tube. ♄. G. Native of the Cape of Good Hope. Erìca Rollinsònii, Hortul. Bedf. eric, wob. p. 21. Flowers purplish-red.

Rollinson's Syringodea. Fl. June, July. Clt. 1820. Shrub.

Cult. See *Erica*, p. 800, for culture and propagation.

XVI. DASYA'NTHES (from δασυς, *dasys*, hairy, and ανθος, *anthos*, a flower; in reference to the corolla, which is hairy). D. Don, in edinb. phil. journ. 17. p. 156.—Erìca species of Lin.

Lin. syst. *Octándria, Monogýnia.* Calyx 4-parted, bibracteate at the base. Corolla tubular, hispid, with an erect 4-lobed limb. Stamens inclosed; filaments capillary; anthers bipartite; cells of anthers mutic at the base, dehiscing longitudinally. Stigma large, peltate. Capsule 4-celled, many-seeded.—An erect shrub, native of the Cape of Good Hope. Leaves loosely imbricate, hispid from bristles, with revolute margins. Flowers terminal, fascicled, yellow.

1 D. Sparma'nni (D. Don, l. c.). ♄. G. Native of the Cape of Good Hope. Erìca Sparmánni, Lin. suppl. 219. in act. holm. 1778. p. 24. t. 2. Thunb. diss. no. 33. Erìca áspera, Andr. heath. vol. 3. t. 55. Erìca hystriciflòra, Sal. in Lin. trans. 6. p. 367. Erìca hórrida, Hortul. Leaves 4 in a whorl. Flowers drooping, by threes.

Sparmann's Dasyanthes. Fl. Sept. Feb. Clt. 1794. Shrub, 1 ft.

Cult. For culture and propagation see *Erìca*, p. 800.

XVII. ECTA'SIS (from εκτασις, *ectasis*, extension; from the stamens being much exserted). D. Don, in edinb. phil. journ. 17. p. 156. Erìca species of authors.

Lin. syst. *Octándria, Monogýnia.* Calyx 4-leaved, glumaceous. Corolla tubular, rather ventricose at the base, with a 4-toothed limb. Stamens much exserted; filaments dilated; anthers bipartite; cells of anthers elongated, tubular, dehiscing by a longitudinal fissure, continuous, with the base of the filaments mutic. Stigma clavate, truncate. Capsule 4-celled, many-seeded. Seeds ovate, compressed, smooth, shining.—Much-branched shrubs, natives of the Cape of Good Hope. Leaves loosely imbricated, with revolute edges, flat above, 3 or 4 in a whorl, but mostly the latter number. Flowers terminal, solitary or numerous.

§ 1. *Flowers lateral. Calyx bractless. Normal species.*

1 E. Petive'rii (D. Don, l. c.) leaves spreadingly recurved, ciliated; flowers solitary; corollas cylindrical; fruit ovate. ♄. G. Native of the Cape of Good Hope. Erìca Petivèrii, Lin. mant. 232. diss. no. 50. Lodd. bot. cab. 1426. Erìca Petíveriàna, Spreng. syst. 2. p. 361. Erìca baculiflòra, Sal. in Lin. trans. 6. p. 346. Corollas yellow.

Var. β; corollas of a dirty rufous colour. ♄. G. Erìca Petivèrii, Thunb. diss. 21.

Var. γ, *hirsùta* (Andr. heath. 2. t. 72.) leaves hairy; corollas deep red.

Petiver's Ectasis. Fl. March, July. Clt. 1774. Shrub.

2 E. Plukne'tii (D. Don, l. c.) bracteas cuneated, remote from the calyx; corolla ovate, pyramidal or conical, smooth. ♄. G. Native of the Cape of Good Hope. Erìca Pluknètii, Lin. spec. ed. 1. p. 356. Erìca fusifórmis, Sal. in Lin. trans. 6. p. 345. Corolla scarlet, 6-7 lines long, leaves linear, spreading.

Var. β; calyx $2\frac{1}{2}$ to 3 lines long; corolla purple, with orange-coloured anthers, 6-7 lines long. ♄. G. Erìca Pluknetiàna, Pl. kew. t. 9. Erìca Pluknètii. Lin. spec. ed. 2. p. 506. exclusive of the synonymes. Erìca Pluknètii nàna, Andr. heath. 1. t. 67. Erìca Pluknètii pínea, Wendl. eric. 1. p. 9. with a figure.

Var. γ; calyx 1 line long; corolla white, 3 to $3\frac{1}{2}$ lines long. ♄. G. Erìca Petivèrii β, Thunb. diss. no. 21.

Var. δ; calyx $2\frac{1}{2}$ lines long; corolla white, 3 to $3\frac{1}{2}$ lines long. Sal. in Lin. trans. 6. p. 346.

Var. ε; calyx 5 lines long; corolla white, 5-8 lines long. ♄. G. Sal. l. c. This is said to be the most showy variety.

Var. ζ, *penicellàta* (Ait. hort. kew. 2. p. 361.) corolla reddish purple, with orange-red anthers. ♄. G. Erìca penicellàta, Andr. heath. 2. t. 69. Lodd. bot. cab. 1918. Erìca Pluknètia interrúpta, Wendl. eric. 2. p. 21. with a figure.

Pluknet's Ectasis. Fl. April, May. Clt. 1774. Shrub.

3 E. bruniades; leaves 3 in a whorl, linear-oblong, erect, short, villously tomentose; flowers terminal, subumbellate, drooping; bracteas remote from the calyx, 4-leaved; corolla campanulate, much longer than the calyx, which is very villous and silky; nectarium astraguliform, silky. ♄. G. Native of the Cape of Good Hope. Erìca bruniàdes, Lin. mant. p. 378. diss. no. 52. with a figure of the flower. Wendl. eric. 16. p. 53. with a figure. Lodd. bot. cab. 1365. Erìca carbasìna, Sal. in

Lin. trans. 6. p. 333. Corolla 1½ line long, white or pale red, also yellow.

Brunia-like Ectasis. Fl. April, July. Clt. 1790. Shrub 1½ ft.

4 E. VALLERÆFLÒRA; leaves 3 in a whorl, linear, downy or hairy, spreading, rather remote; flowers terminal, by threes; bracteas remote, quadrifid; corollas globose, urceolar, a little longer than the calyx, which is large, and densely clothed with silky hairs; nectarium cotyliform, glabrous. ♄. G. Native of the Cape of Good Hope. Erìca valleræflòra, Sal. in Lin. trans. 6. p. 333. Ait. hort. kew. 2. p. 365. Erìca bruniàdes, Andr. heath. 1. t. 37. Erìca villòsa, Pluk. mant. 69. t. 347. f. 9. Wendl. eric. fasc. 16. p. 65. with a figure. Erìca capitàta, Thunb. eric. no. 15. Calyx and corolla pale red. Anthers black. Corolla 1½ line long.

Woolly-flowered Ectasis. Fl. Feb. July. Clt. 1774. Shrub 1½ ft.

§ 2. *Flowers terminal. Calyx imbricated by numerous scales at the base. Aberrant species.*

5 E. Banksia'na (D. Don, l. c.) leaves mucronate; corolla cylindrical, with a reflexed limb; pericarp bearded. ♄. G. Native of the Cape of Good Hope. Erìca Bánksia, Andr. heath. 1. t. 66. Erìca Bánksii, Ait. hort. kew. 2. p. 361. Erìca frágilis, Sal. in Lin. trans. 6. p. 346. Corolla greenish-yellow, with brown anthers.

Var. β, álba; flowers white.

Sir Joseph Banks's Ectasis. Fl. Feb. July. Clt. 1787. Shrub.

6 E. VESTIFLU'A; leaves incurvedly spreading, pilose while young; flowers solitary, terminal; corolla with a cylindrical tube, 7-9 lines long. ♄. G. Erìca vestiflùa, Sal. in Lin. trans. 6. p. 346. Erìca Petiviriàna, Roxb. mss. Corolla rufous.

Flowing-vested Ectasis. Fl. March, June. Clt. 1795. Sh.

7 E. Seba'na (D. Don, l. c.) leaves recurvedly spreading; tube of corolla cylindrical, incurved, ventricose at the base; pericarp oval; calyx and bracteas glabrous. ♄. G. Native of the Cape of Good Hope. Erìca Sebàna, Pl. kew. t. 10. Erìca coccínea, Lin. spec. ed. 2. p. 505. Erìca cothurnàlis, Sal. in Lin. trans. 6. p. 347. Erìca Sebàna aurántia, Andr. heath. vol. 1. Erìca Africàna, &c. Seb. thes. 1. p. 32. t. 21. f. 4. Flowers by threes. Corolla pale brown.

Var. β; bracteas and calyx downy. ♄. G. Erìca Plukenètii, Berg. pl. cap. p. 92. Corollas pale brown.

Var. γ, rùbra; flowers reddish-orange at top, and reddish-purple at the base; anthers orange-yellow.

Var. δ, atrorùbens; flowers reddish-purple. ♄. G.

Seba's Ectasis. Fl. April, Nov. Clt. 1774. Shrub.

8 E. SOCCIFLÒRA; leaves recurvedly spreading; corolla conical; flowers by threes; fruit ovate. ♄. G. Native of the Cape of Good Hope. Erìca socciflòra, Sal. in Lin. trans. 6. p. 347. Bedf. eric. wob. pl. 4. f. 8. Erìca Sebàna víridis, Andr. heath. 1. icon. Corolla greenish-yellow; anthers orange-yellow.

Pump-flowered Ectasis. Fl. April, May. Clt. 1799. Sh.

9 E. FURFURÒSA; leaves incurvedly spreading, downy; flowers by threes; corolla viscid, cylindrical; filaments very broad; nectarium cotyliform. ♄. G. Native of the Cape of Good Hope. Erìca furfuròsa, Sal. in Lin. trans. 6. p. 348. Erìca monadélpha, Andr. heath. 1. t. 65. Sims, bot. mag. 1370. Corolla white, with a red border, and orange-yellow anthers.

Scurfy Ectasis. Fl. Aug. Dec. Clt. 1789. Shrub.

10 E. MONADE'LPHA; corolla with a cylindrical tube, and reflexed segments; filaments very broad. ♄. G. Native of the Cape of Good Hope. Erìca monadélpha, Bedf. eric. wob. p. 15. pl. 2. f. 12. Erìca Bánksia purpùrea, Andr. heath. 3. t. 37. Corolla greenish-white or yellow, with a purple border, and yellow anthers.—Perhaps the same as the preceding.

Monadelphous Ectasis. Fl. Aug. Oct. Clt. 1800. Shrub.

11 E. FOLLICULA'RIS; leaves spreading; flowers solitary, spike-like; corollas conical. ♄. G. Native of the Cape of Good Hope. Erìca folliculàris, Sal. in Lin. trans. 6. p. 348. Erìca Petiveriàna, Andr. heath. 2. t. 71. Wendl. eric. 14. p. 23. Corolla yellow-green or orange-red, 5-7 lines long, with brown anthers. Nectarium quadrangular.

Follicular Ectasis. Fl. Feb. July. Clt. 1794. Shrub.

12 E. MELASTÒMA; leaves 4 in a whorl, stiff, secund; flowers terminal, solitary; corolla cone-shaped. ♄. G. Native of the Cape of Good Hope. Erìca melastòma, Andr. heath. 1. icon. Wendl. eric. 14. p. 23. with a figure. Lodd. bot. cab. 333. Erìca folliculàris β, Sal. in Lin. trans. 6. p. 348. Corolla with a greenish-yellow tube, a dark brown mouth, and orange anthers.

Black-mouthed Ectasis. Fl. May, July. Clt. 1795. Shrub.

13 E. PÍCTA; leaves 4 in a whorl; corolla cylindrical, incurved. ♄. G. Native of the Cape of Good Hope. Erìca pícta, Nois. mss. Bedf. hort. eric. wob. p. 19. Corolla with an orange-yellow tube, and orange anthers.

Painted Ectasis. Fl. Oct. July. Clt. 1820. Shrub.

14 E. PENICILLIFLÒRA; leaves ciliated, erect; flowers by threes; corolla 2 lines long, covered by the calyx, with a spherical tube; anthers converging into a pencil-form. ♄. G. Native of the Cape of Good Hope. Erìca penicilliflòra, Sal. in Lin. trans. 6. p. 348. Erìca Petivèrii vèra, Hortul. Erìca calyculàta, Wendl. eric. 4. p. 5. with a figure. Bracteas and calyxes white. An elegant species.

Pencil-flowered Ectasis. Fl. May, Aug. Clt. 1792. Shrub.

15 E. PLACENTÆFLÒRA; leaves very obtuse; corolla covered by the calyx, with a turnip-formed tube; filaments gradually dilated; stigma narrow. ♄. G. Native of the Cape of Good Hope. Erìca placentæflòra, Sal. in Lin. trans. 6. p. 348. Herb pale, hoary.

Placenta-flowered Ectasis. Shrub.

16 E. PUDIBU'NDA; leaves 3-4 in a whorl, rather viscid; flowers terminal, by threes; calyxes ciliated; corolla conical, viscid. ♄. G. Native of the Cape of Good Hope. Erìca pudibúnda, Sal. in Lin. trans. 6. p. 345. Erìca nùtans, Wendl. eric. fasc. 3. p. 5. with a figure. Corolla 2 lines long; anthers broad, hairy. Fruit turbinate, hairy. Flowers pale red.?

Blush Ectasis. Fl. June, Sept. Clt. 1810. Shrub.

17 E. FILIFÓRMIS; leaves 3 in a whorl, remote, narrow, recurved, clothed with viscid pubescence; calyx bracteate; corolla 1 line long, glabrous, with a recurved tube; filaments broad at the top; stigma narrow; fruit smooth. ♄. G. Native of the Cape of Good Hope. Erìca filifórmis, Sal. in Lin. trans. 3. p. 345.

Filiform Ectasis. Shrub.

18 E. STELLA'RIS; hoary; leaves 4-5 in a whorl, linear, spreading, a little incurved, ciliated; flowers almost sessile, terminal, capitate; bracteas near the calyx; calycine segments linear, ciliated. ♄. G. Native of the Cape of Good Hope. Erìca stellàris, Nois. Lodd. bot. cab. 893. Erìca stellàta, Bedf. eric. wob. p. 24. Flowers white tinged with red. Stamens brown. Corolla urceolate.

Starry Ectasis. Fl. April, June. Clt. 1810. Shrub.

19 E. DEMÍSSA; leaves linear, 3 in a whorl; flowers terminal; bracteas imbricate; corolla cone-shaped. ♄. G. Native of the Cape of Good Hope. Erìca demíssa, Hort. Bedf. eric. wob. p. 8. Flowers greenish-yellow.

Low Ectasis. Fl. Spring. Clt. 1818. Shrub.

20 E.? TU'RGIDA; leaves 3 in a whorl; flowers terminal; pedicels very short; corolla hairy, 1½ line long, with a bulged tube; spurs of anthers cuneated; anthers very short. ♄. G. Native of the Cape of Good Hope. Erìca túrgida, Sal. in Lin. trans. 6. p. 343. Erìca fúsco-rùbens, Roxb. mss. Flowers brownish-red.

Turgid-flowered Ectasis. Shrub.

Cult. For culture and propagation see *Erica*, p. 800.

XVIII. ERIODE'SMIA (from *εριον*, *erion*, wool, and *δεσμη*, *desme*, a fascicle; the flowers resemble a fascicle of wool). D. Don, in edinb. phil. journ. 17. p. 158. Erìca capitàta, Lin. &c.

Lin. syst. *Octándria Monogy'nia*. Calyx large, 4-parted, bibracteate at the base. Corolla campanulate; limb 4-lobed, revolute. Stamens exserted; filaments dilated, flat; anthers bifid, obtuse, scabrous from papillæ; cells of anthers dehiscing by an oblong pore, having the base continuous with the filaments. Stigma capitate. Capsule 4-celled, many-seeded. Seeds angular, shining.—An erect branched shrub. Leaves 3 in a whorl, obtuse, very hairy. Flowers terminal, solitary or by threes, forming a very hairy head.

1 E. capita'ta (D. Don, l. c.). ♄. G. Native of the Cape of Good Hope. Erìca capitàta, Lin. diss. no. 36. mant. 373. Berg. pl. cap. 94. Andr. heath. 1. t. 38. Wendl. eric. no. 3. p. 3. with a figure.—Seb. thes. 1. p. 30. t. 20. f. 1. Erìca by'ssina, Sal. in Lin. trans. 6. p. 383. Calyx very hairy, greenish-yellow. Bracteas imbricate. Corolla white, and very little longer than the calyx.

Capitate-flowered Eriodesmia. Fl. July, Aug. Clt. 1774. Shrub.

Cult. For culture and propagation see *Erìca*, p. 800.

XIX. OCTOPE'RA (from *οκτω*, *octo*, eight, and *πηρα*, *pera*, a sack; in reference to the 8-celled capsule). D. Don, in edinb. phil. journ. 17. p. 156.—Erìca Bergiàna, Lin.

Lin. syst. *Octándria*, *Monogýnia*. Calyx 4-parted, reflexed, naked at the base. Corolla globose, with a contracted bluntly 4-lobed mouth. Stamens inclosed; filaments flat; cells of anthers very short, dehiscing by a large foramen, furnished with a lanceolate acuminated crested appendage at the base. Stigma peltate. Capsule 8-celled, many-seeded.—A procumbent downy shrub, native of the Cape of Good Hope. Leaves broad, 4 in a whorl. Flowers terminal, umbellate; pedicels scaly.

1 O. Bergia'na (D. Don, l. c.). ♄. G. Native of the Cape of Good Hope. Erìca Bergiàna, Lin. mant. p. 235. diss. no. 6. Schnev. pl. no. 46. with a figure. Erìca quadriflòra, Willd. spec. 2. p. 379. Andr. heath. 2. t. 20. Erìca lacunæflòra, Sal. in Lin. trans. 6. p. 377. Erìca nítens, Lee. Flowers purplish-red.

Bergius's Octopera. Fl. April, Aug. Clt. 1787. Shrub procumbent.

Cult. For culture and propagation see *Erìca*, p. 800.

XX. ERE'MIA (from *ερημος*, *eremos*, solitary; from the seeds being solitary in the cells). D. Don, in edinb. phil. journ. 17. p. 156.—Erìca Tótta, Thunb.

Lin. syst. *Octándria*, *Monogýnia*. Calyx 4-parted, imbricated by bracteas at the base; segments broadly orbicular, ciliated, coriaceous. Corolla urceolar, with a small 4-lobed limb. Stamens inclosed; filaments capillary; anthers bipartite; cells of anthers short, mutic at the base, opening by an oblong hole. Stigma capitate. Capsule 4-celled; cells 1-seeded. Seeds large, elliptic, ventricose.—A diffusely branched shrub, native of the Cape of Good Hope. Leaves spreading, hispid from bristles. Flowers glomerate.

1 E. Tótta (D. Don, l. c.). ♄. G. Native of the Cape of Good Hope. Erìca Tótta, Thunb. diss. no. 17. Erìca férox, Sal. in Lin. trans. 6. p. 324.

Hottentot Eremia. Fl. June, July. Clt. 1810. Shrub.

Cult. For culture and propagation see *Erìca*, p. 800.

XXI. SALAXIS (from *salax*, unchaste; but the application is not evident). Sal. MSS. spec. 2.

Lin. syst. *Octándria*, *Monogýnia*. Calyx irregular, 4-leaved. Corolla campanulate, 4-cleft. Stigma peltate. Capsule drupaceous, 3-celled, 3-seeded.—Shrubs, native of the Mauritius. Leaves from 3 to 6 in a whorl, with revolute margins. Flowers somewhat racemose at the tops of the branches.

1 S. arbore'scens (Willd. ex. Spreng, syst. 2. p. 20.) leaves 3 in a whorl, nearly terete, adpressed; pedicels downy. ♄. G. Native of the Mauritius.

Arborescent Salaxis. Shrub.

2 S. monta'na (Willd. l. c.) leaves 3 in a whorl, adpressed, tetragonal; pedicels glabrous. ♄. G. Native of the Mauritius.

Mountain Salaxis. Shrub.

3 S. axilla'ris (Salisb.) leaves 3 in a whorl, glabrous; flowers racemose; corollas globose; branches tomentose. ♄ G. Native of the Cape of Good Hope. Erìca axilàris, Th. diss, no. 10.

Axillary flowery Salaxis. Shrub.

4 S. abietìna (Willd. l. c.) leaves generally 3 in a whorl, linear, spreading. ♄. G. Native of the Mauritius.

Fir-like Salaxis. Shrub.

Cult. Turfy peat mixed with rough sand is the best soil for the species of *Saláxis*; and young cuttings of them strike root readily in sand, under a bell-glass, in a little heat.

XXII. CALLU'NA (from *καλλυνω*, *kalluno*, to adorn; beauty of plant when in blossom). Sal. in Lin. trans. 6. p. 317. Erìca vulgàris, Lin. and others.

Lin. syst. *Octándria*, *Monogýnia*. Calyx 4-parted, membranous, coloured, furnished with 4 bracteas at the base. Corolla campanulate, 4-lobed, shorter than the calyx. Stamens inclosed; filaments dilated; anthers bipartite, biappendiculate at the base; cells of anthers mucronulate, dehiscing lengthwise. Stigma capitate. Capsule with a septicidal dehiscence. Seeds ovoid, smooth.—A small spreading shrub, native of Europe. Leaves trigonal, obtuse, very short, imbricating in 4 rows, having the margins revolute, and the base sagittate. Flowers disposed in long terminal spicate racemes.

1 C. vulga'ris (Sal. in Lin. trans. 6. p. 317.). ♄. H. Native throughout Europe; plentiful in Britain. Erìca vulgàris, Lin. spec. p. 501. Smith's engl. bot. 1013.

Var. α, *purpùrea*; flowers purplish-red.

Var. β, *spùria*; flowers purplish-red; spikes short; branches tufted.

Var. γ, *decúmbens*; flowers purplish-red; spikes short; branches decumbent.

Var. δ, *tomentòsa*; flowers purplish-red; leaves and branches woolly.

Var. ε, *álba*; flowers white, less crowded; corolla shorter.

Var. ζ, *flore pleno*; flowers double, pale purplish-red.

Var. μ, *foliis variegàtis*; leaves variegated; flowers purplish.

Var. θ, *aùrea*; leaves variegated with yellow.

Var. ι, *coccínea*; flowers deep red.

Var. κ, *spicàta*; spikes long; flowers red, or white.

Common Heath or Ling Heather. Fl. July, Sept. Britain. Shrub ½ to 3 feet.

Cult. The varieties of *Callùna vulgàris* are very ornamental when planted in a border or clump, along with the dwarf hardy species of *Erìca* and their varieties, as *Erìca ciliàris*, *E. tétralix*, *E. cinèrea*, and *Gypsocállis multiflòra*, *G. vàgans*, &c. The border in which they are grown requires to be composed of peat soil. All are increased by layers, or young cuttings under a bell-glass.

Subtribe II.

ANDROME'DEÆ, (this Subtribe contains plants agreeing with *Andrómeda* in the Corolla being dead.) D. Don, in Edinb. phil. journ. 17, p. 157. Corolla deciduous.

XXIII. ANDRO'MEDA (named from the daughter of Cepheus, rescued from the sea-monster by Perseus). D. Don, in

phil. journ. 17, p. 157. Andrómeda, species of Authors. Polifòlia, Buxbaum, cent. 5. p. 5. t. 55. f. 1.

LIN. SYST. *Decándria, Monogýnia.* Calyx 5-cleft; segments acute, simple at the base. Corolla globose, with a contracted 5-toothed mouth. Stamens 10, inclosed; filaments bearded; cells of anthers short, furnished with one awn each. Stigma truncate. Capsule with a loculicidal dehiscence; placenta 5-lobed: lobes simple. Seeds elliptic, compressed, shining, with a lateral linear hylum.—Shrubs, natives of Europe, Asia, and North America. Leaves linear-lanceolate, mucronulate, with the margins more or less revolute, quite entire, glaucous beneath, with an elevated rib, and reticulated veins; petioles very short, callous. Flowers terminal, umbellate, very beautiful, reddish, or snow white, furnished with ovate, rather foliaceous, imbricated bracteas, drooping.

1 A. POLIFÒLIA (Lin. spec. 564.) leaves oblong, glaucous beneath; corollas ovate; calycine segments ovate, spreading, white, sometimes tipped with red. ♄. H. Native of the northern countries of Europe, on turfy bogs; as of Russia, Sweden, Denmark, Switzerland, Germany, Britain, &c.; North America, in Canada and Labrador, Bay of St. Lawrence, &c., in bogs, and on the borders of mountain lakes; New York, and Pennsylvania. In Britain, in mossy bogs in the mountainous parts of England and Ireland, and the low lands of Scotland. Lin. fl. lapp. 161. t. 1. f. 3. Oed. fl. dan. t. 54. Smith, engl. bot. t. 713. Buxb. cent. 5. t. 55. f. 1. Pall. fl. ross. 1. t. 1. Pluk. alm. 175. f. 1. Rhododéndron polifòlium, Scop. carn. no. 482. Flowers flesh-coloured or pale red. The plant is called *Wild Rosemary, Poley-Mountain, Moorwort,* and *Marsh Holy Rose.*

Var. α, *latifòlia* (Ait. hort. kew. 2. p. 68.). ♄. H. Native of North America. Broad leaved Marsh Andromeda, or Wild Rosemary, L. Her. stirp. nov. 2. t. 11.

Var. β, *mèdia;* leaves lanceolate; corollas oblong—ovate, red; segments of the calyx more erect. ♄. H. Native of Europe.

Var. γ, *subulàta;* leaves subulate; corollas pink. ♄. H. Native of Britain. Subulate-leaved Wild Rosemary.

Var. δ, *mínima;* leaves linear; corollas pink. ♄. H. Native of Europe. Least Wild Rosemary.

Var. ε, *oleifòlia;* leaves shaped like those of the olive; corollas pink. Olive-leaved Wild Rosemary.

Var. ζ, *glaucophýlla;* leaves lanceolate, glaucous beneath; flowers terminal, drooping. ♄. H. Native of Canada and Labrador. An. polifòlia, β. latifòlia, Lodd. bot. cab. 546. Andr. glaucophýlla, Link. Flowers pale red.

Polium-leaved Marsh Andromeda, or Wild Rosemary. Fl. May, Sept. Britain. Shrub 1 foot.

2 A. ROSMARINIFÒLIA (Pursh. fl. amer. sept. 1. p. 291.) leaves linear-lanceolate, convex, revolute, white beneath, and canescent above; corollas nearly globose; calycine segments oblong, red. ♄. H. Native of Newfoundland and Labrador. A. polifòlia, Michx. fl. bor. amer. 2. p. 254. Pall. fl. ross. 2. p. 53. t. 70. f. B. Flowers white, tinged with red.

Rosemary-leaved Marsh Andromeda. Fl. June. Clt.? Shrub 1 foot.

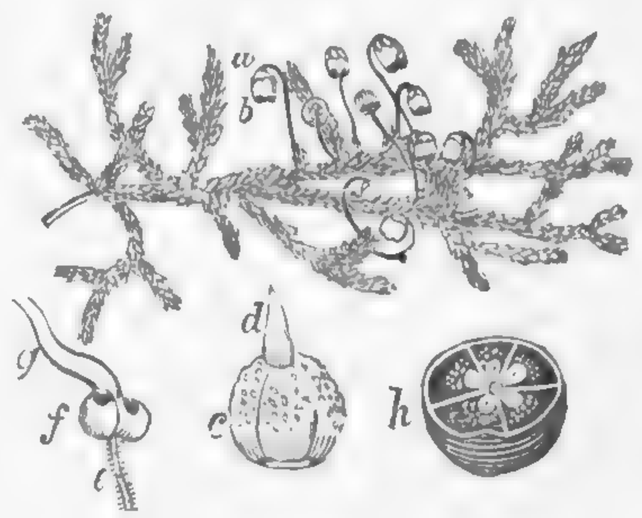
Cult. Peat is the best soil for the species and varieties of *Andrómeda.* They are easily increased by dividing at the root, or by layers.

XXIV. CASSIO'PE (the wife of Cepheus, see *Andrómeda*). D. Don, in edinb. phil. journ. 17. p. 157. Andrómeda species of Lin. and Pall.

LIN. SYST. *Decándria, Monogýnia.* Calyx 5-leaved; leaves imbricated at the base. Corolla campanulate, (f. 136 *b.*), 5-cleft, (f. 136 *a.*) Stamens 10, inclosed; filaments glabrous; cells of anthers short, tumid, furnished with one awn each, (f. 136 *g.*) Style dilated at the base, (f. 136, *d.*); stigma obtuse. Capsule with a loculicidal dehiscence; valves bifid at the apex. Placenta 5-lobed: lobes simple. Seeds oblong, compressed, shining.—Small heath-like shrubs, natives of Asia and North America. Leaves small, imbricated. Flowers solitary, pedunculate, rose-coloured, lateral or terminal.

* *Leaves flat.*

FIG. 136.



1 C. HYPNOÌDES (D. Don. l. c.) leaves loose, acerose. ♄. H. Native of Lapland, Denmark, and Siberia, on the mountains, where it covers tracts of land; and on the north-west coast of America. Andrómeda hypnoìdes, Lin. spec. 563. fl. lapp. 165. t. 1. f. 3. Oed. fl. dan. t. 10. Pall. fl. ross. p. 55. t. 73. f. 2. Hook. bot. mag. t. 2936.—A small creeping shrub, resembling a moss. Flowers small, with a red calyx, and white corolla.

Hypnum-like Cassiope. Fl. June, July. Clt. 1798. Shrub creeping.

2 C. LYCOPODIOÌDES (D. Don, l. c.) leaves ovate, adpressed, imbricated in 4 rows. ♄. H. Native of Siberia and the Island of St. Lawrence. Andrómeda lycopodioìdes, Pall. fl. ross. p. 55. t. 73. f. 1. Flowers red. A small moss-like creeping shrub.

Club-moss-like Cassiope. Shrub creeping.

** *Leaves imbricated in 4 rows, adpressed, with revolute margins, tumid, somewhat bilocular.*

3 C. TETRAGÒNA (D. Don, l. c.) leaves obtuse, mutic, minutely ciliated; peduncles glabrous. ♄. H. Native of Lapland and Siberia; of North America, in Canada, Labrador, and the north-west coast; Island of St. Lawrence, Kotzebue Sound. Andrómeda tetragòna, Lin. spec. 563. fl. lapp. 166. t. 1. f. 4. Pall. fl. ross. p. 50. t. 73. f. 4. Hook. bot. mag. t. 3181. Flowers white.

Tetragonal-branched Cassiope. Fl. March, April. Clt. 1810. Shrub ½ foot.

4 C. MERTENSIA'NA; leaves bluntish, glabrous; pedicels axillary, downy. ♄. H. Native of the Island of Sitcha. Andrómeda Mertensiàna, Bongard, in mem. acad. petersb. 2. p. 152. t. 5. Habit of *C. tetragòna.*

Mertens's Cassandra. Shrub ½ foot.

5 C. ERICOÌDES (D. Don, l. c.) leaves awned, setosely ciliated; peduncles glabrous. ♄. H. Native of Dahuria and Kamtschatka. Andrómeda ericoìdes, Pall. fl. ross. p. 56. t. 73. f. 3. Flower.?

Heath-like Cassiope. Shrub ½ foot.

6 C. FASTIGIA'TA (D. Don, l. c.) leaves elongated at top, with scarious membranous margins; peduncles woolly. ♄. H. Native of Nepaul and Mongol. Andrómeda fastigiàta, Wall. pl. rar. asiat. 3. t. 284. Andrómeda cupressifórmis, Wall. mss. ex D. Don, in mem. wern. soc. 3. p. 411. prod. fl. nep. p. 150. Flowers pale red.

Fastigiate Cassiope. Shrub procumbent.

7 C. REDO'WSKII; leaves scale-formed, shining, smooth, fringed, imbricating in 4 rows, making the branches appear exactly tetragonal; pedicels axillary, glabrous. ♄. H. Native of the east of Siberia. Andrómeda Redówskii, Cham. et

Schlecht. in Linnæa. 1. p. 517. Shrub procumbent, much branched. Flowers drooping. Calyx deeply 4-parted. Corolla campanulate, quadrifid, with very blunt segments. Stamens 8, very short; anthers 2-celled, biaristate, the cells opening by a pore at the apex. Capsule 4-valved; valves septiferous at the middle.

Redowski's Cassiope. Shrub procumbent.

Cult. All the species are delicate little shrubs: they grow well in a peat border, or in pots well drained with sherds in the same kind of soil; and may be increased by layers.

XXV. CASSA'NDRA (a mythological name of the daughter of Priamus and Hecuba). D. Don, in edinb. phil. journ, July, 1834. Andrómeda species, Lin. and others.

Lin. syst. *Decándria*, *Monogýnia*. Calyx 5-leaved, bibracteate at the base; leaflets imbricated at the base. Corolla oblong, with a contracted 5-toothed mouth. Stamens 10, inclosed; filaments glabrous, simple at the base; cells of anthers elongated, and tubular at the apex, mutic. Stigma annular, with a 5-tubercled disk. Capsule with a loculicidal dehiscence. Placenta 5-lobed: lobes simple.—An evergreen shrub, common in North America, north of Europe, and the north of Asia. Branchlets recurved, pubescent. Leaves on short petioles, elliptic-oblong, denticulated, coriaceous, veinless, lepidotted on both surfaces by peltate scales, when young silvery beneath. Flowers axillary, on short pedicels, drooping, snow white, disposed in the manner of racemes at the tops of the branches.

1 C. calycula'ta (D. Don, l. c.) leaves elliptic-oblong, bluntish, obsoletely serrulated, rusty beneath; racemes recurved, leafy; bracteas of calyx broad, ovate, acuminated; corollas oblong-cylindrical. ♄. H. Native of North America, from Canada to Virginia, in bogs and swamps, on the mountains. It grows also in Sweden, Prussia, Siberia, &c. Andrómeda calyculàta, Lin. spec. 565. Pall. fl. ross. 2. p. 53. t. 71. f. 1. Lodd. bot. cab. 1464.

Var. α, ventricòsa (Sims, bot. mag. 1286.).

Var. β, latifòlia (Lodd. bot. cab. 530.).

Var. γ, nàna (Sims, bot. mag. 862. Lodd. bot. cab. 826.)

Calyculated-flowered Cassandra. Fl. April, May. Clt. 1748. Shrub 1 to 3 feet.

2 C. angustifòlia; leaves linear-lanceolate, acute, with subundulated revolute edges, rusty beneath; racemes recurved, leafy; bracteas of calyx minute; corollas oblong-ovate. ♄. H. Native of Carolina and Georgia, in open swamps. Andrómeda calyculàta, *β*, angustifòlia, Ait. hort. kew. 2. p. 70. Andrómeda angustifòlia, Pursh. fl. amer. septr. 1. p. 291. Andrómeda crícpa, Desf. and Link.

Narrow-leaved Cassandra. Fl. April, May. Clt. 1748. Shrub 1 to 2 feet.

Cult. For culture and propagation, see *Lyònia*, p. 813.

XXVI. ZENO'BIA (a queen of Palmyrensi). D. Don, in edin. phil. journ. july, 1834. Andrómeda species, Michx.

Lin. syst. *Decándria*, *Monogýnia*. Calyx 5-lobed. Corolla campanulate; limb revolute, 5-lobed. Stamens 10; filaments glabrous, dilated at the base; cells of anthers elongated, tubular, biaristate at the apex. Stigma truncate. Capsule with a loculicidal dehiscence. Placenta 5-lobed: lobes cuneated, thick, a little arched. Seeds angular, with a lateral oblong hylum.—Evergreen shrubs, natives of North America. Leaves scattered, dilated, with the margins usually toothed. Flowers racemose; pedicels solitary or aggregate.

1 Z. speciòsa (D. Don, l. c.) leaves oval, obtuse, mucronate, crenated, or serrated, veiny; floriferous branches naked, racemose. ♄. H. Native of North Carolina, in swamps. A very ornamental little shrub. Flowers large, white, drooping. Andrómeda speciòsa, Michx. fl. bor. amer. 256. Lodd. bot. cab. 551.

Var. α, nítida (Pursh. fl. amer. sept. 1. p. 294. under Andrómeda); leaves oblong—ovate, serrated, green on both surfaces. ♄. H. Andrómeda cassinæfòlia, Vent. malm. 79. Flowers white.

Var. β, pulverulénta (Pursh. fl. amer. sept. 1. p. 294. under Andrómeda); leaves roundish-ovate, remotely crenated, covered with white powder, as well as the branches. ♄. H. Andrómeda pulverulénta, Bartr. itin. 476. Curt. bot. mag. 667. Andrómeda cassinæfòlia, *β*, Vent. hort. cels. 60. Andrómeda speciòsa, var. *γ*, glaúca. Wats. dendr. brit. t. 26. Andrómeda dealbàta, Lindl. bot. reg. 1010. Andrómeda ovàta, Soland. mss. in herb. Bankes. Flowers white.

Showy Zenobia. Fl. June. Clt. 1800. Shrub 2 to 3 feet.

Cult. See *Lyònia*, p. 831. for culture and propagation.

XXXVII. LYO'NIA (in memory of John Lyon, an indefatigable collector of North American plants, who fell a victim to a dangerous epidemic amidst those savage and romantic mountains, which had so often been the theatre of his labours). Nutt. gen. amer. 1. p. 268. D. Don, in edinb. phil. journ. 17. p. 158.

Lin. syst. *Decándria*, *Monogýnia*. Calyx 5-parted. Corolla ovate or tubular, with a 5-toothed contracted mouth. Stamens inclosed; filaments flattened, dilated, very short, downy; cells of anthers membranous, dehiscing lengthwise, altogether mutic. Style robust, pentagonal, fusiform, thickened at bottom; stigma simple, truncate. Capsule pentagonal, 5-celled, with a loculicidal dehiscence; margins of valves closed by 5 other external narrow valves. Seeds acicular, imbricated.—Shrubs, natives of North America. Leaves usually membranous and downy. Flowers for the most part terminal, disposed in racemose panicles.

* *Leaves evergreen.*

1 L. ferrugínea (Nutt. gen. amer. p. 266.) shrubby; leaves on long petioles, coriaceous, obovate, usually obtuse, quite entire, with hardly revolute edges, covered with brown umbilicate furfuraceous scales, as well as every other part of the plant; pedicels axillary, collected into threes or fives; corollas small, ovate-globose. ♄. H. Native of Georgia, Florida, and Mexico, in pine woods. Andrómeda ferrugínea, Walt. fl. car. 138. Vent. malm. t. 80. Andrómeda, ferrugínea, *β*, fruticòsa, Michx. fl. amer. bor. 1. p. 252. Corollas white inside, and rusty outside.

Ferruginous Lyonia. Fl. June, July. Clt. 1784. Shrub 3 to 5 feet.

2 L. rígida (Nutt. gen. amer. 1. p. 266.) arborescent; leaves coriaceous, stiff, crowded, on short petioles, cuneate-lanceolate, acute, quite entire, convex, with revolute edges, clothed with brown, umbilicate furfuraceous scales, as well as every other part of the plant; pedicels aggregate, axillary; corollas globose. ♄. H. Native of Carolina and Florida, in barren sandy woods. Andrómeda ferrugínea, Willd. spec. 2. p. 609. Ait. hort. kew. 2. p. 67. Andrómeda ferrugínea, *α*, arboréscens, Michx. 1. p. 252. Andrómeda rígida, Pursh. fl. amer. sept. 1. p. 292. Lodd. bot. cab. 430. Corollas white inside. This species is very nearly allied to the preceding; but their habits, and particularly their flowering time, differ so materially, that they are actually distinct.

Stiff Lyonia. Fl. April, May. Cult. 1774. Tree 20 feet.

3 L. margina'ta (D. Don, in edinb. phil. journ. 17, p. 159.) quite glabrous; branchlets somewhat 3-sided; leaves coriaceous, oval, acuminated, quite entire, smooth, having the midrib running through the deflexed margin; pedicels axillary, aggregate; corollas cylindrical; calycine segments elongated, linear, coloured. ♄. H. Native of Carolina and Florida, in sandy forests. An-

drómeda marginàta, Duham. arb. Andrómeda coriàcea, Willd. spec. 2. p. 613. Ait. hort. kew. 2. p. 70. Sims, bot. mag. 1095. Andr. lùcida, Lam. encycl. 1. p. 157. Andr. Mariàna, Jacq. icon. rar. 3. t. 465. A handsome small shrub. Flowers pale red; the calyx long, of a dark red colour. Leaves marked with very fine punctures.

Var. β, *rùbra* (Lodd. bot. cab. 672.) flowers deep red.

Marginated-leaved Lyonia. Fl. June, July. Clt. 1765. Shrub 2 feet.

* * *Leaves deciduous.*

4 L. Maria'na (D. Don, in edinb. phil. journ. 17, p. 159.) leaves oval, acutish at both ends, quite entire, glabrous, rather coriaceous, paler beneath; floriferous branches almost leafless; pedicels aggregate; corolla ovate-cylindrical; calyx foliaceous; capsule conoid. ♄. H. Native from New England to Florida, in woods and dry swamps, particularly in sandy soil. Andrómeda Mariàna, Lin. spec. 564. Sims, bot. mag. 1579.—Pluk. mant. 448. A dwarf shrub. Flowers large, white, sometimes tinged with red. This plant has a number of very striking varieties.

Var. β, leaves narrow, lanceolate. ♄. H.

Maryland Lyonia. Fl. May, Aug. Clt. 1736. Shrub 2 feet.

5 L. racemòsa (D. Don, l. c.) leaves oval-lanceolate, acute, serrulated, membranous, glabrous; spikes terminal, secund, elongated, simple, or branched; bracteas linear, acute; corollas cylindrical; calyxes acute, bibracteate at the base. ♄. H. Native from Canada to Carolina, in bogs and swamps. Andrómeda racemòsa, Lin. spec. 564. Lher. stirp. 2. t. 13. Andr. paniculàta, Walt. carol. 138.—Gron. virg. 67. Flowers white. A middle-sized shrub, which may be reckoned one of the finest in North America, not only for the graceful appearance of its flowers, but also for the fine odour they have. The cells of the anthers are said to be biaristate at the apex; it is, therefore, probably, a species of *Zenòbia*. There are several varieties of the plant.

Racemose-flowered Lyonia. Fl. June, July. Clt. 1736. Shrub 3 to 4 feet.

6 L. arbòrea (D. Don, l. c.) branches terete; leaves oblong, acuminated, mucronately serrated, glabrous; panicles terminal, or many spikes; corollas ovoid-cylindrical, downy. ♄. H. Native from Pennsylvania to Florida, in the valleys of the Alleghany Mountains. Andrómeda arbòrea, Lin. spec. 565. Sims, bot. mag. 905.—Catesb. car. 1. t. 71. A beautiful tree, from 40 to 60 feet high. Flowers white. The leaves have a very pleasant acid taste, from which it has been called sorrel-tree. They are frequently made use of by hunters in those mountains, to alleviate thirst.

Tree Lyonia. Fl. June, July. Clt. 1752. Tree 40 to 60 feet.

7 L. paniculà'ta (Nutt. gen. amer. 1. p. 266.) downy; leaves obovate-lanceolate, subacuminated at both ends, and almost entire; floriferous branches terminal, panicled, nearly naked; clusters of flowers pedunculate; corollas nearly globose, downy. ♄. H. Native from Canada to Carolina; common in all swamps and woods. Andrómeda paniculàta, Lin. spec. 564. Lher. stirp. nov. 2. t. 12. Wats. dendr. brit. 37. Flowers small, white. There are a number of varieties of this species, differing in size, pubescence, shape of leaves, &c. Upper surfaces of the older leaves nearly smooth.

Panicled-flowered Lyonia. Fl. June, July. Clt. 1748. Shrub 3-4 feet.

8 L. frondòsa (Nutt. gen. amer. 1. p. 267.) every part of the plant is densely clothed with powdery villi; leaves oblong, or oblong-obovate, blunt, or acutish, clothed with furfuraceous villi, often rusty, prominently veined: with revolute, entire, scabrous margins; panicle terminal, frondose or leafy; corollas globose, hispid or downy. ♄. H. Native of the lower counties of Virginia and Carolina. Andrómeda frondòsa, Pursh. fl. amer. sept. 1. p. 295. Flowers white. Pursh says the anthers are awned; but Nuttall thinks this must be a mistake, or that his plant must be different from that of Pursh.

Frondose Lyonia. Fl. May, June. Clt. 1806. Shrub 3 feet.

9 L. multiflòra (Wats. dend. brit. t. 128.) leaves narrow-lanceolate, serrated, sprinkled with hair-like atoms; panicle terminal, composed of numerous fascicled racemes. ♄. H. Native of North America. Flowers numerous, small, white. Perhaps only a variety of *L. paniculàta*.

Many-flowered Lyonia. Fl. July. Clt.? Shrub 2 feet.

10 L. Jamaice'nsis (D. Don, in edinb. phil. journ. 17, p. 159.) branches smooth; leaves broad—lanceolate, quite entire, cinereous beneath from dot-like scales, but shining above; pedicels aggregate, on long leafless branches, scaly as well as the calyxes; corollas ovate. ♄. S. Native of Jamaica, on the tops of the mountains. Andrómeda Jamaicénsis, Swartz. fl. ind. occ. 2. p. 838. Flowers white.

Jamaica Lyonia. Shrub 6 feet.

11 L. fasciculà'ta; leaves ovate-lanceolate, bluntish, a little crenated, coriaceous; racemes shorter than the petioles; pedicels aggregate, reflexed. ♄. S. Native of the south of Jamaica, on the mountains. Andrómeda fasciculàta, Swartz, fl. ind. occ. 2. p. 836. Flowers white.

Fascicled-flowered Lyonia. Tree.

12 L. capreæfòlia (Wats. dendr. brit. 127.) leaves coriaceous, elliptic, short-acuminated, serrulated, sprinkled with short fleshy hairs; corollas rather silky, globular, coarctate; racemes and corymbs mixed, lateral, leafy. ♄. H. Native of North America. Flowers white. Perhaps only a variety of *L. paniculàta*.

Caprea-leaved Lyonia. Fl. July. Clt. 1812. Shrub 2 to 3 feet.

13 L.? rubiginòsa; leaves ovate, coriaceous, quite entire, obtuse, downy beneath, rusty when young; racemes lateral, erect; corollas cylindrical. ♄. S. Native of the West Indies, in the Island of St. Thomas. Andrómeda rubiginòsa, Pers. ench. 1. p. 481. Andr. pubéscens, Poir. Leaves shining above, resembling those of *Sàlix càprea*. Racemes very short, in fascicles.

Rusty Lyonia. Shrub.

14 L.? rhomboida'lis; shrubby; floriferous branches triquetrous; leaves somewhat rhomboid-oblong, cartilaginous, glabrous, rusty beneath, quite entire, callous at the apex; peduncles axillary, aggregate, elongated, filiform. ♄. H. Native of Florida and Carolina. Andrómeda rhomboidàlis, Duham. ed. nov. abr. 192.

Rhomboid-leaved Lyonia. Shrub.

Cult. The species thrive best in peat soil, or a sandy loam. Being very ornamental, they are desirable shrubs in every garden. They may either be increased by layers or by seeds. The seeds should be sown in pots or pans in sandy peat soil; they should be covered slightly with earth, as they are extremely small.

XXVIII. LEUCOTHO'E (a mythological name). D. Don, in edinb. phil. journ. 17, p. 159. *Andrómeda* species of authors.

Lin. syst. *Decándria, Monogýnia*. Calyx 5-leaved; leaves imbricated at the base. Corolla tubular, 5-toothed. Stamens inclosed; filaments dilated, flattened, downy; cells of anthers short, truncate, mutic. Stigma ample, capitate. Capsule with a loculicidal dehiscence.—Evergreen shrubs, natives of North

America. Leaves coriaceous, dentately spinulose. Flowers white, racemose, axillary, or terminal.

1 L. axilla'ris (D. Don, l. c.) leaves oblong or oval, acuminated, upper part cartilaginously and mucronately serrulated, covered by scattered glandular hairs on the under surface; young branches clothed with powdery down; racemes axillary, spicate, sessile, beset with scaly bracteas; corollas ovate-cylindrical; filaments ciliated, very short. ♄. H. Native from Virginia to Georgia, on the mountains. Andrómeda axillàris, Solander in hort. kew. 2. p. 89. Pursh. fl. amer. sept. 1. p. 292. Leaves glabrous. Flowers in short spikes, white. Capsule depressed, globose.

Var. β, longifòlia (Pursh. fl. amer. sept. 1. p. 293.) leaves linear-lanceolate, very long. ♄. H. Sims, bot. mag. 2357. Andrómeda Waltèri, Willd.

Axillary-flowered Leucothoe. Fl. May, June. Clt. 1765. Shrub 2 to 3 feet.

2 L. spinulòsa; leaves petiolate, ovate-oblong, rounded at the base, gradually narrowed to the apex, acuminated, somewhat spinulosely serrulated, glabrous, coriaceous; racemes subspicate, axillary, sessile, secund, rather loose, with scaly bracteas; corollas short, ovate-cylindrical. ♄. H. Native of Lower Carolina. Andrómeda spinulòsa, Pursh. fl. amer. sept. 1. p. 293. Andr. Catesbæ'i, Walt. fl. carol. p. 137. Willd. spec. 2. p. 613. Sims, bot. mag. t. 1955. Lodd. bot. cab. 1320. Flowers white. Resembles the preceding in several respects. The figure in Cat. car. is so very bad, that there can be no reference made to it.

Spinulose-leaved Leucothoe. Fl. May, June. Clt. 1793. Shrub 2 feet.

3 L. acumina'ta; quite glabrous; leaves ovate-lanceolate, gradually narrowed to the top, acuminated, quite entire or unequally serrated, glabrous, shining, reticulately veined, coriaceous; racemes axillary, very short, corymbose, nearly naked; flowers pedicellate, drooping; corollas cylindrically ovate. ♄. H. Native of Georgia and Florida, in sandy swamps. Andrómeda acuminàta, Ait. hort. kew. 2. p. 70. Pursh. fl. amer. sept. 1. p. 293. Smith, exot. bot. 89. And. lùcida, Jacq. icon. rar. 1. t. 79. And. populifòlia, Lam. encycl. 1. p. 195. A. reticulàta, Walt. fl. car. 137. Andr. formosíssima, Bartr. cat. Andr. laúrina, Michx. fl. amer. bor. 1. p. 253. Flowers white, in great abundance, which gives the shrub a fine appearance. The stems are hollow, and are used by the natives for making their pipe stems, from whence the name *Pipe-stem-wood*.

Acuminated-leaved Leucothoe. Fl. July, Aug. Clt. 1765. Shrub 2 to 3 feet.

4 L. floribu'nda (D. Don, l. c.) quite glabrous; leaves ovate, oblong, acute, finely serrulated, adpressedly ciliated, glabrous, coriaceous; racemes secund, axillary, and terminal, forming panicles; pedicels bibracteate. ♄. H. Native of Georgia, on the mountains. Andrómeda floribúnda, Lyon. herb. Ker. bot. reg. 807. Pursh. fl. amer. sept. 1. p. 293. Sims, bot. mag. 1566. Flowers pure white, in great abundance.

Bundle-flowered Leucothoe. Fl. May, June. Clt. 1812. Shrub 2 feet.

5 L. spica'ta; glabrous; leaves elliptic-lanceolate, acute, ovate or attenuated at the base, serrated; racemes long, lateral and terminal, secund; branchlets beset with short white hairs. ♄. H. Native from Canada to Florida. Andrómeda spicàta, Wats. dendr. brit. 36. Flowers white.

Spicate-flowered Leucothoe. Fl. June. Clt.? Shrub 2 feet.

Cult. For culture and propagation see *Lyònia*, p. 831. Elegant shrubs, worth cultivating in every shrubbery for the sake of the beauty of their blossoms.

XXIX. PIE'RIS (one of the Muses) D. Don, in edinb. phil. journ. 17, p. 159. Andrómeda species, Wall.

Lin. syst. *Pentándria Monogy'nia.* Calyx deeply 5-parted. Corolla tubular or ovate, with a contracted, 5-toothed, revolute border. Stamens inclosed; filaments dilated, bisetose at top; cells of anthers short, incumbent, dehiscing lengthwise. Style robust, pentagonal; stigma truncate. Capsule with a loculicidal dehiscence. Seeds scobiform.—Trees or shrubs, natives of Nipaul. Leaves coriaceous. Flowers drooping, terminal, racemose.

1 P. formòsa (D. Don, l. c.) leaves lanceolate, acuminated, crenulated, glabrous, acute at the base; racemes erectly spreading, disposed in a terminal thyrse; pedicels recurved, drooping, and are, as well as the calyxes, pruinose; calycine segments ovate-oblong, marginated, shining; corollas ovate. ♄. F. Native of Nipaul, where it is called *Sheabogee* and *Chemata*.—An evergreen tree, with the habit of *A'rbutus* or *Clèthra*. Pedicels unilateral. Flowers rose-coloured, each furnished with a small bractea at the base. Andrómeda formòsa, Wall. in asiat. res. 13. p. 395. D. Don, prod. fl. nep. 149.

Beautiful Pieris. Tree.

2 P. lanceola'ta (D. Don, l. c.) leaves elliptic, bluntly acuminated, quite entire, acute at the base; racemes terminal, glabrous, straight; pedicels scaly, pubescent, calycine segments roundish, ciliated; corollas ovate, downy; style inclosed. ♄. F. Native of Nipaul. Andrómeda lanceolàta, Wall. in asiat. res. 13. p. 390. with a figure. Andr. squamulòsa, D. Don, prod. fl. nep. p. 149. A small much-branched tree. Leaves 3-4 inches long. Corollas purplish. Scales of pedicels ciliated.

Lanceolate-leaved Pieris. Tree small.

3 ovalifòlia (D. Don, l. c.) leaves oval, acuminated, quite entire, rounded at the base; racemes lateral, leafy, many-flowered; pedicels secund, downy; calycine segments ovate, acute; corollas oblong, downy. ♄. F. Native of Nipaul, at Suembu, and in Sirinagur. Andrómeda ovalifòlia, Wall. in asiat. res. 13. p. 391. with a table. Andr. caprícida, Hamilt. mss. Branches downy. Leaves downy when young, 2-4 inches long, and 1-2 broad. Racemes numerous, elongated. Pedicels unilateral. Corolla pale flesh-coloured. The tree is poisonous to goats.

Oval-leaved Pieris. Fl. May. Clt. 1825. Tree 20 to 40 feet.

4 P. Japónica (D. Don, mss.) glabrous; leaves lanceolate, crenulated, attenuated at the base, entire; racemes terminal, panicled. ♄. F. Native of Japan. Andrómeda Japónica, Thunb. fl. jap. p. 181, t. 22. Leaves 1½ to 2 inches long. Flowers red.

Japan Pieris. Shrub.

Cult. Sandy peat and a little loam is the best soil for the species of *Pièris;* and they may be increased by cuttings not too young, planted in sand, with a bell-glass over them.

XXX. PHYLLO'DOCE. (a mythological name). Salisb. par. 36. D. Don, in edinb. phil. journ. July, 1834. Andrómeda species, Lin. Menzièsia species, Swartz and Smith.—Erìca species, Willd.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted. Corolla globose, with a contracted 5-toothed mouth. Stamens 10, inclosed; filaments slender, glabrous; cells of anthers short, truncate, mutic. Stigma peltate, 5-tuberculate. Capsule 5-celled, with a septicidal dehiscence. Seeds compressed, shining.—Small evergreen shrubs, natives of the north of Europe, Asia, and North America. Leaves linear, obtuse, spreading. Flowers terminal, solitary, or many together, in a kind of umbel.

1 P. taxifòlia (Salisb. par. t. 36.) leaves with denticulated margins; peduncles aggregate, glandular; calycine segments lanceolate, acuminated; anthers 3 times shorter than the filaments. ♄. H. Native of Europe; and the north of Asia, at the fountains of Uda. In Scotland, in dry heathy moors, rare; near Aviemore, in Strathspey, ex Mr. R. Brown, of Perth; in the Western Isles of Shiant, G. Don. In North America, on the White Hills of New Hampshire; and on the north-west coast, and of Labrador. Menzièsia cœrùlea, Swartz, in Lin. trans. 10. p. 377. t. 30. f. a. Smith, engl. bot. 2469. Lodd. bot. cab. 164. Andrómeda cœrùlea, Lin. spec. p. 563. fr. lapp. 165. t. 1. f. 5. Œd. fl. dan. 57. Andr. taxifòlia, Pall. fl. ross. p. 54. t. 72. f. 2. fl. lapp. ed. 2. p. 133. t. 1. f. 5. fl. dan. t. 57. Erìca cœrùlea, Willd. spec. 2. p. 393.—Gmel. sib. 4. p. 131. t. 57. f. 2. Flowers blue or purple, but Pursh says they are red in the American plant.

Yew-leaved Phyllodoce. Fl. June, July. Scotland. Shrub ½ foot.

FIG. 137.

2 P. Pallasia'na (D. Don, in edind. phil. journ. 17, p. 159.) leaves with denticulated margins; peduncles aggregate, tomentose; calycine segments ovate-lanceolate, acute, membranous; corollas oblong; anthers one-half shorter than the filaments. ♄. H. Native of Curil Island and the Island of Sitcha. Andrómeda cœrùlea β, viridiflòra, herb. Pall. Menzièsia Aleûtica, Spreng. syst. 2. p. 202. Cham. in Linnæa. 1. p. 515. Bongard, in mem. acad. petersb. 2. p. 154. t. 3. Peduncles clothed with rusty, adpressed, silky hairs. Flowers greenish.

Pallas's Phyllodoce. Shrub ½ foot.

3 P. empetrifórmis (D. Don, l. c.) leaves with denticulated margins; peduncles aggregate, sparingly glandular; calycine segments ovate, obtuse; anthers length of filaments. ♄. H. Native of North America. Menzièsia empetrifórmis, Smith, in Lin. trans. 10. p. 280. Hook. bot. mag. 3176. Flowers pale red.

Empetrum-formed Phyllodoce. Fl. June, July. Clt. 1810. Shrub ½ foot.

Cult. *Phyllódoce* is a genus of elegant, small, heath-like shrubs; they will only thrive in peat soil, and are increased by layers.

XXXI. BRYA'NTHUS (from βρυον, *bryon*, a moss, and ανθος, *anthos*, a flower). Gmel. sib. 4. p. 133. t. 57. f. 3. D. Don, in edinb. phil. journ. 17, p. 160.—Andrómeda species, Lin. Menzièsia, Swartz, Pursh.—Erìca species, Thunb.

Lin. syst. *Decándria*, *Monogýnia*. Calyx 5-leaved, imbricate. Corolla deeply 5-parted, spreading. Stamens 10, shorter than the corolla; filaments flattened, glabrous; cells of anthers short, mutic, or awned behind, dehiscing by a terminal hole. Stigma obtuse. Capsule 5-celled, with a septicidal dehiscence, many-seeded. Seeds ovoid, shining, with a keeled raphe.—Small trailing shrubs, natives of Asia and North America. Leaves crowded, spreading, flattish. Flowers terminal, solitary, or somewhat racemose.

1 B. Gmelìni (D. Don, in edinb. phil. journ. 17. p. 160.) branchlets pruinose; leaves with denticulated margins; peduncles glandular, many-flowered; anthers mutic; style filiform. ♄. H. Native of Kamtschatka, about Port Ochotsk, and of Behring's Island. The plant grows in thick masses, like *Wild Thyme*. Menzièsia bryántha, Swartz, in Lin. trans. 10. p. 378. t. 30. f. b. Andrómeda bryántha, Lin. mant. 238. Pall. fl. ross. p. 57. t. 74. f. 1. Erìca bryántha, Thunb. diss. no. 8. Willd. spec. 2. p. 386. Bryánthus rèpens, serpyllifòlio, flore roseo, Gmel. sib. 4. p. 133. t. 57. f. 3. Flowers red.

Gmelin's Bryanthus. Pl. trailing.

2 B. Stelle'ri (D. Don, l. c.) branchlets glabrous; leaves with obsolete crenulated edges; flowers solitary, nearly sessile; anthers biaristate behind; style conical. ♄. H. Native of the west coast of North America; on the Rocky Mountains, and near the mouth of the Columbia river; and of the Island of Sitcha. Andrómeda Stelleriàna, Pall. fl. ross. p. 58. t. 74. f. 2. Menzièsia empetrifórmis, Pursh, fl. amer. sept. 1. p. 265. but not of others. Flowers pale red.

Steller's Bryanthus. Shrub trailing.

Cult. For culture and propagation see *Phyllódoce*, p. 832.

XXXII. DABŒ'CIA (Called St. Dabeoc's Heath, in Ireland). D. Don, in edinb. phil. journ. 17. p. 160.—Andrómeda species, Lin.—Menzièsia species, Juss.—Erìca species, Lin.

Lin. syst. *Octándria*, *Monogýnia*. Calyx 4-parted. Corolla oval, ventricose; limb 4-toothed. Stamens 8, inclosed; filaments dilated, glabrous; anthers linear, sagittate at the base; cells of anthers parallel, loosened at the apex, dehiscing lengthwise. Stigma simple, truncate. Capsule 4-celled, with a septicidal dehiscence.—A dwarf, bushy, evergreen shrub, native of Ireland and the Pyrenees. Leaves elliptic, flat, clothed with white tomentum beneath. Flowers terminal, racemose, purple.

1 D. polifòlia (D. Don, l. c.). ♄. H. Native of the Pyrenees, and of the west of Ireland, in boggy soil; on Craigh Patrick, in the County of Mayo; very abundant in the district of Cunnemara, in the County of Galway. Andrómeda Dabœ'cia, Lin. syst. 406. Erìca Dabœ'cia, Lin. spec. 509. Smith, engl. bot. 35. Menzièsia Dabœ'cia, D. C. fl. gall. 674. Erìca Hybérnica, &c. Rai, hist. 3. suppl. 244. Menzièsia polifòlia, Juss. ann. mus. 1. p. 55. Vaccínium Cantábricum, Huds. ed. 1. p. 143. Petiv. gaz. 27. f. 4. Racemes secund. The shrub is called *Irish Whorts*, *Cantabrian Heath*, or *St. Dabeoc's Heath*.

Polium-leaved St. Dabeoc's Heath. Fl. June, Sept. Ireland. Shrub 1 to 2 feet.

Cult. This shrub is well fitted for decorating the front of shrubberies, or to be grown on rock-work or banks. It has much the habit of a species of Heath, and is very pretty when in blossom. As the shrub grows in large dense tufts, it may be increased by division; it is also easily increased by layers or cuttings.

XXXIII. ENKIA'NTHUS (from ἔγκυος, *enkuos*, pregnant, and ανθος, *anthos*, a flower; flowers swollen). Lour. cochin. 276. Meladòra, Sal. in hort. trans. 2. p. 156.

Lin. syst. *Decándria*, *Monogýnia*. Calyx 5 cleft, furnished with coloured bracteas. Corolla campanulate; with a 5-cleft limb, and with 5 pits at the base of the tube. Stamens 10, inserted in the base of the corolla; filaments toothed, pilose at base; cells of anthers awned, opening by a pore at the apex. Style filiform. Berry 5-celled, many-seeded.—Elegant shrubs. Leaves broad, opposite, oblong-elliptic-acuminated, glabrous, green and shining on the upper surface, pale beneath, and frequently red. Bud scales red. Flowers large, terminal, drooping, shewy. The species are held in high veneration by the Chinese.

1 E. quinqueflòrus (Lour. coch. p. 276.) stem shrubby; flowers 5-6 together at the tops the branches. ♄. G. Native of the south of China. Andr. rep. 102. Ker. bot. reg. 201. Sims, bot. mag. 1649. Lodd. bot. cab. 1101. E. reticulàtus, Lindl. bot. reg. 883. Flowers pink, or the calyx is red and the corolla nearly white.

Five-flowered Enkianthus. Fl. Feb. Sept. Clt. 1812. Shrub 3 to 10 feet.

FIG. 138.

2 E. biflòrus (Lour. coch. p. 276.) stem shrubby; flowers twin, terminal. ♄. G. Native of the south of China. Flowers red.

Two-flowered Enkianthus. Shrub.

Cult. Elegant green-house plants while in blossom, but rather difficult of culture. The best soil for them is said to be an equal mixture of sandy loam and peat, but care must be taken not to over-water them when not growing freely. Cuttings taken from ripened wood are found to strike root freely, if planted in sand, with a hand-glass placed over them. When they grow to a considerable size, they are the greatest ornaments for a green-house or conservatory.

XXXIV. A'RBUTUS (*Ar boise*, Celt., austere bush; rough fruit). Camer. epit. p. 168. Gærtn. fruct. 59. Tourn. inst. 368. Juss. gen. 160. H. B. et Kunth, nov. gen. amer. 3. p. 279. Adans. fam.—Andráchne, Clus.—A'rbutus species, Lin. gen. no. 750. Schred. gen. 750.

Lin. syst. *Decándria*, *Monogýnia*. Calyx 5-parted. Corolla globose, or ovately campanulate: limb 5-cleft, reflexed. Stamens 10, inclosed; anthers compressed on the sides, dehiscing by 2 pores at the apex, fixed by the back beneath the apex, where they are furnished with 2 reflexed awns. Ovarium seated on a hypogynous disk, or half immersed in it, 5-celled; cells many-seeded. Style 1; stigma obtuse. Berry nearly globose, granular.—Trees and shrubs, with alternate laurel-like leaves. Racemes terminal, panicled. Flowers pedicellate, bracteate. Corollas white or flesh-coloured.

1 A. U'nedo (Lin. spec. 366.) arboreous; branchlets clothed with glandular hairs; leaves oblong-lanceolate, glabrous, serrulated; peduncles smooth, nodding. ♄. H. Native of the south of Europe, as of Spain, Italy, Greece; Palestine, and many other parts of Asia. It is also found in the west of Ireland, in the County of Kerry, near the Lake of Killarney, on barren limestone rocks, where the country people eat the fruit. Mill. fig. t. 48. Cam. epit. 1681. Barrel. icon. t. 674. Smith, engl. bot. 2377. The common *A'rbutus*, or Strawberry-tree, rises to the height of 20 or 30 feet, but rarely with an upright stem. It is one of the greatest ornaments in the month of October and November, that being the season when it is in flower; and the fruit of the former year is ripe. When there is plenty both of fruit and flowers upon the trees, they make a handsome appearance at a season when most others are past their beauty. The fruit is said to have constituted part of the food of mankind in early ages. That it was not in any esteem among the ancients, we may suppose from the name *U'nedo*, if Pliny's reason for that name be the true one,—"cui nomen ex argumento fit unum tantum edendi." Virgil recommends the twigs as good for goats in winter:—"Jubeo frondentia capris Arbuta sufficere;" and for baskets,—"Arbuteæ crates et mystica vannus Iacchi." Horace celebrates the shade of it:—"Nunc viridi membra sub Arbuto stratus." The tree is named, in Greek, Κομαρος, and the fruit M. μιμαικυλον; in Latin, *A'rbutus*, and the fruit *U'nedo*; in Italian, *Arbuto*, *Albato*, *Albatro*, *Corbezzolo*; in French, *L'Arbousier commun*. The Greek name is almost preserved at Constantinople, in *Komaria*.

Var. α, *álba* (Ait. hort. kew. 2. p. 71.) flowers white.
Var. β, *rùbra* (Ait. hort. kew. 2. p. 71.) flowers reddish.
Var. γ, *plèna* (Ait. l. c.) flowers semi-double.
Var. δ, *schizopetàla*; petals cut.
Var. ε, *integrifòlia*; leaves entire. Sims, bot. mag. 2319.
Var. ξ, *crìspa*; leaves curled and cut.
Var. η, *salicifòlia*; leaves narrow.

Unedo or Common Strawberry-tree. Fl. Sept. Dec. Ireland. Tree 10 to 20 feet.

2 A. Canarie'nsis (Lam. dict. vol. 1.) leaves oblong-lanceolate, serrated, glaucous beneath; panicles erect, clothed with hispid hairs. ♄. G. Native of the Canary Islands. Sims, bot. mag. 1577. Flowers greenish white.

Canary-Island Strawberry-tree. Fl. May, June. Clt. 1796. Shrub 8 to 10 feet.

3 A. hy'brida (Ker. bot. reg. 619.) leaves oblong, acute, serrated, glabrous; branchlets pilose; panicle terminal, pendulous, downy; calyx glabrous. ♄. H. Native country unknown. A. andrachnoìdes, Link. enum. 1. p. 395. Flowers white.

Hybrid Strawberry-tree. Fl. Feb. May. Clt.? Shrub 8 to 12 feet.

4 A. serratifòlia (Nois. ex Lodd. bot. cab. t. 580.) leaves serrated, narrower than those of *A. Andráchne*; flowers disposed in terminal clusters. ♄. H. Native country unknown. Flowers yellowish. Perhaps only a variety of the following.

Serrated-leaved Strawberry-tree. Fl. Feb. March. Shrub 6 to 10 feet.

5 A. Andra'chne (Lin. spec. 566.) leaves oblong, bluntish, quite entire, and a little serrated, glabrous; panicles terminal, erect, clothed with viscid down. ♄. H. Native of Greece, Asia Minor, Tauria. Belon says it is common in Crete, and between Aleppo and Antioch. Wheeler observed it near Athens, and saw the fruit in the market of Smyrna. About Magnesia it is so plentiful, that it is used as the principal fuel by the inhabitants. Ehret. act. angl. vol. 57. p. 114. t. 6. Ker. bot. reg. 113. Sims, bot. mag. t. 2024. A. integrifòlia, Lam. Andráchne Theophrásti, Clus. hist. 1. p. 48. Andráchne, Park. theatr. 1490. f. 2. Flowers greenish-white. Fruit like that of the common sort. This is the Ἀδράχνη of Theophrastus, and is called Ἀδράκλα in modern Greek. It is a fine ornamental tree; the largest of the kind in Britain is growing in the botanic garden at Edinburgh. Tournefort enumerates three varieties of it which he observed in the Levant; one with serrated leaves; a second with a large oblong fruit; and a third with large compressed fruit.

Andrachne Strawberry-tree. Fl. March, April. Clt. 1724. Tree 10 to 14 feet.

6 A. laurifòlia (Lin. syst. 407. suppl. 238.) leaves oblong, acuminated at both ends, acutely serrated, glabrous; racemes axillary, secund, sessile, solitary. ♄. H. Native of North America, but what part is unknown, as nothing can be found respecting it in the Linnæan herbarium.

Laurel-leaved Strawberry-tree. Tree.

7 A. Menzie'sii (Pursh. fl. amer. sept. 1. p. 282.) arborescent; leaves broad-oval, quite entire, glabrous, on long petioles; racemes axillary and terminal, panicled, dense-flowered. ♄. H. Native of the north-west coast of America, where it was collected by Mr. Menzies. Hook. et Arn. in Beech. voy. pt. bot. p. 143.

Menzies's Strawberry-tree. Tree.

8 A. tomentòsa (Pursh. fl. amer. sept. 1. p. 282.) shrubby; branches hispid; leaves oval, acute, subcordate at the base, clothed with white tomentum beneath, on short petioles; peduncles axillary, shorter than the leaves, somewhat capitately racemose; flowers campanulately urceolate, bracteate. ♄. H. Native of the north-west coast of America, where it was collected by Mr. Menzies. Hook. bot. mag. t. 3320. Hook. fl. amer. text. bot. 129. f. 1. Flowers pure white. The whole herb, except the flowers, is downy, while young. Petioles and mid-rib of leaves hispid.

Var. β, nùda (Hook. et Arn. in Beech. voy. pt. bot. 144. Hook. fl. amer. bot. 129 fl.) shrub quite destitute of long stiff hairs.

Tomentose Strawberry-tree. Fl. Dec. Clt. 1826. Shrub.

9 A. Xalape'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 279.) leaves oblong, acute, quite entire, glabrous above, but clothed with fuscescent tomentum beneath; panicle terminal, composed of many racemes. ♄. G. Native of Mexico, in mountain woods near Xalapa, and at Malpays de Joya. Epidermis separating, brownish purple. Young branches glabrous, but beset with ramentæ. Leaves obtuse at the base, 2 inches long, petiolate. Corollas ovate, white. Filaments villous, dilated at the base.

Xalapa Strawberry-tree. Tree.

10 A. móllis (H. B. et Kunth, nov. gen. amer. 3. p. 280.) leaves oblong, acute, sharply toothed, coriaceous, clothed with soft pubescence above, and canescent tomentum beneath; panicle terminal, crowded, composed of racemes. ♄. F. Native of Mexico, near Guanaxuato. Branchlets purplish brown, angular, downy. Leaves petiolate. Flowers drooping? like those of the preceding.

Soft Strawberry-tree. Tree.

11 A. densiflòra (H. B. et Kunth, nov. gen. amer. 3. p. 280. t. 260.) leaves on long petioles, oblong, acute, sharply toothed, coriaceous, glabrous above and shining, but clothed with fuscescent down beneath, and the middle nerve with rusty villi; panicle terminal, composed of approximate racemes; flowers crowded. ♄. F. Native of Mexico, on the eastern declivities of the mountains between La Pileta and Xalapa. Branches angular, pilose. Petioles pilose. Leaves 4-5 inches long. Pedicels furnished with 3 bracteas at the base. Corollas oval, white. Filaments dilated and pilose at the base.

Dense-flowered Strawberry-tree. Clt. 1826. Tree 20 feet.?

12 A. petiola'ris (H. B. et Kunth, l. c. p. 281.) arboreous; leaves on long petioles, oblong, acutish, mucronate, with denticulated margins, membranous, glabrous above, but clothed with canescent tomentose pubescence beneath; racemes short, crowded, forming a terminal panicle. ♄. F. Native of Mexico, on the western declivities of mountains between Cuernavaca and Guchilaque. Epidermis separating. Branchlets hairy. Leaves rounded at the base, 3 or $3\frac{1}{2}$ inches long. Petioles hairy, red. Ramenta numerous at the base of the branches. Pedicels villous, canescent. Corollas ovate-globose, white. Filaments villous, dilated at the base.

Petiolate-leaved Strawberry-tree. Tree tall.

13 A. ferrugínea (Lin. syst. 408. suppl. 238.) arborescent; leaves oblong, obtuse, smooth, quite entire; racemes terminal. ♄. G. Native of New Granada. Branches angular, smooth. Leaves petiolate. Racemes axillary, and terminating the branches, solitary. Pedicels bibracteate. Flowers remote, nodding. Corollas longer than in the other sorts, almost like those of *Andrómeda*.

Rusty Strawberry-tree. Tree.

14 A. phyllyreæfòlia (Pers. ench. 1. p. 483.) stem much branched; leaves lanceolate, acuminated, acutely serrated; flowers axillary. ♄. G. Native of Peru. Leaves small. Perhaps a species of *Pernéttya*.

Phyllyrea-leaved Strawberry-tree. Shrub.

15 A. fu'rens (Hook. et Arn. in Beech voy. pt. bot. p. 33.) stem nearly simple, downy; leaves oval, on short petioles, denticulated, coriaceous, with revolute edges, shining above, and glandular on both surfaces, the glands terminating in hairs; racemes short, axillary; rachis and pedicels downy and scaly; calyx glabrous; corolla glabrous outside, and hairy inside. ♄. F. Native of Chili, about Conception. Qued-Qued, Feuille, 3. p. 56. t. 43. A low-growing shrub. The fruit is described by Feuille to be a reddish brown berry, which is dangerous when eaten, causing delirium; whence the Indian name, which signifies madness.

Raging Strawberry-tree. Shrub low.

16 A. puncta'ta (Hook. et Arn. in Beech. voy. pt. bot. p. 33.) much branched; branchlets downy; leaves nearly sessile, ovate-lanceolate, denticulated, coriaceous, with revolute margins, besprinkled with piliferous glands; racemes axillary, downy, scaly; calyx glabrous; corolla glabrous outside, but pilose inside. ♄. F. Native of Chili, about Conception. Apparently a large shrub, and probably the A. phyllyreæfólia, Pers.

Dotted-leaved Strawberry-tree. Shrub.

Cult. The hardy species of this genus being all ornamental trees or shrubs, are proper for conspicuous places in shrubberies, or to stand singly on lawns. *A. Andráchne* must be protected by a mat in severe weather in winter. They are to be increased by seeds, or by budding or inarching on the commoner kinds. The green-house kinds require the treatment of common green-house plants.

XXXV. ARCTOSTA'PHYLOS (from *αρκτος, arctos*, a bear, *σταφυλη, staphyle*, a grape). Gal. Adans. fam. H. B. et Kunth, nov. gen. amer. 3. p. 277. Spreng. syst. 2. p. 287.—U'va-úrsi, Dod. Tourn.—A'rbutus species, Lin.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted (f. 139. *a.*) Corolla globose (f. 139. *b.*) or ovate-campanulate; limb 5-cleft, reflexed. Stamens 10, inclosed; filaments dilated at the base, and pilose; anthers compressed at the sides, dehiscing by 2 pores at the apex (f. 139. *b.*), fixed by the back beneath the middle, where they are furnished with 2 reflexed awns. Ovarium seated on the hypogynous disk, or half immersed in it, usually 5-celled (f. 139. *g.*), rarely 6-9-celled; cells 1-seeded. Style 1; stigma obtuse. Drupe nearly globose.—Shrubs or subshrubs. Leaves alternate. Racemes terminal. Flowers pedicellate, bracteate. Corollas white or flesh-coloured. Drupes red or black.

1 A. u'va-u'rsi (Spreng. syst. 2. p. 287.) stems procumbent; leaves permanent, obovate, quite entire, coriaceous, shining; flowers fasciculate; drupe 5-celled. ♄. H. Native of North America, in the pine barrens of New Jersey, and in mountainous and rocky situations of Canada and New England; and the Island of Unalascha. It is abundant on the continent of Europe, as in Sweden, Denmark, and most parts of the north; also in Switzerland, Germany, Carniola, Dauphiny, Savoy, Siberia, &c. With us it is common upon dry, heathy, mountainous and rocky places throughout the Highlands and Western Isles of Scotland; also in the north of England and Wales. A'rbutus ùva-úrsi, Lin. spec. 566. fl. lapp. no. 162. t. 6. f. 3. Woodv. med. bot. 194. t. 70. Fl. dan. t. 33. Blackw. t. 592. Smith, engl. bot. 714. Arbutus buxifolia, Stokes, bot. 509. U'va-úrsi buxifolia Sal in Gray arr. 2. p. 400.—Schmidt. arb. t. 138. Plench. icon. 340. It is called in English *Bear berries* and *Bear-whortle berries*, from the German, *Barentraube* or *Barenbeere*; in Dutch, *Beerendruif*; in French, *La Busserole*; in Italian, *Uva d'orzo*; in Spanish, *Uba de oso*; in

Portuguese, *Uva de urso;* and by most old botanists, *Uva-ursi.* Leaves like those of box. Flowers pale red, or white with a red mouth, growing in small clusters at the extremities of the branches. The leaves have been much celebrated in calculous and nephritic complaints, and other disorders of the urinary passages; the dose is half a drachm of the powder of the leaves every morning, or 2 or 3 times a day. The trials, however, made in this country by no means answered expectation. Perhaps, upon the whole, it will be found no better than other vegetable astringents; some of which have long been used by the country people in gravelly complaints, and with very great advantage. On the plains of the Mississippi, the Indians smoke the leaves under the name of *Sacacommis*, and consider them of great medicinal virtue. But whatever may be its medicinal qualities, the whole plant is certainly very serviceable in dying an ash-colour, but particularly in tanning leather. In this view, it may deserve attention in those countries where whole mountains are covered with it. The berries are red when ripe, filled with an austere mealy pulp; they serve as food for grouse and other game.

Bear-berries. Fl. May, June. Britain. Shrub trailing.

2 A. alpìna (Spreng. syst. 2. p. 287.) stems procumbent; leaves obovate, acute, wrinkled, serrated, deciduous; racemes terminal. ♄. H. Native of Denmark, Switzerland, Dauphiny, Savoy, Siberia, &c. In many places of the Highlands of Scotland, in dry barren moors. Nothing is more common, says Linnæus, in all the Lapland alps, in Dalekarlia, from their tops to their bases, round the White Sea, especially in very sandy places. It is also found in Canada, and the more northern parts of America, Aleutian Islands, &c. A′rbutus alpìna, Lin. spec. 566. Oed. fl. dan. 73. Smith, engl. bot. 2030. Lightf. fl. scot. 215. t. 11. f. a. b. Pedicels rather hairy. The flowers grow in reflexed racemes, and are pure white. The berries are black when ripe, and of the size of a sloe, with a taste somewhat resembling that of black currants, but more mawkish, insomuch that Linnæus says the Laplanders will scarcely eat them. Haller, on the contrary, thinks the flavour not unpleasant. Mr. Miller describes them as of a pleasant taste, so as frequently to be eaten by the inhabitants of those countries where the plant grows wild.

Alpine Bear-berry. Fl. April, June. Scotland. Shb. trailing.

3 A. polifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 277. t. 25.) erect; leaves linear-lanceolate, acute, with quite entire and revolute margins, coriaceous, glabrous above, but downy and glaucescent beneath. ♄. F. Native of the temperate parts of Mexico, near Villalpando. Andrómeda ledifòlia, Humb. prol. p. 41. A much branched shrub. Racemes terminal, erect, an inch long, downy. Flowers nodding. Corolla scarlet (f. 139.)

FIG. 139.

Polium-leaved Bear-berry. Shrub 4 to 6 feet.

4 A. glauce′scens (H. B. et Kunth, l. c. p. 278.) erect; leaves lanceolate-oblong, obtuse, submucronate, quite entire, coriaceous, glabrous and shining above, but downy and glaucescent beneath; racemes terminal, solitary, erect; flowers secund. ♄. F. Native of Mexico, between Guanaxuato and Valenciana. Racemes 3 inches long, beset with glandular villi. Corollas scarlet.?

Glaucescent Bear-berry. Shrub.

5 A. pu′ngens (H. B. et Kunth, l. c. p. 278. t. 259.) leaves ovate-oblong, acute, mucronate, rather pungent, quite entire, coriaceous, clothed with fine down on both surfaces; racemes short, at first terminal, but at length lateral. ♄. F. Native of Mexico, in high places near Moran and Villalpando. A dwarf, much branched shrub. Branchlets angular, downy. Pedicels approximate, fastigiate. Corollas white.

Pungent-leaved Bear-berry. Shrub 1 foot.

6 A.? Hooke′ri; branches prostrate, rather downy; leaves petiolate, permanent, oval or obovate, coriaceous, shining, minutely reticulated, mucronately pungent, smoothish, finely margined, almost quite entire; racemes terminal, short; flowers bracteate. ♄. F. Native of Chili. A′rbutus púngens, Hook. et Arn. in Beech. voy. pt. bot. 144. Habit of *A. ùva úrsi*, and with the leaves of the same size. Flowers small, urceolate; young leaves white from down beneath, more or less serrated.

Hooker's Bear-berry. Shrub prostrate.

Cult. The hardy species of this genus grow well in a mixture of sand, loam, and peat, or in a peat border. They are increased by layers, put down in the spring. The green-house kinds require the treatment of other hardy green-house shrubs.

XXXVI. PERNE′TTYA (named after M. Pernetty, author of a history of his voyage to the Falkland Islands). Gaud. in Freyc. voy. p. 454. t. 67.

Lin. syst. *Decándria, Monogýnia.* Calyx inferior, 5-parted. Corolla globose: limb 5-parted, revolute. Stamens 10, almost hypogynous, inclosed; filaments thickened at the base; cells of anthers bifid, and dehiscing at the apex. Ovarium free, depressed, globose, 5-celled; cells many-seeded. Hypogynous scales or glands 10, 3-lobed, forming a ring round the ovarium, and alternating with the stamens. Style terminal, short. Stigma convex, obsoletely 5-lobed. Berry propped by the rather fleshy calyx. Seeds minute, oblong-ovate.—Small, much branched shrubs, with small alternate approximate leaves; axillary, solitary, pedunculate, drooping white flowers, and bracteate peduncles. This genus agrees with Epacrídeæ in the presence of hypogynous scales.

1 P. empetrifo′lia (Gaud. l. c. t. 67.) much branched, diffuse; leaves alternate, distich, oblong, quite entire; flowers lateral, solitary, drooping. ♄. F. Native of the Falkland Islands. A′rbutus empetrifòlia, Lin. suppl. p. 239. Pers. syn. 1. p. 483. A. pùmila? Willd. spec. 3. p. 619. Pers. ench. 1. p. 483. Andrómeda empetrifòlia, Lam. dict. 1. p. 155. Bruyère à feuilles poinstues, Pernetty, voy. 2. p. 64. Flowers white. Leaves like those of *E′mpetrum.*

Crow-berry-leaved Pernettya. Shrub 2 to 3 feet.

2 P. mucrona′ta (Gaud. in ann. sc. 5. p. 102.) leaves ovate, cuspidate, denticulately serrulate, stiff, shining on both surfaces; pedicels axillary, bracteate, about equal in length to the leaves. ♄. H. Native of Terra del Fuego, Cape Horn, and Straits of Magellan. Lindl. bot. reg. 1675. A′rbutus mucronàta, Lin. fil. suppl. p. 239. Forst. in comm. goet. 9. p. 31. Graham in bot. mag. t. 3093. Lam. ill. t. 366. f. a. Lodd. bot. cab. 1848. Flowers white, drooping.

Mucronate-leaved Pernettya. Fl. May. Clt. 828. Shrub 2 to 3 feet.

3 P. microphy′lla (Gaud. l. c.) leaves ovate, acute, serrated; pedicels short, axillary. ♄. H. Native of the Straits of Magellan. A′rbutus microphýlla, Forst. in comm. gœt. 9. p. 32. Willd. spec. 2. p. 619. A′rbutus serpyllifòlia, Lam. Flowers white, drooping.

Small-leaved Pernettya. Shrub 2 to 3 feet.

4 P. myrsinìtis; leaves ovate-lanceolate, serrated, scat-

tered; pedicels solitary, axillary, very short. ♄. H. Native of the Straits of Magellan, in woods on the mountains. Andrómeda myrsinìtis, Lam. ill. gen. t. 365. f. 2. Leaves small.

Myrtle-like Pernettya. Shrub 2 to 3 feet.

5 P. Cavanillesia'na; leaves ovate, acute, glabrous, obtusely serrated; pedicels axillary, solitary, furnished with two scales at the base; stems trailing. ♄. F. Native of South America. Andrómeda prostràta, Cav. icon. 6. p. 43. t. 562. f. 2. Leaves green above, and rusty and veiny beneath, on very short petioles.

Cavanilles's Pernettya. Shrub prostrate.

6 P. pilòsa; stem pilose, procumbent; leaves ovate-elliptic, ciliately-serrulated, coriaceous, mutic at the apex and callous; pedicels axillary, 1-flowered, elongated, nutant; corolla ovate, with blunt revolute teeth. ♄. H. Native of Mexico. A'rbutus pilòsa, Graham, in bot. mag. 3177. Corolla white.

Pilose Pernettya. Fl. May. Clt. May, June. Shrub prostrate.

7 P. purpu'rea (D. Don, mss. in herb. Lamb.) branchlets setose; leaves lanceolate, acute, denticulated, glabrous, veiny beneath; pedicels scabrous, glandular; corollas ovate. ♄. F. Native of Peru. Flowers purple. ?

Purple-flowered Pernettya. Shrub.

8 P. cilia'ris (D. Don, l. c.) branchlets setose; leaves ovate-lanceolate, acute, having the margins denticulated, and ciliated with bristles; peduncles glandular. ♄. F. Native of Mexico.

Ciliated Pernettya. Shrub.

Cult. For culture and propagation see *Phyllódoce*, p. 833.

XXXVII. AGARI'STA (a mythological name, the beautiful daughter of Clifthenes; in reference to the beauty of the flowers). D. Don, mss.—Andrómeda species of Comm. and other authors.

Lin. syst. *Decándria Monogýnia*. Calyx fleshy, 5-lobed; lobes imbricate at the base. Corolla ovate, with a contracted, 5-toothed, conical mouth. Stamens 10, inclosed; filaments flattened, dilated at the base, and villous; anthers bipartite; with short membranous cells, which are mutic at the base and diverging at the apex, opening by a terminal hole. Style robust, terete; stigma capitate. Capsule globose, pentagonal, 6-celled, with a loculicidal dehiscence. Placentas thick, oblong. Seeds angular, curved.—Evergreen shrubs. Natives of the Mauritius and South America. Leaves coriaceous, reticulately veined, quite entire. Flowers racemose, terminal, very beautiful. Intermediate between *Gaulthèria* and *Andrómeda*.

1 A. buxifo'lia; leaves cordate ovate, mucronulate, rusty beneath; panicle terminal, downy, composed of racemes; flowers secund. ♄. G. Native of the Island of Bourbon. Andrómeda buxifòlia, Lam. dict. 1. p. 158. Smith, icon. ined. 1. p. 59. t. 59. Lindl. bot. reg. Hook. bot. mag. t. 2660. Lodd. bot. cab. 1494. Flowers scarlet. Corollas sub-cylindrical.

Box-leaved Agarista. Fl. June, July. Clt. 1822. Shrub 3 to 6 feet.

2 A. salicifòlia; leaves lanceolate, attenuated at both ends, white beneath; racemes simple, secund, glabrous. ♄. S. Native of the Mauritius. Andrómeda salicifòlia, Comm. mss. Lam. dict. 1. p. 159. Smith, icon. ined. t. 58. Hook. exot. fl. 3. t. 192. bot. mag. 3286. Leaves 2-4 inches long. Racemes simple. Corolla oblong, ovate, beautiful purple.

Willow-leaved Agarista. Shrub 2 to 3 feet.

3 A. subrotu'nda; leaves roundish-elliptic, cordate at the base, mucronate at the apex, glabrous above, but clothed with ferruginous tomentum beneath; racemes terminal, solitary, or fascicled, secund, downy. ♄. G. Native of Brazil, in the province of Minas Geraes, on rocks about Villa St. Joao d'el Rey. Andrómeda subrotúnda, Pohl. pl. bras. 2. p. 32. t. 121. Branches tomentose. Leaves on very short petioles, approximate, setosely denticulated on the nerves and margins, and terminating in a spinose mucrone. Corolla ovate, ventricose, pure red or scarlet, with almost erect segments. Ovaries villous.

Roundish-leaved Agarista. Shrub 3 feet.

4 A. multiflòra; leaves lanceolate, rounded at the base, glabrous; racemes axillary, suprafoliaceous; ovarium glabrous. ♄. G. Native of Brazil, in the province of Minas Geraes, in mountainous places; in Serra Matuquiera. Andrómeda multiflòra, Pohl. pl. bras. 2. p. 33. t. 122. Shrub much branched. Leaves petiolate, remote, $2\frac{1}{2}$ inches long and 8 lines broad. Racemes many-flowered, secund. Bracteas oblong, acute, ciliated. Corolla elliptic, ventricose, white, with erect segments.

Many-flowered Agarista. Shrub 6 to 10 feet.

5 A. Pòhlii; leaves ovate, acute at the apex, emarginate at the base, glabrous, painted beneath on the sides of the nerve with dots; racemes axillary. ♄. G. Native of Brazil, in the province of Minas Geraes, in dry mountainous places of Itambe. Andrómeda crassifòlia, Pohl. pl. bras. 2. p. 34. Leaves on short petioles, deciduous, $1\frac{1}{2}$ inch long and 8 lines broad. Racemes many-flowered, secund; bracteas linear, glabrous. Corollas unknown.

Pohl's Agarista. Tree.

6 A. Bracamore'nsis; leaves ovate-oblong, obtuse, obsoletely mucronate, with revolute margins, coriaceous, glabrous, shining above; racemes axillary and terminal, approximate at the tops of the branches. ♄. G. Native of New Granada, in the province of Bracamoros, near St. Felipe, and Paramo de Yamoca. Andrómeda Bracamorénsis, H. B. et Kunth, nov. gen. amer. 3. p. 288. t. 263. Andrómeda myrtifòlia, Willd. herb. Branchlets angular. Leaves 6-7 lines long. Bracteas minute at the base of the pedicels. Corollas scarlet, with ovate, obtuse, revolute teeth. Stigma ciliated, hardly thicker than the style.

Bracamoros Agarista. Tree 10 to 15 feet.

7 A. Sprenge'lii; leaves ovate-oblong, obtuse, mucronate, coriaceous, with revolute margins, glabrous on both surfaces; racemes axillary, drooping. ♄. S. Native of Brazil, within the tropic. Andrómeda revolùta, Spreng. neu. entd. 2. p. 131. syst. 2. p. 291. Young leaves and young branches rather downy.

Sprengel's Agarista. Shrub.

8. A. eucalyptoi'des; glabrous; leaves on long petioles, oblong, acuminated, obliquely rounded at the base, with revolute margins; racemes lateral, approximate towards the tops of the branches. ♄. G. Native of Brazil, at Rio Grande do Sul. Andrómeda eucalyptoìdes, Cham. et Schlecht, in Linnæa. 1. p. 519. An elegant shrub. Young branches angular. Leaves $1\frac{1}{2}$ inch long. Corolla urceolate, 3 lines long, with obtuse spreading teeth, scarlet. ? Ovarium pubescent.

Eucalyptus-like Agarista. Shrub or small tree.

9 A. pu'lchra; glabrous; leaves petiolate, ovate, mucronate, coriaceous, with revolute margins; racemes secund, axillary and terminal, glabrous, approximate at the tops of the branches; ovarium glabrous. ♄. S. Native of Brazil, within the tropic. Andrómeda púlchra, Cham. et Schlecht. in Linnæa. 1. p. 521. Branches angular. Leaves more than an inch long, larger than those of *A. nummulària*. Style length of corolla. Corolla urceolate, with short obtuse spreading teeth, scarlet.

Fair Agarista. Shrub 1 to 2 feet.

10 A. nummula'ria; leaves on short petioles, cordate, broad-ovate, rather retuse, mucronate, coriaceous; racemes axillary and terminal, and are, as well as the young branches, hispid; ovarium downy. ♄. G. Native of the south of Brazil, in the province of Rio Grande do Sul. Andrómeda nummulària,

Cham. et Schlecht, in Linnæa, 1. p. 520. Leaves shining above, ciliated with long stiff hairs on the nerves beneath, and margins while young. Larger leaves 8 lines long. Racemes approximate at the tops of the branches. Calyx hairy. Style exserted. Corolla urceolate, with short, obtuse, reflexed teeth, scarlet. ?

Money-wort-leaved Agarista. Shrub 1 to 2 feet.

11 A. NERIIFÒLIA; quite glabrous; leaves petiolate, oblong-lanceolate, acute, ovate at the base, coriaceous; panicle terminal, composed of numerous racemes; ovarium glabrous. ♄. S. Native of Brazil, within the tropic. Andrómeda neriifòlia, Cham. et Schlecht, in Linnæa, 1. p. 522. Leaves 3 inches long, shining above and paler beneath. Racemes secund; flowers drooping. Corolla urceolate, with short, obtuse, hardly spreading teeth, scarlet. ? Calycine segments finely ciliated.

Nerium-leaved Agarista. Shrub 2 feet.

12 A. OLEIFÒLIA; leaves on short petioles, oblong, subacuminated, mucronate, acutish at the base, or rounded, with reflexed margins, flat, glabrous, coriaceous; racemes axillary, length of leaves; calycine segments ovate, acuminated, acute; corollas oblong; ovarium glabrous. ♄. S. Native of equinoxial Brazil. Andrómeda oleifòlia, Cham. in Linnæa, 8. p. 504.—Flowers scarlet, with white filaments and yellow anthers. There are varieties of it having the inflorescence either hairy or glabrous.

Olive-leaved Agarista. Shrub 6 to 10 feet.

13 A. SERRULA'TA; leaves subimbricated, almost sessile, spreading, stiff, ovate, cordate, acute, reticulately veined, with reflexed margins, and serrulately-ciliated near the margin above, very scabrous, hairy on the nerve beneath as well as the branchlets, inflorescence, and calyxes; racemes terminal, and from the axils of the upper leaves, and much exceeding them; calycine segments ovate, acuminated, acute or lanceolate, one-half the length of the corolla; ovarium downy. ♄. S. Native of Brazil, within the tropic. Andrómeda serrulàta, Cham. et Schlecht. in Linnæa, 8. p. 506. Corollas scarlet, with obtuse spreading teeth.

Serrulated-leaved Agarista. Shrub 2 to 3 feet.

14 A. PÍSTRIX; branchlets bluntly angular; leaves on short petioles, ovate-cordate, acute in the young state, and obtuse in the adult state, always mucronate, coriaceous, marginated, clothed with fine white tomentum beneath, as well as the branchlets, inflorescence, and calyxes; racemes terminal and axillary, exceeding the leaves; calycine segments broad, ovate, acuminated, acute, spreading; corollas downy; ovarium clothed with white tomentum. ♄. S. Native of Brazil. Andrómeda Pístrix, Cham. in Linnæa, 8. p. 508. Leaves 15 lines long. Corollas ovoid, coriaceous, scarlet, much larger than those of *A. púlchra*. Style woolly at the base.

Whale Agarista. Shrub.

15 A. CHLORA'NTHA; leaves on short petioles, ovate-cordate, obtuse, mucronate, coriaceous, glabrous, with revolute margins; branches, inflorescence, and calyxes downy; racemes terminal and axillary, a little longer than the leaves; calycine segments narrow-ovate, acuminated, or lanceolate, acute, longer than the third part of the corolla, which is ovoid-cylindrical; ovarium downy or villous. ♄. S. Native of Brazil. Andrómeda chlorántha, Cham. in Linnæa, 8. p. 508. A box-like shrub, with the habit of *A. Bracamorénsis* and *A. revolùta*. Corollas white, green at the apex, glabrous.

Green-flowered Agarista. Shrub 6 to 10 feet. ?

16 A. PULCHE'LLA; leaves on short petioles, cordate, ovate-oblong, mucronate, marginated, rather coriaceous, flat, pubescent on the midrib beneath while young, as well as the petioles, branchlets, and inflorescence; racemes terminal and axillary, 3-8-flowered, a little longer than the leaves; flowers on long pedicels; calycine segments broad-ovate, acuminated, acute. ♄. S. Native of Brazil. Andrómeda pulchélla, Cham. in Linnæa, 8. p. 509. Like *A. neriifòlia* and *A. púlchra*, but differs much in the inflorescence. Leaves ½ inch long. Young branches angular. Racemes crowded at the tops of the branches.

Neat Agarista. Shrub.

17 A. PYRIFÒLIA; leaves ovate, acuminated, quite entire, and are, as well as the panicle, glabrous. ♄. S. Native of the Mauritius. Andrómeda pyrifòlia, Pers. ench. 1. p. 481.—Tree 20 feet high, with sulcately striated bark. Flowers obscure, purple.

Pear-leaved Agarista. Tree 20 feet.

18 A. ILICIFÒLIA; leaves cordate, broad, coriaceous, slightly toothed; racemes axillary and terminal, crowded at the tops of the branches. ♄. S. Native of Peru. Andrómeda ilicifòlia, Pers. ench. 1. p. 481. Leaves on short petioles, ovate and quite entire when young, but when larger and older furnished with a few distant teeth at the base.

Holly-leaved Agarista. Shrub.

19 A. ERIOPHY'LLA; leaves roundish-ovate, tomentose on both surfaces, and terminated by a gland, quite entire; racemes terminal, secund, bracteate; corollas ovate. ♄. G. Native of Brazil, on the mountains. Andrómeda eriophýlla, Vand. fl. lus et bras. spec. Pers. ench. 1. p. 482.

Woolly-leaved Agarista. Shrub.

20 A.? ANASTOMÒSANS; leaves ovate, subserrated, dotted beneath, with anastomosing veins; racemes axillary, glomerate. ♄. S. Native of New Granada. Andrómeda glomeràta, Cav. icon. 6. p. 42. Stem villous. Leaves rather veiny. Corollas glabrous. Bracteas longer than the pedicels.

Anastomosing Agarista. Shrub.

Cult. Agarista is a genus of most showy and elegant shrubs, well worth the cultivator's care. Peat and sand is the best soil for them: and cuttings not too young will strike root in sand under a hand-glass, in a moderate heat. Although the species are said to require the stove, they would probably be better if treated as greenhouse plants.

XXXVIII. DIPLECO'SIA (from *διπλους*, *diplous*, double, and *κως*, *kos*, a covering; in reference to the double covering, the calyx and calyculus.) Blum. bijdr. 857.

Lin. syst. *Decándria*, *Monogýnia*. Calyx 5-cleft, girded by a calyculus at the base, which is composed of 2 combined bracteas. Corolla campanulate, with a 5-cleft reflexed limb. Stamens 10, inclosed, inserted in the calycine disk; anthers bifid at the apex, the lobes undivided. Style erect; stigma truncate. Capsule subglobose, depressed, inclosed in the calyx, which is baccate, 5-celled, and dehiscing irregularly. Seeds numerous, cuneated, compressed, fixed to fleshy prominent receptacles.—Parasitical shrubs. Leaves scattered, coriaceous. Flowers solitary or in fascicles, axillary. Corollas pale-greenish. This genus is intermediate between *Andrómeda* and *Gaulthèria*. It differs from the latter in the structure of the corolla and anthers; and from the first in the baccate calyx and dehiscence of the fruit.

1 D. PILÒSA (Blum. bijdr. 858.) leaves ovate-lanceolate, acuminated, strigose above and pilose beneath, as well as the branchlets; pedicels solitary or twin. ♄. S. Native of Java, on Mount Salak, in woods, where it is called by the natives *Kila Ge Daijbula*.

Pilose Diplecosia. Shrub.

2 D. LATIFÒLIA (Blum. l. c.) leaves oval, acutish at both ends, with recurved margins, glabrous; pedicels fascicled. ♄. S. Native of Java, upon trees on the mountains.

Broad-leaved Diplecosia. Fl. Year. Shrub par.

3 D. HETEROPHY'LLA (Blum. l. c. p. 858.) leaves oblong or lanceolate, acuminated at both ends, nearly veinless, glabrous, dotted beneath; pedicels fascicled. ♄. S. Native of Java, on the higher mountains, on the west side of the island.

Var. β; leaves cuneate-oblong, acutish or obtuse.

Variable-leaved Diplecosia. Fl. Year. Shrub par.

Cult. For culture and propagation, see *Agarista*, p. 838.

XXXIX. GAULTHE'RIA (so named by Kalm, from Gaulthier, a physician and botanist of Canada). Lin. gen. no. 551. Schreb. 449. Gærtn. fruct. 63. Juss. gen. p. 161. R. Br. prod. p. 559. H. B. et Kunth. nov. gen. amer. 3. p. 282.

LIN. SYST. *Decándria, Monogýnia.* Calyx 5-cleft. Corolla ovate, with a short 5-cleft limb (f. 140. *h.*). Stamens 10, inclosed; anthers bifid at the apex; lobes biaristate (f. 140. *e.*). Style 1; stigma obtuse. Hypogynous scales 10, obsolete or connate at the base. Capsule depressedly globose, 5-celled, 5-furrowed, covered by the calyx, which is sometimes baccate; valves septiferous in the middle. Placentas adnate to the base of the column. Seeds numerous, covered by a reticulated testa.—Small trees or shrubs. Leaves alternate. Flowers axillary and terminal, racemose, rarely solitary; pedicels bibracteolate. Corollas white, rose-coloured, or scarlet. Filaments usually hairy.

* *Flowers axillary, solitary. Peduncles or pedicels beset with some imbricated bracteas at the base.*

1 G. PROCU'MBENS (Lin. spec. 565.) stem procumbent; branches erect, naked at bottom, but with crowded leaves at top; leaves obovate, acute at the base, finely and ciliately toothed; flowers few, terminal, nutant. ♄. H. Native of North America, in dry woods, on mountains, and in sandy plains from Canada to Virginia. Andr. bot. rep. 116. Kalm. amœn. 3. p. 14. t. 1. f. 6. Duham. arb. 1. p. 286. t. 113. Lodd. bot. cab. t. 82. Sims, bot. mag. 1966.—A little shrubby plant, resembling seedling plants of *Kálmia latifòlia.* Flowers white. Berries red, eatable, and known by the name of partridge berries. The leaves, if properly cured, make a most excellent tea, for which reason it is likewise known by the name of *Mountain Tea.*

Procumbent Gaultheria. Fl. July, Sept. Clt. 1762. Shrub ½ foot, procumbent.

2 G. RE'PENS (Blum. bijdr. p. 857.) stem creeping, rather pilose; leaves minute, rather pilose beneath, ovate, acute, coriaceous; peduncles axillary, 1-flowered. ♄. G. Native of Java, on the top of Mount Gede.

Creeping Gaultheria. Fl. Year. Shrub.

3 G. NUMMULARIOÌDES (D. Don, prod. fl. nep. p. 150.) branches filiform, procumbent, very bristly; leaves cordate, mucronulate, nearly sessile, naked above, but hispid from hairs beneath and on the margins; pedicels axillary, very short, solitary. ♄. H. Native of Nipaul, on the Alps. Shrub much branched. Flowers drooping. Pedicels and calyxes glabrous. Calycine segments broad-ovate, mucronulate, with connivent margins. Corolla ovate, longer than the calyx.

Money-wort-like Gaultheria. Shrub procumbent.

4 G. BUXIFÒLIA (Willd. in nov. act. berol. vol. 4.) stem erect; branches hairy; leaves roundish-ovate, obtuse, toothed, coriaceous, scabrous from dots beneath; pedicels filiform. ♄. S. Native of Caraccas. Branches hairy, erect.

Box-leaved Gaultheria. Shrub.

5 G. ANASTOMÒSANS (R. Br. prod. p. 559. H. B. et Kunth, nov. gen. amer. 3. p. 283.) branches, margins, and under sides of leaves, clothed with bristly hairs; leaves ovate, acute, crowded at the base, obsoletely denticulated, shining above; flowers axillary, solitary, pedicellate. ♄. G. Native of New Granada, near Santa Fe de Bogota. Andrómeda anastomòsans, Lin. suppl. 237. Willd. spec. 2. p. 614. Vent. Choix, t. 53. Pedicels pilose, furnished with 5-7 imbricated bracteas at the base. Corollas ovate, glabrous, white.

Anastomosing Gaultheria. Shrub.

6 G. PURPURA'SCENS (H. B. et Kunth, nov. gen. amer. 3. p. 282.) procumbent? branchlets and leaves clothed with bristly hairs; leaves elliptic-oblong, acute at both ends, serrulated, 1-nerved, purplish beneath; flowers axillary, solitary. ♄. G. Native of New Granada. Hairs or bristles dark purple. Leaves green above. Peduncles or pedicels bracteate at the base. Fruit drooping.

Purplish-leaved Gaultheria. Shrub procumbent.

7 G. MYRSINOÌDES (H. B. et Kunth, l. c. p. 283.) branches and leaves glabrous; leaves oblong, acute, obtuse at the base, crenated at top, shining above; flowers axillary, solitary. ♄. G. Native of New Granada, near the town of Almaguer. Branchlets angular. Peduncles downy, furnished with imbricated bracteas at the base. Corollas ovate-globose, glabrous, white.

Myrsine-like Gaultheria. Shrub.

8 G. MYRTILLOÌDES (Cham. et Schlecht, in Linnæa. vol. 1. p. 523.) branches beset with bristles, as well as the under sides of the leaves and calyxes; leaves broad-lanceolate, with the margins ciliately serrulated and somewhat reflexed; flowers axillary, solitary, on short pedicels near the tops of the branches. ♄. G. Native of Brazil, within the tropic. Scales at base of pedicels ciliated. Corolla urceolate, pilose inside, glabrous outside, with reflexed teeth. Filaments dilated at base.

Myrtle-like Gaultheria. Shrub ½ to 1 foot.

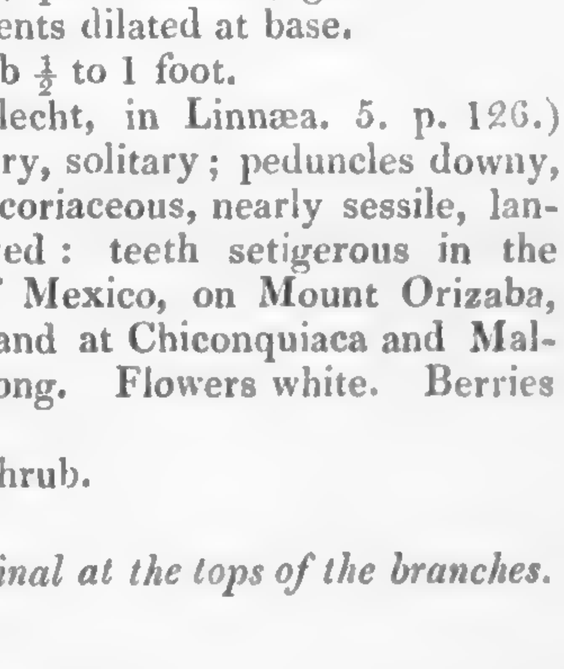
9 G. CILIA'TA (Cham. et Schlecht, in Linnæa. 5. p. 126.) shrubby, glabrous; flowers axillary, solitary; peduncles downy, bracteolate at the base; leaves coriaceous, nearly sessile, lanceolate, acute, sharply serrulated: teeth setigerous in the young state. ♄. G. Native of Mexico, on Mount Orizaba, along with *Solànum tuberòsum;* and at Chiconquiaca and Malpays de Joya. Leaves ½ inch long. Flowers white. Berries black.

Ciliated-leaved Gaultheria. Shrub.

** *Racemes axillary and terminal at the tops of the branches. Pedicels bibracteate.*

10 G. SHA'LLON (Pursh. fl. amer. sept. 1. p. 283. with a figure); procumbent, hairy; leaves ovate, subcordate, serrated, glabrous on both surfaces; racemes secund, bracteate, clothed with rusty down. ♄. H. Native of North America, on the falls of the Columbia, and near the Western Ocean. Hook. bot. mag. t. 2843. Lindl. bot. reg. 1411. Lodd. bot. cab. 1372. Branches warted, clothed with rusty down while young. Leaves broad, abruptly acuminated. Pedicels scaly. Corolla white, tinged with red, downy, urceolate, with a closed limb. Berries globose, acute, fleshy, purple.—This plant grows in the shade of close pine forests, where hardly any thing else will grow, which makes it a very desirable shrub for plantations. The berries of the Shallon are much esteemed by the natives, on account of their agreeable flavour.

FIG. 140.



Shallon Gaultheria. Fl. May. Clt. 1826. Shrub procumbent.

11 G. fragrantíssima (Wall. in asiat. res. 13. p. 297, with a figure); branchlets glabrous, rather triquetrous; leaves elliptic-oblong, acute, crenulated, glabrous, attenuated at the base; racemes axillary, solitary, erect, downy. ♄. F. Native of Nipaul, at Narainhetty. G. fràgrans, D. Don, prod. fl. nep. 151. A'rbutus laurifòlia, Hamilt. mss. Leaves coriaceous, reticulately veined, 2-4 inches long. Racemes shorter than the leaves. Bracteas ovate-oblong, concave, equal in length to the pedicels. Calycine segments ovate, acute. Corollas oblong, silky, drooping a little, pale red, very sweet scented. Shrub much branched.

Very fragrant Gaultheria. Clt. 1824. Shrub.

12 G. punctà'ta (Blum. bijdr. p. 856.) leaves lanceolate, terminated by a gland, serrated, dotted beneath, glabrous as well as the branches; racemes panicled, terminal; calyxes ciliated. ♄. G. Native of Java, very common on the top of Mount Gede, where it is called by the natives *Tjatagie-wangie*.

Dotted-leaved Gaultheria. Shrub.

13 G. leucocá'rpa (Blum. bijdr. p. 856.) branches and leaves glabrous; leaves ovate-oblong, long-acuminated, bluntly serrated; racemes axillary and terminal, drooping; calyxes a little ciliated. ♄. G. Native of Java, in woods on the higher mountains, where it is called *Zantigi badas* by the natives.

White-fruited Gaultheria. Fl. Year. Shrub.

14 G. Sprenge'lii; leaves oblong, rounded at both ends, callous at the apex, quite entire, with revolute edges, hispid on both surfaces; branches hairy; racemes terminal, straight, secund, clothed with clammy hairs. ♄. S. Native of Brazil, where it was collected by Sello. G. híspida, Sprengel, syst. 2. p. 288. but not of R. Br.

Sprengel's Gaultheria. Shrub.

15 G.? bractea'ta; branches beset with rusty hairs; leaves ovate-acute, obscurely denticulated, shining above and rusty beneath; racemes terminal, simple; corollas and calyxes hairy. ♄. G. Native of Quito, near the Crater of Tunguragua, and on Mount Chimborazo. Andrómeda bracteàta, Cav. icon. 6. p. 42. t. 562. f. 1. Hairs on the under side of the leaves, bulbous at the base. Leaves $1\frac{1}{2}$ inch long, and 1 inch broad. Bracteas at the base of the pedicels concave, ovate-acute, and the pedicels are bibracteolate. Stamens 10, villous; anthers biaristate at the base. Corollas tubular, pale red, with erect ovate-acute teeth.

Bracteate Gaultheria. Shrub $1\frac{1}{2}$ foot.

16 G. ellíptica (Cham. in Linnæa. 8. p. 502.) racemes, corollas, and capsules, downy; bracteas and calyxes ciliated, the rest of the plant glabrous; leaves elliptic, acute at both ends, mucronate, marginated, rather coriaceous, finely and equally serrulated, smooth and shining above, and beset with black dots beneath, reticulately veined; racemes terminal and axillary, forming a panicle; bracteas ovate-orbicular, obtuse, concave, at first imbricated, and therefore the racemes appear strobile-formed. ♄. S. Native of the south of Brazil, where it was collected by Sello. Very like G. acuminàta, Cham. in Linnæa, 5. p. 126. and G. vernàlis, Pœpp. pl. chil. exsic. 3. no. 119. Prostrate and rooting. Corollas ovate-urceolate, inflated, downy outside and villous inside.

Elliptic-leaved Gaultheria. Shrub creeping.

17 G. acumina'ta (Schlecht. et Cham. 5. p. 126. and 7. p. 524.) shrubby, glabrous; flowers racemose, axillary; leaves on short petioles, ovate, acuminated, acute, finely serrulated, coriaceous, reticulately veined, discoloured, full of black dots beneath, but scabrous on both surfaces from elevated dots; serratures mucronate. ♄. G. Native of Mexico, on Serra Colorado; and at St. Salvador and Malpays de Joya. Flowers white. Fruit black. Leaves $3\frac{1}{2}$ inches long.

Acuminated-leaved Gaultheria. Shrub.

18 G. reticula'ta (H. B. et Kunth, nov. gen. 3. p. 284.) branches and leaves glabrous; leaves oblong, acutish at both ends, serrulately crenulated, shining above; racemes crowded at the tops of the branches, axillary and terminal; corollas glabrous. ♄. G. Native of the Andes of Quito, between Ona and Loxa, in Paramo de Saraguru. Andrómeda reticulàta, Humb. prol. p. 39. Leaves terminated by a sessile gland, shining above. Racemes involucrated by some bracteas at the base, downy. Corolla ovate, tubular, white, glabrous. Fruit capsular.

Reticulated-leaved Gaultheria. Shrub.

19 G. coccínea (H. B. et Kunth, l. c. p. 284.) branches rather pilose; leaves roundish-ovate, acutish, rounded at the base, denticulated, glabrous, shining above and dotted beneath; racemes terminal and axillary at the tops of the branches; corollas clothed with glandular hairs. ♄. S. Native of Caraccas, on Mount Avila. Andrómeda coccínea, Humb. prol. p. 39. Leaves with black dot-like glands beneath. Racemes involucrated by imbricate bracteas at the base. Flowers secund, on long pedicels; pedicels clothed with glandular hairs. Bracteas at the base of the pedicels concave, coloured, glandularly ciliated. Corollas ovate, scarlet, clothed with glandular hairs. Fruit capsular. ?

Scarlet-flowered Gaultheria. Shrub.

20 G. odora'ta (Humb. trav. 1. p. 397. and 599. nov. gen. 3. p. 285. Pers. ench. 1. p. 482.) branchlets beset with glandular viscid hairs; leaves ovate-oblong, acuminately cuspidate, cordate at the base, sharply denticulated, glabrous and shining above, and scabrous from dots beneath; racemes axillary and terminal at the tops of the branches; corollas pilose. ♄. S. Native of New Andalusia, on Mount Tumiriquíri; and on the southern declivity of Mount Silla de Caraccas, where it is called Pejoa by the natives; and of Mexico, at Cuesta Grande de Chiconquiaca. G. scabra, Willd. herb. Shrub much branched. Leaves aromatic, 2 inches long, glandularly ciliated while young. Racemes involucrated by some bracteas at the base. Flowers secund, nutant. Pedicels beset with glandular hairs as well as the rachis. Bracteas red, lanceolate, length of pedicels. Corollas ovate, pale red. Fruit capsular.

Sweet-scented Gaultheria. Shrub 4 to 5 feet.

21 G. cordifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 285. t. 261.) branchlets clammy, hispid; leaves ovate, acute, cordate, denticulated, rugose, glabrous and shining above, but hairy beneath; racemes axillary and terminal at the tops of the branches; corollas clothed with clammy hairs. ♄. G. Native of New Granada, on the Andes near Almaguer and Pansitara, in rather frigid places. Branches twining, ex Bonpl. Leaves $3\frac{1}{2}$ inches long. Pedicels and flowers beset with glandular hairs and clammy. Bracteas oblong, acute, concave, ciliated with glandular hairs, and clothed with adpressed hairs outside, longer than the pedicels. Calyx clammy, clothed with glandular hairs. Corollas ovate, scarlet or purple.

Heart-leaved Gaultheria. Shrub.

22 G. rígida (H. B. et Kunth, l. c. p. 286.) branchlets puberulous; leaves ovate-oblong, acute, cordate at the base, sharply denticulated, glabrous, but a little ciliated; racemes axillary and terminal at the tops of the branches; corollas glabrous. ♄. S. Native of the province of Cumana, on Mount Cocollar. Andrómeda rígida, Humb. trav. p. 397. Leaves terminated by a sessile gland. Racemes involucrated by many imbricated bracteas. Bracteas oblong, concave, ciliated, glabrous, coloured, longer than the pedicels. Pedicels and rachis downy. Corollas ovate, scarlet.

Stiff Gaultheria. Tree small.

23 G. tomentòsa (H. B. et Kunth, l. c. p. 287. t. 262.)

branches and under sides of leaves clothed with rusty tomentum; leaves glabrous and shining above, lanceolate-oblong, acute, obtuse at the base, with quite entire revolute margins; racemes axillary and terminal at the tops of the branches; corollas tomentose. ♄. S. Native of the Andes, about Quito, in Paramo de Saraguru. Leaves tomentose on both surfaces while young. Pedicels and calyxes clothed with rusty down. Bracteas tomentose, ovate-oblong, much shorter than the pedicels. Corolla ovate.

Tomentose Gaultheria. Tree 10 to 15 feet.

24 G. ferrugínea (Cham. et Schlecht, in Linnæa, 1. p. 524.) leaves ovate, acute, shining above, with serrulately scabrous margins, clothed with rusty tomentum beneath, as well as the racemes and flowers. ♄. G. Native of Brazil, within the tropic. Leaves often cordate at the base. Racemes bracteate, erect, rising from the axils at the tops of the branches, the whole forming a panicle. Corolla 3 lines long, with erect teeth.

Rusty Gaultheria. Shrub.

25 G. sca`bra (Willd. in nov. act. soc. berol. 4.) leaves ovate-cordate, acute, toothed, scabrous, reticulately veined beneath; racemes axillary, simple; calyx and bracteas clothed with glandular hairs. ♄. S. Native of Caraccas. Calyx baccate, black.

Scabrous Gaultheria. Shrub.

26 G. ere'cta (Vent. hort. cels, p. 5. t. 5.) leaves ovate, mucronate, clothed with rusty hairs; branches and racemes clothed with glandular clammy hairs. ♄. G. Native of Peru. Leaves with revolute denticulated margins.

Erect Gaultheria. Shrub.

27 G. híspida (R. Br. prod. p. 559.) leaves long-lanceolate, serrulated, pilose beneath as well as on the petioles; branchlets hispid; racemes axillary and terminal, shorter than the leaves; rachis and pedicels downy; calyxes baccate; fruit and ovaries glabrous; stem erect. ♄. F. Native of Van Diemen's Land. Corollas white.?

Hispid Gaultheria. Shrub erect.

28 G. rupe'stris; racemes simple, bracteate; corollas campanulate; leaves oblong, serrulated. ♄. F. Native of New Zealand. Andrómeda rupéstris, Forst. prod. no. 195. Nearly allied to the preceding.

Rock Gaultheria. Shrub erect.

29 G. antipòda (Forst. prod. no. 186.) leaves roundish-ovate, serrate-toothed, glabrous, reticulately veined; branches downy; stem diffuse; racemes panicled, rather hairy; corollas glabrous. ♄. F. Native of New Zealand. Flowers white.?

Antipodal Gaultheria. Shrub.

Cult. The species are ornamental: they thrive best in a peat soil, and are readily increased by dividing or by layers. The greenhouse species should be treated as other hardy greenhouse shrubs.

XL. EPIGÆ`A (from επι, *epi*, upon; and γαια, *gaia*, the earth: the plant creeps upon the surface of the earth). Lin. gen. no. 550. Schreb. gen. no. 240. Nutt. gen. amer. 1. p. 269.—Memècylum Mich. gen. 13.

Lin. syst. *Decándria Monogy'nia.* Calyx large, 5-parted, furnished with 3 bracteas at the base. Corolla salver-shaped, with a 5-parted spreading limb; tube villous inside. Stamens 10. Capsule 5-celled, many-seeded. Placenta 5-parted.—Creeping, tufted, evergreen shrubs. Flowers fragrant, in dense, axillary, and terminal racemes.

1 E. re`pens (Lin. spec. 565.) branches, petioles, and nerves of leaves very hairy; leaves cordate-ovate, quite entire; corollas cylindrical. ♄. H. Native from Canada to Carolina, on shady rocks and in stony woods, sides of hills and roots of pines. Andr. bot. rep. 102. Lam. ill. t. 367. f. 1. Lodd. bot. cab. 160.—Pluk. alm. t. 107. f. 1. Flowers white, tinged with red, very fragrant.

Creeping Epigæa. Fl. May, July. Clt. 1736. Shrub creeping.

2 E. cordifòlia (Swartz, prod. 73. fl. ind. occ. 2. p. 842.) stem erectish, strigose; leaves cordate, roundish, stiff, hispid, serrated, convex; corollas ovate. ♄. S. Native of Guadaloupe and Cayenne. Lam. ill. t. 367. f. 1. Flowers white.?

Heart-leaved Epigæa. Shrub erectish.

Cult. E. rèpens is a beautiful procumbent shrub: it will thrive only in peat soil and shady situations, and, being rather tender, should have a hand-glass or frame placed over it in frosty weather; indeed, it grows best under a hand-glass or frame the whole year: it is increased by layers or separating the rooted shoots; or by cuttings, which root readily in sand with a hand-glass over them. For the culture of *E. cordifòlia* see *Agarista*, p. 838.

XLI. PHALEROCA'RPUS (from φαληρος, *phaleros*, white, and καρπος, *karpos*, a fruit; in reference to the colour of the berries). Vaccínium, Lin. Gaulthèria, Pursh. Oxycóccus, Nutt. A'rbutus, Lam.

Lin. syst. *Octándria Monogy'nia.* Calyx 4-cleft, bibracteate at the base. Corolla short, campanulate, 4-cleft. Stamens 8; filaments hairy.? Hypogynous disk 8-toothed.? Anthers semibifid.—A small creeping plant with hispid branches, small, roundish-oval, acute leaves; and axillary, solitary, nearly sessile, white? flowers. Habit of Wild Thyme.

1 P. serpyllifòlia; ♄. H. Native from Canada to Pennsylvania. Mr. Nuttall has observed this plant north-westward of Lake Michigan; and, as Mr. Pursh very justly remarks, abounding where evergreens are predominant, keeping pretty constant pace with the northern forests of pines, larches, and firs, growing always amidst sphagnum. Vaccínium hispídulum, Lin. spec. 500. Michx. fl. 6. bor. amer. 1. p. 228. t. 23. Gaulthèria serpyllifòlia, Pursh. fl. amer. sept. 1. p. 283. t. 13. A'rbutus filifòrmis, Lam. dict. 1. p. 228. Berries white, produced in inconsiderable quantities. They are aromatic, not very acid, and rather insipid than agreeable. The shrub has the same aromatic taste and smell as *Gaulthèria procúmbens.*

Wild Thyme-leaved Snowberry. Fl. April, May. Clt. 1815. Shrub creeping.

Cult. See *Oxycóccus*, p. 858, for culture and propagation.

XLII. CLE'THRA (from κληθρα, *klethra*, the Greek name of the alder; resemblance in leaves). Lin. gen. no. 553. Schreb. gen. 751. Gærtn. fruct. 1. p. 301. t. 63. Juss. gen. 160. Gron. 43. Nutt. gen. 1. p. 275. H. B. et Kunth, nov. gen. amer. 3. p. 288.—Cuellària, Ruiz et Pav. syst. 103.

Lin. syst. *Decándria, Monogy'nia.* Calyx 5-parted. Corolla so deeply 5-parted as to appear pentapetalous. Stamens 10, inclosed, or nearly so; anthers behind, at length inflexedly pendulous and obverse, cordate, mucronate at the apex, mutic. Ovarium free. Style straight. Stigma trifid. Capsule girded by the calyx, 3-celled, with a loculicidal dehiscence; cells many-seeded.—Shrubs or trees. Leaves alternate. Racemes terminal, solitary or panicled. Flowers bracteate, white.

1 C. alnifòlia (Lin. spec. 566.) leaves cuneate-obovate, acute, coarsely serrated above, glabrous on both surfaces, and of the same colour; racemes spicate, simple, bracteate, clothed with hoary tomentum. ♄. H. Native from New England to Virginia, in swamps, frequent. Schmidt, arb. 47. Lam. ill. 369. Duh. arb. 1. p. 176. t. 71. Mill. fig. 28. Catesb. car. 1. t. 66. C. alnifòlia, var. α, denudàta, Ait. hort. kew. 2. p. 73.

Alder-leaved Clethra. Fl. July, Sept. Clt. 1731. Shrub 3 to 4 feet.

2 C. tomentòsa (Lam. dict. 2. p. 46.) leaves cuneate-obovate, acute, finely serrated at top, clothed with white tomentum beneath; racemes spicate, simple, bracteate, villously tomentose. ♄. H. Native of Virginia and Carolina, in swamps. Wats. dend. brit. t. 39. C. alnifòlia, β, pubéscens, Ait. hort. kew. 2. p. 73. C. incàna, Pers. ench. 1. p. 482. This is a very distinct species, although it has been considered by some as a mere variety of the preceding.

Tomentose Clethra. Fl. July, Oct. Clt. 1731. Shrub 3 to 4 feet.

3 C. sca'bra (Pers. ench. 1. p. 482.) leaves broad, cuneate-obovate, acute, scabrous on both surfaces, coarsely serrated: serratures hooked; racemes spicate, subpanicled, bracteated, finely tomentose. ♄. H. Native of the western parts of Georgia, where it was collected by Mr. Lyon.

Scabrous Clethra. Fl. July, Oct. Clt. 1806. Shrub 3 to 4 feet.

4 C. paniculà'ta (Ait. hort. kew. 2. p. 73.) leaves narrow, cuneate-lanceolate, acute, acuminately serrated, glabrous on both surfaces; panicle terminal, elongated, composed of racemes, and clothed with white tomentum, ♄. H. Native of Carolina.

Panicle-flowered Clethra. Fl. July, Oct. Clt. 1770. Shrub 3 to 4 feet.

5 C. acumina'ta (Michx. fl. amer. bor. 1. p. 260.) leaves oval, acuminated, bluntish at the base, serrated, glabrous on both surfaces, rather glaucous beneath; racemes spicate, almost solitary, bracteate, clothed with white tomentum. ♄. H. Native of Carolina, on the high mountains. Lodd. bot. cab. 1427. C. montàna, Batr. cat. Grows to the size of a tree. Flowers resembling those of *C. alnifòlia*.

Acuminated-leaved Clethra. Fl. July, Oct. Clt. 1806. Tree 10 to 15 feet.

6 C. Brasilie'nsis (Cham. in Linnæa. 8. p. 510.) leaves obovate, obtuse, rather retuse, acutish at the base, cuneated, glabrous above and tomentose beneath, almost quite entire, or serrulately-toothed at the apex: teeth and apex mucronate; racemes forming panicles at the tops of the branches, tomentose; segments of corolla fringed; genitals inclosed. ♄. S. Native of tropical Brazil. The leaves vary much in form and size. Tomentum of a rusty-colour.

Brasilian Clethra. Shrub or tree.

7 C. fagifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 289.) arboreous; leaves obovate, sharply and remotely toothed, coriaceous, glabrous; racemes clustered at the tops of the branches. ♄. S. Native of South America, in woods near Bonavista, between Caraccas and La Victoria. Young branches angular, and densely clothed with rusty down. Leaves 3-4 inches long, paler beneath. Racemes clothed with rusty tomentum. Corollas white, about the size of those of the lily of the valley.

Beach-leaved Clethra. Tree.

8 C. bícolor (H. B. et Kunth, l. c. p. 289.) arboreous? leaves oblong, coarsely and undulately crenated, coriaceous, glabrous above, but clothed with white tomentum beneath; racemes in fascicles at the tops of the branches. ♄. S. Native of South America, near Santa Fe de Bogota. Cuellària floribúnda, Willd. herb. Branchlets angular, clothed with rusty down, intermixed with stiff hairs, as well as the racemes. Leaves 3-4 inches long, having the teeth intermixed with gland-formed denticulations, while young having a few dot-formed stellate hairs above. Corollas white.

Two-coloured-leaved Clethra. Tree.

9 C. fimbria'ta (H. B. et Kunth, l. c. p. 290. t. 264.) arboreous; leaves elliptic-oblong, quite entire, coriaceous, glabrous above, but clothed with white tomentum beneath; racemes in fascicles at the tops of the branches; stamens hardly inclosed. ♄. S. Native along with the preceding. Cuellària rugòsa, Willd. herb. Branches glabrous, brown. Flowers sub-secund, nutant, about the size of those of *C. alnifòlia*. Pedicels, calyxes, and rachi clothed with rusty tomentum. Corolla white, having the segments emarginately 2-lobed, and laciniately fringed at the apex.

Fringed-flowered Clethra. Tree.

10 C. ferrugínea (Ruiz. et Pav. fl. per. vol. 4. t. 380. f. b.) leaves oblong, quite entire, acuminated, excavated at the base. ♄. G. Native of Peru, on the mountains of Pillao, Panao, and Chinchao, in groves. Cuellària ferrugínea, Ruiz et Pav. syst. p. 103. Branches, leaves, and racemes clothed with rusty hairs. Racemes simple, fascicled at the tops of the branches. Flowers rather large.

Rusty Clethra. Clt. 1800. Tree 15 feet.

11 C. obova'ta (Ruiz et Pav. fl. per. 4. t. 381.) leaves obovate, wrinkled, denticulated. ♄. G. Native of Peru, in forests about Cuchero. Cuellària obovàta, Ruiz et Pav. syst. p. 103. Racemes long, fascicled at the tops of the branches. Branches and leaves downy. Flowers small.—A tall tree. The wood is very hard, and is made into utensils by the natives.

Obovate-leaved Clethra. Tree tall.

12 C. revolu'ta (Ruiz et Pav. fl. per. 4. t. 380. f. a.) leaves oblong, denticulated, revolute and excavated at the base. ♄. G. Native of Peru, in forests towards Pillao. Cuellària revolùta, Ruiz et Pav. syst. p. 103. Branches, leaves, and racemes downy. Racemes simple, fascicled at the tops of the branches.

Revolute-leaved Clethra. Tree 30 feet.

13 C. cane'scens (Herb. Reinwdt. ex Blum. bijdr. p. 863.) leaves cuneate-oblong, acute, serrulated at the apex; panicle terminal, clothed with canescent scurf; calycine segments ovate, acute. ♄. G. Native of the Celebes, in woods, on the mountains.

Canescent panicled Clethra. Fl. Sept. Shrub.

14 C. tinifòlia (Swartz, fl. ind. occ. 2. p. 845.) arboreous; leaves oblong-lanceolate, quite entire, hoary beneath; racemes spike-formed, panicled at the tops of the branches, tomentose. ♄. G. Native of the south of Jamaica; also of Mexico, near Chiconquiaco. Tìnus occidentàlis, Lin. spec. 530. Volkamèria, P. Browne, jam. 214. t. 21. f. 1. Sloan. jam. 2. p. 86. t. 198. f. 2. Flowers white. Sloane calls this tree Bastard Locust tree.

Laurestine-leaved Clethra. Clt. 1825. Tree 12 to 14 feet.

15 C. arbòrea (Ait. hort. kew. 2. p. 73.) leaves oblong, attenuated, lanceolate, glabrous on both surfaces, serrated; racemes spike-formed, panicled at the tops of the branches; calycine segments obtuse. ♄. G. Native of Madeira. Sims, bot. mag. 1057. Flowers white. There are several varieties of this species; a smaller variety, and a variegated-leaved one.

Tree Clethra. Fl. Aug. Oct. Clt. 1784. Tree 8 to 10 feet.

Cult. All the species of this genus are very ornamental. The hardy kinds thrive best in peat earth, or a very light sandy loam: they are dwarf shrubs, and are therefore well fitted for the front of shrubberies, where the soil will suit. By layers is the usual mode of increasing them, but they also strike root readily from cuttings in sand under a hand-glass. The greenhouse kinds are well adapted for large conservatories, and they thrive in the same kind of soil recommended for the hardy species. Cuttings taken from wood not too ripe will strike root readily in sand under a hand-glass. All may be raised from seeds, which in most of the species ripen in plenty.

Tribe II.

RHODO'REÆ (so called because the genera contained in it agree with *Rhodòra*, or *Rhododendron*, in particular characters).

D. Don, in edinb. phil. journ. 17. p. 152. Rhodoràceæ, Juss. gen. 158. Anthers 2-celled. Ovarium free. Hypogynous disk nectariferous, rarely ornamented with scales. Buds strobile-like from imbricated scales. Leaves flat, having the extremity of the midrib callous.

XLIII. RHODODE'NDRON (from *ῥοδον*, *rhodon*, a rose, and *δενδρον*, *dendron*, a tree; in reference to the terminal bunches of flowers, which are usually red). Lin. gen. no. 548. Schreb. gen. no. 746. Gærtn. fruct. 1. p. 304. t. 63. Juss. gen. 158. D. Don, in edinb. phil. journ. prod. fl. nep. p. 152.—Azàlea species of authors.—Rhodòra, Lin.—Chamærhodòdendros, Tourn. inst. t. 373.

Lin. syst. *Penta-Decándria*, *Monogýnia*. Calyx 5-parted. Corolla somewhat funnel-shaped, or campanulate; rarely rotate or 5-parted; limb 5-cleft, somewhat bilabiate; upper lip the broadest, and usually spotted. Stamens 5-10, usually exserted, declinate; anthers opening by 2 terminal pores. Capsule 5-celled, 5-valved, rarely 10-celled and 10-valved, as in *R. arbòreum*, with a septicidal dehiscence at the apex. Placentas simple, angular. Seeds compressed, scobiform, winged.—Shrubs or trees, usually evergreen. Leaves alternate, quite entire, terminated by a spacelate apex, or yellow gland. Flowers terminal, corymbose, showy.

Sect. I. Po'nticum. Limb of calyx short, 5-lobed. Corolla campanulate. Stamens 10. Ovarium 5-celled.—Leaves coriaceous, evergreen.

1 R. Po'nticum (Lin. spec. 562.) leaves oblong-lanceolate, glabrous on both surfaces, attenuated towards the thick petioles, with a streak on the upper surface, of a wide lanceolate form; racemes short, corymbose. ♄. H. Native of Asia Minor, at Pontus; and of Gibraltar, Iberia, and Caucasus, in wet places in beech and alder coppices. Pall. fl. ross. 1. p. 43. t. 29. Jacq. icon. rar. 1. t. 78. Lam. ill. 364. Curt. bot. mag. 650. Leaves sometimes becoming ferruginous beneath. Corolla purple, large, with ovate, acute, or lanceolate segments. Calyx minute, 5-toothed, somewhat cartilaginous. This is a very common plant, of which there are a great many varieties. The most remarkable are those with white, red, or bluish flowers, and striped leaves. Tournefort has related that the flowers of this species were reputed to impart a noxious quality to honey; this Güldenstadt contradicts, and imputes it to *Azàlea Póntica*.

Var. β, obtùsum (Wats. dendr. brit. t. 162.) leaves subcordate, coriaceous, obtuse; calyx very short, unequally and undulately crenated. ♄. H. Native of Pontus. Shrub 3-4 feet high. Flowers purple.

Var. γ, myrtifòlium (Lodd. bot. cab. 908.) leaves small; flowers purple. ♄. H. Native of Gibraltar.

Var. δ, Smíthii (Sweet, fl. gard. n. s. t. 50.) leaves lanceolate, clothed with white tomentum beneath; corymbs many-flowered; ovarium tomentose, 10-celled; flowers of a rosy purple, approaching to crimson, elegantly spotted with black. ♄. H. A hybrid, raised by Mr. Smith, of Coombe Wood, from the seed of *R. Pónticum*, impregnated by the pollen of *R. arbòreum*.

Pontic Rhododendron or Rose-bay. Fl. May, June. Clt. 1763. Shrub 6 to 12 feet.

2 R. ma'ximum (Lin. spec. p. 563.) arborescent; leaves elliptic-oblong, acute, convex, bluntish at the base, whitish or rusty beneath, glabrous; calycine segments oval-obtuse: segments of corolla roundish. ♄. H. Native from Canada to Carolina, on the mountains near rivulets and lakes. Sims, bot. mag. 951. Lam. ill. 364.—Schmidt, abr. t. 121.—Mill. fig. 229.—Catesb. car. 3. t. 17. f. 2. Flowers pale red, in umbellate corymbs, studded with green, yellow, or purple protuberances.

Largest Rhododendron or American Rose-bay. Fl. June, Aug. Clt. 1736. Shrub 10 to 15 feet.

3 R. purpu'reum; arboreous; leaves large, oblong-elliptic, flattish, acute, bluntish at the base, green and glabrous on both surfaces; segments of corolla oblong, obtuse. ♄. H. Native of Virginia and Carolina, on the highest mountains, near lakes. R. máximum γ, purpùreum, Pursh, fl. amer. sept. 1. p. 297. Flowers large, purple. Calycine segments obtuse. This shrub approaches near to *R. Pónticum*, but it differs in its foliaceous calyx, and otherwise. It grows to an immense size; its stem is often found 18 inches and more in diameter, and its foliage triple the size of any other species.

Purple-flowered Rhododendron. Fl. May, June. Clt.? Tree 20 feet.

4 R. Pu'rshii: arborescent; leaves cuneate-lanceolate, flat, glabrous, tapering gradually to the base, paler beneath; calycine segments oval, obtuse; segments of corolla roundish-oblong. ♄. H. Native of New Jersey and Delaware, in shady cedar swamps. R. máximum β, álbum, Pursh, fl. amer. sept. 1. p. 297. Flowers white, smaller than those of *R. máximum*.

Pursh's Rhododendron. Fl. June, Aug. Clt. 1811. Shrub 6 to 8 feet

5 R. macrophy'llum (D. Don, mss. in herb. Lamb.) leaves lanceolate, acute, glabrous on both surfaces, as well as the peduncles, rounded at the base; ovarium bristly. ♄. H. Native of the north-west coast of America, where it was collected by Menzies. Petioles an inch long. Leaves 7-8 inches long. Flowers copious, smaller than those of *R. máximum*, white. Calycine lobes short, rounded. Filaments glabrous.

Long-leaved Rhododendron. Shrub.

6 R. Catawbie'nse (Michx. fl. bor. amer. 1. p. 258.) leaves short-oval, rounded, and obtuse at both ends, glabrous, of a different colour beneath; calycine segments elongated, oblong. ♄. H. Native on the high mountains of Virginia and Carolina, particularly on the head waters of the Catawba River. Sims, bot. mag. 1671. Lodd. bot. cab. 1176. Flowers purple, disposed in umbellate corymbs.

Var. β, Russellìanum (Sweet fl. gard. n. s. t. 91.) leaves oblong, finely tomentose beneath; corymbs many-flowered; flowers of a bright rosy red, approaching to crimson. ♄. H. A hybrid, raised from the seed of *R. Catawbiénse*, impregnated by the pollen of *R. arbòreum*, by Mr. Russell, of Battersea.

Catawba Rhododendron. Fl. June, Aug. Clt. 1809. Shrub 4 feet.

7 R. brachyca'rpum (D. Don, mss. in herb. Lamb.) leaves elliptic-oblong, obtuse, clothed with rusty tomentum beneath, rounded at the base; ovaries 5-celled, and are as well as the peduncles hairy.? ♄. H. Native of Japan. Petioles half an inch long. Leaves 3 inches long. Calycine lobes very short, roundish, revolute, callous. Style elongated. Stigma clavate.

Short-fruited Rhododendron. Shrub.

8 R. chrysa'nthum (Lin. syst. 405. suppl. 237.) leaves acutish, attenuated at the base, oblong, glabrous, reticulately veined, and of a rusty colour beneath; flowers and buds clothed with rusty tomentum; pedicels hairy; calyx hardly any; segments of the corolla rounded; ovarium tomentose. ♄. H. Native of Siberia, on the highest mountains, and of Caucasus. Pall. itin. append. p. 729. no. 87. t. N. f. 1-2. fl. ross. 1. p. 44. t. 30. Woodv. med. bot. 433. t. 149. Plenk,

FIG. 141.

par. lond. t. 80.—Gmel. sib. 4. t. 54. R. officinàle, Salisb. p. 121. t. 54. Branches decumbent, beset with rusty stipula-formed scales. Flowers handsome, large, drooping, revolute, rather irregular, yellow. Stigma 5-lobed. The plant and its effects were first described by Gmelin and Steller, who mention it as used in Siberia for the cure of rheumatism: with us it is used in decoction as a substitute for *Colchicum*. (F. 141.)

Yellow-flowered Rhododendron. Fl. June, July. Clt. 1796. Shrub $\frac{1}{2}$ to 1 foot.

9 R. Cauca'sicum (Pall. fl. ross. 1. p. 46. t. 30.) leaves ovate-oblong, clothed with rusty tomentum beneath, rugged and green above; peduncles hairy; bracteas elongated, tomentose; ovarium downy. ♄. H. Native of Caucasus, on high rocks, near the limits of perpetual snow. Sims, bot. mag. 1145. Root creeping. Branches procumbent. Flowers purple or white, disposed in umbellate corymbs. Corollas rotate, with wavy rounded segments.

Caucasian Rhododendron. Fl. Aug. Clt. 1803. Shrub 1 foot.

10 R. puncta'tum (Andr. bot. rep. 36. Vent. cels. t. 15.) leaves oval-lanceolate, acute at both ends, glabrous, beset with rusty resinous dots beneath; pedicels short; calycine teeth short; segments of corolla ovate, a little undulated. ♄. H. Native of Carolina, on the mountains, particularly on the head waters of the Savannah River. Sims, bot. mag. 2285. R. ferrugíneum, var. mìnus, Pers. ench. 1. p. 478. R. mìnus, Michx. fl. bor. amer. 1. p. 258. R. punctàtum, var. mìnus, Wats. dendr. brit. 162. A. An elegant shrub. Flowers pink, disposed in umbellate corymbs. Corollas funnel-shaped. Capsules elongated.

Var. β, màjus (Ker. bot. reg. 37.) leaves and flowers larger.

Dotted-leaved Rhododendron. Fl. July, Aug. Clt. 1786. Shrub 4 feet.

11 R. ferrugi'neum (Lin. spec. 562.) leaves oblong, attenuated at both ends, glabrous, shining and green above, but thickly beset with rusty dots beneath; calycine segments dentately ciliated. ♄. H. Native of the Alps of Europe, as of Switzerland, Austria, Savoy, Dauphiny, and Piedmont, where this and *R. hirsùtum* terminate ligneous vegetation, and furnish the shepherds with their only fuel. Jacq. obs. 1. p. 26. t. 16. fl. austr. 3. t. 255. Lodd. bot. cab. 65.—Lob. icon. 366. Leaves like those of the box-tree, when young ciliated with a few hairs at bottom. Flowers of a beautiful rose-colour or scarlet, disposed in umbellate corymbs, marked with ash-coloured or yellow dots. Corollas funnel-shaped. Filaments hairy at bottom.

Var. β, flòre-álbo; flowers white.

Rusty-leaved Rhododendron. Fl. May, July. Clt. 1752. Shrub 1 foot.

12 R. hirsu'tum (Lin. spec. 562.) leaves ovate-lanceolate or elliptic, acutish, ciliated with rusty hairs on the margins, glabrous above, dotted and hairy beneath; calycine segments fringed, bearded. ♄. H. Native of the Alps of Europe, as of Switzerland, Austria, Styria, Dauphiny, &c. Jacq. austr. 1. t. 98. Sims, bot. 1853. Lodd. bot. cab. 479.—Lob. icon. 468. Very like *R. ferrugíneum*. Flowers pale red or scarlet, disposed in umbellate corymbs. Corollas funnel-shaped.

Var. β, variegàtum; leaves edged with yellow.

Hairy Rhododendron. Fl. May, July. Clt. 1656. Shrub 1 to 2 feet.

13 R. setòsum (D. Don, in wern. soc. trans. 3. p. 408. prod. fl. nep. 152.) branchlets beset with bristles; leaves oval, mucronate, bristly on the margins and under surfaces; pedicels beset with glandular hairs; calycine segments rounded, coloured, naked, crenulated. ♄. F. Native of Nipaul, on Gosaingsthan. A small, stiff, much-branched shrub. Leaves $\frac{1}{2}$ an inch long. Flowers purple, size of those of *R. Daúricum*, disposed in umbellate corymbs. Calyx purple. Filaments bearded at the base. Stigma capitate.

Bristly Rhododendron. Fl.? Clt. 1825. Shrub $\frac{1}{2}$ to 1 ft.

Sect. II. Boòram (the name of the first species in Nipaul). Limb of calyx 5-lobed. Corolla campanulate. Stamens 10. Ovarium 8 or 10-celled. Leaves coriaceous, evergreen.—Species all natives of India.

14 R. arbòreum (Smith, exot. bot. t. 6.) leaves lanceolate, acute, silvery beneath, tapering to the base; peduncles and calyxes woolly; segments of corolla 2-lobed, with crenulately curled margins; capsule 10-celled, tomentose. ♄. F. Native of Nipaul, on the mountains at Narainhetty, where it is called *Booram* by the natives. Hook. exot. fl. 168. Lindl. bot. reg. t. 896. Sweet, fl. gard. 3. t. 250. R. purpùreum, Hamilt. mss. Tree very showy when in blossom. Leaves 4-6 inches long. Flowers large, scarlet, dotted with black on the upper lip inside, disposed in dense heads. Stigma capitate, crenulated.

Tree Rhododendron. Fl. March, May. Clt. 1820. Tree 20 feet.

15 R. a'lbum (Hamilt. mss. Sweet, fl. gard. t. 148.) leaves lanceolate, wrinkled and dark green above, but of a rusty cinnamon colour beneath; alternate filaments toothed. ♄. F. Native of Nipaul. R. arbòreum γ, floribus niveis, D. Don, prod. fl. nep. p. 154. Wall. pl. asiat. var. 2. t. 123. Flowers white, spotted with purple on the upper lip. Dr. Wallich considers this and *R. arbòreum* to be only varieties of each other.

White-flowered Rhododendron. Fl. March, May. Clt. 1818. Tree 10 feet.

16 R. cinnamòmeum (Wall. cat. no. 760.) leaves lanceolate, acute, obtuse at the base, clothed with intense rusty tomentum beneath; limb of calyx short, callous, 5-lobed; ovarium tomentose, 10-celled. ♄. F. Native of Nipaul. Very nearly allied to *R. arbòreum*, and hardly distinct from that species. Leaves 3-4 inches long. Corolla with wavy cloven segments, apparently white. Capsule an inch long. Perhaps the same as *R. álbum*.

Cinnamon-coloured-leaved Rhododendron. Fl. June. Clt. 1817. Tree.

17 R. barba'tum (Wall. cat. no. 757.) leaves oblong-lanceolate, acute, obtuse at the base, yellowish beneath; calycine segments dilated, membranous; ovarium 10-celled, glandular, hispid; petioles and mid-rib of leaves bristly; filaments glabrous, toothless. ♄. F. Native of Nipaul. Habit of *R. arbòreum*. Leaves a span long. Corolla dark red, with broad rounded cloven segments. Ovarium thickly beset with glanduliferous bristles.

Bearded Rhododendron. Tree.

18 R.? linearifòlium (Poir. suppl. ex Spreng. syst. 2. p. 293.) leaves linear, coriaceous, obtuse, with revolute edges, clothed with rusty down beneath; flowers corymbose; calyx minute, obtuse, velvety. ♄. F. Native of the East Indies.

Linear-leaved Rhododendron. Shrub.

19 R. campanula'tum (D. Don, in wern. mem. 3. p. 409. prod. fl. nep. 153.) leaves elliptic-oblong, mucronate, rusty beneath, rather cordate at the base; segments of corolla flat, emarginate; ovarium 6-celled, glabrous. ♄. F. Native of Nipaul, on Gosaingsthan, a high mountain to the north of the valley. Lodd. bot. cab. 1944. Sweet, fl. gard. n. s. t. 241. Under surfaces of leaves clothed with fine scaly pubescence, at first of a purplish hue, afterwards changing to nearly white, and finally to a deep ferruginous brown. Flowers copious, disposed in corymbose clusters. Pedicels glabrous. Bracteas fringed. Corollas large, pale pink, changing to white, having the upper lip marked with irregular purple spots. Filaments bearded at the base. This species surpasses all others in the size of its flowers, except one found in Java by Dr. Horsefield.

Campanulate-flowered Rhododendron. Fl. April. Clt. 1817. Shrub 3 to 5 feet.

20 R. formòsum (Wall. pl. rar. asiat. 3. p. 3. t. 207,) leaves lanceolate, acute, attenuated at the base, beset with rusty dots beneath; segments of corolla entire, flat; filaments bearded; ovarium 10-celled. ♄. F. Native of Nipaul. Leaves an inch and a half long. Flowers about the size of those of *R. Pónticum*, white, suffused with red. Limb of calyx short.

Showy Rhododendron. Shrub.

Sect. III. Pogona'nthum (from *πωγων*, *pogon*, a beard; and *ανθος*, *anthos*, a flower; throat of corolla woolly inside). Limb of calyx short, 5-lobed. Corolla salver-shaped, with a cylindrical tube, and a spreading limb. Stamens 8, inclosed. Ovarium 5-celled.—Leaves evergreen, coriaceous.

21 R. anthopògon (D. Don, in mem. wern. soc. 3. p. 409.) branchlets downy; leaves oval, rusty beneath from lepidoted tomentum; corollas with a woolly throat. ♄. F. Native of Nipaul, on Gosaingsthan. R. aromáticum, Wall. cat. Shrub much branched. Leaves ending in a reflexed mucrone, naked above. Flowers glomerate, sulphur-coloured. Pedicels short, lepidoted and resinous. Calycine segments rounded at the apex, with villous margins. Segments of corolla roundish, with undulately curled margins. Filaments glabrous. Stigma clavate.

Bearded-flowered Rhododendron. Fl. April, May. Clt. 1820. Shrub 1 to 1½ foot.

Sect. IV. Lepípherum (from *λεπις*, *lepis*, a scale; and *φερω*, *phero*, to bear; leaves covered with small scales.) Limb of calyx dilated, 5-lobed. Corolla campanulate or rotate. Stamens 10. Ovarium 5-celled.—Leaves membranous, sometimes deciduous.

22 R. lepidòtum (Wall. cat. 758.) every part of the plant is beset with ferruginous scale-like dots; leaves spatulate or lanceolate, attenuated at the base, beset with round scale-like dots, as well as the branchlets, ferruginous beneath; calycine segments rounded; corollas short, campanulate, lepidoted, with roundish entire lobes; capsules also lepidoted; filaments woolly at the base. ♄. F. Native of Nipaul. A widely-branched shrub, with the habit of *R. Daúricum*. Leaves of a thinner texture, about an inch long. Flowers as well as the capsule covered with round rust-coloured scales. Flowers deep pink, solitary or 2-5 together, terminal, on short filiform pedicels.

Scaly-dotted Rhododendron. Shrub 2 to 3 feet.

23 R. Lappónicum (Wahl. fl. suec. p. 249.) shrub branched, procumbent; branches divaricate; corollas rotately funnel-shaped; leaves oblong, obtuse, stiff, beset with foveolate dots, yellowish and lepidoted beneath. ♄. H. Native of the Arctic regions of Europe, Asia, and North America. Azàlea Lappónica, Lin. fl. suec. p. 64. spec. 214. fl. lapp. ed. Smith, p. 59. t. 6. f. 1. Hook. bot. mag. 3106. Young branches obscurely pubescent, warted. Leaves deep green above, pale green and at length yellowish beneath, thickly beset with hollow dots on both surfaces, which are covered by umbilicate permanent scales. Flowers crimson, disposed in umbellate corymbs, 5-6 together, surrounded by large dotted scales or bracteas. Calyx covered with yellow scales, ciliated. Segments of corolla unequal, undulated. Stamens 5-8, equal in length to the corolla. Stigma capitate, 5-lobed. Filaments hairy at the base.

Lapland Rhododendron. Fl. July. Clt. 1825. Shrub procumbent.

24 R. Dau'ricum (Lin. spec. 562.) deciduous; leaves oblong, attenuated at both ends, glabrous, lepidoted from rusty scales, particularly beneath; limb of calyx 5-toothed; corollas rotate. ♄. H. Native of Siberia, peculiar to the alpine tracts of Eastern Asia; it appears first at the mouth of the river Yenesee, and beyond that, especially from the river Uda, in the pine woods, it begins to be common; but about the Baikal it is most abundant, and extends through the deserts of the Mongols to China and Thibet; at the Lena it becomes more rare, and beyond that it is much dwarfer, with more slender flowers and narrower leaves. Pall. fl. ross. 1. p. 47. t. 32. Andr. bot. rep. t. 4. Curt. bot. mag. t. 636. Lodd. bot. cab. 605.—Amm. ruth. 181. t. 21. Roots knobbed, bound by fibres. Stems twisted and knobbed in the wild state. Petioles downy. Leaves dotted on both surfaces, but ferruginous beneath; before the fall in autumn they become of a dusky red colour. The flowers rise before the leaves from the tops of the branches, from buds which are composed of concave downy scales. Corollas purple.

Var. β, atrovírens (Ker. bot. reg. t. 194.) evergreen; leaves deep green and shining above. ♄. H. Native of Siberia. Sims, bot. mag. 1888.

Daurian Rhododendron. Fl. March, Dec. Clt. 1780. Shrub 2 to 6 feet.

Sect. V. Chamæcístus (from *χαμαι*, *chamai*, on the ground; and *cistus*, the rock-rose: plants with the habit of species of Heliánthemum. Limb of calyx foliaceous, 5-cleft. Corolla rotate. Stamens 10. Ovarium 5-celled.—Leaves small, membranous, evergreen.

25 R. Camtscha'ticum (Pall. fl. ross. 1. p. 48. t. 33.) leaves obovate, acutish, 5-nerved, naked, ciliated; peduncles hairy, usually twin; calycine segments ciliated, foliaceous. ♄. H. Native of Kamtschatka and the Aleutian Islands, in muddy places on the mountains. Gmel. sib. 4. p. 126. no. 13. Corollas purple, rotate. A prostrate shrub.

Kamtschatka Rhododendron. Fl. July. Clt. 1802. Shrub prostrate.

26 R. chamæcístus (Lin. spec. 562.) leaves oblong-lanceolate, attenuated at both ends, stiffish, glandularly ciliated; peduncles usually twin, and are as well as the calyxes beset with glandular hairs. ♄. H. Native of the Alps of Europe; as of Austria, Carniola, Mount Baldo, and near Salzburgh; and in Eastern Siberia. Jacq. fl. austr. 3. t. 217. Curt. bot. mag. t. 488. Lodd. bot. cab. 1491.—Mich. gen. 225. t. 106.—Pluk. phyt. t. 23. f. 4. Corollas rotate, pale purple. A dwarf tufted shrub, with small leaves, about the size of those of a species of *Heliánthemum*.

Ground-Cistus Rhododendron. Fl. May, June. Clt. 1786. Shrub ½ foot.

Sect. VI. Tsutsu'tsi (the Chinese name of the first species). Limb of calyx foliaceous, 5-cleft. Corolla campanulate. Stamens 5-10. Ovarium 5-celled.—Leaves membranous, evergreen, hispid from pili.

27 R. I'ndicum (Sweet, fl. gard. n. s. 128.) branches strigose; leaves cuneate-lanceolate, finely crenulated, strigose, attenuated at both ends; calycine teeth long-lanceolate, obtuse, ciliated, spreading; flowers terminal, solitary or twin, decandrous. ♄. S. Native of China. Much cultivated in Japan for the sake of its elegant flowers. Azàlea I'ndica, Lin. spec. 214. Thunb. jap. 84. Sims, bot. mag. 1480. Lodd. bot. cab. 275.—Herm. lugdb. 152. t. 153. Tsut-sut-si, Kœmpf. amœn. 845. t. 146. Flowers showy, scarlet or red.

Var. β, púlchrum (Sweet, fl. gard. n. s. 117.) calyx very hairy, with subulate segments; leaves elliptic, acute; flowers decandrous, terminal, 2-3 together. ♄. G. A hybrid between *R. ledifòlium*, impregnated by the pollen of *R. I'ndicum*. R. I'ndicum, var. γ, Smíthii, Sweet, hort. brit. 2. p. 343. Corollas large, of a deep rosy purple, spotted with deep red inside.

Var. γ, ignéscens (Sweet, fl. gard. n. s. 128.). The four lower segments of the corolla flame-coloured, and the superior one lilac, and obsoletely dotted. ♄. S. Native of China.

Var. δ, *aurantìacum;* flowers of orange-red colour. ♄. G. Native of China.

Var. ε, *lutéum* (Sweet, l. c.) flowers double, yellow.

Var. ζ, *variegàtum* (Blum. bijdr. 851.) leaves obovate, covered with white strigose bristles; flowers rose-coloured, variegated with white. ♄. G. Native of China.

Var. η, *spatulàtum* (Blum. bijdr. 852.) leaves spatulate, mucronate, beset with rusty strigæ; flowers rose-coloured. ♄. G. Native of China and Japan.

Var. ϑ, *grandiflòrum* (Blum. bijdr. 853.) leaves oblong-spatulate, mucronate, beset with white bristles or strigæ; flowers large, solitary, deep rose-coloured. ♄. G. Native of China and Japan.

Var. ι, *angustifòlium* (Blum. l. c.) leaves narrow-lanceolate.

Var. κ, *floribúndum* (Blum. l. c.) leaves narrow, cuneate-lanceolate, beset with rusty strigæ; stem much branched. ♄. G. Native of China and Japan.

Indian Rhododendron. Fl. March, May. Clt. 1808. Shrub 3 to 6 feet.

28 R. scàbrum; leaves ovate, mucronulate, acute at the base, ribbed beneath, beset with adpressed bristles, as well as the branchlets and peduncles; flowers decandrous; filaments papillose; anthers corniculate at the base; stigma dilated. ♄. G. Native of Japan, in woods on mountains. R. máximum, Thunb. fl. jap. p. 181. Flowers deep rose-coloured, campanulate, usually twin. Lobes of corolla oblong, obtuse, twice longer than the tube. Stamens exserted. Calycine segments oval, obtuse, ciliated. Leaves $1\frac{1}{2}$ to 3 inches long, coriaceous. Corolla 3 inches in diameter.

Scabrous Rhododendron. Shrub.

29 R. macrà'nthum; leaves opposite or 3 in a whorl, obovate or lanceolate, mucronulate, shining, clothed with adpressed bristles; flowers pentandrous; calycine segments lanceolate, acute, deeply toothed, bristly; filaments glabrous. ♄. G. Native of Japan. Azàlea macránthum, Bunge, in mem. acad. petersb. 2. p. 115. R. nítens, D. Don, mss. Stems several, rising from the root-stock, 2-4 feet long, procumbent, naked. Branches fascicled, leafy at the tips, beset with adpressed silvery bristles, which change to brown, as well as the calyxes. Flowers solitary or in pairs, nearly sessile, involucrated by bracteas. Corollas large, of a brilliant salmon-colour, glabrous outside; the limb spreading with oblong blunt lobes; the upper lobes marked with deeper coloured spots. There is a variety of this species, having the flowers pale pink and striped.

Large-flowered Rhododendron. Fl. May, June. Clt. 1833. Shrub procumbent, 2 to 3 feet.

30 R. reticula'tum (D. Don, mss.) leaves broadly ovate, acute, rather coriaceous, sparingly hairy, glaucous and reticulately veined beneath. ♄. G. Native of Japan, on the mountains, and has been lately introduced by Mr. Knight, of King's Road, Chelsea. Stems erect, a foot or 2 feet high, stiff. Leaves stiff, $1\frac{1}{2}$ inch long, rounded at the base, bright green and shining above, beset with a few adpressed bristles as well as the young shoots. Flowers not seen.

Reticulated-leaved Rhododendron. Fl.? Clt. 1834. Shrub.

31 R. Farre'ræ (Tate, in Sweet. fl. gard. n. s. t. 95.) branches stiff, villous while young, but glabrous in the adult state; leaves stiff, coriaceous, ovate, obtuse, ending in a short cartilaginous mucrone, attenuated at the base, nerved and reticulately veined, hairy on both surfaces, with somewhat recurved ciliated edges; petioles ciliated at the base; flowers terminal, solitary. ♄. G. Native of China, from whence it was brought by Capt. Farrer. Calyx pilose, 5-lobed. Corolla spreading, with undulated segments, lilac or pale purple-red. A dwarf deciduous shrub. Flowers decandrous.

Farrer's Rhododendron. Fl. March. Clt. 1829. Shrub.

32 R. phœnìceum; hairy; leaves oblong-obovate, tapering into the petioles at the base; flowers collected at the tops of the branches, large, decandrous; stamens short; calyx erect, glandular, and viscid. ♄. S. Native of China. Azàlea I'ndica, var. phœnìcea, Sweet. fl. gard. n. s. 128. Azàlea I'ndica γ, Hook. bot. mag. 2667. Azàlea ledifòlia β, phœnìcea, Hook. bot. mag. 3239. Flowers purple, having the upper segments spotted.

Var. β, *flore pleno* (Hook. bot. mag. 2509.) flowers double, purple. Lodd. bot. cab. 1461.

Purple Rhododendron. Fl. May. Clt. 1824. Shrub 3 to 10 feet.

33 R. ledifòlium; the whole shrub is hairy; leaves-elliptic-lanceolate, opaque; flowers by threes at the extremity of the branches, decandrous; calyx erect, glandular and viscid; stamens unequal. ♄. G. Native of China, about Pekin. Azàlea ledifòlia, Hook. bot. mag. 2901. Azàlea I'ndica, var. álba, Lindl. bot. reg. t. 811. Lodd. bot. cab. 1253. Rhod. leucánthum, Bunge, in mem. acad. petersb. 2. p. 115. Flowers showy, pure white.

Ledum-leaved Rhododendron. Fl. March, May. Clt. 1819. Shrub 2 to 6 feet.

34 R. mucrona'tum; much branched; branches pilose; leaves cuneate-oblong, mucronate, clothed with clammy hairs; flowers in fascicles; calycine segments long-acuminated, pilose; flowers octandrous and decandrous. ♄. G. Native of China. Flowers white. Azàlea mucronàta, Blum. bljdr. p. 853.—Perhaps the same as *R. ledifòlium*.

Mucronate-leaved Rhododendron. Shrub.

35 R. Burma'nni; leaves linear-lanceolate, long-acuminated, with recurved margins, clothed with silky villi on both surfaces. ♄. G. Native of Japan. Azàlea rosmarinifòlia, Burm. ex Blum. bijdr. p. 853. but not of Roth. Flowers pentandrous.

Burmann's Rhododendron. Shrub.

36 R. móllis; branchlets pilose; leaves oblong-lanceolate, acute, narrowed at the base, ciliated, very soft beneath; flowers in fascicles; calyx very short; tube clothed with silky tomentum; flowers pentandrous. ? ♄. G. Native of China. Azàlea móllis, Blum. bijdr. p. 853.

Soft Rhododendron. Shrub.

37 R. Loureiria'na; leaves lanceolate, quite entire, rugose about the edges, smooth; corolla white, dotted with red, as also the calyx, anthers, and germs. ♄. G. Native of Cochinchina. Azàlea punctàta, Lour. coch. p. 113. Flowers disposed in terminal heaps.

Loureiro's Rhododendron. Shrub 4 to 5 feet.

38 R. decu'mbens (D. Don, mss.) stems decumbent; leaves ovate, acute; flowers pentandrous; segments of the calyx ovate, acute, ciliated. ♄. G. Native of China, from whence it has been lately introduced by Knight and Tate. Flowers crimson.

Decumbent Rhododendron. Fl. April, May. Clt. 1833. Shrub decumbent.

39 R. Sine'nse (Sweet. fl. gard. 290.) leaves slowly deciduous, elliptic, acutish, pilosely pubescent, feather-nerved, with ciliated margins, canescent beneath; corollas downy; stamens equal in length to the limb of the corolla. ♄. G. Native of China. Azàlea Sinénsis, Lodd. bot. cab. 885. Flowers flame-coloured, pentandrous.

Var. β, *flavéscens* (Sweet, fl. gard. 290.) flowers yellow.

Chinese Rhododendron. Fl. May, June. Clt. 1823. Shrub 3 to 4 feet.

Sect. VII. Pentanthe'ra (from πεντε, *pente*, five; and ανθηρα, *anthera*, an anther; flowers pentandrous). Limb of calyx short, 5-lobed. Corolla funnel-shaped. Stamens 5. Ovarium 5-celled. Leaves deciduous.

40 R. fla'vum; flowers leafy, clammy; leaves ovate, oblong, pilose, ciliated; corolla funnel-shaped; stamens very long. ♄. H. Native of the Levant, at Pontus; Caucasus, Turkey, &c. Azàlea Póntica, Lin. spec. 1669. Curt. bot. mag. t. 433. Azàlea arbòrea, Lin. spec. ed. 1. p. 150.—Buxb. cent. 5. p. 36. t. 69. Flowers fine yellow. Leaves shining. There are a great number of varieties of this species in the gardens, differing principally in the colour of the flowers, and the hue of the leaves. The flowers are of all shades, from yellow to copper or orange-colour. They are sometimes white, (see Sims, bot. mag. 2383.), and are sometimes striped with yellow and red.

Yellow-flowered Rhododendron. Fl. May, June. Clt. 1793. Shrub 4 to 6 feet.

41 R. nudiflòrum (Torr. fl. un. st. 1. p. 140.) leaves lanceolate-oblong, nearly smooth and green on both surfaces, ciliated on the margins, having the mid-rib bristly beneath, and woolly above; flowers rather naked, not clammy; tube of corolla longer than the divisions; teeth of calyx short, rather rounded; stamens much exserted. ♄. H. Native from Canada to Georgia, on the sides of hills. Azàlea nudiflòra, Lin. spec. 214. Azàlea periclymenoìdes, Michx. fl. bor. amer. 1. p. 151. This beautiful shrub has a great many varieties, besides those mentioned below, for which see Loud. hort. brit. p. 66. and supplement, among which is one with double flowers. Flowers scarlet, pink, white, striped, variegated, red, purple, &c., disposed in terminal clustered racemes, appearing before the leaves. The variety *η* proves clearly that *Azàlea* and *Rhododéndron* are not generically distinct.

Var. α, coccíneum (Sims, bot. mag. 180.) flowers scarlet; leaves lanceolate. ♄. H. Native of Georgia, near Savannah.

Var. β, rùtilans (Pursh, fl. amer. sept. 1. p. 152.) flowers deep red; calyxes minute. ♄. H. Ait. hort. kew. p. 319.

Var. γ, cárneum (Pursh, l. c.) corollas pale red, having the tube red at the base; calyx foliaceous. ♄. H. Ait. l. c. Ker. bot. reg. 120.

Var. δ, álbum (Pursh, l. c.) flowers white; calyx middle-sized. ♄. H. Ait. l. c.

Var. ε, papilionàceum (Pursh, l. c.) flowers reddish, with the lower segment white; calyx foliaceous. ♄. H. Ait. l. c.

Var. ζ, partìtum (Pursh, l. c.) flowers pale red, 5-parted even to the base. ♄. H. Ait. l. c.

Var. η, polyándrum (Pursh, l. c.) flowers rose-coloured, short; stamens 10-20. ♄. H. Native near Philadelphia.

Var. θ, Goveniànum; branches tomentosely downy; leaves evergreen or deciduous, oblong, acute, downy while young, but glabrous in the adult state, and recurved at the apex; tube of corolla a little shorter than the segments. ♄. H. A hybrid, raised from the seed of *R. nudiflòrum*, impregnated by the pollen of a hybrid raised between *R. Pónticum* and *R. Catawbiénse*. Flowers delicate light purple, disposed in terminal racemose corymbs. R. Goveniànum, Sweet, fl. gard. 3. t. 263.

Var. ι, rùbrum (Lodd. bot. cab. t. 51.) flowers red. ♄. H.

Naked-flowered Rhododendron. Fl. April, June. Clt. 1734. Shrub 3 to 4 feet.

42 R. viscòsum (Torr. l. c.) leaves oblong-obovate, acute, smooth and green on both surfaces, ciliated on the margins, having the mid-rib bristly; flowers clammy, leafy, hairy; tube of corolla as long as the segments; teeth of the calyx short, rounded; stamens hardly longer than the corolla. ♄. H. Native from Canada to Georgia, in swamps and shady woods. Azàlea viscòsa, Lin. spec. 214.—Pluk. alm. 106. t. 161. f. 4. Catesb. car. 1. t. 57. Flowers white, sweet-scented, in terminal clusters, downy. There are a great number of varieties of this species, (see Loud. hort. brit. p. 66.), varying in the colour of the flowers, and otherwise. The flowers are white and red, and variegated with these colours. There is a downy variety with red flowers figured in Lodd. bot. cab. t. 441.

Var. β, ornàtum (Sweet, fl. gard. n. s. 137.). A hybrid raised from the seed of *R. viscòsum β rubéscens*, fertilized by the pollen of *R. Pónticum*.

Clammy-flowered Rhododendron. Fl. July, Aug. Clt. 1734. Shrub 2 to 4 feet.

43 R. calendula'ceum (Torr. l. c.) leaves oblong, pubescent on both surfaces, at length hairy; flowers large, not clammy, rather naked; teeth of calyx oblong; tube of corolla hairy, shorter than the segments. ♄. H. Native from Pennsylvania to Carolina. Azàlea calendulàcea, Michx. fl. bor. amer. 1. p. 156. Lodd. bot. cab. 1394. A. nudiflòra, var. coccínea, Ait. hort. kew. 319. Flowers yellow, red, orange-coloured, and copper-coloured. Sims, bot. mag. 172. Lodd. bot. cab. 1394. or flame-coloured. Ker. bot. reg. 145. Said to be the handsomest shrub in North America. There are a great many varieties of it, varying in the colour of the flowers. See Loud. hort. brit. p. 66.

Var. β, Mortèrii (Sweet, fl. gard. n. s. t. 10.) A hybrid between *R. calendulàceum* and one of the red varieties of *R. nudiflòrum*. There are also two kinds of this; one with a flesh-coloured corolla, having the upper segment orange-coloured, edged with flesh-colour, called *R. Mortèrii cárnea;* and another called *Mortèrii*, var. *præ'stans*, with pale copper-coloured flowers, tinged with blush.

Marygold Rhododendron. Fl. May, June. Clt. 1806. Shrub 2 to 6 feet.

44 R. arbore'scens (Torr. l. c.) leaves obovate, rather obtuse, smooth on both surfaces, glaucous beneath, ciliated on the margins, having the mid-rib almost smooth; flowers not clammy, leafy; tube of corolla longer than the segments; calyx leafy, with the segments oblong and acute; filaments exserted. ♄. H. Native of Pennsylvania, on the sides of rivulets near the Blue Mountains. Azàlea arboréscens, Pursh, fl. amer. sept. 1. p. 153. Flowers large, reddish; leaves of flower-buds large, yellowish brown, surrounded with a fringed white border.

Arborescent Rhododendron. Fl. May, July. Clt. 1818. Tree 10 to 20 feet.

45 R. nítidum (Torr. l. c.) branches smoothish; leaves oblanceolate, rather mucronate, coriaceous, smooth on both surfaces, shining above, having the nerve bristly beneath, with revolute ciliated margins; flowers clammy, leafy; tube of corolla a little longer than the segments; calyx very short; filaments exserted. ♄. H. Native from New York to Virginia, in deep mossy swamps on the mountains. Azàlea nítida, Pursh, fl. amer. sept. 1. p. 153. Ker. bot. reg. 414. Flowers white, tinged with red. Leaves dark green, shining, smaller than any other species of the present section.

Shining-leaved Rhododendron. Fl. June, July. Clt. 1812. Shrub 2 to 4 feet.

46 R. híspidum (Torr. l. c.) branches straight, very hispid; leaves long-lanceolate, hispid above, and smooth beneath, glaucous on both surfaces, ciliated on the margins, having the nerve bristly beneath; flowers very clammy, leafy; tube of corolla wide, scarcely longer than the segments; teeth of calyx oblong, rounded; filaments exserted. ♄. H. Native of New York and Pennsylvania, on the borders of lakes on the highest part of the Blue Mountains. Azàlea híspida, Pursh, fl. amer. sept. 1. p. 154. Wats. dendr. brit. 6. Azàlea viscòsa, var. glaúca, Ait. hort. kew. 1. p. 319.? Flowers white, with a red border, and a tinge of red on the tube, which makes them appear to be of a rose-colour before expansion. Stamens sometimes 10. This species may be distinguished from the rest of the present section by its bluish appearance.

Hispid Rhododendron. Fl. July, Aug. Clt. 1734. Shrub 10 to 15 feet.

47 R. bícolor; leaves oblong, clothed on both surfaces with fine hoary pubescence, not bristly on the nerve; flowers small,

not clammy, naked; tube of corolla hardly longer than the segments; calyxes very short: having one of the segments linear, and 4 times longer than the rest; filaments exserted; branchlets hispid. ♄. H. Native of Carolina and Georgia, on barren sandy hills. Azàlea bícolor, Pursh, fl. amer. sept. 1. p. 153. Azàlea nudiflòra, var. bícolor, Ait. hort. kew. 1. p. 319.—Trew. ehret. t. 48. Flowers slender and smaller than the rest, of a pale rose-colour, or nearly white, with a deep red-coloured tube.

Two-coloured-flowered Rhododendron. Fl. May, June. Clt. 1734. Shrub 3 to 4 feet.

48 R. glau'cum; branchlets hispid; leaves oblanceolate, acute, glabrous on both surfaces, glaucous beneath, ciliated on the margins, having the mid-rib bristly; flowers very clammy, leafy; tube of corolla twice longer than the segments; calyx very short; filaments about equal in length to the segments of the corolla. ♄. H. Native from New England to Virginia, in swamps of a clayey soil. Azàlea glaúca, Pursh, fl. amer. sept. 1. p. 154. Lam. ill. p. 493. Wats. dendr. brit. 5. Azàlea viscòsa, var. floribúnda, Ait. hort. kew. 1. p. 319. Flowers white, very fragrant. The shrub is dwarfer than other species of the present section, and flowers in great abundance. Nuttall considers this as only a variety of *A. viscòsa*, differing in nothing but in the under sides of the leaves being glaucous.

Glaucous-leaved Rhododendron. Fl. June, July. Clt. 1734. Shrub 2 feet.

49 R. cane'scens; leaves obovate-oblong, downy above, and tomentose beneath, not bristly on the middle nerve; flowers not clammy, nearly naked; tube of corolla hardly shorter than the segments; teeth of calyx very short, rounded, obtuse; stamens hardly exserted. ♄. H. Native of Lower Carolina, on the banks of rivers; and of Virginia, on the mountains of the Cacapoon Springs, near Winchester. Azàlea canéscens, Michx. fl. bor. amer. 1. p. 150. Wats. dendr. brit. 116. Flowers rose-coloured.

Canescent Rhododendron. Fl. May, June. Clt. 1812. Shrub 3 to 4 feet.

50 R. speciòsum; branches hairy; leaves lanceolate, ciliated, acute at both ends; calyx pubescent; corolla silky, with obtuse, ciliated, lanceolate, undulated segments; stamens exserted. ♄. H. Native of North America. Azàlea speciòsa, Willd. enum. p. 10. Lodd. bot. cab. 624. Wats. dendr. brit. 116. A coccínea, Lodd. Flowers scarlet and orange-coloured. There are several varieties of this species, varying in the shape of the leaves and the colour of the flowers; see Loud. hort. brit. p. 66. Lodd. bot. cab. 1255.

Showy Rhododendron. Fl. May, June. Clt.? Shrub 3 to 4 feet.

Sect. VIII. Rhodòra (from ῥοδον, *rhodon*, a rose; colour of flowers). Limb of calyx 5-toothed. Corolla bilabiate; upper lip broadest, and 2-3-cleft; lower one bidentate. Stamens 10. Capsule 5-celled, 5-valved.—Leaves deciduous. Habit of last section.

51 R. Rhodòra; leaves oval, quite entire, pubescent and glaucous beneath; flowers in terminal clusters, or racemose umbels. ♄. H. Native of Canada, Newfoundland, and on the mountains of New York and Pennsylvania, in bogs. Rhodòra Canadénsis, Lin. spec. 561. Lher. stirp. nov. 1. p. 141. t. 68. Lam. ill. t. 364. Curt. bot. mag. 474. Flowers pale purple, rising before the leaves.

Red-flowered Rhododendron. Fl. April, May. Clt. 1767. Shrub 2 feet.

Cult. Of all the genera in existence, *Rhododéndron* comprises the most handsome, elegant, and showy shrubs, well fitted for adorning shrubberies, or to be grown singly on lawns. All the species grow best in peat soil, or very sandy loam, or vegetable mould: they are either increased by layers or by seeds. When raised in the latter way, the seeds must be sown early in the spring, in flat pans or pots, filled with peat earth, and covered very slightly; the pots or pans should then be set in a close frame, or at the front of a hot-house, till the plants come up, watering them very slightly when dry; and as soon as the seedlings have grown high enough to be laid hold of, they should be planted out into other pans or pots, filled with the same kind of mould; after which they may stand in a close frame for a few days, until they have struck fresh roots, and afterwards hardened to the air by degrees. The smaller kinds of *Rhododéndron* may be propagated freely by cuttings, taken off from young wood, and planted in sand, placing a bell-glass over them. There are now in the gardens a great many hybrid kinds of *Rhododéndron*, and are still increasing in number; some of which outvie the species in splendour. The species natives of Nipaul, China, and Japan, in mild winters, would probably succeed in the open air, but they will not survive a severe winter without protection; they are therefore best kept in pots, and placed among other greenhouse or frame plants. *R. arbòreum* and *R. álbum* are among the most showy of the species, and are well adapted for conservatories, or to be placed in large tubs in the greenhouse. Young cuttings of the tender kinds, if torn off close to the stem, and planted in a pot of sand, will strike root readily; the pot should be plunged in heat under a hand-glass.

XLIV. VIRE'YA (named by Blume after M. Virey, a French physician). Blum. bijdr. p. 854.

Lin. syst. *Decándria, Monogýnia.* Calyx small, obsoletely 5-toothed. Corolla subcampanulate, or funnel-shaped, regular, 5-lobed, adnate to the disk of the calyx. Stamens 10, inserted in the calycine disk; alternate filaments the shortest; anthers oblong, bursting inwardly, naked, dehiscing by two pores at the apex. Style filiform; stigma capitate, 5-furrowed. Capsule silique-formed, 5-angled, 5-celled. Placenta 5-lobed. Seeds numerous, expanded into a bristle-formed awn at both ends.—This genus differs from *Rhododendron* in the calyx being small, and in the stamens not being attached to the corolla in any way.—Mostly parasitical shrubs. Leaves scattered and verticillate, quite entire, coriaceous, covered with scaly dots beneath. Flowers disposed in terminal fascicles.

* *Corollas subcampanulate.*

1 V. Java'nica (Blum. bijdr. 854.) leaves oblong-lanceolate, clothed with fine rusty dots beneath; flowers showy, deep orange. ♄. G. Native of Java, at the foot of Mount Salak, where it is called by the natives *Gaga Mirha.*

Var. β; flowers citron-coloured, smaller.

Java Vireya. Fl. Year. Shrub.

2 V. a'lba (Blum. bijdr. 855.) leaves lanceolate, densely clothed with rusty scales beneath: flowers white, middle-sized. ♄. G. Native of Java, on Mount Salak, parasitical upon trees. Rhododéndron álbum, Blum. cat. hort. buitenz. p. 72.

White-flowered Vireya. Fl. Year. Shrub.

* * *Corollas funnel-shaped.*

3 V. tubiflòra (Blum. bijdr. p. 855.) leaves lanceolate, densely clothed with rusty dot-like scales beneath; flowers scarlet. ♄. G. Native of Java, on the higher mountains.

Tube-flowered Vireya. Fl. Year. Shrub.

4 V. Cele'bica (Blum. l. c.) leaves broad, lanceolate, clothed with rusty dot-like scales beneath; flowers scarlet. ♄. G. Native of the Celebes, in mountain woods.

Celebes Vireya. Fl. Year. Shrub.

5 V. retu'sa (Blum. bijdr. p. 856.) leaves spatulate, retuse, with recurved margins, beset with rusty dots beneath; branches

rough; flowers scarlet. ♄. G. Native of the west of Java, on high mountains.

Retuse-leaved Vireya. Fl. Year. Shrub.

Cult. For culture and propagation, see *Agarísta*, p. 838.

XLV. BEJA'RIA (so named by Mutis after a Spanish botanist of the name of Bejar). Mutis, amer. 1. t. 8. Lin. gen. Reich. no. 648. Juss. gen. 159.—Befária, Humb. et Bonpl. pl. æquin. 2. p. 118. t. 117. nov. gen. amer. 3. p. 290.—Acúnna, Ruiz et Pav.

Lin. syst. *Dodecándria, Monogýnia.* Calyx deeply 7-cleft. Corolla so deeply 7-cleft as to appear of 7 petals, spreading. Stamens 14, hypogynous; anthers obverse or pendulous, awnless. Ovarium free, 7-furrowed. Style elongated; stigma depressedly capitate, 7-furrowed. Capsule depressedly globose, girded by the permanent calyx, and terminated by the style, 7-celled, 7-valved, with a septicidal dehiscence; cells many-seeded. —Elegant alpine shrubs; with scattered, crowded, quite entire, coriaceous leaves; racemose or corymbose, bracteate flowers. Corollas usually purple.

1 B. resinòsa (Mutis, amer. 1. t. 8. Lin. syst. 443. suppl. 246.) branchlets downy; leaves ovate, smooth; corymbs terminal, simple; pedicels downy; corollas resinous and viscid; filaments downy near the base. ♄. G. Native of New Granada. Branches proliferous. Leaves an inch long. Corollas purple.

Resinous-flowered Bejaria. Shrub 3 to 5 feet.

2 B. racemòsa (Vent. cels. p. 51. t. 51.) branchlets smooth or hispid; leaves ovate-lanceolate, glabrous; flowers disposed in racemose terminal panicles. ♄. G. Native of Georgia and Florida, in sandy places. B. paniculàta, Michx. fl. bor. amer. 1. p. 280. t. 26. Corollas purple.

Racemose-flowered Bejaria. Fl. June, July. Clt. 1810. Shrub 3 to 5 feet.

3 B. glau'ca (Humb. et Bonpl. pl. æquin. 2. p. 118. t. 177.) glabrous; leaves oblong, obtuse, glaucous beneath; racemes terminal and axillary; pedicels somewhat fastigiate. ♄. G. Native of South America, in the alpine region of the province of Venezuela, near the top of Silla de Caraccas. Shrub much branched; branchlets angular. Corolla flesh-coloured, glabrous: filaments glabrous.

Glaucous-leaved Bejaria. Fl. June, July. Clt. 1826. Shrub 3 to 6 feet.

4 B. coarcta'ta (Humb. et Bonpl. pl. æquin. 2. p. 125. t. 121.) branchlets clothed with pubescent tomentum; leaves oblong, glabrous, glaucous beneath; corymbs terminal, simple; peduncles, pedicels, rachi, and calyxes clothed with rusty tomentum. ♄. G. Native of Peru, in cold places near the city of Caxamarca. Shrub much branched. Flowers purple. Filaments glabrous, but dilated and pubescent at the base.

Coarctate-corymbed Bejaria. Shrub 4 to 5 feet.

5 B. grandiflo'ra (Humb. et Bonpl. pl. æquin. 2. p. 122. t. 119.) leaves ovate, glabrous above, but clothed with rusty tomentum beneath, as well as the pedicels, peduncles, rachi, calyxes, and branchlets; corymbs terminal, branched a little, many-flowered. ♄. G. Native of the province of Quito, in cold places between Loxa and Ona, in Paramo de Saraguru; and near Alto de Pulla, and Vinajacu. Shrub much branched; branches subverticillate. Corollas purple, about the size of those of *Dictámnus álbus*. Filaments glabrous, but dilated and ciliated at the base.

Great-flowered Bejaria. Shrub 3 to 4 feet.

6 B. æ'stuans (Mutis, in Lin. fil. suppl. 247. mant. 242. Humb. et Bonpl. pl. æquin. 2. p. 120. t. 118.) leaves elliptic, rather glabrous above, but downy and glaucous beneath, while young clothed with rusty tomentum, and ciliated with glands; corymbs terminal, simple; peduncles, pedicels, rachi, calyxes, and branchlets clothed with clammy glandular hairs. ♄. G. Native of New Granada, near Gonzanama. Much branched; branchlets subverticillate. Flowers smaller than those of the preceding, purple. Filaments villous at the base.

Heating Bejaria. Shrub 10 to 15 feet.

7 B. ledifòlia (Humb. et Bonpl. pl. æquin. 2. p. 124. t. 120.) leaves oblong, somewhat mucronate, with revolute edges, glaucous beneath, beset with glandular hairs on both surfaces along the middle nerve; racemes terminal; peduncles, pedicels, rachi, branchlets, and calyxes clothed with clammy glandular hairs. ♄. G. Native of South America, on the top of Silla de Caraccas. Shrub much branched; branches purplish. Flowers about the size of those of *B. glaúca*, purple.

Ledum-leaved Bejaria. Shrub 3 to 4 feet.

8 B. Caxamarce'nsis (H. B. et Kunth, nov. gen. amer. 3. p. 294.) branchlets pilose; leaves oblong, glabrous above, pubescently hairy and glaucous beneath; corymbs terminal, simple; peduncles, pedicels, and rachi, clothed with rusty pilose tomentum; calyxes hairy. ♄. G. Native of Peru, on the Andes, about Caxamarca. A much-branched shrub. Flowers size of those of the preceding, purple; petals narrow.

Caxamarca Bejaria. Shrub 3 to 4 feet.

9 B. lanceola'ta (Ruiz et Pav. fl. per. 4. t. 1513. f. b.) branches and racemes hairy; leaves ovate-lanceolate; corymbs simple, racemose; pedicels short. ♄. G. Native of Peru, on the high hills of Rodos Pillao and Huassa-Huassi, where it is called *Rosa-Rosa*, or *Rosa Huaytta*. Acúnna lanceolàta, Ruiz et Pav. syst. p. 124. Flowers purple or rose-coloured.

Lanceolate-leaved Bejaria. Fl. May, Aug. Shrub 4 to 6 feet.

10 B. oblónga (Ruiz et Pav. fl. per. 4. t. 1513. f. a.) leaves oblong, with revolute margins; flowers corymbose; pedicels long. ♄. G. Native of Peru, in the province of Tarma, at Churupallana; and of Panatahua, at Acomaya and Macora, where it is called *Rosa-Rosa*, from the copious rose-coloured flowers. Acúnna oblónga, Ruiz et Pav. syst. p. 123. Flowers purple or rose-coloured. Branches, petioles, and corymbs downy. Corymbs compound.

Oblong-leaved Bejaria. Shrub 4 to 5 feet.

Cult. For culture and propagation see *Agarísta*, p. 838. Extremely elegant plants, with the habit of some species of *Rhododéndron*, and are therefore well worth the cultivator's care.

XLVI. HYMENA'NTHES (from *ὑμην, hymen*, a membrane; and *ανθος, anthos*, a flower; in reference to the thin corollas). Blum. bijdr. 862.

Lin. syst. *Dodecándria, Monogýnia.* Calyx small, obsoletely denticulated. Corolla campanulate, with a short compressed tube, and a 7-parted limb; segments of the limb imbricated. Stamens 14, hypogynous: alternate ones shortest. Anthers fixed by the back, mutic, opening by 2 pores at the apex. Ovarium free, girded by a nectariferous tumid margin at the base. Style long; stigma obtuse, 7-crenated. Capsule oblong, 7-celled, 7-valved, many-seeded.—Nearly allied to *Bejària*, but differs from it in the small calyx and monopetalous corolla.

1 H. Japónica (Blum. l. c.) shrub a little branched; leaves subverticillate, 3 to 4 in a whorl, petiolate, oblong, acutish, narrowed at the base, quite entire, coriaceous, glabrous, reticulated above, veinless and yellowish beneath; flowers disposed in dense, terminal, bracteate spikes. ♄. G. Native of Japan, from whence it was received by Blume under the name of *Rhododéndron máximum*.

Japan Hymenanthes. Shrub.

Cult. For culture and propagation see *Agarista*, p. 838.

XLVII. KA'LMIA (named by Linnæus in honour of Peter Kalm, professor at Abo, in Sweden; author of Travels in America. 1753). Lin. gen. no. 545. Gærtn. fruct. 1. p. 305. t. 63, Juss. gen. 158. Nutt. gen. amer. 1. p. 267.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-parted. Corolla salver-shaped; under side of limb producing 10 cornute protuberances, and as many cavities on the upper side, in which the anthers lie, or are concealed. Capsule 5-celled, many-seeded; dissepiments marginal.—Evergreen shrubs, with alternate or ternately verticillate leaves. Flowers disposed in terminal, racemose, compound corymbs; but in one species the flowers are solitary and axillary. Pedicels long, 1-flowered, tribracteate at the base; external bractea originating from the rachis. Buds naked. Anthers opening by two oblique truncate pores.—This genus is considered poisonous, and is often fatal to cattle.

1 K. latifòlia (Lin. spec. 560.) leaves on long petioles, scattered, or 3 in a whorl, oval, coriaceous, smooth and green on both surfaces; corymbs terminal, downy, and viscid. ♄. H. Native from Canada to Carolina, on the sides of stony hills. Curt. bot. mag. 175. Bigel. med. bot. p. 133. Wangh. amer. t. 25. f. 50.—Catesb. car. 2. t. 98.—Trew. ehrh. t. 38. f. 1.—Pluk. mant. t. 379. f. 6. A very elegant shrub when in flower: in America it is called *Laurel*, and on the mountains *Calico-bush*. Flowers red. It is not improbable that the deleterious honey in Philadelphia might have been collected by the bees from the flowers of the Calico-bush, which in some places pervades, in rocky woods and depressed summits of mountains, almost in a similar manner with *Callùna vulgàris* of Europe.

Broad-leaved Kalmia. Fl. June, July. Clt. 1734. Shrub 3 to 10 feet.

2 K. angustifòlia (Lin. spec. 561.) leaves petiolate, scattered, or 3 in a whorl, oblong, obtuse, rather rusty beneath; corymbs lateral; bracteas linear; peduncles and calyxes clothed with glandular pubescence. ♄. H. Native from Canada to Carolina, in bogs, swamps, and sometimes in dry mountain lands. Curt. bot. mag. 331. Lodd. bot. cab. 502.—Catesb. car. 3. t. 17. f. 1.—Trew. ehrh. t. 38. f. 2. Flowers dark red. The shrub is known by the name of *Sheep Laurel* in North America, being considered very poisonous when fed upon by sheep. There are several varieties of this species besides the one mentioned, differing in the size of parts, and in the deeper and lighter shade of the corolla. See Loud. hort. brit. p. 171.

Var. β, ovàta (Pursh, fl. amer. sept. 1. p. 296.) leaves broader; stem taller. ♄. H. Native of New Jersey, on the mountains.

Narrow-leaved Kalmia. Fl. May, July. Clt. 1736. Shrub 1 to 2 feet.

3 K. glau'ca (Ait. hort. kew. ed. 2. p. 64.) branchlets 2-edged or triquetrous; leaves opposite, on short petioles, oblong, smooth, glaucous beneath, with revolute edges; corymbs terminal, compound, bracteate; pedicels and calyxes glabrous. ♄. H. Native of bogs in Canada; and on the borders of mountain lakes of New York and Pennsylvania; and of the Island of Sitcha. Curt. bot. mag. 177. Lam. ill. t. 363. Lher. stirp. nov. 2. t. 9. Lodd. bot. cab. 1508. K. polifòlia, Wangh. act. soc. berol. 8. p. 129. t. 5. A very handsome upright small shrub, with pale red flowers. According to Nuttall, the flowers are disposed in terminal compound corymbs, each corymb composed of 3 racemose corymbulets; and the pedicels and calyxes are said by him to be clothed with powdery viscid pubescence.

Var. β, rosmarinifòlia (Pursh, fl. amer. sept. 1. p. 296.) leaves linear, more revolute on the margins, and having the under surface green. ♄. H. Mr. Pursh discovered this variety in a bog near Albany, and is inclined to think it a distinct species.

Glaucous-leaved Kalmia. Fl. April, May. Clt. 1767. Shrub 1 to 2 feet.

4 K. cunea'ta (Michx. fl. bor. amer. 1. p. 257.) leaves scattered, sessile, cuneate-oblong, glandularly pubescent beneath, minutely awned at the apex; corymbs lateral, few-flowered. ♄. H. Native of Carolina, on the mountains. Branches twiggy. Leaves deciduous. Flowers white, red at the bottom, disposed in sessile, lateral, fastigiate clusters.

Cuneate-leaved Kalmia. Fl. May, June. Clt. 1820. Shrub 1 to 2 feet.

5 K. hirsu'ta (Walt. fl. carol. 138. Michx. fl. amer. bor. 1. p. 257. Curt. bot. mag. 138.) branches, leaves, and calyxes very hairy; leaves opposite and alternate, almost sessile, elliptic; peduncles axillary, solitary, 1-flowered, longer than the leaves. ♄. H. Native of South Carolina and Georgia, in barren pine-woods. K. ciliàta, Bartr. itin. 18. A beautiful little shrub, but difficult to cultivate. Leaves small, like thyme. Flowers large, red.

Hairy Kalmia. Fl. June, Aug. Clt. 1786. Shrub 2 to 3 feet.

Cult. Handsome shrubs when in blossom. They grow best in peat soil, and are increased either by layers or by seeds. When raised by seeds, they are reared and otherwise treated in the manner recommended for *Rhododéndron*, which see, p. 848.

XLVIII. MENZIE'SIA (named in honour of Archibald Menzies, F.L.S. &c. surgeon and naturalist to the expedition under Vancouver, in which voyage he collected many specimens of plants on the north-west coast of America, New Holland, Van Diemen's Land, &c.). Smith, icon. ined. 56. Nutt. gen. amer. 1. p. 251. D. Don, in edinb. phil. journ. 17. p. 160.

Lin. syst. *Octándria, Monogýnia.* Calyx 4-lobed. Corolla tubular or globose: limb very short, 4-lobed, revolute. Stamens 8, inclosed; filaments subulate, glabrous; cells of anthers parallel, connate, mutic at the base, and opening each by an oblique foramen at the apex. Stigma obtuse. Capsule ligneous, 4-celled, with a septicidal dehiscence. Placenta 4-lobed. Seeds scobiform.—Deciduous shrubs, natives of North America. Leaves membranous, glaucous beneath. Pedicels numerous, terminal, 1-flowered, fascicled.

1 M. ferrugínea (Smith, icon. ined. 1. p. 56. t. 56.) corolla urceolate, with rounded lobes; leaves and branches hairy. ♄. H. Native of the north-west coast of America, particularly on the Columbia River; and of the Island of Sitcha. Lam. ill. t. 285. M. urceolàris, Salisb. par. lond. no. 44. Leaves obovate-lanceolate. Flowers of a rust-colour.

Rusty-flowered Menziesia. Fl. May, June. Clt. 1811. Shrub 3 to 4 feet.

2 M. globula'ris (Salisb. par lond. 44.) corolla globose, with rounded lobes; leaves and branches hairy. ♄. H. Native of Virginia and Carolina, on high mountains; plentiful on the Cacapoon Mountains, near Winchester, Virginia. M. Smíthii, Michx. fl. bor. amer. 1. p. 235. Azàlea pilòsa, Lam. ill. 494. M. pilòsa, Pers. ench. 1. p. 420. Leaves lanceolate. Flowers yellowish brown.

Globular-flowered Menziesia. Fl. May, June. Clt. 1806. Shrub 3 to 5 feet.

3 M.? triflòra (Bert. ex Spreng. syst. 2. p. 202.) corolla oblong, with pointed lobes; leaves and branches glabrous. ♄. S. Native of Jamaica, on the mountains. M.? elàta, D. Don, mss. Andrómeda octándra, Swartz. prod. p. 73. fl. ind. occ. 2. p. 840. Leaves spatulate, oblong. Peduncles aggregate, reflexed.

Three-flowered Menziesia. Shrub tall.

Cult. For culture and propagation see *Azàlea*, p. 851.

XLIX. AZA'LEA (from αζαλεος, *azaleos*, dry, arid; habita-

tion of plant). D. Don, in edinb. phil. journ.—Azàlea procúmbens, Lin. and other authors.—Loiseleùria, Desv. Chamælèdon, Link, enum. 1. p. 210.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla short, campanulate, 5-cleft. Stamens 5, equal, shorter than the corolla; cells of anthers opening by a terminal pore. Style straight, inclosed. Capsule 5-celled: with 5 cloven-pointed valves, whose inflexed edges form the double partitions.—A small, evergreen, glabrous, procumbent shrub, with the habit of *Thyme*. Leaves opposite, small, elliptic, glabrous, with revolute margins. Flowers pedicellate, rising in fascicles from the axils of the upper leaves, small, red.

1 A. procu'mbens (Lin. spec. 205.). ♄. H. Native of Europe, on mountains; plentiful on the tops of mountains in Scotland, but rare on the mountains in the north of England. In North America, in the alpine regions of the White Mountains, New Hampshire; and on Grandfather Mountain, Carolina, &c. Fl. dan. t. 9. Lin. fl. lapp. ed. 2d. p. 60. t. 6. f. 2. Smith, engl. bot. t. 865. Lodd. bot. cab. 762.—Bocc. mus. 2. p. 64. t. 53. Chamælèdon procúmbens, Link. enum. 1. p. 210. Loiseleùria, procúmbens, Desv.

Procumbent Azalea. Fl. April, May. Britain. Shrub procumbent.

Cult. This small shrub grows well in a peat border, or in pots in sandy peat earth; it is easily increased by layers or by seeds.

L. LEIOPHY'LLUM (from λειος, *leios*, smooth; and φυλλον, *phyllon*, a leaf; leaves quite smooth). Pers. ench. 1. p. 477. Spreng. syst. 2. p. 276. Ammyrsìne, Pursh, fl. amer. sept. 1. p. 280.—Fischèra, Swartz.—Lèdum buxifòlium, Berg. Ait.

Lin. syst. *Decándria, Monogýnia.* Calyx deeply 5-parted. Corolla 5-petalled. Stamens 10, exserted; anthers opening by 2 terminal pores. Capsule 5-celled, 5-valved, dehiscing at the apex.—A small, erect, bushy shrub. Leaves small, convex, oval, glabrous, shining. Flowers white, disposed in terminal corymbs; the delicacy of the leaves, and the abundance of its white flowers, are highly ornamental.

1 L. thymifòlium (Pers. ench. 1. p. 477. Spreng. syst. 2. p. 315.). ♄. H. Native of New Jersey and the mountains of Carolina, particularly on the highest summits of the Catawba ridge. By the inhabitants of New Jersey it is called *Sand-Myrtle*. Lèdum buxifòlium, Bergius, in act. petrop. 1777. p. 1. t. 3. f. 2. Ker. bot. reg. 531. Ait. hort. kew. 2. p. 66. Lodd. bot. cab. 52. Lèdum thymifòlium, Lam. dict. 3. p. 459. ill. t. 363. f. 2. Lèdum serpyllifòlium, Lher. stirp. nov. 2. t. 10. Ammyrsìne buxifòlia, Pursh, fl. amer. sept. 1. p. 301. Fischèra, Swartz.

Thyme-leaved Leiophyllum. Fl. May, June. Clt. 1736. Shrub $\frac{1}{2}$ to 1 foot.

Cult. For culture and propagation see *Lèdum* below.

LI. LE'DUM (ληδον, ledon, was a name applied by the ancients to a plant producing the substance called *Ladanum*, and now known by the name of *Cistus Lèdum;* in foliage, the *Lèdum* of modern botanists agrees with the plant of the ancients). Lin. gen. no. 546. Gærtn. fruct. 2. p. 145. t. 112. Juss. gen. 159. Nutt. gen. amer. 1. p. 275.

Lin. syst. *Decándria, Monogýnia.* Calyx minute, 4-toothed. Corolla 5-petalled, spreading. Stamens 5-10, exserted; anthers opening by 2 terminal pores. Capsule subovate, 5-celled, 5-valved, opening at the base, pedicellate. Seeds numerous, flat, linear, scabrous, furnished with a membranous wing at each extremity.—Dwarf evergreen shrubs. Leaves coriaceous, with revolute margins, and tomentose on the under surface. Flowers white, disposed in terminal corymbs; pedicels bracteate at the base. Shrubs exhaling a peculiar scent when bruised.

1 L. palu'stre (Lin. spec. 561.) leaves linear, with revolute margins, clothed with rusty tomentum beneath; stamens 10, longer than the corolla. ♄. H. Native of Canada, in swamps, and round the mountain lakes of New York; in Kotzebue's Sound, &c.; also of the north of Europe, as of Denmark, Silesia, &c. Oed. fl. dan. 1031. Duh. arb. 1. t. 67. Schmidt, arb. 163. Lodd. bot. cab. 560. Lèdum Silesìacum, Clus. pan. 68. Rosmarìnum sylvéstre, Cam. epit. 546. Flowers white. Leaves resembling those of *Rosmary*.

Var. β, decúmbens (Ait. hort. kew. ed. 2. vol. 3. p. 48.) shrub decumbent. ♄. H. Native near Hudson's Bay.

Marsh Wild-Rosmary. Fl. April, May. Clt. 1762. Shrub 2 feet.

2 L. latifòlium (Ait. hort. kew. 2. p. 65.) leaves linear-oblong, with replicate margins, clothed with rusty tomentum beneath; stamens 5, about the length of the corolla. ♄. H. Native of Canada, in sphagnous swamps; Greenland, Labrador, Newfoundland, Hudson's Bay. This or the preceding species has lately been found in Ireland. Jacq. icon. 3. t. 464. Schmidt, arb. t. 164. Lam. ill. t. 363. f. 1. Lodd. bot. cab. 534. L. Grœnlándicum, Retz, obs. 4. p. 26. Fl. dan. t. 567. L. palústre, Michx. fl. bor. amer. 1. p. 259. Flowers white. A larger and broader leaved shrub than the last; commonly called *Labrador Tea;* and the leaves are said to be a good substitute for it. Bees are very fond of the flowers.

Broad-leaved Wild-Rosmary, or Labrador Tea. Fl. April, May. Clt. 1763. Shrub 2 to 4 feet.

3 L. Canade'nse (Lodd. bot. cab. 1049.) leaves ovate petiolate, white beneath; flowers disposed in terminal umbellate corymbs, large. ♄. H. Native of Canada, in swamps. Flowers white.

Canadian Wild-Rosmary. Fl. April, May. Clt.? Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Cult. A peat soil, or very sandy loam answers best for the species of this genus; and they are readily increased by layers and seeds. The seeds should be sown, and the seedlings afterwards managed in the manner recommended for *Rhododéndron*, p. 848.

Tribe III.

VACCINIE'Æ (the genera contained in this section agree with *Vaccínium*, in the ovarium being adherent). D. Don, in edinb. phil. journ. 17. p. 152. Anthers 2-celled. Ovarium adherent. Disk perigynous, nectariferous. Fruit baccate. Gemmation scaly.

LII. VACCI'NIUM (an ancient Latin name, whether of a berry or a flower, has always been a point in dispute among critics, as well as the etymology of the word). Lin. gen. 191. Ait. hort. kew. vol. 2. p. 355. Pursh, fl. amer. bor. 1. p. 284. Juss. gen. 162. Nutt. gen. amer. 1. p. 263. Lam. ill. 286. Gærtn. fr. t. 28.—Vìtis-idæ'a, Tourn. inst. t. 377.

Lin. syst. *Octo-Decándria, Monogýnia.* Calyx 4-5-toothed (f. 142. *a.*) Corolla urceolate or campanulate (f. 142. *b.*), more or less deeply 4-5-cleft; limb reflexed. Stamens 8-10, hypogynous. Anthers 2-horned (f. 142. *d.*), dehiscing at the summits, and sometimes furnished at the back with 2 spreading spurs or bristles. Style longer than the stamens; stigma obtuse. Berry globose (f. 142. *e.*), depressed at top, 4-5-celled (f. 142. *f.*), many-seeded.—The species of *Vaccínium* are mostly confined to Europe and North America, but are peculiarly abundant in the latter country. They are suffruticose, shrubby, gemmaceous plants. Bud-scales often permanent, on the base of the small branches. Leaves alternate, membranous, often beset with resinous dots, either permanent or deciduous. Flowers pedicellate, either solitary, simply racemose, or tufted, drooping, inodorous, generally very elegant, tinted with various shades of red or pink, never blue, scarcely yellowish.

Berries black, purple, bluish, or red, generally eatable, though not always pleasant, nor wholesome in a crude state. The species of this genus were ill understood by Linnæus, who therefore has led all following authors astray. In reviewing the whole, we find something to add, though we have many specimens that are dubious. We are obliged to follow the distribution of Linnæus, into the evergreen and deciduous species, though some uncertainty must always attend that character respecting species known from dried specimens only.

§ 1. *Leaves deciduous.*

* *Pedicels* 1-*flowered, usually solitary, rarely twin or fasciculated.*

1 V. MYRTÍLLUS (Lin. spec. 498.) pedicels solitary, 1-flowered; leaves serrated, ovate, smooth; stem acutely angular, smooth; calyx hardly divided. ♄. H. Native on heaths, stony moors, and mountain woods throughout most parts of Europe, especially the more northern; plentiful in Britain. Dr. Sibthorp gathered it on the Bithynian Olympus. It is common on the hills in the Island of Unalaschka. Smith, engl. bot. 456. Fl. dan. 974.—Ger. emac. 1415. Math. valgr. 1. p. 210. Cam. epit. 135. Corolla globose, generally 5-cleft, of a very delicate waxy pink hue. Berries the size of currants, bluish black, covered by a mealy bloom, eaten in tarts or with cream, or made into jellies, in the north and west of England and Scotland. In Devonshire the berries are eaten with clotted cream; in Poland they are ripe in July, and being mixed with wood strawberries, and eaten with new milk, are considered a great delicacy. They may be successfully cultivated in a shady border, in bog earth. The fruit is sometimes sent into Norfolk from Devonshire. The juice of them has been employed to stain paper or linen purple. In autumn the wood game chiefly live upon the product of this shrub. Mr. Menzies brought from the west coast of North America what can scarcely be considered more than a gigantic variety, 7 or 8 feet high, larger in every part, with less distinctly serrated leaves.

Myrtle-like or Common Bilberry, or Bleaberry. Fl. May. Britain. Shrub ½ to 2 feet.

2 V. CHAMISSÒNIS (Bongard, in mem. acad. petersb. 2. p. 151.) pedicels solitary, 1-flowered, short, deflexed while in fruit; leaves elliptic, nearly entire, obtuse, mucronulated, glabrous, glaucous beneath; calyx 5-toothed; flowers decandrous. ♄. H. Native of the Island of Sitcha. V. myrtíllus, Cham. et Schlecht. in Linnæa. 1. p. 525. Branches erect, angular. Corolla white, urceolate, with short obtuse lobes. Anthers awned on the back. Berries black.

Chamisso's Whortle-berry. Shrub 1 foot.

3 V. OVALIFÒLIUM (Smith, in Rees' cycl. no. 2.) pedicels solitary, 1-flowered; leaves elliptic, obtuse, pointless, entire, smooth, strongly veined beneath; stem angular; calyx hardly divided. ♄. H. Native of the north-west coast of America, where it was collected by Mr. Menzies; and in the Island of Sitcha by Bongard. Branches smooth, less acutely angular than in the foregoing species. Leaves 1½ inch long. The flowers seem to agree with those of *V. myrtíllus* in colour and structure, except that the corolla is more ovate. Berries black, crowned, cup-shaped, with a slightly 4-lobed calyx.

Oval-leaved Bilberry. Shrub 10 to 12 feet.

4 V. PARVIFÒLIUM (Smith, in Rees' cycl. no. 3.) pedicels solitary, 1-flowered, clavate while bearing the fruit; leaves elliptic, obtuse pointed, entire, smooth, glaucous and slightly veined beneath; stem acutely angular; calyx hardly divided. ♄. H. Native of the north-west coast of America, where it was collected by Mr. Menzies; and in the Island of Sitcha by Bongard. Branches smooth, as acutely angled as in *V. myrtíllus*. The leaves agree most in shape with *V. ovalifòlium*, but are not a quarter the size, even when full grown. The berries are red, and make excellent tarts. They appear to be smaller than the last, and crowned with a similar calyx.

Small-leaved Bilberry. Shrub 8 to 10 feet.

5 V. GEMINIFLÒRUM (H. B. et Kunth, nov. gen. amer. 3. p. 267.) flowers axillary, twin, drooping, decandrous; leaves oblong, bluntish, crenulated, reticulately veined, rather membranous, glabrous; anthers furnished with 2 awns on the back. ♄. F. Native of Mexico, between Omitlan and Moran. Habit and stature of *V. myrtíllus*. Branchlets angular, downy. Leaves 8-10 lines long, paler beneath. Corolla campanulate, ventricose at the base, with short ovate bluntish segments. Filaments membranous, glabrous.

Twin-flowered Whortle-berry. Shrub 1 foot.

6 V. HÍRTUM (Thunb. jap. 155.) pedicels solitary, 1-flowered; leaves ovate, serrated, hairy all over, as well as the young branches. ♄. F. Native of Japan, on the hills between Miaco and Jedo. Branches terete. Flowers on very short stalks.

Hairy Bilberry. Fl. April. Shrub 2 to 3 feet.

7 V. ULIGINÒSUM (Lin. spec. 499.) pedicels somewhat aggregate, 1-flowered; leaves obovate, entire, smooth; branches terete. ♄. H. Native of Sweden, Germany, Siberia, Switzerland, Savoy, Scotland, and the north of England; as well as in the more northern parts of America, and on its west coast; and in the Island of Sitcha, on marshy mountain heaths and alpine bogs. Smith, engl. bot. t. 581. Fl. dan. 231. Myrtíllus grándis, Bauh. hist. 1. p. 518. Taller than the Common Bilberry, and of a more glaucous hue. Leaves glaucous beneath. Flowers flesh-coloured, with 8 long-horned stamens. Berries large, juicy, black, covered with a mealy bloom; they are eatable, but not either very grateful or wholesome. A variety with slightly pointed leaves was published by an apothecary at Berne, in 1787, as *V. mucronàtum*, an imaginary species.

Bog or Great Bilberry. Fl. April, May. Britain. Shrub 2 feet.

8 V. CALYCÌNUM (Smith, in Rees' cycl. no. 7.) pedicels solitary, 1-flowered; leaves obovate, serrated, smooth, with downy ribs; branches angular; calycine segments deep, ovate. ♄. F. Native of the Sandwich Islands, in woods upon lofty mountains. Leaves 1½ inch long, and near an inch wide. Corolla oblong, with 5 angles.

Large-calyxed Bilberry. Shrub 2 to 3 feet.

9 V. ANGUSTIFÒLIUM (Ait. hort. kew. ed. 2. vol. 2. p. 356.) pedicels scattered, mostly solitary, 1-flowered, naked; leaves lanceolate, nearly entire, downy at the ribs and margins. ♄. H. Native of Canada, about Hudson's Bay and Labrador. Berries large, bluish black, known by the name of *Bluets*. V. myrtilloìdes, Michx. fl. bor. amer. 1. p. 234. Michaux says this species has the habit of *V. myrtíllus;* its leaves being membranous, of a narrow lanceolate form.

Narrow-leaved Whortle-berry. Fl. April, May. Clt. 1776. Shrub 2 feet.

10 V. SALÍCINUM (Cham. et Schlecht. in Linnæa. 1. p. 525.) flowers axillary, solitary, on short pedicels; leaves cuneate-lanceolate, cuspidate, quite entire, rather coriaceous, reticulately veined; corolla cylindrically urceolate, with a 4-cleft revolute limb. ♄. H. Native of Unalascha, on mossy hills. Shrub trailing, glabrous, habit of *Sàlix alpígena*, creeping under the moss. Branches angular, cinnamon-coloured. Flowers drooping. Calycine lobes 4-5, short, ovate, acute. Stamens 8, inclosed. Anthers biaristate on the base.

Willowy Whortle-berry. Shrub creeping.

11 V. CÆSPITÒSUM (Michx. fl. bor. amer. 1. p. 234.) flowers

lateral, solitary, nearly sessile; leaves somewhat wedge-shaped, rounded, obtuse, serrated, membranous, very smooth. ♄. H. Native of America, in the more northern regions, particularly about Hudson's Bay; also in the Island of Sitcha. A little shrub, with many crowded stems, from 2 to 4 inches high, very smooth in every part. Corolla of a short urceolate form. Berries nearly sessile, globose, black, with a glaucous bloom.

Tufted Whortle-berry. Clt. 1823. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

* * *Flowers in sessile tufts.*

12 V. GALE'ZANS (Michx. fl. bor. amer. 1. p. 232.) flowers on very short stalks, in sessile tufts; leaves sessile, lanceolate-wedge-shaped, slightly serrated, downy; calyx pointed; corollas ovate, much contracted at the mouth; style prominent. ♄. H. Native of Virginia and Carolina, in shady woods and swamps. V. galifórmis, Smith, in Rees' cycl. no. 16. Flowers small, yellowish-white. Berries small, globular, black. Michaux describes this shrub as having the aspect of *Myrìca Gàle*, with slightly downy branches. Leaves varying. The pedicels shorter than the flowers, burst from a bud, composed of numerous crowded scales.

Gale-like Whortle-berry. Fl. May, June. Clt. 1806. Shrub 2 feet.

13 V. TENE'LLUM (Ait. hort. kew. ed. 2. vol. 2. p. 358.) flowers in dense sessile tufts; leaves nearly sessile, ovate-lanceolate, acuminated, finely serrated, smooth, except the rib and margins; branches angular, with a downy line on each side; calyx of 5, deep, acute segments. ♄. H. Native from New England to Virginia, on dry hills, on a gravelly soil. Wats. dendr. brit. 35. V. Pennsylvánicum, Lam. dict. 1. p. 74. Michx. fl. bor. amer. 1. p. 232. A low, very branching shrub. Corollas pale red, or white. Berries large, bluish black, extremely sweet, and agreeable to eat. The mountains of Pennsylvania produce an immense variety of this species, in size and shape of the fruit, leaves, and flowers. Leaves sometimes an inch long.

Delicate Whortle-berry. Fl. May. Clt. 1772. Shrub 1 to 2 feet.

14 V. LIGU'STRINUM (Michx. fl. bor. amer. 1. p. 283.) flowers nearly sessile, in tufts; leaves nearly sessile, erect, lanceolate, mucronate, finely serrated, veiny, downy; corolla longish, ovate; branches angular. ♄. H. Native from Pennsylvania to Virginia, in dry woods; common on the mountains. Pursh, fl. amer. sept. 1. p. 288. exclusive of the syn. of Willd. A straight shrub. Leaves membranous, furnished with conspicuous, often purplish veins. Scales of the flower-buds often purplish. Corollas purplish-red. Berries black. The leaves vary extremely in shape and size. The *V. ligústrinum* of Linnæus is a nonentity, or rather no *Vaccínium*, according to Smith, being the very same plant with *Lyònia paniculàta*.

Privet-like Whortle-berry. Fl. May, July. Clt.? Shrub.

* * * *Flowers disposed in racemes.*

15 V. PA'LLIDUM (Ait. hort. kew. ed. 2. vol. 2. p. 355.) racemes bracteate; corolla cylindrically bell-shaped; leaves ovate, acute, finely serrated. ♄. H. Native of North America, from whence it was said to have been sent, in 1772, to Kew Gardens, by Dr. Samuel Martin; but Mr. Pursh never met with it.

Pale-flowered Whortle-berry. Fl. May, June. Clt. 1772. Shrub 2 feet.

16 V. ARBÒREUM (Marsh. in Michx. fl. amer. bor. 1. p. 230.) pedicels axillary and solitary, or terminal and racemose, naked; leaves ovate, acute, with slight glandular serratures, polished above, and rather downy beneath; corollas bell-shaped, acute; stamens the length of the tube. ♄. H. Native from North Carolina to Florida, in dry woods on the rocky banks of rivers. V. diffùsum, Ait. hort. kew. ed. 2. vol. 2. p. 356. A large shrub, sometimes 20 feet high, very elegant. Corollas white, tinged with red. Berries globular, black, almost dry. Branches terete, downy while young. This species joins the solitary flowered species with the racemose flowered species; the axillary flowers being solitary and pedicellate, and the terminal ones racemose.

Tree Whortle-berry. Fl. May, June. Clt. 1765. Shrub 10 to 20 feet.

17 V. STAMÍNEUM (Lin. spec. 498.) racemes downy, with oval bracteas as long as the flowers; anthers biaristate on the back, twice as long as the spreading bell-shaped corolla; leaves elliptic, acute, entire, glaucous and rather downy beneath. ♄. H. Native from New England to Florida. Andr. bot. rep. 263. V. álbum, Pursh, fl. amer. sept. 1. p. 285. V. elevàtum, Banks, herb. Lodd. cat.—Pluk. mant. 22. phyt. t. 339. f. 3. Trunk 2 feet high, with numerous green branches, which are downy while young. Leaves $1\frac{1}{2}$ or 2 inches long, on very short downy stalks. Flowers decandrous, copious, white, having linear anthers, which are spurred near the base. Berries greenish or white, called *Deer-berries*. The bracteas resemble the leaves, but are much smaller. The *V. álbum*, Lin. is *Xylósteum ciliàtum* β, Pursh, fl. amer. sept. 1. p. 161.; and therefore there is no wonder that subsequent investigators could never ascertain the *V. álbum* of Linnæus. We must notice another error of Linnæus, to prevent mistake. He cites, under *V. stamíneum*, the proper figure of Plukenet, but with a wrong synonyme or definition. Here also it falls to our lot to correct him respecting another of Kalm's plants, *V. mucronàtum*, which has ever remained as unintelligible as *V. álbum*. His described specimen is certainly a pomaceous plant.

Var. β; (H. B. et Kunth, nov. gen. amer. 3. p. 267.) leaves larger, ciliated on the nerves beneath and margins. ♄. F. Native of Mexico, in woods between Pachuca and Real del Monte. Shrub $\frac{1}{2}$ foot. Corolla campanulate, white.

Long-stamened Whortle-berry. Fl. May, June. Clt. 1772. Shrub 1 to 2 feet.

18 V. DUMÒSUM (Ait. hort. kew. ed. 2. vol. 2. p. 356.) racemes downy, with oval bracteas: and the pedicels with 2 lanceolate bracteoles; leaves obovate, mucronate, entire, downy and viscid; ovarium hairy; corolla bell-shaped, obtuse, longer than the stamens. ♄. H. Native from New Jersey to Florida, in dry sandy woods, particularly in pine-forests. Curt. bot. mag. 1106. Andr. bot. rep. 112. V. frondòsum, Michx. fl. bor. amer. 1. p. 230. V. hirtéllum, Ait. hort. kew. ed. 2. vol. 2. p. 357. A low bushy shrub, with round branches. Leaves $1\frac{1}{2}$ inch long. Calycine segments fringed. Corollas white, tinged with pink, rather large. Berries black, globular.

Var. β, *hùmile* (Wats. dendr. brit. t. 32.) flowers white; anthers red; pedicels solitary, axillary; shrub $\frac{1}{2}$ foot high.

Bushy Whortle-berry. Fl. June, July. Clt. 1774. Shrub 2 to 3 feet.

19 V. CORYMBÒSUM (Lin. spec. 499.) flowering branches almost leafless; racemes corymbose, drooping, with membranous bracteas, which are shorter than the downy flower-stalks; leaves elliptic, acute, minutely serrated, smooth, with downy ribs. ♄. H. Native from Canada to Carolina and Georgia, in swamps and wet woods. Wats. dendr. brit. 123. V. amœ'num, Ait. hort. kew. ed. 2. vol. 2. p. 358. Andr. bot. rep. 138. V. disomórphum, Michx. fl. bor. amer. 1. p. 231. V. elevàtum, Hort. V. álbum, Lam. dict. 1. p. 13. A tall shrub, sometimes 7-8

feet high, with numerous roughish terete branches, which are somewhat angular and downy while young. Leaves $1\frac{1}{2}$ to 2 inches long, tipped with a glandular point. Racemes rising from the branches of the preceding year, seldom accompanied by leaves. Bracteas reddish, membranous, fringed. Calycine segments broad and shallow. Corollas white or reddish, cylindrically urceolate, rather angular, contracted at the mouth. Stamens 10, downy; anthers inclosed, having a double pouch at the base, but no spurs. Berries black, insipid. This species has a number of varieties in size, shape, and colour.

Var. β, virgàtum (Ait. hort. kew. ed. 2. vol. 2. p. 358.) flowers white, tinged with crimson or pale red, very elegant, smaller than the species. ♄. H. Native of Virginia and Carolina, in swamps. Andr. bot. rep. 181. Wats. dendr. brit. t. 33. In Andrews's plate of *V. virgàtum*, the racemes are accompanied by leaves, of which we have seen no example in *V. corymbòsum*. Shrub 2 feet high. Racemes short, lateral and terminal.

Var. γ, fuscàtum (Ait. hort. kew. l. c.) flowers striped with red and white; calyx downy. ♄. H. Native of Lower Carolina and Georgia, in swamps. V. formòsum, Andr. bot. rep. t. 97.

Var. δ, angustifòlium; leaves narrow-lanceolate, acuminated at both ends, sessile, besprinkled with brown minute pedicellate glands beneath, and hairy on the mid-rib above. V. virgàtum, var. angustifòlium, Wats. dendr. brit. t. 34. Flowers almost white.

Corymbose-flowered Whortle-berry. Fl. May, June. Clt. 1765. Shrub 4 to 7 feet.

20 V. MARIA'NUM (Wats. dendr. brit. t. 124.) racemes lateral, numerous, many-flowered; corolla cylindrical, contracted at the mouth; leaves elliptic, coriaceous, glabrous, distinctly and minutely denticulated. ♄. H. Native of North America. Flowers decandrous, white.

Maryland Whortle-berry. Fl. May, June. Clt. 1812. Shrub 5 feet.

21 V. GRANDIFLÒRUM (Wats. dendr. brit. 125. f. a.) racemes terminal, 3-4-flowered; corollas cylindrical, contracted at the mouth; leaves lanceolate, finely serrated, attenuated at both ends, glabrous. ♄. H. Native of North America. Flowers white, decandrous.

Great-flowered Whortle-berry. Fl. July, Aug. Clt. 1812. Shrub $1\frac{1}{2}$ foot.

22 V. ELONGA'TUM (Wats. dendr. brit. t. 125. B.) corymbs few-flowered, bractless; pedicels downy; leaves elliptic-lanceolate, serrulated, tipped by a glandular hair each, and with a few hairs on the nerves; branchlets downy. ♄. H. Native of North America. Corollas white, with reflexed teeth.

Elongated Whortle-berry. Fl. July, Aug. Clt. 1812. Shrub 3 to 4 feet.

23 V. MINUTIFLÒRUM (Wats. dendr. brit. 125. c.) racemes terminal, few-flowered; corollas cylindrical, with erect teeth; leaves rather coriaceous, bluntly subserrated, each tipped by a gland. ♄. H. Native of North America. Flowers white.

Minute-flowered Whortle-berry. Fl. July, Aug. Clt. 1812. Shrub 1 foot.

24 V. GLA'BRUM (Wats. dendr. brit. t. 125. D.) spikes lateral; corollas campanulately cylindrical; leaves elliptic, entire, glabrous. ♄. H. Native of North America. Flowers white.

Glabrous Whortle-berry. Fl. July, Aug. Clt. 1812. Shrub.

25 V. BRACTEA'TUM (Thunb. fl. jap. 156.) racemes axillary, longer than the glabrous, acute, serrated leaves; bracteas lanceolate, serrated; pedicels furnished with 2 awl-shaped bracteoles. ♄. F. Native of Japan, in the Island of Niphon. Branches smooth, angular while young. Racemes 2-3 inches long; pedicels secund, drooping. Corollas cylindrical, white. The leaves may be evergreen.

Bracteate-flowered Whortle-berry. Shrub.

26 V. CILIA'TUM (Thunb. fl. jap. 156.) racemes axillary, longer than the ovate, bristly, nearly entire leaves; bracteas lanceolate, smooth. ♄. F. Native of Japan, &c. where it is called *Sasjebu*. The stem is smooth, and the branches villous. Leaves 1-2 inches long, unequal. Flowers red, unilateral.

Ciliated-leaved Whortle-berry. Shrub.

27 V. FRONDÒSUM (Lin. spec. 499.) racemes loose; bracteas obovate, not half so long as the slender pedicels, which bear 2 small linear bracteoles in the middle; leaves obovate-oblong, obtuse, entire, smooth. ♄. H. Native from New Jersey to Carolina, in open woods. Andr. bot. rep. 140. V. glaúcum, Michx. fl. bor. amer. 1. p. 231. Flowers small, almost globular, white. Berries large, blue, globular, eatable, called by the country people *Blue Tangles*. Branchlets terete, smooth, and slender. Leaves 2-3 inches long, glaucous beneath, and sprinkled with minute resinous dots. Racemes lateral from the former year's wood. Flowers drooping, greenish-white, shaped like those of the *Lily of the valley*, but smaller; anthers inclosed.

Var. β, venústum (Ait. hort. kew. ed. 2. vol. 2. p. 357.) leaves lanceolate, acute at both ends. ♄. H. V. frondòsum, var. β, lanceolàtum, Pursh, fl. bor. amer. 1. p. 786.

Leafy Whortle-berry. Fl. May, June. Clt. 1761. Shrub 3 feet.

28 V. RESINÒSUM (Ait. hort. kew. ed. 2. vol. 2. p. 357.) racemes leafless, viscid, downy, with lanceolate bracteoles on the pedicels; leaves obovate-lanceolate, bluntish, entire, covered with resinous dots; calyx in 5 deep ovate segments, longer than the ovarium. ♄. H. Native from Canada to Carolina, in woods, and on mountains frequent. Curt. bot. mag. t. 1288. Andrómeda baccàta, Wangh. amer. t. 30. f. 69. Branches terete, downy when young. Leaves usually $1\frac{1}{2}$ inch long, bright green on both sides, rather viscid. Racemes lateral from last year's wood, drooping. Flowers greenish-yellow. Berries black, eatable.

Var. β, rubéscens (Pursh, fl. amer. sept. 1. p. 286.) corollas redish. ♄. H. Curt. bot. mag. 1288.

Var. γ, lutéscens (Pursh, l. c.) leaves lanceolate; flowers redish-yellow. ♄. H. V. parviflòrum, Andr. bot. rep. 125.

Resinous Whortle-berry. Fl. May, June. Clt. 1782. Shrub 2 to 3 feet.

29 V. ARCTOSTA'PHYLOS (Lin. spec. 500.) racemes lateral; bracteas all at the base of the pedicels; leaves elliptic, acute, minutely serrated, hairy beneath; stamens as long as the corolla, which is bell-shaped, with very hairy filaments; calyx slightly 5-lobed. ♄. H. Native on the coast of the Black Sea, where it was gathered by Tournefort, who describes it as a shrub about the height of a man, with a trunk as thick as a man's arm. Young branches downy on two opposite sides. Leaves $2\frac{1}{2}$ inches long. Racemes from the wood of the preceding year, below the fresh leafy shoots, drooping, rather hairy, each composed of 8-10 pendulous flowers, of a dirty white colour, tinged with purple. Anthers spurred at the base. Corollas bell-shaped, hairy. Tournefort judges this to be, with great probability, the αρκτοσταφυλος, or Bear's Grape, of Galen. What the var. β of Linnæus may be, we know not, as nothing answerable to it is to be found in Tournefort's Corollarium.

Bear's-Grape Whortle-berry. Fl. April, June. Clt. 1800. Shrub 5 to 6 feet.

30 V. PADIFÒLIUM (Smith, in Rees' cycl. no. 22.) racemes lateral; bracteas all at the base of the pedicels; leaves ovate-

lanceolate, acute, serrulated, smooth on both surfaces, except the mid-rib; stamens nearly as long as the bell-shaped corolla, with smooth slightly fringed filaments; calyx 5-lobed. ♄. F. Native of Madeira, on the loftiest part of the island, where it forms impenetrable thickets. V. arctostáphylos, Andr. bot. rep. t. 30. Curt. bot. mag. 974. V. Maderénse, Link. enum. 1. p. 375. Corollas larger than those of the preceding, pale green, with a purple tinge; sometimes it appears to be all over purple externally. The Caucasian plant, discovered by Pallas, is said not to differ from that of Madeira. Pallas says the berries are black, juicy, eatable, and gratefully acid; and he sometimes found the flowers 4-cleft.

Bird-cherry-leaved Bear's Grape. Fl. June, Aug. Clt. 1777. Shrub 6 to 10 feet.

31 V. CYLINDRA'CEUM (Smith, in Rees' cycl. no. 23.) racemes lateral; bracteas serrated, all at the base of the pedicels; leaves elliptic-lanceolate, acute, serrulated, quite smooth, except the base of the mid-rib; stamens half the length of the cylindrical corolla, with hairy filaments; calyx slightly 5-toothed. ♄. H. Native of the Azores, on the mountains, where it is called *Uva de Serra*, or Mountain-berry. Apparently arborescent. Branches downy on the opposite sides. Racemes numerous, rising from the wood of the preceding year. Flowers drooping, nearly an inch long, apparently red or purple.

Cylindrical flowered Bear's Grape. Shrub or tree.

32 V. LEDIFO'LIUM (Pohl, pl. bras. 2. p. 36. t. 123.) racemes axillary and terminal, loose, downy; flowers unilateral; leaves sessile, linear, attenuated at the base, ciliated, glabrous above, but yellowish-brown beneath, with the nerves downy. ♄. G. Native of Brazil, in the province of Minas Geraes, on the higher mountains, in dry places. Stem dark, hoary. Leaves deciduous. Bracteas of two forms, acute, ciliated. Corolla white, glabrous, having the teeth reflexed.

Ledum-leaved Whortle-berry. Shrub 1 foot.

§ 2. *Leaves evergreen.*

* *Flowers racemose.*

33 V. MERIDIONA'LE (Swartz. fl. ind. occ. p. 676.) racemes erect, downy; bracteas coloured, solitary, ovate, at the base of the pedicels; leaves ovate, crenated, smooth; stem arboreous. ♄. G. Native of Jamaica, on the Blue Mountains. Tree with a very straight trunk and hard wood. Branches downy when young. Leaves 1 inch long. Flowers drooping, reddish-white. Corollas ovate, quadrangular before expansion, contracted at the mouth, with 4 acute, recurved segments. Stamens 8, as long as the corolla: their filaments hairy in the middle. Berries roundish, juicy, pleasantly flavoured, pale red, resembling those of *V. vìtis-idæ'a*. The flowers are rarely 5-cleft, and decandrous. Racemes rising from the top of the wood of the preceding year.

Southern Whortle-berry. Fl. March, June. Clt. 1778. Tree 10 to 30 feet.

34 V. CONFE'RTUM (H. B. et Kunth, nov. gen. amer. 3. p. 265. t. 250.) racemes axillary, solitary, short, sessile, drooping, about equal in length to the leaves; leaves ovate elliptic, bluntish, crenulated, coriaceous, glabrous; flowers decandrous; anthers mutic. ♄. H. Native of Mexico, on high mountains near Moran and Cerro de Oyamel. Branchlets angular, glabrous. Leaves 5-6 lines long, beset with scattered, brown, minute dots beneath. Pedicels bibracteate at the base. Corolla campanulate, white, with ovate, acute, recurved segments.

Crowded-leaved Whortle-berry. Shrub 1 foot.

35 V. FLORIBU'NDUM (H. B. et Kunth, nov. gen. amer. 3. p. 266. t. 251.) racemes terminal and axillary, drooping, much longer than the leaves; leaves oblong, acute, coriaceous, glabrous, crenulated; flowers octandrous and decandrous; anthers mutic. ♄. G. Native of Peru, on the mountains near Caxamarca. Branchlets angular, downy. Leaves 6-7 lines long, besprinkled with a few black dots beneath. Corolla campanulate, white, having a quadrifid or quinquefid limb, with oval bluntish segments. Flowers about the size of those of *V. vìtis-idæ'a*. Filaments membranous, ciliated. Racemes approximate at the tops of the branches, bracteate (f. 142.)

FIG. 142.

Bundle-flowered Whortle-berry. Shrub.

36 V. LEUCA'NTHUM (Cham. in Linnæa. 7. p. 524.) arboreous; branches angular, sometimes downy; leaves coriaceous, on short petioles, oval-lanceolate, acute, glandularly serrated, having the petioles and mid-rib downy above, the rest glabrous; racemes secund, rising from the branches of the preceding year, leafless; flowers drooping; corollas urceolately campanulate; anthers biaristate. ♄. F. Native of Mexico, below St. Salvador. Flowers white. Fruit black and edible. Nearly allied to *V. Meridionàle*.

White-flowered Whortle-berry. Shrub.

37 V. CARACCASA'NUM (H. B. et Kunth, nov. gen. amer. 3. p. 266.) racemes axillary, twice longer than the leaves; flowers secund, octandrous or decandrous; leaves elliptic, acute, crenulated, coriaceous, glabrous, shining above; anthers biaristate on the back. ♄. H. Native on the southern declivity of Mount Silla de Caraccas. Branchlets angular, glabrous. Leaves shining above, 9-10 lines long. Racemes crowded at the tops of the branches. Corolla campanulate, glabrous, reddish-white, with a 4-5-parted limb; segments ovate, acutish. Filaments membranous, ciliated.

Caraccas Whortle-berry. Fl. May, June. Clt. 1825. Shrub.

38 V. VÌTIS-IDÆ'A (Lin. spec. 500.) racemes terminal, drooping, with ovate concave bracteas, which are longer than the pedicels; leaves obovate, revolute, minutely toothed, dotted beneath; corolla bell-shaped. ♄. H. Native of dry, barren, stony woods and heaths in the north of Europe; plentiful in Scotland, Westmoreland, Derbyshire, and Wales. Mr. Pursh says it occurs on rocks near the sea-coast, from Canada to New England; but the American plant is more robust than the European, with considerably larger leaves. Lodd. bot. cab. 616. It has also been found in the islands of Kamtschatka, Unalaschka, and St. Lawrence. Smith, engl. bot. 598. Fl. dan. t. 40. Lodd. bot. cab. 1023. — Vìtis-idæ'a rùbra, Cam. epit. 136. Root creeping, woody. Stems ascending a span high; young branches terete, downy. Leaves like those of box, but darker. Flowers pale pink, 4-cleft, octandrous. Anthers without spurs. Berries blood-red, acid, austere, and bitter, less palatable in tarts than either the Cranberry or Bilberry, but excellent in a rob or jelly, for colds and sore throats, as well as to eat with roast meat; to which latter purpose this jelly is universally applied by the Swedes, and forms a sauce to venison which is thought superior to currant jelly. In Wales it is used with roast mutton. It may be cultivated in a moist shady border of bog-earth, like the *Bleaberry*.

Cow-berry or Red Whortle-berry. Fl. June. Britain. Shrub ½ foot.

39 V. MYRTIFÒLIUM (Michx. fl. bor. amer. 1. p. 229.) creeping, quite smooth; leaves petiolate, oval, shining, revolute, sparingly and minutely toothed; racemes axillary, nearly sessile, of few flowers; corolla bell-shaped, somewhat inflated, minutely 5-toothed; anthers without dorsal horns. ♄. H. Native of Carolina. Michaux describes the berries as small, globose, crowned by the calyx, black, on short stalks.

Myrtle-leaved Whortle-berry. Fl. May, July. Clt. 1812. Shrub creeping.

40 V. CRASSIFÒLIUM (Andr. bot. rep. t. 105.) racemes lateral and terminal, corymbose; bracteas shorter than the pedicels; leaves elliptic, crenated, smooth, paler and veiny beneath; corolla bell-shaped; stem diffuse. ♄. H. Native of Carolina. Curt. bot. mag. 1152. A hairy shrub, requiring some shelter from our variable winters and springs. Leaves not an inch long, with a little minute pubescence on the mid-rib and petioles. Flowers 5-cleft, decandrous, prettily variegated with pink and white, drooping, on red corymbose stalks. Stamens hairy.

Thick-leaved Whortle-berry. Fl. May, June. Clt. 1787. Shrub trailing.

41 V. VILLÒSUM (Smith, in Rees' cycl. no. 29.) racemes longer than the leaves; pedicels, calyx, corolla, and lanceolate bracteas densely hairy; leaves elliptic, entire, revolute, coriaceous, with a blunt point, hairy on the upper side. ♄. F. Native of Mexico, from whence specimens were sent by Mutis to Linnæus. Branches densely hairy when young. Leaves crowded, an inch long, on thick downy petioles, scarcely hairy beneath, except on the mid-rib. Racemes towards the ends of the younger branches, axillary, drooping, very hairy. Pedicels bracteolate. Corolla purplish, with 5 hairy angles, and as many recurved teeth. Perhaps a species of *Gaylussàcia*.

Villous Whortle-berry. Shrub.

42 V. NÍTIDUM (Andr. bot. rep. t. 480.) racemes terminal, corymbose; bracteas shorter than the pedicels; leaves elliptic-obovate, acute, crenated, smooth and shining; corollas cylindrical. ♄. H. Native of Carolina. Curt. bot. mag. 1550. Stems either erect or diffuse. Leaves ½ to 1 inch long, paler and veiny beneath. Pedicels, bracteas, and calyx very smooth, of a shining red or purple colour. Calyx of 5 broad, or rather shallow segments. Corollas ovate, oblong, white or pink, with 5 slight spreading teeth, decandrous. The branches are downy on two opposite sides.

Shining-leaved Whortle-berry. Fl. May, June. Clt. 1794. Shrub 1 foot, or decumbent.

43 V. SCHLECHTENDA'LII; racemes elongated, erect, and are as well as the petioles, peduncles, and ribs of leaves on the under surface, downy; leaves rather coriaceous, permanent, with the nerves and veins prominent on both surfaces, lanceolate or ovate-lanceolate, acute, adpressedly serrated, callously mucronate at the apex as well as the serratures, and running into the short petioles, at the base; fructiferous branches nearly leafless. ♄. F. Native of Mexico, near Jalacinga, in woods. Vaccínium, nov. spec. Cham. et Schlecht. in Linnæa. 6. p. 395. An erect, much-branched, evergreen, smoothish shrub. Leaves 2 inches long, and 9 lines broad. Bracteas linear, acute, caducous; calyx bibracteate at the base. Berries drooping, umbonate, crowned by the minute calycine teeth.

Schlechtendal's Whortle-berry. Shrub.

44 V. BUXIFÒLIUM (Salisb. par. t. 4.) racemes axillary, of few flowers; leaves petiolate, obovate, toothed or crenated, smooth on both surfaces; stems tufted; corollas roundish-ovate; filaments glandular; stigma capitate. ♄. H. Native of the western parts of Virginia, near Winchester and the Sweet Springs. Curt. bot. mag. 928. Lodd. bot. cab. 648. V. brachýcerum, Michx. fl. bor. amer. 1. p. 234. A handsome little shrub, in stature and general aspect, resembling *V. vìtis-idæ'a*. The leaves are, however, smooth, even, and not dotted on the under side. Corollas globular, contracted at the mouth, not bell-shaped. Stamens 10. Anthers spurless at the base, discharging their pollen by lateral, not terminal apertures. Flowers white, delicately striped with red.

Box-leaved Whortle-berry. Fl. June. Clt. 1794. Shrub ½ foot.

45 V. OVA'TUM (Pursh, fl. amer. sept. 1. p. 290.) racemes axillary and terminal, bracteate, short; leaves on short petioles, oblong, ovate, acute, revolute, serrated, smooth, coriaceous; corolla cylindrical, campanulate; calyxes acute. ♄. H. Found by Governor Lewis on the banks of the Columbia River, and by Mr. Menzies on the north-west coast of America. Hook. et Arn. in Beech. voy. pt. bot. p. 144. Shrub much branched; branches hairy, as well as the petioles. The foliage is like that of *Pernéttya mucronàta*.

Ovate-leaved Whortle-berry. Fl. May. Clt. 1826. Shrub.

46 V. CANADE'NSE (Richards. in Frankl. 1st journ. append). leaves lanceolate, quite entire, downy; racemes terminal; flowers fasciculate; style inclosed. ♄. H. Native of Arctic America.

Canadian Whortle-berry. Shrub.

47 V. SCA'BRUM (Pohl. pl. bras. 2. p. 37. t. 124.) racemes terminal and axillary, longer than the leaves, beset with glandular hairs; leaves on short petioles, oblong, mucronate, with revolute ciliated edges, scabrous, having the nerves hispid beneath. ♄. G. Native of Brazil, in turfy bogs at Registo Velho and Villa de Barbacena. Stems many from the same root, leafy at the tops. Leaves scabrous above, and glabrous beneath, permanent. Pedicels pilose, bracteate at the base. Bracteas of two forms, deciduous. Corolla glabrous, campanulate, white.

Scabrous Whortle-berry. Shrub 1 foot.

48 V. MONTA'NUM (Pohl, pl. bras. 2. p. 38. t. 125.) racemes axillary, bracteate, pilose; leaves on short petioles, oblong-elliptic, mucronate, hardly narrowed at the base, glabrous, but having the nerves on the under side rather pilose. ♄. G. Native of Brazil, in the province of Minas Geraes, in dry places on Serra de Pinheiro. Leaves permanent, dark green above, and yellowish-green beneath, 8 lines long and 4 broad. Flowers unilateral. Corolla campanulate, glabrous, white.

Mountain Whortle-berry. Shrub diffuse.

* * *Flowers disposed in scaly tufts, nearly sessile.*

49 V. MYRSINÌTES (Michx. fl. bor. amer. 1. p. 233.) flowers in terminal and lateral tufts; leaves sessile, oval, mucronate, obscurely serrated, smooth and shining above, but rather hairy and dotted beneath; stem erect, much branched; corolla oblong-ovate. ♄. H. Native of Carolina and Florida, in dry sandy woods. A beautiful little shrub, with slightly downy branches. Leaves glandular beneath. Tufts of flowers axillary, with purple scales. Calycine segments scarlet. Corolla of a fine purple colour, 5-toothed. Stamens 10.

Var. β, lanceolàtum (Pursh, fl. bor. amer. 1. p. 290.) leaves lanceolate, acute at both ends.

Var. γ, obtùsum (Pursh, l. c.) leaves roundish-obovate.

Myrtle-like Whortle-berry. Fl. May, June. Clt.? Shrub small.

* * * *Flowers solitary, pedicellate.*

50 V. CE'REUM (Forst. prod. 28.) pedicels axillary, solitary, 1-

flowered, furnished with 2 lanceolate bracteas about the middle; leaves roundish-ovate, serrated; calyx of 5 broad ovate pointed segments. ♄. F. Native of Otaheite and Owahu. Andrómeda cèrea, Lin. fil. suppl. 238. Branches terete, slightly downy when young. Leaves mucronate, about an inch long. Corolla ovate-oblong, with 5 angles, and 5 erect small segments. Stamens 10. Anthers with 2 dorsal horns, according to Linnæus. Perhaps a species of *Pernéttya*.

Waxy Whortle-berry. Shrub small, ½ foot.

51 V. RETICULA'TUM (Smith, in Rees' cycl. no. 30.) pedicels axillary, solitary, 1-flowered, downy; leaves obovate, more or less serrated, coriaceous, with a blunt point, strongly reticulated on both sides, and nearly smooth. ♄. F. Native of the Sandwich Islands, on the high mountains, in woods, where it was collected by Mr. Menzies. Branches when young angular and downy. Leaves an inch long, with revolute margins. Pedicels bractless, swelling upwards. Calyx in 4 or 5 deep-ribbed coloured segments, at length involute. Corolla cylindrical, twice as long as the calyx, purple, slightly hairy, with 4 or 5 erect blunt teeth. Style hairy. Berries globular, depressed, nearly smooth.

Reticulated-leaved Whortle-berry. Shrub.

52 V. HUMIFU'SUM (Graham, in edinb. phil. journ. June, 1831.) pedicels axillary, solitary, 1-flowered, furnished with many bracteas; leaves evergreen, ovate, acutish, quite entire, glabrous on both surfaces, ciliated; stem prostrate, creeping; flowers decandrous; anthers obtuse, mutic. ♄. H. Native of North America, on the Rocky mountains. Branchlets downy. Flowers drooping. Corollas campanulate, white, often partially tinged with red outside, with reflexed teeth. Stigma capitate. Filaments glabrous, flattened. Fruit edible, well-flavoured.

Trailing Whortle-berry. Fl. May, June. Clt. 1827. Shrub creeping.

53 V. PENDULIFLÒRUM (Gaud. in Freyc. voy. pt. bot. p. 454.) pedicels axillary, solitary, 1-flowered, elongated, pendulous in the fruit-bearing state; flowers decandrous; calycine segments lanceolate, one-half shorter than the corolla, which is campanulate and 5-angled; anthers awned; branches angular, leafy; leaves oblong, sharply serrated, rather coriaceous. ♄. F. Native of the Sandwich Islands, at the altitude of 500 hexapods. An erect glabrous shrub.

Pendulous-flowered Whortle-berry. Shrub.

54 V. MICROPHY'LLUM (Herb. Reinwdt. ex Blum. bijdr. p. 851.) stem shrubby; branchlets puberulous; leaves oval, obtuse, quite entire, with recurved margins, veiny, coriaceous, glabrous; pedicels almost solitary, axillary, 1-flowered; corollas urceolate; anthers mutic; calyx bractless. ♄. G. Native of the Celebes, on the mountains.

Small-leaved Whortle-berry. Shrub.

55 V. DENTA'TUM (Smith, in Rees' cycl. no. 31.) pedicels axillary, solitary, 1-flowered, smooth; leaves obovate, with sharp tooth-like serratures, coriaceous, veiny, very smooth; calyx longer than the smooth ovarium. ♄. F. Native of the Sandwich Islands, on the lofty mountains, where it was found by Mr. Menzies. The branches are angular, and always smooth, like every other part. Leaves rather longer than the *V. reticulàtum*, with less prominent veins. Calycine segments keeled.

Tooth-leaved Vaccinium. Shrub.

56 V. OBTU'SUM (Pursh, fl. amer. sept. 1. p. 290.) pedicels axillary, solitary, 1-flowered; leaves small, oval, rounded, and blunt at each end, mucronate, entire, coriaceous, smooth; stem creeping. ♄. H. Native of the north-west coast of America, where it was gathered by Mr. Menzies.

Blunt-leaved Whortle-berry. Shrub.

57 V. EMPETRIFO'LIUM (H. B. et Kunth, nov. gen. amer. 3. p. 263. t. 268.) creeping, quite glabrous leaves approximate, subimbricated, obtuse, quite entire, coriaceous, glabrous; pedicels solitary, axillary, 1-flowered; flowers octandrous; corollas tubularly campanulate; anthers mutic; calyx bibracteate at the base. ♄. G. Native of the western declivity of the burning Mount Antisana, between Pintac and Pinantura. Leaves 2½ lines long. Corolla scarlet, glabrous: with ovate, acute, spreading segments. Anthers dehiscing lengthwise. Filaments ciliated.

Empetrum-leaved Whortle-berry. Shrub creeping.

58 V. PENÆOÌDES (H. B. et Kunth, nov. gen. amer. 3. p. 264.) creeping, glabrous; leaves approximate, subimbricated, oblong, acute, obsoletely and remotely crenulated, stiff, glabrous, a little ciliated; pedicels short, axillary, solitary, 1-flowered; flowers octandrous; calyx bibracteate; anthers mutic. ♄. G. Native of the province of Quito, at Mount Tunguragua, near Cuchilla de Guandisava. Leaves 3 lines long. Branchlets downy. Flowers solitary, on the tops of the branches. Corolla tubularly campanulate, scabrous, with ovate acutish segments. Filaments pilose.

Penæa-like Whortle-berry. Shrub creeping.

59 V. ACUMINA'TUM (H. B. et Kunth, nov. gen. amer. 3. p. 264.) arboreous; leaves approximately subimbricated, ovate, acuminated, quite entire, coriaceous, glabrous; flowers axillary, solitary, twin or tern, almost sessile, octandrous; calyx bibracteate; anthers mutic.? ♄. G. Native of New Granada, in Paramo de Almaguer, and near Pansitara. Branches clothed with rusty hairs, densely leafy. Leaves on short petioles, 3 lines long. Corollas nearly globose, white, with a quadrifid reflexed limb. Filaments pilose.

Acuminated-leaved Whortle-berry. Shrub 10 to 15 feet.

60 V. ALATERNOÌDES (H. B. et Kunth, nov. gen. 3. p. 265.) arborescent? leaves roundish, elliptic, acutish, quite entire, obsoletely 3-nerved, coriaceous, glabrous; flowers axillary, solitary, twin or tern, sessile, octandrous; calyx bibracteate; anthers mutic, half exserted. ♄. G. Native of the Andes of Peru, near Ayavaca. Branches downy. Leaves 8-9 lines long. Corolla tubularly campanulate, white, with a quadrifid revolute limb. Filaments villous.

Alaternus-like Whortle-berry. Shrub or small tree.

N. B. There are several plants with different names than those above, in the gardens, but these names are only synonymous with some of the species described above, as *V. prunifòlium*, *V. halleriæfòlium*, and *V. salicinum*.

Cult. All the species may be raised from seeds, or from offset root-suckers, creeping roots, and trailing rooting stems. Those also growing with several rooted stalks, may be divided in the root and top into separate plants, in which way they succeed very well. The seeds should be sown, when that method is pursued, in the autumn, as soon as they are ripe and gathered, in a shady border; and when the plants are up, and require to be removed, keep a ball of earth about their roots. The offsets or root-plants may be set out in the same season, in proper places. The species are admitted into gardens and pleasure-grounds for the sake of variety, curiosity, and ornament, and some of them are grown for the use of their fruit. All thrive best in peat soil, or very sandy loam. Some require to be grown in moist situations, and others in dry. The stove and green-house kinds should be treated as other green-house and stove shrubs; and cuttings of them strike readily in sand, under a bell-glass; those of the stove species in heat.

LIII. OXYCO'CCUS (*from* *ὀξυς*, *oxys*, sharp, and *κοκκος*, *kokkos*, a berry; in reference to the sharp acid taste of the berries). Pers. syn. 1. p. 419. Pursh, fl. amer. sept. 1. p. 263.

Nutt. gen. amer. 1. p. 250.—Vaccínium species of Lin. and others.

Lin. syst. *Octándria, Monogýnia.* Calyx 4-toothed. Corolla 4-parted, with nearly linear revolute segments. Stamens 8, with connivent filaments; anthers tubular, 2-parted. Berries many-seeded.—Small, prostrate, creeping, evergreen shrubs, with small leaves, growing in sphagnose morasses. Branches filiform, proliferous. Flowers produced at the base of the spring branchlets, in short gemmaceous racemes; pedicels filiform, conspicuously bibracteate. Berries red, rarely white, acid.

1 O. palu'stris (Pers. ench. 1. p. 419.) stems filiform, creeping; leaves small, ovate, entire, acute, smooth, with revolute margins; pedicels terminal, 1-flowered; segments of corolla oval. ♄. B. H. Native of turfy mossy bogs in the mountainous parts of Europe; common in Switzerland, Russia, Scotland, Ireland, and the north of England, as well as in Lincolnshire and the neighbouring part of Norfolk. Mr. Pursh speaks of it as common on the boggy mountains of North America, from Canada to Pennsylvania, Island of Unalaschka. O. vulgàris, Pursh. fl. amer. sept. 1. p. 263. O. Europæ'us, Nutt. gen. amer. 1. p. 251. Vaccínium Oxycóccus, Lin. spec. 500. Smith, engl. bot. t. 319. Oed. fl. dan. t. 80. Vaccínium Oxycóccus, var. *α*, ovalifòlius, Michx. fl. bor. amer. 1. p. 228. Vaccínia palústris, Ger. emac. 1419. Lob. icon. 2. t. 109. Oxycóccum, Cord. hist. 140. 2 f. 1. Leaves convex, and dark shining green above, and glaucous beneath. Stems reddish. Pedicels few together, about the tops of the branches, red, slightly hoary. Corolla pink, with reflexed oblong segments. Stamens with purple downy filaments and yellow anthers. Berries pear-shaped, globular, often spotted, crimson, of a peculiar flavour, with a strong acidity, grateful to most people in the form of tarts, for which purpose they are largely imported from Russia. Not long since, cranberries from Lincolnshire and the north-west corner of Norfolk were sold in the streets of Norwich by cart-loads; but the extensive inclosures have in many parts destroyed and drained their native bogs. Lightfoot records, that at Longtown, on the borders of Cumberland, not less than 20*l.* or 30*l.* worth were sold each market day, for 5 or six weeks together, and dispersed over different parts of the kingdom. In Sweden, these berries serve only to boil silver plate to its due degree of whiteness, their sharp acid corroding the superficial particles of the copper alloy.

Marsh or Common Cranberry. Fl. May, June. Britain. Shrub creeping.

2 O. macroca'rpus (Pursh. fl. amer. sept. 1. p. 263.) stems prostrate, filiform, creeping; leaves elliptic-oblong, nearly flat and obtuse, distantly subserrulated on the margins, glaucous beneath, downy at the points when young: segments of the corolla linear-lanceolate; flower-bearing branches erect, proliferous; pedicels lateral. ♄. B. H. Native from Canada to Virginia, in bogs, principally on a sandy soil, and on high mountains. Wats. dendr. brit. t. 122. Vaccínium macrocárpum, Ait. hort. kew. ed. 1. vol. 2. 13. t. 7. Hook. bot. mag. 2506. Lam. ill. t. 286. f. 4. Vaccínium hispídulum, Wangh. amer. t. 30. f. 67. Vaccínium oxycóccus *β*, oblongifòlius, Michx. fl. amer. bor. 1. p. 228. Points of young leaves, peduncles, and the margins of the calyx and bracteas downy. Berries spherical, red, often remaining throughout the winter. This is a larger and more robust plant than the preceding. Several flowers come forth at the ends of the last year's branches, surmounted by the shoots of the present year. The bracteas are situated in the upper part of the pedicels in this, while in the preceding they are situated at the lower part. The berries are larger, and of a brighter red than the last, and are collected in great abundance for making tarts in America, and exported from thence to Europe; but they always prove here far inferior in quality to the Russian cranberries, however excellent in America. The best way of having American cranberries in Europe is by cultivation in an artificial bog, with great plenty of water, as first contrived by Sir Joseph Banks. A very few square yards of ground thus employed will yield as many cranberries as any family can use. If allowed to hang until they are full ripe, as late as October, they are even better than the common cranberry, and may be kept dry in bottles throughout the year. Our wild cranberries have generally been gathered too early; as may also be the case with those brought from America. "Wherever there is a pond," Mr. Neill observes, "the margin may, at a trifling expence, be fitted up for the culture of this plant, and it will continue productive for many years. All that is necessary is to drive in a few stakes 2 or 3 feet within the margin of the pond, and to place some old boards within these, so as to prevent the soil of the cranberry-bed from falling into the water; and lay a parcel of small stones or rubbish in the bottom, and over it peat or bog earth, to the depth of about 3 inches above and 7 inches below the surface of the water. In such a situation the plants grow readily; and if a few be put in they entirely cover the bed in the course of a year or two, by means of their long runners, which take root at different points. From a very small space a large quantity of cranberries may be gathered; and they prove a remarkable regular crop, scarcely affected by the state of the weather, and not subject to the attack of insects.

Large-fruited or American Cranberry. Fl. May, July. Clt. 1760. Shrub creeping.

3 O. ere'ctus (Pursh. fl. amer. sept. 1. p. 264.) leaves oval, acuminated, serrulated and ciliated; pedicels axillary; corolla before expansion long and conical, at length revolute; stem erect. ♄. H. Native of Virginia and Carolina, on the high mountains. Wats. dendr. brit. t. 31. Vaccínium erythrocárpum, Michx. fl. amer. bor. 1. p. 227. Branches flexuous. Leaves membranous, somewhat hairy. Flowers red. Berries scarlet, (black, ex Wats,) and quite transparent, of an exquisite taste. Very different in habit from the other species.

Erect Cranberry. Fl. May, June. Clt. 1806. Shrub 2 feet.

Cult. When any of the species are grown for the sake of their berries, they should be planted in an artificial bog, as mentioned under *O. macrocárpus.* But when grown only for having a specimen of the plants, they will grow well in pots filled with peat and sand, having sphagnum set round their roots: the pots should be well drained with sherds, and set in deep pans of water.

LIV. GAYLUSSA'CIA (named after L. Gay-Lussac, a celebrated French physician, and member of the Academy of Sciences, Paris). Humb. Bonpl. et Kunth, nov. gen. amer. 3. p. 275. t. 257. Cham. et Schlecht. in Linnæa. 1. p. 528. Lussàcia, Spreng.—Thibaúdia species, Humb.

Lin. syst. *Pentándria, Monogýnia.* Limb of calyx 5-cleft. Corolla tubular, ventricose at the base; limb 5-toothed. Stamens 10, inserted in the limb of the calyx, inclosed; anthers mutic, drawn out from the top into 2 little tubes. Style erect; stigma depressedly capitate. Drupe nearly globose, clothed by the calyx, 10-celled; cells 1-seeded. Seeds lenticular, smooth. —Evergreen or deciduous shrubs. Leaves scattered, coriaceous, each terminated by a mucrone or gland. Racemes axillary, approximate. Flowers scarlet, bracteate. Very nearly allied to *Thibaúdia,* but very distinct.

* *Corollas urceolate, or cylindrical.*

1 G. buxifòlia (H. B. et Kunth, nov. gen. amer. 3. p. 276.

t. 257.) young branchlets hispid; leaves elliptic or elliptic-oblong, rounded at both ends, terminated by a depressed brown gland, pilosely pubescent on both surfaces with minute scattered glands beneath, toothed at the apex; racemes axillary and approximate at the tops of the branches; flowers and fruit downy. ♄. S. Native near Caraccas, on Mount Avila, and near Santa Fe de Bogota. Corollas scarlet. Calycine segments ovate, acute.

Box-leaved Gaylussacia. Shrub.

2 G. IMBRICA'TA (Pohl. pl. bras. 2. p. 40. t. 126.) leaves imbricated, oval-elliptic, minutely crenated at the apex, terminated by a callous mucrone; calyx and corolla glabrous; bracteas of 2 forms, linear-lanceolate and oblong acute. ♄. G. Native of Brazil, in the province of Rio Janeiro, at Rio Tejucco, on the mountains. G. buxifòlia, Cham. et Schlecht. in Linnæa. vol. 1. p. 528. but not of H. B. et Kunth. Leaves permanent, clothed with yellow down on the nerves beneath. Racemes many-flowered, 2 inches long, downy. Flowers scarlet or crimson.

Imbricated-leaved Gaylussacia. Shrub 2 feet.

3 G. PU'LCHRA (Pohl. pl. bras. 2. p. 41. t. 127.) leaves oblong-elliptic, quite entire, with revolute edges, each terminated by a short callous mucrone, glabrous above, but pilose on the nerves and veins beneath, as well as the calyxes; corollas glabrous; bracteas of two forms, linear and oblong, acute. ♄. G. Native of Brazil, in the province of Minas Geraes, by waysides about Arrayal St. Joao Baptista. Stem branched, hoary. Branches leafy, glabrous, floriferous at the tops. Leaves deciduous, remote, green above and yellowish-green beneath, $1\frac{1}{2}$ inches long and 8 lines broad. Racemes loose.

Fair Gaylussacia. Shrub 2 feet.

4 G. DEPE'NDENS; branchlets angular, downy; leaves ovate, mucronate, cinereous; flowers axillary, aggregate; teeth of calyx ovate, acute. ♄. G. Native of Peru. Vaccínium depéndens, Ruiz et Pav. in herb. Lamb. Leaves an inch long.

Dependent Gaylussacia. Shrub.

5 G. MICROPHY'LLA; branchlets pilose, terete; leaves ovate, acuminated, striated beneath; flowers solitary, nearly sessile; calycine teeth ovate, acute. ♄. G. Native of Peru. Leaves hardly more than a line and a half long. Flowers scarlet. (v. s. in herb. Lamb.).

Small-leaved Gaylussacia. Shrub.

6 G. CRENA'TA (D. Don, mss. in herb. Lamb.) branchlets terete, downy; leaves oblong, acute, crenated; flowers aggregate; calycine teeth ovate, acute. ♄. G. Native of Peru. Leaves half an inch long. Flowers scarlet.

Crenated-leaved Gaylussacia. Shrub.

7 G. RUGÒSA (Cham. et Schlecht. in Linnæa. 1. p. 534.) branches hispid; leaves oblong, retuse, rugose, with revolute margins, scabrous above and hairy beneath, furnished with 2-3 short teeth on each side; racemes secund, drooping, 8-10-flowered, beset with glandular hairs; corollas tubularly urceolate, hairy on the angles and at the tops of the segments; young leaves beset with pili, which are tipped with black glands. ♄. G. Native of Brazil, without the tropic. Filaments ciliated. Calycine teeth narrow, acuminated.

Rugose Gaylussacia. Shrub 1 to 2 feet.

8 G. RHODODE'NDRON (Cham. et Schlecht. in Linnæa. 1. p. 533.) branches hispid; leaves nearly glabrous, elliptic, narrowed at the base; petioles pruinose, obsoletely serrated towards the apex; racemes lateral, secund, drooping; corollas cylindrical. ♄. G. Native of Brazil, within the tropic. Racemes terminal, or nearly so, and axillary. Flowers dense, secund. Pedicels hispid. Calycine segments short, elliptic, obtuse, ciliated. Corollas pilose or smoothish.

Rhododendron Gaylussacia. Shrub.

9 G. PSEU'DO-VACCÍNIUM (Cham. et Schlecht. in Linnæa. 1. p. 530.) glabrous or downy; leaves elliptic-lanceolate; racemes terminal, aggregate; corollas cylindrical; ovarium glabrous. ♄. G. Native of Brazil, within the tropic, in open sandy places; near Caravellos Freireis. Vaccínium Brasiliénsis, Spreng. nov. prov. p. 42. syst. 2. p. 212. Leaves obsoletely serrated towards the top, with a few ciliæ at the base of the younger leaves. Racemes axillary, erect, secund, bracteate, of a fine crimson colour, as well as the corollas, which are cylindrically urceolate; calycine teeth roundish, acuminated. There are glabrous and downy varieties of this species.

False-vaccinium Gaylussacia. Shrub 1 to 2 feet.

10 G. MYRTIFÒLIA (Cham. et Schlecht. in Linnæa. 8. p. 494.) leaves obovate-lanceolate, acute, terminated by an obtuse callous point, with serrulated reflexed margins, an inch long; racemes crimson, usually solitary, nearly terminal, erect, exceeding in leaves; calycine segments short, ovate, acuminated. ♄. G. Native of Brazil, within the tropic. Corolla tubular, ventricose. Young branches pilose. Young leaves ciliated. Leaves yellowish beneath, pilose on the petiole and midrib.

Myrtle-leaved Gaylussacia. Shrub.

11 G. SALICIFÒLIA (Cham. et Schlecht. in Linnæa. 1. p. 532.) quite glabrous and pruinose; leaves oblong, lanceolate, with adpressed serratures towards the apex; flowers 1-4 together, from the axils of the younger leaves; pedicels filiform, short, drooping, bractless; corolla cylindrical, plicate, with obtuse reflexed segments. ♄. G. Native of Brazil, within the tropic. Flowers not seen. Calycine teeth broad from the base, acuminated.

Willow-leaved Gaylussacia. Shrub 1 to 2 feet.

12 G. LANCEOLA'TA (Blum. bijdr. p. 861.) stem parasitical; leaves oblong-lanceolate, acuminated, coriaceous, glabrous, reticulately veined, and triple-nerved beneath; racemes axillary, simple, and are, as well as the calyxes, tomentose; pedicels tribracteate at the base. ♄. G. Native of Java, on trees on the mountains. Anthers biaristate on the back, beneath the apex. Stigma truncate, simple. Capsule 10-celled; cells 1-seeded.

Lanceolate-leaved Gaylussacia. Shrub.

13 G. DE'NSA (Cham. in Linnæa. 8. p. 490.) leaves rather inconspicuously and bluntly crenulated in front, and terminating in an erect mucrone; inflorescence crimson; calycine segments triangular; stamens glabrous. ♄. G. Native of Brazil, within the tropic. Branches, petioles, and rachi canescent from down, with the nerves and margin densely ciliated, as well as the bracteas and calyxes. Corolla glabrous, rarely pilose on the nerves.

Var. β; branchlets, rachi, and petioles, downy from shorter hairs; bracteas and calyxes ciliated; nerves and veins of leaves prominent beneath. ♄. G.

Var. γ; leaves coriaceous, having the nerves and veins hardly conspicuous beneath, quite glabrous in the adult state.

Dense-flowered Gaylussacia. Shrub.

14 G. MYRTILLOÌDES (Cham. in Linnæa. 8. p. 498.) leaves sharply serrated in front, ending in a straight mucrone; calycine segments lanceolate, length of the corolla; filaments ciliated, length of anthers. ♄. G. Native of Brazil, within the tropic. Branchlets, petioles, rachi, pedicels, and ovaries, beset with long spreading white hairs. Inflorescence crimson, glanduliferous. Leaves having the margins and nerves beneath pilose in the young state. Bracteas and calyxes pectinately ciliated. Corollas glabrous.

Myrtle-like Gaylussacia. Shrub.

15 G. PA'LLIDA (Cham. in Linnæa. vol. 8. p. 499.) branches marked by cicatrices occasioned by the falling of the leaves; leaves nearly sessile, quite entire, usually acute, terminating

each in an inflexed white mucrone; flowers pale, clothed with glandular down; bracteas foliaceous, green, length of flowers; bracteoles somewhat foliaceous, lanceolate, situated under the calyxes; calycine segments lanceolate, about a third the length of the corolla; filaments villous, about a fourth the length of the anthers. ♄. S. Native of Brazil, within the tropic.

Pale-flowered Gaylussacia. Shrub.

16 G. angustifòlia (Cham. in Linnæa. 8. p. 499.) branches, petioles, inflorescence, and calyxes downy; leaves coriaceous, linear-lanceolate, narrowed into the short petioles at the base, ending each in a callous acute point, with reflexed inconspicuously serrulated edges, shining above and rufescent beneath; racemes axillary, nearly terminal, erect, exceeding the leaves; lower bracteas foliaceous: superior ones coloured; calycine segments ovate, acuminated, or acutely triangular, and are, as well as the bracteas, ciliated; corollas cylindrical, downy on the nerves; filaments villous, shorter than the anthers. ♄. S. Native of equinoxial Brazil. Inflorescence coloured.

Narrow-leaved Gaylussacia. Shrub.

17 G. pinifòlia (Cham. et Schlecht. in Linnæa. 1. p. 536. and 8. p. 500.) quite glabrous and pruinose; leaves linear, acute at both ends, crenated; peduncles axillary, 1-3-flowered, furnished with small glandularly serrated bracteas; corolla urceolate, with short erect teeth. ♄. S. Native of equinoxial Brazil. The young leaves at the tops of the branches and flowers are crimson. Calycine teeth ovate, acuminated, cuspidate, with glandularly ciliated edges.

Pine-leaved Gaylussacia. Shrub $\frac{1}{2}$ to 1 foot.

* * *Corollas campanulate.*

18 G. pseu'do-gaulthe'ria (Cham. et Schlecht. in Linnæa. 1. p. 535.) branches straight, hispid; leaves narrow-elliptic, subcordate, scabrous on both surfaces, obsoletely serrulated towards the top; racemes axillary and terminal at the tops of the branches, approximate, secund, erect, hispid, bracteate. ♄. S. Native of Brazil, within the tropic. Stems rising from the root, biennial or triennial, about a foot high, branched. Flowers white, hardly crimson. Corollas campanulate, with hairy angles. Calycine teeth narrow, lanceolate. Ovarium hairy, glandular.

False Gaultheria Gaylussacia. Shrub 1 foot.

19 G. decípiens (Cham. in Linnæa. 8. p. 500.) branches hairy; leaves coriaceous, elliptic, obtuse, attenuated at the base, obsoletely crenated towards the apex; racemes from the axils of the ultimate leaves, secund, erect; calycine teeth triangular, acuminated; corolla campanulate, pilose on the angles, with erect triangular teeth. ♄. S. Native of Brazil, within the tropic. G. buxifòlia, Cham. et Schlecht. in Linnæa. 1. p. 528. but not of H. B. et Kunth. Leaves glabrous above, but pubescent on the nerves beneath. Corollas white, campanulate, not scarlet. This species has been referred to *G. imbricàta* by Pohl, but it differs from it in the flowers being campanulate and white, not scarlet.

Deceiving Gaylussacia. Shrub 1 to $1\frac{1}{2}$ foot.

20 G. amœ'na (Cham. in Linnæa. 8. p. 501.) branches, petioles, and inflorescence downy; calyxes glabrous, but are, as well as the bracteas, ciliated with glandular hairs; leaves on very short petioles, ending each in a callous mucrone, serrulated in front, with reflexed margins covered with resinous dots beneath, having the veins and nerves prominent beneath; racemes nearly terminal, erect, elongated; calycine segments ovate, acuminated; corolla campanulate, glabrous, filaments ciliated, half the length of the anthers; bracteas foliaceous. ♄. G. Native of Brazil, within the tropic. Flowers white.

Var. a; leaves obovate-cuneated, rounded.

Var. β; leaves narrower, blunt at the base, acuter at the apex, oblong or lanceolate.

Pleasant Gaylussacia. Shrub 4 to 6 feet.

21 G. inca'na (Cham. in Linnæa. 1. p. 536.) clothed with hoary tomentum; leaves oblong, with revolute margins, quite entire; racemes axillary and terminal, approximate at the tops of the branches, secund, erect; corollas campanulate, downy. ♄. G. Native of Brazil, within the tropic. Leaves cinereous above and white beneath. Calycine teeth lanceolate. Corolla downy, as well as the filaments.

Hoary Gaylussacia. Shrub 1 foot.

Cult. For culture and propagation see *Agarísta*, p. 838. All the species are extremely elegant when in blossom, and are therefore very desirable plants in every collection.

LV. THIBAU'DIA (named after Thiebaut de Berneaud, secretary of the Linnæan Society of Paris; author of several botanical memoirs). Pav. mss. H. B. et Kunth, nov. gen. amer. 3. p. 268. Ruiz et Pav. fl. per. vol. 4. ined.—Cavínium Aub. du Pet. Th.

Lin. syst. *Decándria, Monogýnia.* Calyx urceolar; limb 5-lobed. Corolla tubular, coarctate at the apex and 5-toothed. Stamens 10, inclosed; filaments very short, dilated; anthers 2-celled, shortly spurred at the base, drawn out into two tubes at the apex; cells or tubes parallel, dehiscing lengthwise by a linear fissure. Ovarium 5-celled. Style pentagonal. Stigma ample, peltate. Berry 5-celled; cells many-seeded. Seeds minute, angular, dotted.—Shrubs. Natives of Peru. Leaves evergreen, coriaceous, quite entire, nerved. Flowers drooping, bracteate, disposed in lateral corymbose racemes.

1 T. bractea'ta (Ruiz et Pav. fl. per. 4. t. 388. ined). leaves ovate-lanceolate, acuminated, 5-nerved; bracteas large, permanent, coriaceous, 2-lobed; anthers spurred at the base. ♄. S. Native of Peru. Branches angular, glabrous. Leaves rounded at the base, 2-3 inches long, petiolate. Flowers disposed in terminal thyrsoid corymbs at the tops of the branches. Corollas scarlet, nearly an inch long. Bracteas imbricated. Filaments bearded at the apex.

Bracteate Thibaudia. Shrub.

2 T. mellífera (Ruiz et Pav. l. c. t. 387. f. b.) branches terete, downy; leaves oblong, obtuse, feather-nerved, acute at the base; flowers axillary, corymbose, bractless; limb of calyx nearly entire; corollas short. ♄. S. Native of Peru. Leaves 2-3 inches long, on short petioles, glabrous. Bracteas small. Peduncles downy. Limb of calyx obsoletely 5-lobed. Filaments glabrous.

Honey-bearing Thibaudia. Shrub.

3 T. punctatifòlia (Ruiz et Pav. l. c. t. 387. f. a.) leaves oblong-lanceolate, acuminated, 5-nerved, rounded at the base, dotted beneath; calyx bluntly 5-lobed; racemes elongated, nodding; bracteas large, oblong, mucronate, adpressed; corollas ventricose; filaments glabrous. ♄. S. Native of Peru. Leaves a hand long, glabrous. Petioles short, robust. Branchlets angular. Racemes a span long, many-flowered. Flowers drooping. Corolla ventricose, an inch long.

Dotted-leaved Thibaudia. Shrub.

4 T. coarcta'ta (Ruiz et Pav. l. c. t. 385.) branchlets angular, glabrous; leaves lanceolate, acuminated, 5-nerved, rounded at the base; flowers aggregate; bracteas 2-lobed, roundish, coriaceous; calycine teeth acute; filaments glabrous. ♄. S. Native of Peru. T. bícolor, Dunal. in herb. Lamb. Leaves 3-4 inches long, marked with white veins above. Flowers peduncu-

late, subcorymbose, 5-10 together, drooping. Berries large. Corolla 1½ inch long.

Coarctate-flowered Thibaudia. Shrub.

5 T. CAULIALA'TA (Ruiz et Pav. l. c. t. 386.) branchlets angular; leaves nearly sessile, cordate-oblong, obtuse, denticulated; racemes few-flowered; bracteas lanceolate, acuminated; calycine teeth short, acute; filaments glabrous. ♄. S. Native of Peru. Leaves 4 inches long, feather-nerved. Bracteas permanent, lanceolate, coriaceous. Corolla an inch long.

Wing-stemmed Thibaudia. Shrub.

6 T. ELLÍPTICA (Ruiz et Pav. l. c. t. 384. f. b.) branchlets angular; leaves elliptic-oblong, with revolute margins; flowers aggregate; calycine teeth acutish, very short. ♄. S. Native of Peru. Leaves 3 inches long, attenuated at the base, on short petioles, feather-nerved. Peduncles half an inch long.

Elliptic-leaved Thibaudia. Shrub.

7 T. EMARGINA'TA (Ruiz et Pav. l. c. t. 384. f. a.) branchlets terete, glabrous; leaves obovate, emarginate, bristly beneath; flowers solitary; calyx obsoletely 5-toothed; corollas conical; filaments glabrous. ♄. S. Native of Peru. Leaves 1½ inch long, 3-nerved, acute at the base. Corolla ventricose, 3 lines long. Flowers pendulous. Peduncles glabrous.

Emarginate-leaved Thibaudia. Shrub.

8 T. FLORIBÚNDA (H. B. et Kunth, nov. gen. amer. 3. p. 269. t. 254.) branchlets terete, glabrous; leaves lanceolate, acuminated, reticulately veined, glabrous, as well as the inflorescence; racemes axillary, solitary; bracteas imbricated; filaments glabrous. ♄. S. Native of New Grenada, near Santa Fe de Bogota. Leaves 5 inches long. Calycine teeth ovate, acute. Corolla ventricose, scarlet.

Bundle-flowered Thibaudia. Shrub.

9 T. LONGIFÒLIA (H. B. et Kunth, l. c.) branchlets pentagonal, glabrous; leaves long-lanceolate, acuminated, obtuse at the base, reticulately triple and quintuple-nerved, and are, as well as the calyxes and corollas, glabrous. ♄. G. Native of the Andes, about Quindiu, near La Seja. Leaves 6-7 inches long. Racemes axillary, shorter than the leaves. Flowers size and structure of those of the preceding species.

Long-leaved Thibaudia. Shrub.

10 T. FALCA'TA (H. B. et Kunth, l. c.) branchlets terete, glabrous, fuscescent; leaves lanceolate, acuminated, falcate at the apex, acute at the base, reticulately quintuple-nerved, and are, as well as the calyx and corollas, glabrous. ♄. S. Native of New Granada, near Almaguer. Leaves 8 inches long. Racemes axillary, solitary, shorter than the leaves.

Falcate-leaved Thibaudia. Shrub.

11 T. MACROPHY'LLA (H. B. et Kunth, l. c. p. 270.) branchlets terete, glabrous; leaves ovate-lanceolate, acuminated, rounded at the base, reticulately quintuple-nerved, and are, as well as the calyx and corollas, glabrous. ♄. S. Native on the Andes, about Popayan, near Pindamon and Palace. Leaves on short petioles, 8-9 inches long. Racemes axillary, solitary, nearly sessile, 3 or 4 times shorter than the leaves. Corollas large, tubular, white, but red and ventricose below. Calycine teeth short, acute.

Long-leaved Thibaudia. Shrub 10 feet.

12 T. RUPE'STRIS (H. B. et Kunth, l. c. p. 270.) branchlets downy, striated a little; leaves lanceolate, bluntish, acute at the base, reticulately veined, glabrous above and downy beneath, especially on the nerves; calyxes glabrous. ♄. S. Native of New Granada, in Paramo de Saragura, near Loxa and Alto de Pulla. Leaves 3 inches long. Racemes axillary. Fruit nearly globose, about the size of those of *Prùnus spinòsa*.

Rock Thibaudia. Shrub.

13 T. NÍTIDA (H. B. et Kunth, l. c. p. 271.) branchlets trigonal, ? glabrous, fuscescent; leaves oblong, obtuse, rounded at the base, somewhat quintuple-nerved, shining, and are, as well as the calyxes and corollas, glabrous. ♄. S. Native on the eastern declivities of the Andes, about Quindiu, between Quebrada de Tochecito and La Seja. Leaves on short petioles, 4 inches long, beset with minute dots beneath. Racemes axillary, solitary, almost sessile, 2 inches long, involucrated by large roundish-ovate, obtuse, concave, coloured bracteas at the base.

Shining-leaved Thibaudia. Shrub.

14 T. CORDIFÒLIA (H. B. et Kunth, l. c. p. 271. t. 255.) branchlets furrowed, resinous, shining; leaves ovate, cordate, obtuse, quintuple or septuple-nerved, shining above, and are, as well as the calyxes, glabrous; corollas downy. ♄. G. Native of New Granada, on the Andes. Bracteas oblong, obtuse, coloured, concave. Calycine teeth ovate, acute. Corolla tubular, ventricose. Racemes axillary at the tops of the branches, solitary, sessile, hardly longer than the leaves. Filaments glabrous.

Heart-leaved Thibaudia. Shrub.

15 T. MELASTOMOÌDES (H. B. et Kunth, l. c. p. 272.) branchlets terete, smooth, brown, glabrous; leaves oblong, short-acuminated, rounded at the base, rather cordate, reticulately quintuple-nerved, and are, as well as the calyxes and corollas, glabrous. ♄. G. Native along with the preceding. Leaves having minute scattered dots beneath, 3 inches long, and an inch broad. Racemes axillary, solitary, sessile, shorter than the leaves, covered with the imbricated bracteas before expansion. Bracteas oblong, concave, rounded at the apex.

Melastoma-like Thibaudia. Shrub.

16 T. STROBULÍFERA (H. B. et Kunth, l. c. p. 272.) branchlets downy, obsoletely angular; leaves oblong, acuminated, rounded at the base, reticulately triple or quintuple-nerved, and are, as well as the calyxes and corollas, glabrous. ♄. G. Native of New Granada, in frigid places, between Rio Uduchapa and Paramo de Saraguru, near Loxa. Leaves beset with black dots beneath, reticulately 3-5-nerved, 2½ inches long. Racemes axillary, solitary, sessile, shorter than the leaves, strobile formed before expansion. Bracteas at the base of the pedicels, oblong, rounded and ciliated at top. Corolla tubular, ventricose at the base, red. Calycine teeth short, ovate, acute. Filaments ciliated.

Strobile-bearing Thibaudia. Shrub.

17 T. SCABRIU'SCULA (H. B. et Kunth, l. c. p. 272.) branches terete, roughish; branchlets angular, downy, fuscous; leaves oblong, acuminated, rounded and subcordate at the base, roughish from dots above, downy on the nerves beneath, and beset with minute black dots between the nerves; branchlets, calyxes, and corollas downy. ♄. G. Native about Quindiu, on the Andes. Inflorescence like that of the preceding species.

Roughish Thibaudia. Shrub.

18 T. PUBE'SCENS (H. B. et Kunth, l. c. p. 273.) climbing: branchlets trigonal, hairy; leaves oblong, or oblong-elliptic, acuminated, rounded at the base, reticulately quintuple or septuple-nerved, glabrous above, but downy beneath, as well as the calyxes and corollas. ♄. ◡. S. Native near Caraccas, on Mount Avila, between Puerta de la Silla and El Pexual: also of New Granada, near Ibague and Boca del Monte. Branches red. Leaves 5 inches long and 2 broad. Racemes axillary, solitary, sessile, covered by the bracteas before expansion, 1 to 1½ inch long. Corolla whitish-red. Calyxes with ovate-oblong, obtuse, spreading teeth. Filaments glabrous.

Downy Thibaudia. Shrub climbing.

19 T. QUERE'ME (H. B. et Kunth, l. c. p. 274. t. 256.) branchlets terete, glabrous, brown; leaves oval-elliptic, acumi-

nated, acute at the base, reticulately quintuple-nerved; branches, calyxes, and corollas glabrous. ♄. S. Native of South America, in the province of Choco, in one place near the town of Cali, towards Cerro de San Antonio, where it is called *Quereme de Cali*. Leaves 3 or 3½ inches long. Pedicels tribracteate at the base, red. Corollas tubular, ventricose at the base, red. Calycine teeth ovate, acute, short. The flowers, bracteas, and wood, are very sweet scented when dried, and which scent is easily communicated to water, spirits, or wine. Spirits of wine saturated with this aroma smells like cloves, and is useful in mitigating tooth-ache.

Quereme Thibaudia. Shrub 5 to 6 feet.

20 T. ardisiæfòlia (H. B. et Kunth, l. c. p. 274.) branches terete, glabrous; leaves opposite, sessile, oblong, obtuse, subcordate, reticulately nerved, and are, as well as the branches, calyxes, and corollas, glabrous. ♄. S. Native of New Grenada, near Fusagaruga, in woody places. Leaves 3½ inches long, with diaphanous edges. Racemes axillary, sessile, solitary, pendulous, girded by small imbricated bracteas at the base. Corollas cylindrically tubular, scarlet, with a white limb. Calycine teeth ovate, acute, ciliated.

Ardisia-leaved Thibaudia. Tree 16 to 20 feet.

Cult. For culture and propagation see *Agarista*, p. 838. Extremely elegant shrubs when in blossom.

LVI. AGAPETES (from αγαπητος, *agapetos*, beloved; in reference to the plants being showy). D. Don, mss. in herb. Lamb. Thibaúdia species, Wall and Blume. Ceratostèma species, Roxb.

Lin. syst. *Decándria Monogy'nia*. Limb of calyx 5-cleft. Corolla tubular; limb 5-cleft. Stamens 10; filaments very short, flattened; anthers mutic, very long, furnished at the base with a short thick appendage, exserted, emarginate at the apex; cells of anthers confluent, filiform, glabrous. Stigma clavate. Ovarium 5-celled. Berry 5-celled, many-seeded. Seeds angular.—Evergreen shrubs, natives of the East Indies. Leaves lanceolate, coriaceous, with denticulated margins. Flowers corymbose and racemose, rarely almost solitary. Corollas scarlet.

§ 1. *Corollas tubular.*

1 A. setígera (D. Don, in herb. Lin. soc.) leaves scattered, lanceolate, petiolate, acuminated, obtuse at the base; flowers disposed in racemose corymbs; peduncles and calyxes hispid; filaments bearded; anthers bifid; segments of corolla ovate-oblong. ♄. G. Native of the East Indies, on the Pundua mountains. Thibaúdia setígera, Wall. cat. no. 752. Leaves about 4 inches long, on very short robust petioles, obsoletely denticulated. Flowers numerous, in lateral and terminal corymbose racemes, furnished with bristly hairs. Corolla about an inch long.

Bristle-bearing Agapetes. Shrub.

2 A. verticilla'ta (D. Don, l. c.) leaves verticillate, lanceolate, acuminated, finely denticulated, acute at the base; flowers corymbose; peduncles and calyxes hispid; corolla glabrous, with short blunt lobes; filaments nearly smooth; anthers bifid. ♄ G. Native of the East Indies, on the Pundua mountains. Thibaúdia verticillàta, Wall. cat. no. 753. Leaves on very short petioles, disposed in interrupted verticillate fascicles. Corolla scarcely an inch long. Stigma almost simple.

Whorled-leaved Agapetes. Shrub.

3 A. loranthifòra (D. Don. l. c.) leaves sessile, lanceolate, bluntly acuminated, quite entire; flowers generally solitary; segments of the corolla elongated; anthers emarginate at the apex; filaments and corollas smoothish. ♄. G. Native of the East Indies. Thibaúdia loranthifòlia, Wall. cat. no. 754. Leaves 3 inches long, cuneate-lanceolate. Calyx with ovate acute teeth, and is, as well as the peduncles, rather bristly. Segments of corolla ovate at the base.

Loranthus-flowered Agapetes. Shrub.

4 A. variega'ta (D. Don, l. c.) leaves on short petioles, lanceolate, acuminated, denticulated, attenuated at the base, veiny; flowers lateral, corymbose; segments of corolla lanceolate, revolute; filaments bearded; anthers bifid. ♄. G. Native of the East Indies, on the Pundua mountains. Thibaúdia variegàta, Wall cat. no. 751. Leaves 6 inches long. Peduncles and calyx glabrous. Corolla glabrous, an inch long.

Variegated Agapetes. Shrub.

§ 2. *Corollas short, ovate.*

5 A. acumina'ta (D. Don, l. c.) leaves petiolate, lanceolate, long-acuminated, toothed; flowers copious, corymbose, lateral. ♄. G. Native of Silhet. Thibaúdia acuminàta, Wall. cat. no. 6297. Leaves a span long. Calycine segments ovate, mucronate. Calyx and peduncles finely downy.

Acuminated-leaved Agapetes. Shrub.

6 A. Sprenge'lii; leaves petiolate, ovate-lanceolate, acuminated, denticulated, attenuated at the base, woolly; flowers racemose, glabrous; peduncles glabrous; calycine segments ovate, denticulated; filaments downy; anthers bifid. ♄. G. Native of the East Indies. Thibaúdia Sprengèlii, Wall. cat. no. 6298. Leaves 3 inches long. Flowers drooping, from 5 to 7 in a cluster. Corolla ovate-oblong, about 2 lines long.

Sprengel's Agapetes. Shrub.

7 A. serra'ta; leaves verticillate, petiolate, lanceolate, acuminated, serrated, attenuated at the base; flowers racemose, pendulous, and are, as well as the filaments, glabrous: branchlets chaffy. ♄. G. Native of the East Indies. Thibaúdia serràta, Wall. cat. no. 6299. Leaves 2 inches long, on very short foot stalks. Calycine teeth very short, mucronate. Corolla ovate-oblong, 2 lines long.

Serrated-leaved Agapetes. Shrub.

8 A. symplocifòlia (D. Don, l. c.) branchlets downy; leaves ovate, mucronate, serrulated; flowers and calyxes downy; calycine segments rounded, mucronulate; filaments bearded. ♄. G. Native of the East Indies. Andrómeda symplocifòlia, Wall. cat. no. 1522. Corolla a line long.

Symplocos-leaved Agapetes. Shrub.

9 A. ellíptica; stem parasitical; leaves elliptic-oblong, acutish at both ends, biglandular at the base, coriaceous, veiny, glabrous; racemes secund, finely tomentose. ♄. G. Native of Java, on Mount Salak, upon trees. Thibáudia ellíptica, Blum. bijdr. p. 859.

Elliptic-leaved Agapetes. Fl. Year. Shrub parasitical.

10 A. floribu'nda; leaves elliptic-oblong, acuminated at both ends, coriaceous, glabrous, veiny; calyxes ciliated. ♄. G. Native of Java, on the tops of the mountains, where it is called *Prut* by the natives. Thibaúdia floribúnda, Blum. bijdr. l. c.

Bundle-flowered Agapetes. Shrub.

11 A. laurifòlia; stem parasitical; leaves cuneated-oblong, bluntish, coriaceous, glabrous, almost veinless; racemes glabrous. ♄. G. Native of Java, on the top of Mount Burangrang, upon trees. Thibaúdia laurifòlia, Blum. l. c.

Laurel-leaved Agapetes. Shrub parasitical.

12 A. varingiæfòlia; leaves oblong-lanceolate, acutish coriaceous, glabrous, nearly veinless; racemes leafy, and are, as

well as the calyxes, downy. ♄. G. Native of Java, on Mount Gede, where it is called by the natives *Jatigie-betul*. Thibaúdia varingiæfòlia, Blum. bijdr. p. 860.

Varingia-leaved Agapetes. Fl. Year. Shrub.

13 A. lu'cida; stem sometimes parasitical; leaves small, obovate, rather retuse, with recurved margins, coriaceous, glabrous, a little veined; racemes, calyxes, and corollas downy. ♄. G. Native of Java, in the higher woods. Thibaúdia lùcida, Blum. l. c.

Shining Agapetes. Fl. Year. Shrub parasitical.

14 A. coria'cea; stem parasitical; leaves elliptic or oblong-lanceolate, much acuminated, coriaceous, somewhat 3-nerved, and are, as well as the racemes, calyxes, and corollas, glabrous. ♄. G. Native of Java, on the mountains, upon trees, where it is called *Kilagiday* by the natives. Thibaúdia coriàcea, Blum. l. c.

Coriaceous-leaved Agapetes. Shrub parasitical.

15 A. cuneifòlia; leaves cuneiform, obtuse, sometimes retuse, with recurved margins, coriaceous, nearly veinless, and are, as well as the racemes and calyxes, glabrous. ♄. G. Native of Java, on the higher mountains, in woods. Thibaúdia cuneifòlia, Blum. bijdr. p. 861.

Wedge-leaved Agapetes. Fl. Year. Shrub.

16 A. myrtoìdea; branchlets downy; leaves ovate-elliptic, bluntish, with recurved margins, coriaceous, nearly veinless, downy on both surfaces at the midrib; racemes glabrous. ♄. S. Native of the Moluccas, on the tops of the burning mountains. Thibaúdia myrtoìdea, Blum. bijdr. 861.

Myrtle-like Agapetes. Shrub.

Cult. For culture and propagation see *Agarista*, p. 838.

LVII. CERATOSTE'MA (from κερας, *keras*, a horn, and στημων, *stemon*, a stamen; in reference to the anthers being bluntly spurred at the base). Juss. gen. p. 163. Ruiz et Pav. fl. per et Chil. vol. 4. ined.

Lin. syst. *Decándria Monogýnia*. Limb of calyx large, 5-parted, foliaceous. Corolla tubular, coarctate at the apex, 5-lobed. Stamens 12; filaments very short. Anthers bluntly spurred at the base; cells elongated at the apex, filiform, almost wholly free, dehiscing by a terminal pore each. Stigma simple, obtuse. Berry 5-celled, many-seeded. Seeds small, angular.—Evergreen shrubs, natives of Peru. Leaves oblong, on short petioles, almost veinless, coriaceous, rounded and subcordate at the base. Flowers almost sessile, lateral and terminal, pedunculate. Corollas large, scarlet.

1 C. grandiflòra (Ruiz et Pav. fl. per. 4. t. 383. f. b.) branchlets and peduncles downy; leaves lanceolate or ovate, usually mucronate; calycine segments acuminated; corollas longer than the peduncles. ♄. G. Native of Peru. Leaves an inch or an inch and a half long, obtuse.

Great-flowered Ceratostèma. Shrub.

2 C. hirsu'ta (Ruiz. et Pav. fl. per. 4. t. 383. f. a. ined.) branchlets and peduncles downy; leaves ovate-oblong, obtuse; calycine segments ovate, mucronate, reticulated; corollas about equal in length to the peduncles. ♄. G. Native of Peru. C. cordifòlia, Dunal, in herb. Lamb. Leaves 1½ inch long.

Hairy Ceratostèma. Shrub.

Cult. See *Agarista*, p. 838, for culture and propagation.—Elegant shrubs, worth cultivating in every collection.

Tribe IV.

PYRO'LEÆ (this tribe only contains the genus *Pyròla*). D. Don, in edinb. phil. journ. 17. p. 152. Anthers 2-celled. Ovarium free. Hypogynous disk naked. Seeds peltate, samaroid. Embryo dicotyledonous. Plants leafy, terrestrial.

LVIII. PYRO'LA (a diminutive of *Pyrus*, a pear-tree; resemblance in the leaves). Lin. gen. no. 554. Tourn. inst. t. 134. Juss. gen. 161. Gærtn. fruct. 3. p. 303. t. 63. D. Don, in werm. mem. 5. p. 224.

Lin. syst. *Decándria Monogýnia*. Calyx 5-parted. Petals 5. Stamens 10. Anthers dehiscing at the base by 2 holes. Stigma 5-lobed. Capsule 5-celled; valves connected by fine intricate tomentum. Placentas lunate, with simple lobes. Cells many-seeded. Seeds narrow, scobiform, winged at both ends. Embryo transverse. Humble evergreen herbs with wide creeping roots. Leaves petiolate, alternate, smooth, and usually shining, coriaceous, crenulated, toothed or serrated. Scapes erect, furnished with a few scales, usually triquetrous or quadrangular, convolute. Flowers pedicellate, bracteate, pendulous, globose or campanulate, white or red, disposed in terminal racemes. All the *Pyrolæ* are possessed of strong astringent qualities, and were formerly much esteemed for supposed healing properties; they are now wholly disused.

§ 1. *Stamens ascending. Style declinate, longer than the petals: stigma annular. Scapes erect. Flowers campanulate, pendulous, racemose, scattered, rarely somewhat secund.*

1 P. rotundifòlia (Lin. spec. 567.) leaves roundish, quite entire or crenulated, shorter than the dilated petioles; scape triquetrous; calycine segments lanceolate, acute; stigma clavate, bluntly 5-toothed. ♃. H. Native of Asia, Europe, and North America, in old woods, in stony or sandy soil. In Britain, in dry heathy woods, but rare; in the north of England and Highlands of Scotland. Smith, engl. bot. 213. exclusive of the syn. of fl. dan. Lam. ill. t. 367. f. 1. P. grandiflòra, Radd. diss. p. 27. t. 3. f. 2.—Riv. mon. t. 137. and 136. f. 2.—Mor. ox. sect. 12. t. 10. f. 1. Leaves numerous. Scapes furnished with 2-3 lanceolate-acute scales. Racemes 10-16-flowered. Pedicles secund, rather remote, scattered. Flowers rather large, milk-white.

Round-leaved Winter-green. Fl. June, July. Britain. Pl. ½ foot.

2 P. asarifòlia (Michx. fl. bor. amer. 1. p. 251.) leaves reniform, coriaceous, repandly crenated, twice shorter than the dilated petioles; scapes acutely triquetrous; racemes many-flowered; calycine segments ovate, acuminated, adpressed; stigma clavate, with an elongated 5-lobed disk. ♃. H. Native of Canada, in pine woods; and on the mountains of Pennsylvania, in beech woods. Leaves numerous. Scapes furnished with a few scarious convolute scales. Racemes elongated. Pedicels remote, scattered. Flowers greenish-white or yellowish-green, about the size of those of the preceding.

Asarum-leaved Winter-green. Fl. June, July. Clt. 1810. Pl. ½ foot.

3 P. chlora'ntha (Swartz, in Stockh. trans. 1810. t. 5. Nutt. gen. amer. 1. p. 273.) leaves orbicular, retuse, obsoletely crenulated, twice shorter than the narrow petioles; raceme few-flowered; calycine segments very short, obtuse; petals oblong; openings of anthers tubular; stigma clavate, with an elongated 5-lobed disk. ♃. H. Native of Sweden and Upper Canada. Lodd. bot. cab. 1542. P. convolùta, Bart. prod. fl. phil. p. 50. P. asarifòlia, Rad. diss. p. 23. t. 4. f. 1. exclusive of the synonyme of Michaux. P. rotundifòlia, β, nummulària, Muhl. cat. P. mìnor, Pursh. mss. and perhaps of fl. amer. sept. 1. p. 299. Scapes tetragonal, furnished only with one minute scale in the middle. Pedicels curved, scattered. Flowers cam-

panulate, about the size of those of *P. ellíptica*, greenish-white, pendulous.

Green-flowered Winter-green. Fl. June, July. Clt. 1818. Pl. ½ foot.

4 P. occidenta'lis (R. Br. mss. in herb. Banks, ex D. Don, in wern. mem. 5. p. 232.) leaves roundish, membranous, obsoletely denticulated, twice longer than the simple petioles; racemes few-flowered; calycine segments oblong, obtuse; disk of stigma 5-lobed. 4. H. Native of Sledge Island, on the north-west coast of America, where it was collected by D. Nelson. Leaves numerous, one-half smaller than those of *P. mínor*. Scapes triquetrous. Pedicels equal in length to the bracteas. Flowers globose, pendulous, milk-coloured, size of those of *P. rotundifo'lia*.

Western Winter-green. Pl. ½ foot.

5 P. ellíptica (Nutt. gen. amer. 1. p. 273.) leaves elliptic or ovate, membranous, serrulated, longer than the dilated petioles; racemes few-flowered; bracteas lanceolate, subulate, recurved at top; calycine segments very short, ending each in a recurved mucrone; petals oval; stigma clavate, with an elevated 5-lobed disk. 4. H. Native of both Canadas, in woods; and around Philadelphia; and in the woods of New Jersey. Rad. diss. p. 81. t. 5. f. 1. P. ovalifòlia, Pursh, mss. in herb. Lamb. Scapes acutely triquetrous, furnished with a solitary scarious scale near the base. Pedicels scattered, distant. Flowers campanulate, white, with a grateful smell, smaller than those of *P. rotundifòlia*.

Elliptic-leaved Winter-green. Fl. June, July. Clt. 1818. Pl. ½ foot.

6 P. denta'ta (Smith in Rees' cycl. D. Don in wern. mem. 5. p. 235.) leaves cuneate-oblong, coriaceous, acute at the base, twice as much longer than the narrow petioles, having the margin remotely toothed or quite entire; racemes elongated, few-flowered, rather secund; petals oval; disk of stigma elongated, 5-lobed. 4. H. Native of the Island of Nootka, on the north-west coast of America, where it was collected by Mr. Menzies. Leaves crowded. Scapes angular, naked. Racemes drooping at the apex, secund. Flowers campanulate, drooping, milk-white.

Toothed-leaved Winter-green. Pl. 1 foot.

7 P. pícta (Smith in Rees, cycl. D. Don in wern. mem. 5. p. 235.) leaves ovate, mucronulated, coriaceous, somewhat serrated, equal to the narrow petioles in length, red beneath, but dark green, and marked along the veins with whitish bands above; racemes many-flowered; petals roundish: stigma clavate, with a 5-lobed disk. 4. H. Native of the Island of Nootka, on the north-west coast of America; and of Japan, near the town of Nagasaki. Scapes acutely triquetrous, reddish, never convolute, furnished with scarious scales. Pedicels scattered. Flowers globosely campanulate, pendulous, white.

Painted-leaved Winter-green. Pl. ½ foot.

8 P. aphy'lla (Smith in Rees' cycl. D. Don in wern. mem. 5. p. 237.) leafless; scape angular, furnished with numerous scales at the base; racemes many-flowered, rather secund; calycine segments ovate, acute, crenulated; petals roundish; disk of stigma elongated, 5-crenated. 4. H. Native of Nootka Island, on the north-west coast of America, where it was collected by Mr. Menzies. Scapes numerous. Flowers globose, pendulous, milk-white. This remarkable species, although wholly destitute of leaves, is not, strictly speaking, leafless; their place is supplied by a kind of foliaceous scales, of a greenish colour. In some of the fine specimens preserved in the Banksian herbarium, an approach to leaves may be distinctly observed.

Leafless Winter-green. Pl. ½ foot.

§ 2. *Stamens erect, bent towards the pistillum. Style declinate, longer than the petals. Stigmas without a ring. Scapes erect. Flowers racemose, globose, pendulous, scattered, never secund.*

9 P. me'dia (Swartz, in act. holm. 1804. p. 257. t. 7. Smith, engl. bot. t. 1945.) leaves orbicular or roundish-oval, crenulated, coriaceous, equal in length to the dilated petioles; scapes spiral, acutely triquetrous; racemes many-flowered; calycine segments ovate, acute; stigma capitate, bluntly 5-lobed. 4. H. Native of Sweden, Scotland, and the north of England, among bushes and in woods; very common in Scotland, especially in mountainous districts. Radd. diss. p. 21. t. 3. P. rotundifòlia, Fl. dan. t. 110.—Blackw. 594. Huds. angl. p. 175. Lightf. scot. 1. p. 218. With. brit. 1. p. 408.—Riv. mon. 138. Leaves numerous. Pedicels scattered. Flowers pendulous, white tinged with red, much larger than those of *P. mìnor*.

Intermediate Winter-green. Fl. June, July. Britain. Pl. ½ foot.

§ 3. *Stamens erect. Style straight; stigma exannulated, or without a ring. Scapes erect. Flowers pendulous, racemose.*

10 P. mìnor (Lin. spec. 567.) leaves roundish or oval, coriaceous, repandly crenulated, longer than the petioles, which are dilated; racemes spicate; bracteas much longer than the pedicels; calycine segments very short; style inclosed; stigma flattish, 5-lobed. 4. H. Native of the colder parts of Europe, and the north of Asia, on heaths, in bushy places, and in woods; in Britain, in mossy woods and thickets, in mountainous situations; in Yorkshire, and common in many parts of Durham; woods near Brodie House, and at the Falls of Clyde, and many other places of Scotland. Fl. dan. t. 55. Smith, engl. bot. 158. Rad. diss. p. 15. t. 1. P. ròsea, Smith, engl. bot. 2543. Rad. diss. p. 18. t. 2. P. rotundifòlia, Pall. ind. taur. —Gmel. sib. 4. p. 128. no. 16. t. 56. f. 1.—Riv. mon. t. 136. f. 1. Leaves numerous, mucronulated at the apex. Scapes quadrangular, furnished with a lanceolate membranous scale in the middle. Racemes spicate, dense. Flowers globose, with a contracted mouth, white tinged with red. A variety of this species has been gathered in the Island of Unalaschka.

Smaller Winter-green. Fl. June, July. Britain. Pl. ¼ to ⅓ foot.

11 P. secu'nda (Lin. spec. 567.) leaves ovate, acute, membranous, sharply serrated, longer than the narrow petioles; raceme secund or unilateral; calycine segments rounded; petals oblong; style exserted; stigma flattish, 5-lobed. 4. H. Native of Europe, Asia; and North America, from Canada to New Jersey; among bushes and in alpine woods, particularly in dry, mossy, pine woods; in Britain, in mossy alpine woods; in Yorkshire; in many fir or birch woods in Scotland; on the hill of Dunnairn; in Darway forest, near Brodie House. Fl. dan. t. 402. Smith, engl. bot. t. 517.—Gmel. sib. 4. p. 129. t. 56. f. 2. Riv. mon. t. 138. f. 2.—Mor. hist. 1. sect. 12. t. 10. f. 4. Stems rather woody. Leaves mucronulate. Peduncles bluntly angular. Racemes elongated, many-flowered. Flowers campanulate, white, tinged with pale green.

Secund-flowered Winter-green. Fl. June, July. Britain. Pl. ¼ to ½ foot.

Cult. All the species of Winter-green are very pretty when in blossom, but are extremely difficult to cultivate in gardens. They grow best in a sandy or gravelly soil, in a shady situation. They should be mulched with moss, and a hand-glass placed over them. They may be increased by division.

LIX. CHIMA'PHILA (from χειμα, *cheima*, winter, and φιλεω, *phileo*, to love; the plants are green in winter). Pursh, fl. amer. sept. 1. p. 300. Nutt. gen. amer. 1. p. 274. —Chimàza, R. Br. in herb. Banks—Pyròla species, Lin. and others.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-toothed (f. 143. *a.*) Petals 5, at length reflexed (f. 143. *b.*) Stamens 10; anthers dehiscing at the base by 2 holes; filaments stipitate; stipes discoid, ciliated. Style very short, immersed in the germ. Stigma annular, orbicular, (f. 143. *d.*), with a 5-lobed disk. Capsules 5-celled, opening from the summit; margins of valves destitute of tomentum; cells many-seeded. Seeds narrow, scobiform, winged at both ends. Embryo transverse. — Evergreen suffruticose plants, with creeping roots. Leaves lanceolate, serrated, verticillate. Scapes naked. Flowers corymbose, white.

1 C. corymbòsa (Pursh. fl. amer. sept. 1. p. 300.) leaves cuneate-lanceolate, serrated, 4-5 in a whorl; peduncles pubescent, bearing a 5-6-flowered corymb at top; bracteas linear-subulate; appendages of filaments ciliated; style immersed. ♄. H. Native of Europe, Asia, and North America, from Canada to Carolina, in sandy and gravelly woods. Pyròla umbellàta, Lin. spec. 468. Sims, bot. mag. 7781. Chimàza umbellàta, R. Br. in herb. Banks.—Riv. pent. t. 139. f. 2.—Mor. hist. 3. sect. 12. t. 10. f. 5. Root creeping. Plant evergreen, frutescent. Leaves green on both surfaces, acutely and distantly serrated from the middle to the apex. Flowers corymbose, pendulous, at length erectish, greenish-white, tinged with red. Anthers purplish.

Umbellate-flowered Winter-green. Fl. June. Clt. 1752. Pl. $\frac{1}{4}$ to $\frac{1}{3}$ foot.

2 C. macula'ta (Pursh. fl. amer. sept. 1. p. 300. Nutt. gen. amer. 1. p. 275.) leaves lanceolate, acute, with white bands on the upper surface along the nerve and veins, opposite, or 4 in a whorl; peduncles downy, bearing a 2-3-flowered corymb at the apex; bracteoles linear; appendages of filaments woolly; style very short. ♄. H. Native of North America, from Canada to Carolina, in sandy or gravelly woods; also on the north-west coast. Pyròla maculàta, Lin. spec. 568. Sims, bot. mag. 897. Chimàza maculàta, R. Br. in herb. Banks.—Pluk. mant. 157. t. 349. f. 4. Plant suffrutescent, evergreen. Root creeping. Stem procumbent at base and ascending at apex. Lower surface of leaves red. Pedicels and calyxes red, clothed with clammy down. Flowers pendulous, white. Anthers yellow. This plant is in high esteem for its medicinal qualities among the Indians; they call it *sip-si-sewa*. Mr. Pursh tells us, that he has witnessed the beneficial effects of a decoction of this plant in a very severe case of hysterics; and he says it is a plant eminently deserving the attention of physicians. We are also informed that its decoction has proved very serviceable in scrofulous diseases.

FIG. 143.

Spotted-leaved Winter-green. Fl. June. Clt. 1752. Pl. dec. 3 to 4 inches long.

3 C. Menzie'sii (Spreng. syst. 2. p. 317.) leaves alternate, or 3 in a whorl, lanceolate, acuminated, serrated, discoloured; peduncles 2-flowered, glabrous; bracteas broad-roundish; calycine segments elliptic, acute; style distinct. ♄. H. Native of the north-west coast of America, where it was collected by Mr. Menzies. Pyròla Menzièsii, R. Br. in herb. Banks ex D. Don, in wern. mem. 5. p. 245. Plant suffrutescent, evergreen. Root creeping. Stems ascending, red. Pedicels glabrous. Flowers pendulous, white. Leaves deep green above and red beneath. This species has a striking resemblance to *P. maculàta.*

Menzies' Winter-green. Plant ascending, 2 to 3 inches long.

Cult. See *Pyròla*, for culture and propagation, above.

LX. MONE'SES (from μονος, *monos*, alone; flowers solitary on the tops of the scapes). Sal. mss. in Gray, brit. arrang. 2. p. 403. Pyròla uniflòra, of authors.

Lin. syst. *Decándria, Monogýnia.* Calyx 5-toothed (f. 144. *a.*) Corolla 5-lobed (f. 144. *b.*) Stamens 10, inclinate. Anthers dehiscing at the base by two holes; cells of anthers elongated and tubular. Stigma 5-toothed (f. 144. *f.*) Capsule 5-celled; valves dehiscing from the apex, destitute of tomentum.—An herb with a creeping root. Leaves orbicular, 3 in a whorl, coriaceous, serrated. Scapes 1-flowered. Pedicels bracteate. Flowers white.

1 M. grandiflòra (Sal. mss. in Gray, brit. arrang. 2. p. 403.) flowers solitary, at the top of the scape; cells of anthers elongated and tubular; stigma acutely 5-toothed; leaves orbicular, serrated. ♃. H. Native of Europe, Asia, and North America, in alpine mossy woods; in Britain, in alpine woods and by the sides of trickling rills; in the western islands of Harris and Borneras: in a fir wood near Brodie House, by Forres. Pyròla uniflòra, Lin. spec. 568. Fl. dan. t. 8. Smith, engl. bot. t. 146.—Moris. hist. 3. p. 505. sect. 12. t. 10. f. 2.—Riv. mon. t. 139. f. 1. Leaves 3, rarely 4 in a whorl, longer than the dilated petioles. Scape furnished with an ovate scale above the middle. Flowers large, solitary, drooping, white, very sweet-scented. Stamens recumbent.

FIG. 144.

Great-flowered Winter-green. Fl. June, July. Britain. Pl. $\frac{1}{4}$ to $\frac{1}{3}$ foot.

Cult. For culture and propagation, see *Pyròla*, above.

LXI. CLADOTHA'MNUS (from κλαδος, *klados*, a branch, and θαμνος, *thamnos*, a shrub). Bongard, in mem. acad. petersb. 2. p. 155. t. 1.—Pyròla fruticòsa, Escholz. mss.

Lin. syst. *Decándria Monogýnia.* Calyx 5-parted. Petals 5. Stamens 10. Anthers wholly adnate, dehiscing by 2 pores at the apex. Stigma globose, somewhat 5-lobed. Capsule globose, 5-valved, rarely 6-valved, and 5, rarely 6-celled.

Margins of the valves septiferous. Placenta 5-lobed; lobes roundish. Seeds numerous, small, involved in membranous aril.—A much branched shrub. Leaves sessile, entire, elliptic or oblong, glabrous, but when young finely ciliated, glaucescent beneath, 1½ inch long and 5 lines broad. Flowers axillary, solitary.

1 C. PYROLIFLÒRUS (Bongard, l. c). ♄. H. Native of the north-west coast of America, and of the Island of Sitcha.

Pyrola-flowered Cladothamnus. Shrub 4 to 6 feet.

Cult. For culture and propagation see *Azàlea*, p. 851.

Tribe V.

MONOTRO'PEÆ (this tribe contains plants agreeing with *Monótropa* in many important characters). D. Don, in edinb. phil. journ. 17. p. 152. Anthers 1-celled. Ovarium free. Hypogynous disk naked. Seeds peltate. Embryo undivided. —Leafless parasitical herb.

LXII. HYPO'PITYS (from *ὑπο*, *hupo*, under; and *πιτυς*, *pitys*, a pine-tree; the species are parasitical on the roots of pine-trees). Dill. gen. 7. Nutt. gen. amer 1. p. 270.—Monótropa species, Lin. and others.—Orobanchoìdes, Tourn. mem. acad. 170.

LIN. SYST. *Decándria*, *Monogýnia*. Calyx 3 to 5-parted. Corolla permanent, so deeply 4-5-cleft as to appear of 4-5 petals; each segment with a cucullate nectariferous base. Stamens 8-10. Anthers small, horizontal, with 2 obtuse horns at their base, at length opening flat. Stigma orbicular, with a bearded margin. Capsule 5-celled, 5-valved. Seeds very numerous, minute, girded by a narrow wing or membrane.—Parasitical upon the roots of trees destitute of proper leaves and verdure. Roots composed of dense imbricating scales. Stems or scapes aggregate, simple, furnished with alternate scales. Flowers racemose, pedicellate. Raceme bent at first, but at length erect.—Scent of the whole plant musky.—Habit of *Orobánche*.

1 H. EUROPÆ'A (Nutt. gen. amer. 1. p. 271.) scape spike-flowered; scales and flowers glabrous outside; lateral flowers octandrous. ♃. H. Native of many parts of Europe, as Sweden, Denmark, France, Italy, Britain, &c., in woods, where the ground is covered with rotten leaves, at the roots of fir, beech, and oak. In North America, from Canada to Pennsylvania, at the roots of beech and other trees, in shady moist places. With us, in Oxfordshire, in Stoken Church woods, and between Nettle-bed and Henley, Bedfordshire, Buckinghamshire, Berkshire, frequent; Maidstone in Kent; Tring in Hertfordshire; in the beech woods of Sussex; in Selbourn-hanger, Hampshire; Riley in Gloucestershire; Enville in Staffordshire; Shottesham and Stoke in Norfolk; in Scotland, but not common. Monótropa Hypópitys, Lin. spec. 555. Smith, engl. bot. t. 69. Fl. dan. t. 232. Hipópitys multiflòra, Scop. carn. no. 178. Dill. gies. 99. append. 134. t. 7.—Mentz. pug. 3. f. 5.—Pluk. phyt. t. 209. f. 5.—Mor. hist. 3. sect. 12. t. 16. f. 20. The whole plant has a pale yellow or brownish yellow appearance; the American one is much smaller than the European one. In Sweden it is given dry to sheep that are affected with cough.

European Yellow Bird's-nest. Fl. June, July. Britain. Pl. ½ foot.

2 H. HYPOPHE'GEA; raceme few-flowered; petals glabrous, jagged, about equal in length to the style, which is quite glabrous. ♃. H. Native of Europe, in beech woods. Monótropa hypophègea, Wallr. sched. Monótropa hypóxya, Spreng. syst. 2. p. 317.

Beech Yellow Bird's-nest. Pl. ½ foot.

3 H. LANUGINÒSA (Nutt. gen. amer. 1. p. 271.) scapes spike-flowered; bracteas and flowers woolly. ♃. H. Native of North America, from Pennsylvania to Carolina, in similar places to the preceding. Monótropa lanuginòsa, Michx. fl. bor. amer. 2. p. 266. The whole plant is of a light tan colour, downy in every part. Segments of calyx inconstant in number.

Woolly Yellow Bird'-nest. Pl. ½ foot.

Cult. The species are not cultivatable.

LXIII. MONO'TROPA (from *μονος*, *monos*, one; and *τροπεω*, *tropeo*, to turn; flowers turned one way). Nutt. gen. amer. 271.—Monótropa species, Lin. gen. no. 536. Juss. gen. 430.

LIN. SYST. *Decándria Monogýnia*. Calyx none. Corolla permanent, so deeply 5-parted as to appear 5-petalled; each segment with a cucullate nectariferous base. Stamens 10; anthers reniform, horizontal, with 2 obtuse horns at their base, emitting the pollen near the middle by 2 transverse chinks. Stigma orbicular, naked. Capsule 5-celled, 5-valved. Seeds numerous, minute, surrounded by a wing.—Parasitical plants, mostly upon the roots of trees, destitute of proper leaves and verdure. Root roundish, composed of an agglomeration of intricate succulent fibres, producing many 1-flowered scaly scapes or stems. Flowers at first nutant. Plants white and smooth, destitute of the musky odour of *Hypópitys*, but having a nauseous lileaceous scent when bruised. Habit of *Orobánche*.

1 M. MORISONIA'NA (Michx. fl. bor. amer. 1. p. 266.) scapes elongated, very straight, 1-flowered, furnished with distant scales; flower erect. ♃. H. Native of Virginia and Carolina, in shady woods, parasitical on the roots of trees.—Mor. hist. 3. sect. 12. t. 16. f. 5. Flowers larger than in the following species, frequently with 12 stamens.

Morison's White Bird's-nest. Pl. ½ foot.

2 M. UNIFLÒRA (Lin. spec. 555.) scape short, thick, 1-flowered, furnished with approximate scales; flowers drooping. ♃. H. Native from New York to Carolina, parasitical on the roots of trees, in shady moist places. Hook. exot. fl. t. 85. —Pluk. alm. t. 209. f. 2. Catesb. car. 1. t. 36.

One-flowered White Bird's-nest. Fl. May, June. Clt. 1824. Pl. ½ foot.

Cult. The species are not cultivatable.

LXIV. PTERO'SPORA (from *πτερον*, *pteron*, a wing, and *σπορα*, *spora*, a seed; the seeds are surrounded by a membranous margin or wing). Nutt. gen. amer. 1. p. 269. Lindl. coll. with a figure.

LIN. SYST. *Decándria*, *Monogýnia*. Calyx 5-parted. Corolla ovate, with a 5-toothed reflexed border. Stamens 10. Anthers excentrically peltate, 2-celled, adnate to the filaments by the margin, bisetose at the base. Capsule 5-celled, imperfectly 5-valved; dissepiments and valves united towards the base, and joined with the central axis. Placenta 5-lobed. Seeds very numerous and minute, each furnished with a terminal wing.—An evanescent annual plant, destitute of verdure, with the habit of *Monótropa*, to which it is nearly allied. Leaves none. Stem simple, racemose. Flowers numerous, scattered, reddish, resembling those of some species of *Andrómeda*. Peduncles rather long, 1-flowered, drooping.

1 P. ANDRÓMEDA (Nutt. gen. amer. 1. p. 27.) ☉. H. Native of Upper Canada, near the Falls of Niagara, in clay soils; banks of Seneca lake; and near Albany, in the state of New

York. Plant covered with brownish viscid hairs. Stems brownish red or purple, furnished with lanceolate scales at the base. Peduncles filiform, nutant. Corollas white, with a red border.

Andromeda-flowered Pterospora. Fl. July. Pl. 1 to 2 feet.

Cult. The plant is not cultivatable.

XXXVIII. SCHWEINI'TZIA (named after the Rev. —— Schweinitz, author of a monograph of the American species of the genus *Carex*, published in Annals of the Lyceum of New York). Ell. fl. car. vol. 2. Nutt. gen. amer. addend.

LIN. SYST. *Decándria, Monogýnia.* Calyx 5-leaved; segments concave, equal with the corolla. Corolla campanulate, with a 5-cleft border, and a 5-cleft nectarium at the base of the corolla. Stamens 10. Anthers adnate to the filaments, 1-celled, opening from the inverted base by 2 naked pores. Stigma subglobose, closed, internally 5-cleft. Capsule 5-celled.? Seeds? A small, herbaceous, and probably parasitical plant, destitute of proper leaves and verdure. Scapes scaly. Flowers terminal, aggregate, sessile, bracteate; bracteas large.

1 S. CAROLINIA'NA (Ell. fl. car. vol. 2.) ⊙. H. Native of North Carolina, in rich shady woods. Flowers sweet-scented, reddish-white.

Carolina Schweinítzia. Fl. Feb. March. Pl. ½ foot.

Cult. The plant is not cultivatable.
